Ma	anage	ement Tools	
6	_	oduction	
7		b-Based Management	
	7.1	Getting Acquainted with the Web Interface	
		7.1.1 Computer Requirements	
		7.1.2 Accessing the Web Interface	
		7.1.3 Areas of the GUI	
		7.1.5 Navigation Tree	
		7.1.5.1 Displaying Navigation Tree in Basic and Full View	55
		7.1.5.2 Showing / Hiding the Navigation Pane	
		7.1.6 Working with Configuration Pages	
		7.1.6.1 Accessing Pages	
		7.1.6.3 Modifying and Saving Parameters	
		7.1.6.4 Working with Tables	60
		7.1.7 Searching for Configuration Parameters	
		7.1.8 Creating a Login Welcome Message	
		7.1.9 Getting Help	
	7.2	Viewing the Home Page	
	7.3	Configuring Web User Accounts	
	7.5	7.3.1 Basic User Accounts Configuration	
		7.3.1 Basic Oser Accounts Configuration	
	7.4	Displaying Login Information upon Login	
	7.5	Configuring Web Security Settings	
	7.6	Web Login Authentication using Smart Cards	
	7.7	Configuring Web and Telnet Access List	
	1.1	- Comigaring 1100 and Torrot / 100000 List	1 1

8	CLI-	Based Management	79
	8.1	Enabling CLI	79
		8.1.1 Enabling Telnet for CLI	79
		8.1.2 Enabling SSH with RSA Public Key for CLI	
	8.2	Establishing a CLI Session	
	8.3	Configuring Maximum Telnet/SSH Sessions	
	8.4	Command Shell	
		8.4.1 Getting Familiar with the Command Shell	
		8.4.1.2 Accessing Subdirectories	
		8.4.2 Status Commands	
		8.4.3 Ping Command	
		8.4.4 Test Call (TC) Commands	
		8.4.6 Configuration Commands	
		8.4.7 PSTN Commands	90
		8.4.8 LDAP Commands	90
9	SNIV	MP-Based Management	93
	9.1	Enabling SNMP and Configuring SNMP Community Strings	93
	9.2	Configuring SNMP Trap Destinations	
	9.3	Configuring SNMP Trusted Managers	
	9.4	Configuring SNMP V3 Users	
10		File-Based Management	
10			
	10.1		
		10.1.1 Configuring Individual ini File Parameters	
		10.1.3 General ini File Formatting Rules	
	10.2	Configuring an ini File	.102
	10.3	Loading an ini File to the Device	.102
	10.4	Secured Encoded ini File	.103
	10.5	Configuring Password Display in ini File	.103
	10.6	INI Viewer and Editor Utility	.104
Ge	neral	System Settings	.105
11	Con	figuring SSL/TLS Certificates	.107
		11.1.1 Configuring TLS Certificate Contexts	
		11.1.2 Assigning CSR-based Certificates to TLS Contexts	111
		11.1.3 Assigning Externally Created Private Keys to TLS Contexts	
		11.1.4 Generating Private Keys for TLS Contexts11.1.5 Creating Self-Signed Certificates for TLS Contexts	
		11.1.6 Importing Certificates and Certificate Chain into Trusted Certificate Store	
		11.1.7 Configuring Mutual TLS Authentication	
		11.1.7.1 TLS for SIP Clients	. 116
		11.1.7.2 TLS for Remote Device Management	. 117
40	D = 4		
12		e and Time	
		Configuring Date and Time Manually	
	12.2	Configuring Automatic Date and Time using SNTP	.119

	12.3	Configuring Daylight Saving Time	121
Ge	neral	VoIP Configuration	123
		work	
	13.1	Ethernet Interface Configuration	125
		Ethernet Interface Redundancy	
		Configuring IP Network Interfaces	
		13.3.1 Assigning NTP Services to Application Types	
		13.3.2 Multiple Interface Table Configuration Summary and Guidelines	131
		13.3.3 Networking Configuration Examples	
		13.3.3.1 One VoIP Interface for All Applications	
		13.3.3.3 VoIP Interfaces for Combined Application Types	
		13.3.3.4 VoIP Interfaces with Multiple Default Gateways	134
	13.4	Configuring Static IP Routes	
		13.4.1 Configuration Example of Static IP Routes	
	40.5	13.4.2 Troubleshooting the Routing Table	
		Configuring Quality of Service.	
		Configuring ICMP Messages	
	13.7	DNS	
		13.7.1 Configuring the Internal DNS Table	140 142
	13.8	Configuring NFS Settings	
		Network Address Translation Support	
		13.9.1 Device Located behind NAT	
		13.9.1.1 Configuring STUN	146
		13.9.1.2 Configuring a Static NAT IP Address for All Interfaces	
		13.9.1.3 Configuring NAT Translation per IP Interface	14 <i>1</i>
		13.9.2.1 SIP Signaling Messages	
		13.9.2.2 Media (RTP/RTCP/T.38)	
	13.10	ORobust Receipt of Media Streams by Media Latching	152
	13.11	1 Multiple Routers Support	152
	13.12	2IP Multicasting	152
14	Seci	urity	153
	14.1	Configuring Firewall Settings	153
	14.2	Configuring General Security Settings	157
	14.3	Intrusion Detection System	158
		14.3.1 Enabling IDS	159
		14.3.2 Configuring IDS Policies	
		14.3.3 Assigning IDS Policies	
	1/1/1	IPSec and Internet Key Exchange	
	14.4	14.4.1 Enabling IPSec	
		14.4.2 Configuring IP Security Proposal Table	
		14.4.3 Configuring IP Security Associations Table	
15	Med	lia	173
	15.1	Configuring Voice Settings	173

		15.1.1 Configuring Voice Gain (Volume) Control	
		15.1.2 Silence Suppression (Compression)	
	45.0	15.1.3 Echo Cancellation	
	15.2	Fax and Modem Capabilities	
		15.2.1 Fax/Modem Operating Modes	
		15.2.2.1 T.38 Fax Relay Mode	
		15.2.2.2 G.711 Fax / Modem Transport Mode	. 180
		15.2.2.3 Fax Fallback	
		15.2.2.4 Fax/Modem Bypass Mode	
		15.2.2.5 Fax / Modem NSE Mode	
		15.2.2.6 Fax / Modem Transparent with Events Mode	
		15.2.2.7 Fax / Modem Transparent Mode	183
		15.2.3 V.34 Fax Support	
		15.2.3.1 Bypass Mechanism for V.34 Fax Transmission	185
		15.2.3.2 Relay Mode for T.30 and V.34 Faxes	
		15.2.3.3 V.34 Fax Relay for SG3 Fax Machines	. 186
		15.2.4 V.150.1 Modem Relay	188
		15.2.5 Simultaneous Negotiation of Fax (T.38) and Modem (V.150.1) Relay	
		15.2.6 V.152 Support	
	45.0	15.2.7 Fax Transmission behind NAT	
	15.3	Configuring RTP/RTCP Settings	
		15.3.1 Configuring the Dynamic Jitter Buffer	
		15.3.2 Comfort Noise Generation	
		15.3.3.1 Configuring DTMF Transport Types	
		15.3.3.2 Configuring RFC 2833 Payload	194
		15.3.4 Configuring RTP Base UDP Port	
	15.4	Configuring IP Media Settings	196
		15.4.1 Answering Machine Detection (AMD)	
		15.4.1.1 Detecting Answering Machine Beeps	
		15.4.1.2 SIP Call Flow Example of AMD	
		15.4.1.3 Configuring AMD	. 200
		15.4.1.4 Enabling IP-to-Tel Call Disconnection upon Detection of Answering Machine 201	
		15.4.2 Automatic Gain Control (AGC)	202
	15.5	Configuring Various Codec Attributes	
		Configuring DSP Templates	
	15.7	Configuring Media (SRTP) Security	.205
16	Serv	rices	207
	16 1	SIP-based Media Recording	207
	10.1	16.1.1 Enabling SIP-based Media Recording	
		16.1.2 Configuring SIP Recording Routing Rules	
		16.1.3 Configuring SIP User Part for SRS	
		16.1.4 Interworking SIP-based Media Recording with Third-Party Vendors	
		16.1.4.1 Genesys	
		16.1.4.2 Avaya UCID	212
	16.2	RADIUS Authentication	.213
		16.2.1 Setting Up a Third-Party RADIUS Server	
		16.2.2 Configuring RADIUS Authentication	
		16.2.3 Securing RADIUS Communication	
		16.2.4 Authenticating RADIUS in the URL	
	16.3	LDAP-based Management and SIP Services	
		16.2.1 Enabling the LDAD Comice	219
		16.3.1 Enabling the LDAP Service	

		16.3.2 Enabling LDAP-based Web/CLI User Login Authentication and Authorization	
		16.3.3 Configuring LDAP Servers	219
		16.3.4 Configuring LDAP DNs (Base Paths) per LDAP Server16.3.5 Configuring the LDAP Search Filter Attribute	
		16.3.6 Configuring Access Level per Management Groups Attributes	
		16.3.7 Configuring LDAP Search Methods	
		16.3.8 Configuring the Device's LDAP Cache	
		16.3.9 Configuring Local Database for Management User Authentication	
		16.3.10 LDAP-based Login Authentication Example	
		16.3.11 Active Directory-based Routing for Microsoft Lync	
		16.3.11.1 Querying the AD and Routing Priority	
		16.3.11.2Configuring AD-Based Routing Rules	
	40.4		
	10.4	Least Cost Routing.	
		16.4.1 Overview	
		16.4.2.1 Enabling the LCR Feature	
		16.4.2.2 Configuring Cost Groups	
		16.4.2.3 Configuring Time Bands for Cost Groups	
		16.4.2.4 Assigning Cost Groups to Routing Rules	
	16.5	Configuring Call Setup Rules	.247
		16.5.1 Call Setup Rule Examples	251
17	Oua		
17		lity of Experience	
	17.1	Reporting Voice Quality of Experience to SEM	.253
		17.1.1 Configuring the SEM Server	
		17.1.2 Configuring Clock Synchronization between Device and SEM	
		17.1.3 Enabling RTCP XR Reporting to SEM	
		Configuring Quality of Experience Profiles	
	17.3	Configuring Bandwidth Profiles	.258
	17.4	Configuring Media Enhancement Profiles	.260
18	Con	trol Network	263
		Configuring Media Realms	
	18.2	Configuring Remote Media Subnets	.265
	18.3	Configuring SRDs	.267
	18.4	Configuring SIP Interfaces	.270
	18.5	Configuring IP Groups	.273
		Configuring Proxy Sets	
19	SIP	Definitions	.291
	19.1	Configuring SIP Parameters	.291
		Configuring Registration Accounts	
		19.2.1 Regular Registration Mode	
		19.2.2 Single Registration for Multiple Phone Numbers using GIN	
	19.3	Configuring Proxy and Registration Parameters	
		19.3.1 SIP Message Authentication Example	
	19.4	Configuring SIP Message Manipulation	
		Configuring SIP Message Policy Rules	
20	Cod	ers and Profiles	.307
	20.1	Configuring Default Coders	.307

	20.2 Configuring Coder Groups	310
	20.3 Configuring Tel Profile	312
	20.4 Configuring IP Profiles	314
Ga	teway Application	341
21	Introduction	3/13
22	Digital PSTN	
	22.1 Configuring Trunk Settings	
	22.2 TDM and Timing	
	22.2.1 Configuring TDM Bus Settings	
	22.2.2 Configuring Digital PCM Settings	
	22.2.4 Clock Settings	
	22.2.4.1 Recovering Clock from PSTN Line Interface	
	22.2.4.2 Configuring BITS Synchronization Mode	350
	22.2.4.3 Configuring Internal Clock as Clock Source	
	22.3 Configuring Transmission Settings	352
	22.4 Configuring CAS State Machines	353
	22.5 Configuring Digital Gateway Parameters	355
	22.6 Tunneling Applications	357
	22.6.1 TDM Tunneling	
	22.6.1.1 DSP Pattern Detector	
	22.6.2 QSIG Tunneling	
	22.7 ISDN Non-Facility Associated Signaling (NFAS)	
	22.7.1 NFAS Interface ID	
	22.7.2 Working with DMS-100 Switches	
	22.7.3 Creating an NFAS-Related Trunk Configuration	
	22.8 ISDN Overlap Dialing	
	22.8.1 Collecting ISDN Digits and Sending Complete Number in SIP	
	22.8.2 Interworking ISDN Overlap Dialing with SIP According to RFC 3578	
	22.9 Redirect Number and Calling Name (Display)	
	22.10SDH / SONET Configuration	
	22.10.1 Trunk Numbering (KLM Numbering)	
	22.10.1 Trunk Numbering (KEW Numbering)	
	22.10.1.2T1 Trunk Enumeration (Sonet Mappings)	
23	Trunk Group	
	•	
	23.1 Configuring Trunk Group Table	
	23.2 Configuring Trunk Group Settings	377
24	Manipulation	383
	24.1 Configuring General Settings	383
	24.2 Configuring Source/Destination Number Manipulation Rules	
	24.3 Manipulating Number Prefix	
	24.4 SIP Calling Name Manipulations	
	24.5 Configuring Redirect Number IP to Tel	
	24.6 Manipulating Redirected and Diverted Numbers for Call Diversion	
	24.7 Mapping NPI/TON to SIP Phone-Context	397

	24.8	Configuring Release Cause Mapping	399
		24.8.1 Fixed Mapping of SIP Response to ISDN Release Reason	
		24.8.2 Fixed Mapping of ISDN Release Reason to SIP Response	
		24.8.3 Reason Header	
	24.9	Numbering Plans and Type of Number	404

Note and Warnings

Note: This device is considered an **INDOOR** unit and therefore, must be installed only indoors. In addition, Ethernet port interface cabling must be routed only indoors and must not exit the building.

Note: The scope of this document does not fully cover security aspects for deploying the device in your environment. Security measures should be done in accordance with your organization's security policies. For basic security guidelines, refer to AudioCodes *Recommended Security Guidelines* document.

Note: Throughout this manual, unless otherwise specified, the following naming conventions are used:

- The term device refers to your AudioCodes products.
- The term blade refers to the TP-8410 blade or TP-6310 blade.

Note: Before configuring the device, ensure that it is installed correctly as instructed in the *Hardware Installation Manual*.

User's Manual Notices

Note: T3 is synonymous with DS3.

Notes:

- By default, the device supports export-grade (40-bit and 56-bit) encryption due to US government restrictions on the export of security technologies. To enable 128bit and 256-bit encryption on your device, contact your AudioCodes sales representative.
- This device includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).
- This device includes cryptographic software written by Eric Young (eay@cryptsoft.com).

Note: Some of the features listed in this document are available only if the relevant Software License Key has been purchased from AudioCodes and installed on the device. For a list of Software License Keys that can be purchased, please consult your AudioCodes sales representative.

Note: OPEN SOURCE SOFTWARE. Portions of the software may be open source software and may be governed by and distributed under open source licenses, such as the terms of the GNU General Public License (GPL), the terms of the Lesser General Public License (LGPL), BSD and LDAP, which terms are located at: http://www.audiocodes.com/support and all are incorporated herein by reference. If any open source software is provided in object code, and its accompanying license requires that it be provided in source code as well, Buyer may receive such source code by contacting AudioCodes, by following the instructions available on AudioCodes website.

User's Manual

User's Manual 1. Overview

1 Overview

The Mediant 3000 (hereafter referred to as *device*) is a SIP-based Voice-over-IP (VoIP) media gateway, offering an integrated voice media gateway functionality for voice, data, and fax streaming over IP networks. The device addresses mid-density applications deployed in IP networks, by delivering up to 2,016 simultaneous voice channels.

The device is also a fully featured Enterprise class Session Border Controller (SBC), providing a secured voice network (VoIP) deployment based on a Back-to-Back User Agent (B2BUA) implementation. The device's SBC application provides control over SIP signaling and usually also the media streams involved in setting up, conducting, and tearing down calls.

The device supports various PSTN physical interfaces, depending on implemented blade:

- TP-6310 Blade: provides 1+1 protected STM-1/OC-3 interfaces or up to three scalable T3 PSTN interfaces, which can be connected directly to the PSTN or to the enterprise's PBX
- TP-8410 Blade: provides up to 63 E1 or 84 T1 (DS1) PSTN interfaces, and allows different and dedicated physical Ethernet ports for each network type (Media, OAMP and Control)

The device also provides SIP trunking (IP-to-IP and/or Trunk-to-IP) capabilities for Enterprises operating with multiple Internet Telephony Service Providers (ITSP) for VoIP services. The device provides full system redundancy, offering an ideal solution for deploying high-density, high-availability Voice-over-Packet systems.

The device can be offered as a standalone IP-to-IP media gateway, PSTN-IP media gateway, or a combined PSTN-IP/IP-to-IP media gateway. The supported offering depends on the installed Software License Key.

Note: For maximum call capacity figures, see "SBC and DSP Channel Capacity" on page 919.

The device supports a wide variety of VoIP and cellular vocoders, standards-compliant signaling and call control, and is based on AudioCodes' VoIPerfect™ architecture core technology. The device supports a broad selection of voice processing related algorithms such as G.711, G.723.1, G.729A Vocoders, G.168-2000 compliant echo cancellation, T.38 real-time Fax over IP, a wide selection of in-band and out-of-band tone detection and generation, as well as signaling protocol support including ISDN PRI.

Analog Gateway

Figure 1-1: Mediant 3000 Typical Application

The device's chassis provides a compact, rugged 19-inch rack mount unit, 2U high (3.5" or 89 mm), designed to meet NEBS level-3 requirements. The device is a four-slot chassis (four front and rear slots) that houses VoIP communication blades, synchronization and alarm blades, and rear transition modules (RTM). The front and rear blades interface through a backplane located in the middle of the chassis. The device's chassis' modular design allows easy add and replacement of modules. All modules are hot-swappable, allowing component replacement while the system is fully operational with no disruption to service. The device contains the following main components:

- Up to two VoP communication blades
- RTM's (amount and type depend on the implemented VoP blade)
- Up to two SA/M3K Synchronization and Alarm blades
- Up to two Power Entry modules
- Up to two Power Supply module

These components function in either an Active/Standby redundant or load-sharing configuration to provide full continuous performance coverage and are ideal building blocks for deploying high-density, high availability, Voice-over-Packet systems.

The device can operate in one of the following modes:

- Simplex Mode: This mode provides only one VoP communication blade and one Synchronization and Alarm blade (SA/M3K). In this mode, the device can also support an optional, integrated CPU (iCPU) for third-party applications.
- High Availability 1+1 (HA) Mode: This mode provides system redundancy. The device houses two VoP communication blades (one active and one standby), two RTMs, and two Synchronization and Alarm blades. The device's hardware design

User's Manual 22 Document #: LTRT-89725

User's Manual 1. Overview

contains redundant modules for every part of the system, including redundant network connectivity, comprehensive switchover processing and backup data storage and access, as well as applicable load-sharing schemes. In addition, components are hotswappable so that they can be replaced while the system is fully operational with no disruption to service.

To achieve HA, the software resides on redundant components and performs the following:

- Monitors system components to detect any hardware failures
- Handles switchover procedures to overcome possible failures

For more details on the HA system, see "HA Overview" on page 533.

1.1 Functional Block Diagrams

The functional block diagrams of the Mediant 3000 with the TP-6310 blade and with the TP-8410 blade are shown in the figures below, respectively:

1.2 SIP Overview

Session Initiation Protocol (SIP) is an application-layer control (signaling) protocol used on the E-SBC and gateway for creating, modifying, and terminating sessions with one or more participants. These sessions can include Internet telephone calls, media announcements, and conferences.

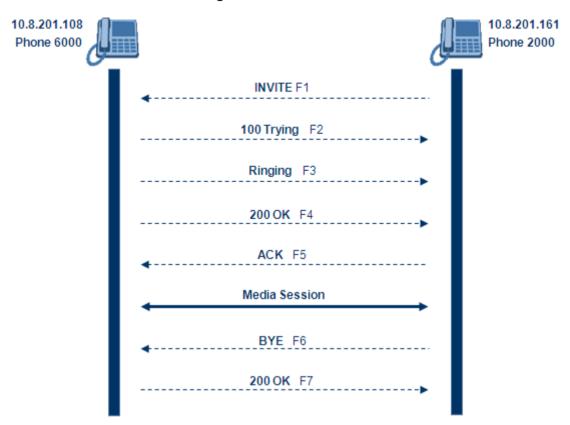

SIP invitations are used to create sessions and carry session descriptions that enable participants to agree on a set of compatible media types. SIP uses elements called Proxy servers to help route requests to the user's current location, authenticate and authorize users for services, implement provider call-routing policies and provide features to users.

SIP also provides a registration function that enables users to upload their current locations for use by Proxy servers. SIP implemented in the E-SBC and gateway, complies with the Internet Engineering Task Force (IETF) RFC 3261 (refer to http://www.ietf.org).

User's Manual 1. Overview

The SIP call flow, shown in the figure below, describes SIP messages exchanged between two devices during a basic call. In this example, device with IP address 10.8.201.108 and phone number 6000, dials device with IP address 10.8.201.161 and phone number 2000.

Part I

Getting Started with Initial Connectivity

User's Manual 2. Introduction

2 Introduction

This part describes how to initially access the device's management interface and change its default IP address to correspond with your networking scheme.

This page is intentionally left blank.

3 Default OAMP IP Address

The device is shipped with a factory default IP address for operations, administration, maintenance, and provisioning (OAMP), through its VoIP LAN interface. You can use this address to initially access the device from any of its management tools (embedded Web server, EMS, or Telnet/SSH). You can also access the device through the console CLI, by connecting the device's serial (RS-232) port to a PC.

The table below lists the device's default IP address.

Table 3-1: Default VoIP LAN IP Address for OAMP

IP Address	Value
Application Type	OAMP + Media + Control
Private IP Address	 TP-6310 or TP-8410 blade in Slot 1: 10.1.10.10 TP-6310 or TP-8410 blade in Slot 3: 10.1.10.11 (only for HA mode)
Prefix Length	255.255.0.0 (16)
Default Gateway	0.0.0.0
VLAN ID	1
Interface Name	"O+M+C"

This page is intentionally left blank.

4 Configuring VoIP LAN Interface for OAMP

You can change the IP address of the VoIP-LAN interface for OAMP, using any of the following methods:

- Embedded HTTP/S-based Web server see "Web Interface" on page 35
- Embedded command line interface (CLI) see "CLI" on page 37
- Bootstrap Protocol (BootP) see BootP/TFTP Server on page 39

Note: This section describes how to change the default LAN IP address for Mediant 3000 Simplex mode. For Mediant 3000 High Availability (HA) mode, see Assigning an IP Address for Mediant 3000 HA on page 41.

4.1 Web Interface

The following procedure describes how to change the IP address of the OAMP on the VoIP-LAN interface, using the Web-based management tool (Web interface). The default IP address is used to initially access the device.

- To configure the VolP-LAN IP Address for OAMP, using the Web interface:
- 1. Connect one of the Ethernet ports located on the RTM-8410 or RTM-6310 directly to the network interface of your computer, using a straight-through Ethernet cable.

Figure 4-1: LAN Connection to PC for Initial Connectivity for RTM-8410

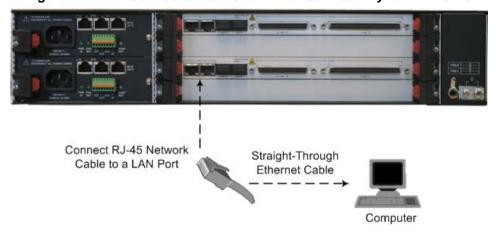

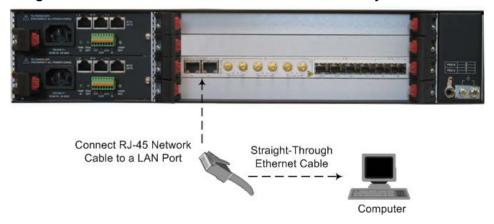

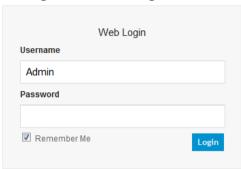

Figure 4-2: LAN Connection to PC for Initial Connectivity for RTM-6310

- Change the IP address and subnet mask of your computer to correspond with the default OAMP IP address and subnet mask of the device.
- Access the Web interface:
 - **a.** On your computer, start a Web browser and in the URL address field, enter the default IP address of the device; the Web interface's Web Login screen appears:

Figure 4-3: Web Login Screen

- **b.** In the 'Username' and 'Password' fields, enter the case-sensitive, default login username ("Admin") and password ("Admin").
- c. Click Login.
- 4. Open the Interface Table page (Configuration tab > VoIP menu > Network > IP Interfaces Table).

- 5. Select the 'Index' radio button corresponding to the OAMP + Media + Control application type, and then click Edit.
- **6.** Change the IP address to correspond with your network IP addressing scheme, for example:

IP Address: 10.8.6.86

Prefix Length: 24 (for 255.255.255.0)

• Gateway: 10.8.6.85

- 7. Click Submit.
- 8. Save your settings by resetting the device with a flash burn (see "Resetting the Device" on page 547).
- **9.** Disconnect the device from the PC and cable the device to your network. You can now access the management interface using the new OAMP IP address.

Note: When you complete the above procedure, change your PC's IP address to correspond with your network requirements.

4.2 CLI

This procedure describes how to configure the VoIP-LAN IP address for OAMP using the device's CLI. The procedure uses the regular CLI commands. Alternatively, you can use the CLI Wizard utility to set up your device with the initial OAMP settings. The utility provides a fast-and-easy method for initial configuration of the device through CLI. For more information, refer to the *CLI Wizard User's Guide*.

Notes:

- For HA mode, this method changes only the local, private IP addresses of the blades. These IP addresses are used for maintenance and fallback in case of a major problem preventing the device from operating in HA mode.
- To operate in HA mode, the "global" IP addresses must be configured in the Interface table.

> To configure the OAMP IP address in the CLI:

1. Connect the RS-232 port of the device to the serial communication port on your computer. For more information, refer to the *Hardware Installation Manual*.

Figure 4-4: Serial Connection with PC for CLI Communication for TP-6310

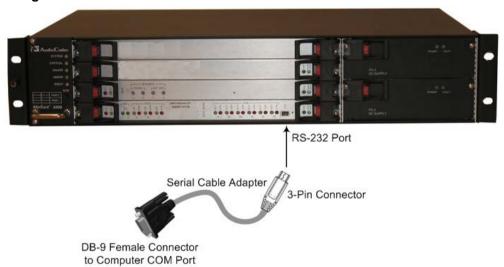

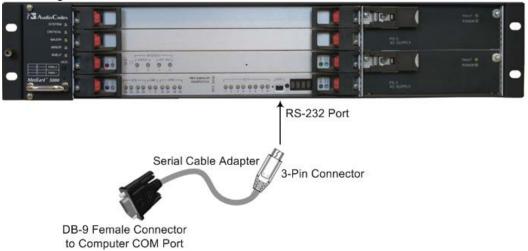

Figure 4-5: Serial Connection with PC for CLI Communication for TP-8410

2. Establish serial communication with the device using a terminal emulator program such as HyperTerminal, with the following communication port settings:

Baud Rate: 115,200 bps

Data Bits: 8Parity: NoneStop Bits: 1

Flow Control: None

3. At the prompt, type the login username (default is "Admin" - case sensitive):

login: Admin

4. At the prompt, type the password (default is "Admin" - case sensitive): password: Admin

5. At the prompt, type the following command to access the Configuration folder: />CONF

6. View the current network settings, by typing the following command: /CONFiguration>GCP IP

7. Change the network settings, by typing the following command: /CONFiguration>SCP IP <IP address> <subnet mask> <Default Gateway> You must enter all three network parameters, each separated by a space, for example:

/CONFiguration>SCP IP 10.13.77.7 255.255.0.0 10.13.0.1

- **8.** Save your changes and reset the device, by typing the following command: /CONFiguration>SAR
- 9. For HA mode, repeat the above steps for the second blade.
- **10.** Cable the device to your network. You can now access the device's management interface using this new OAMP IP address.

4.3 BootP/TFTP Server

You can assign an IP address to the device using BootP/TFTP protocols. This can be done using the AudioCodes AcBootP utility (supplied) or any standard compatible BootP server.

Note: You can also use the AcBootP utility to load the software file (.cmp) and configuration file (.ini). For a detailed description of the AcBootP utility, refer to AcBootP Utility User's Guide.

To assign an IP address using BootP/TFTP:

- Start the AcBootP utility.
- 2. Select the **Preferences** tab, and then set the 'Timeout' field to "50".
- 3. Select the Client Configuration tab, and then click the Add New Client button.

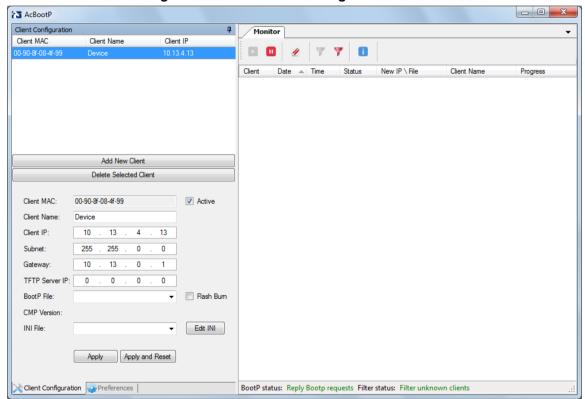

Figure 4-6: BootP Client Configuration Screen

4. Configure the following fields:

- 'Client MAC': Enter the device's MAC address. The MAC address is printed on the label located on the underside of the device. Ensure that the check box to the right of the field is selected in order to enable the client.
- 'Client IP': Enter the new IP address (in dotted-decimal notation) that you want to assign the device.
- 'Subnet': Enter the new subnet mask (in dotted-decimal notation) that you want to assign the device.
- 'Gateway': Enter the IP address of the Default Gateway (if required).

- 5. Click **Apply** to save the new client.
- 6. Power down and then power up the device. This enables the device to receive its new networking parameters through the BootP process.

5 Configuring an IP Address for Mediant 3000 HA

This section describes how to assign IP addresses to the Mediant 3000 High Availability (HA) device. This can be done using one of the following tools:

- BootP and the Web interface see "Web Interface" on page 42
- AudioCodes EMS management tool see "EMS" on page 43

The Mediant 3000 HA houses two TP-6310 blades or two TP-8410 blades, where one is active while the other is redundant (or in standby). Each of these two blades has a different private IP address, which is used for initial configuration, maintenance, or fallback in case of a major device problem which prevents it from operating in HA mode. When initially configuring the blades, the BootP server communicates with the blades using these two IP addresses.

In addition to the private IP addresses, the device has "global" (public) IP addresses used by the active blade for communicating with the IP network (i.e., OAMP, Media, and Control interfaces). These global IP addresses can be configured using the ini file, Web, or EMS management tools. From the perspective of the WAN interface (e.g., proxy server), the two blades have the same IP address (global IP address) and the redundant blade is a transparent entity.

Table 5-1: Default IP Addresses for Mediant 3000 HA

Parameter	Default Value
Private IP Addresses	Blade in Slot 1: 10.1.10.10Blade in Slot 3: 10.1.10.11
Subnet Mask	255.255.0.0
Global IP Address	0.0.0.0

Notes:

- Ensure that both blades are connected to the network.
- Ensure that your IP addressing scheme does not include the blades' default
 private IP addresses. These are internal, default IP addresses reserved for the two
 blades. You must assign a new private IP address to each blade according to your
 organization's IP addressing scheme.

- The global IP addresses must be different from the private IP addresses of the blades.
- It is recommended to define the private IP addresses of the blades in the same subnet as the device's OAMP interface. This allows the blades to send reports to a Syslog server in case of major device failure.
- You can also assign private IP addresses to the blades using CLI, as described in "CLI" on page 37.

Version 6.8 41 Mediant 3000

5.1 Web Interface

The following procedure describes how to initially assign a global (public) IP address to Mediant 3000 HA using AudioCodes AcBootP utility and the Web interface.

To initially assign a global IP address to Mediant 3000 HA:

- Assign the device's two blades with new private IP addresses that correspond to your network IP addressing scheme, using BootP:
 - a. Ensure that both blades are connected to the network.
 - **b.** Start the AcBootP utility.
 - **c.** Add a BootP client for each blade with a new private IP address, as shown in the example below.

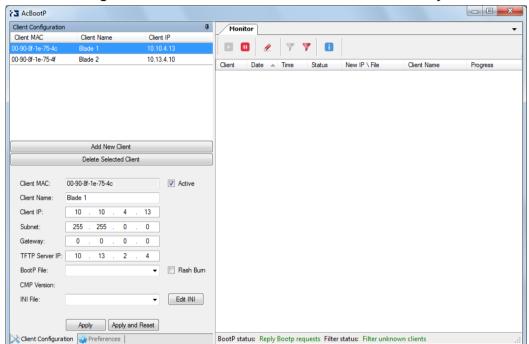

Figure 5-1: Clients for each Blade Added in BootP Utility

- d. Power down the chassis.
- e. Power up the chassis and wait about 20-30 seconds, and then power down and power up the chassis once again within 15 seconds; both blades send a BootP request to the network and the BootP server sends the new private IP addresses to the blades.
- f. In AcBootP, verify after about 15 seconds that both blades have received their new private IP addresses.

2. Define the global IP address:

- Access the Web interface with the IP address that you assigned to the blade in Slot 1.
- Open the Interface Table page (Configuration tab > VoIP menu > Network > IP Interfaces Table).

- **c.** Click the **Add Index** button and define global IP addresses for the OAMP, Media, and Control application types, as desired.
- d. Click Submit.
- e. Save your settings to the device's flash memory with a device reset; the new global IP address is saved to flash memory and the device resets, entering HA mode with active and redundant blades. Note that the Web interface session terminates as it is no longer accessible through the blade's private IP address.
- Re-access the Web interface with the new, global IP address that you assigned the device for the OAMP interface; the device is now accessed through the active blade in Slot 1.

Note: If at a later stage, you need to change the global IP address, and the current and new global IP address are in different subnets, then it's recommended to also define the private addresses of the blades in the same subnet as the new global IP address. This allows the blades to send reports to a Syslog server in case of major device failure.

5.2 EMS

The following procedure describes how to initially assign a global IP address to Mediant 3000 HA using AudioCodes EMS management tool.

- To initially assign a global IP address to Mediant 3000 HA using the EMS:
- Power down the chassis.
- 2. Ensure that both blades are connected to the network.
- Power up the chassis.
- 4. Assign new private IP addresses to the two blades:
 - a. Start a BootP server application and add a client configuration with the following settings:
 - **a.** Create two entries, one for each blade, where each entry defines the new private IP address of each blade.
 - **b.** Define the path to the .cmp file.

Note: When loading the device from BootP, the HA mode is disabled.

b. Power down and then power up the chassis, wait about 20-30 seconds, and then power down and power up the chassis once again; both blades send a BootP request to the network and the BootP server sends the new private IP addresses to the blades. In the BootP application, verify that the blades have received their new private IP addresses (after approximately 15 seconds).

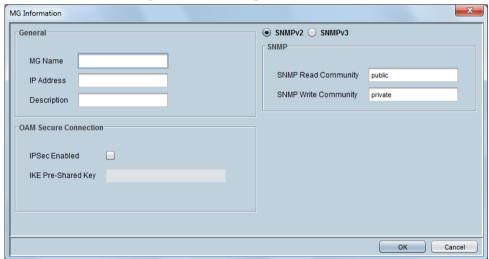

- 5. Using AudioCodes EMS, configure the active blade's new local IP address:
 - a. Add a region for your Mediant 3000 (refer to the EMS User's Guide).

Figure 5-2: Adding a Region

- b. Verify that Mediant 3000 is up and running, by pinging its IP address.
- Right-click the region you added, and then from the shortcut menu, choose Add MG.

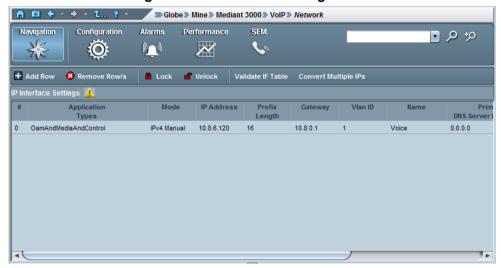

Figure 5-3: Defining the IP Address

- d. In the 'MG Name' field, enter an arbitrary name for the device.
- e. In the 'IP Address' field, enter the private IP address that you assigned to the blade in Slot 1; the device is now configured in the EMS Server with the private IP address of the blade in Slot 1. If you double-click the device in the MGs List window, the Status window appears displaying only the active blade in Slot 1 (i.e., the device is not yet in HA mode).
- 6. Using AudioCodes EMS, configure the global IP address:
 - In the MGs List window, double-click the device; the Status window appears.
 - **b.** In the Status window, click the active blade.

c. Open the IP Interface Settings screen - in the Navigation pane, click the device name, and then **VoIP**, **Network**, **IP Interface Settings**.

Figure 5-4: IP Interface Settings Table

d. In the table, select the OamAndMediaAndControl interface row, and then in the Configuration pane, click IP interface Settings; the IP Interface Settings frame opens.

IP Interface Settings Parameters List Application Types oamAndMediaAndControl 🔻 IP Address 10 8 6 120 $\overline{\mathbf{v}}$ 16 Prefix Length $\overline{\mathbf{v}}$ Gateway 10.8.0.1 ₹ VLAN ID 1 Interface Name Voice ₹ Primary DNS Server IP Address Not Available Paramete Secondary DNS Server IP Address Not Available Parameter Interface Mode IPv4 Manual Apply Refresh

Figure 5-5: IP Interface Settings Frame

- e. Define the global IP address. The global IP address must be a unique address that resides in the same subnet as the private IP addresses that were assigned to the blades.
- f. Click **Apply** and close the active window.
- 7. Click the **Home** button, and then on the Actions bar, click the **Reset** button to reset the device. Ensure that the 'Burn Configuration into Flash Memory' check box is selected.
- 8. In the MG Tree, under the Region that you added, right-click the device, and then from the shortcut menu, choose **Remove MG** to delete it from the EMS.

- 9. Add once again the Mediant 3000 under your Region to the EMS with the new global IP address that you defined above.
- **10.** Right-click the active blade, and then choose **Configuration > Upload**; the EMS server synchronizes with the blade's configuration settings.
- **11.** Verify that the device is up and running by pinging its IP address. If it is up and running, the EMS's Status screen displays a graphic representation of it. The active blade is displayed in black and the redundant blade in blue.

Notes:

- Once you reset the device, you can only access it using the new global IP address that you assigned to the OAMP interface.
- If you later want to change the global IP address:
 - 1) If the device is configured with VLAN interfaces, you must switch back to a single interface configuration before changing the global IP address.
 - 2) Do not load a .cmp or an .ini file when using BootP/DHCP; otherwise, the current configuration running on the device's flash memory will be erased.
 - 3) If the current and new global IP address are in different subnets, then it's recommended to also define the private addresses of the blades in the same subnet as the new global IP address. This allows the blades to send reports to a Syslog server in case of major device failure.

Part II

Management Tools

User's Manual 6. Introduction

6 Introduction

This part provides an overview of the various management tools that can be used to configure the device. It also provides step-by-step procedures on how to configure these management tools.

The device provides the following management tools:

- Embedded HTTP/S-based Web server see "Web-based Management" on page 51
- Command Line Interface (CLI) see "CLI-Based Management" on page 79
- Simple Network Management Protocol (SNMP) see "SNMP-Based Management" on page 93
- Configuration ini file see "INI File-Based Management" on page 99

Notes:

- Some configuration settings can only be done using a specific management tool.
 For example, some configuration can only be done using the Configuration ini file method.
- Throughout this manual, whenever a parameter is mentioned, its corresponding Weband ini file parameter is mentioned. The *ini* file parameters are enclosed in square brackets [...].
- For a list and description of all the configuration parameters, see "Configuration Parameters Reference" on page 691.

This page is intentionally left blank.

7 Web-Based Management

The device provides an embedded Web server (hereafter referred to as *Web interface*), supporting fault management, configuration, accounting, performance, and security (FCAPS), including the following:

- Full configuration
- Software and configuration upgrades
- Loading auxiliary files, for example, the Call Progress Tones file
- Real-time, online monitoring of the device, including display of alarms and their severity
- Performance monitoring of voice calls and various traffic parameters

The Web interface provides a user-friendly, graphical user interface (GUI), which can be accessed using any standard Web browser (e.g., Microsoft™ Internet Explorer).

Access to the Web interface is controlled by various security mechanisms such as login user name and password, read-write privileges, and limiting access to specific IP addresses.

Notes:

- The Web interface allows you to configure most of the device's settings. However, additional configuration parameters may exist that are not available in the Web interface and which can only be configured using other management tools.
- Some Web interface pages and/or parameters are available only for certain hardware configurations or software features. The software features are determined by the installed Software License Key (see "Software License Key" on page 575).

7.1 Getting Acquainted with the Web Interface

This section provides a description of the Web interface.

7.1.1 Computer Requirements

The client computer requires the following to work with the Web interface of the device:

- A network connection to the device
- One of the following Web browsers:
 - Microsoft[™] Internet Explorer[™] (Version 6.0 and later)
 - Mozilla Firefox® (Versions 5 through 9.0)
- Recommended screen resolutions: 1024 x 768 pixels, or 1280 x 1024 pixels

Note: Your Web browser must be JavaScript-enabled to access the Web interface.

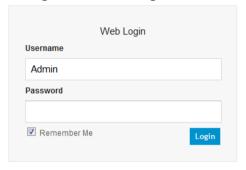

7.1.2 Accessing the Web Interface

The following procedure describes how to access the Web interface.

- To access the Web interface:
- 1. Open a standard Web browser (see "Computer Requirements" on page 51).
- 2. In the Web browser, specify the OAMP IP address of the device (e.g., http://10.1.10.10); the Web interface's Login window appears, as shown below:

Figure 7-1: Web Login Screen

- 3. In the 'Username' and 'Password' fields, enter the case-sensitive, user name and password respectively.
- **4.** Click **Login**; the Web interface is accessed, displaying the Home page. For a detailed description of the Home page, see "Viewing the Home Page" on page 66.

Notes:

- The default login username and password is "Admin". To change the login credentials, see "Configuring the Web User Accounts" on page 68.
- If you want the Web browser to remember your password, select the 'Remember Me' check box and then agree to the browser's prompt (depending on your browser) to save the password for future logins. On your next login attempt, simply press the Tab or Enter keys to auto-fill the 'Username' and 'Password' fields, and then click Login.

• Depending on your Web browser's settings, a security warning box may be displayed. The reason for this is that the device's certificate is not trusted by your PC. The browser may allow you to install the certificate, thus skipping the warning box the next time you connect to the device. If you are using Windows Internet Explorer, click View Certificate, and then Install Certificate. The browser also warns you if the host name used in the URL is not identical to the one listed in the certificate. To resolve this, add the IP address and host name (ACL_nnnnnn, where nnnnnn is the serial number of the device) to your hosts file, located at /etc/hosts on UNIX or C:\Windows\System32\Drivers\ETC\hosts on Windows; then use the host name in the URL (e.g., https://ACL_280152). Below is an example of a host file:

127.0.0.1 localhost 10.31.4.47 ACL 280152

7.1.3 Areas of the GUI

The areas of the Web interface's GUI are shown in the figure below and described in the subsequent table.

Administration Serings Serings

Figure 7-2: Main Areas of the Web Interface GUI

Table 7-1: Description of the Web GUI Areas

Item #	Description		
1	AudioCodes company logo.		
2	Product name.		
3	Toolbar, providing frequently required command buttons. For more information, see "Toolbar Description" on page 54.		
4	Displays the username of the Web user that is currently logged in.		
5	 Navigation bar, providing the following tabs for accessing various functionalities in the Navigation tree: Configuration, Maintenance, and Status & Diagnostics tabs: Access the configuration menus (see "Working with Configuration Pages" on page 57) Search tab: Enables a search engine for searching configuration parameters (see "Searching for Configuration Parameters" on page 61) 		
6	Navigation tree, displaying a tree-like structure of elements (configuration menus or search engine) pertaining to the selected tab on the Navigation bar. For more information, see "Navigation Tree" on page 55.		
7	Work pane, displaying the configuration page of the selected menu in the Navigation tree. This is where configuration is done. For more information, see "Working with Configuration Pages" on page 57.		

7.1.4 Toolbar Description

The toolbar provides frequently required command buttons, described in the table below:

Table 7-2: Description of Toolbar Buttons

Table 1-2. Description of Toolbar Buttons			
lcon	Button Name	Description	
⊘	Submit	Applies parameter settings to the device (see "Saving Configuration" on page 550). Note: This icon is grayed out when not applicable to the currently opened page.	
0	Burn	Saves parameter settings to flash memory (see "Saving Configuration" on page 550).	
Device Actions ▼	Device Actions	 Opens a drop-down list with frequently needed commands: Load Configuration File: Opens the Configuration File page for loading an <i>ini</i> file to the device (see "Backing Up and Loading Configuration File" on page 585). Save Configuration File: Opens the Configuration File page for saving the <i>ini</i> file to a folder on your PC (see "Backing Up and Loading Configuration File" on page 585). Reset: Opens the Maintenance Actions page for performing various maintenance procedures such as resetting the device (see "Resetting the Device" on page 547). Software Upgrade Wizard: Starts the Software Upgrade Wizard for upgrading the device's software (see "Software Upgrade Wizard" on page 579). Switch Over: Opens the High Availability Maintenance page for switching between Active and Redundant blades (see High Availability Maintenance on page 551). Reset Redundant: Opens the High Availability Maintenance page for resetting the Redundant blade (see High Availability Maintenance on page 551). 	
(f)	Home	Opens the Home page (see "Viewing the Home Page" on page 66).	
②	Help	Opens the Online Help topic of the currently opened configuration page (see "Getting Help" on page 64).	
-	Log off	Logs off a session with the Web interface (see "Logging Off the Web Interface" on page 65).	
-	Reset	If you modify a parameter on a page that takes effect only after a device reset, after you click the Submit button, the toolbar displays "Reset". This is a reminder that you need to later save your settings to flash memory and reset the device.	

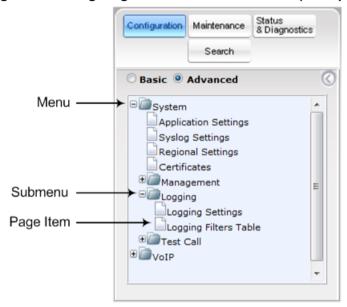

7.1.5 Navigation Tree

The Navigation tree is located in the Navigation pane and displays a tree-like structure of menus pertaining to the selected tab on the Navigation bar. You can drill-down to the required page item level to open its corresponding page in the Work pane.

The terminology used throughout this manual for referring to the hierarchical structure of the tree is as follows:

- Menu: first level (highest level)
- Submenu: second level contained within a menu
- Page item: last level (lowest level in a menu) contained within a menu or submenu

Figure 7-3: Navigating in Hierarchical Menu Tree (Example)

Note: The figure above is used only as an example. The displayed menus depend on supported features based on the Software License Key installed on your device.

7.1.5.1 Displaying Navigation Tree in Basic and Full View

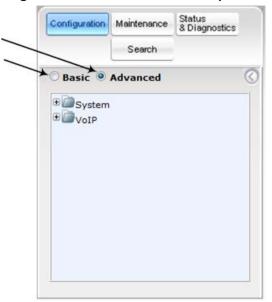

You can view an expanded or reduced display of the Navigation tree. This affects the number of displayed menus and submenus in the tree. The expanded view displays all the menus pertaining to the selected configuration tab; the reduced view displays only commonly used menus.

To display a reduced menu tree, select the Basic option (default).

To display all menus and submenus, select the Advanced option.

Figure 7-4: Basic and Full View Options

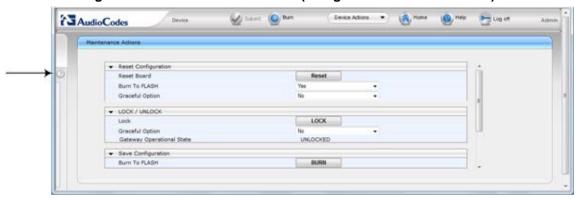

Note: After you reset the device, the Web GUI is displayed in Basic view.

7.1.5.2 Showing / Hiding the Navigation Pane

You can hide the Navigation pane to provide more space for elements displayed in the Work pane. This is especially useful when the Work pane displays a wide table. The arrow button located below the Navigation bar is used to hide and show the pane.

- To hide the Navigation pane, click the left-pointing arrow; the pane is hidden and the button is replaced by the right-pointing arrow button.
- To show the Navigation pane, click the right-pointing arrow; the pane is displayed and the button is replaced by the left-pointing arrow button.

Figure 7-5: Show and Hide Button (Navigation Pane in Hide View)

7.1.6 Working with Configuration Pages

The configuration pages contain the parameters for configuring the device and are displayed in the Work pane.

7.1.6.1 Accessing Pages

The configuration pages are accessed by clicking the required page item in the Navigation tree.

> To open a configuration page:

- On the Navigation bar, click the required tab (Configuration, Maintenance, or Status & Diagnostics); the menus pertaining to the selected tab appear in the Navigation tree
- 2. Navigate to the required page item, by performing the following:
 - Drill-down using the plus
 ∃ sign to expand the menu and submenus.
- 3. Click the required page item; the page opens in the Work pane.

You can also access previously opened pages by clicking the Web browser's **Back** button until you have reached the required page. This is useful if you want to view pages in which you have performed configurations in the current Web session.

Note: Depending on the access level of your Web user account, certain pages may not be accessible or may be read-only (see "Configuring Web User Accounts" on page 68). If a page is read-only, "Read-Only Mode" is displayed at the bottom of the page.

7.1.6.2 Viewing Parameters

Some pages allow you to view a reduced or expanded display of parameters. The Web interface provides two methods for displaying page parameters:

- Displaying "basic" and "advanced" parameters see "Displaying Basic and Advanced Parameters" on page 57
- Displaying parameter groups see "Showing / Hiding Parameter Groups" on page 58

7.1.6.2.1 Displaying Basic and Advanced Parameters

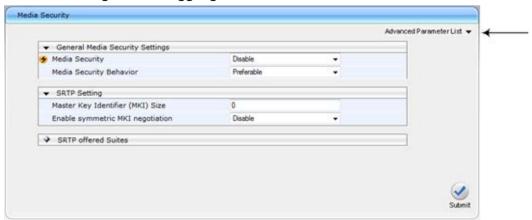

Some pages provide a toggle button that allows you to show and hide parameters. This button is located on the top-right corner of the page and has two display states:

- Advanced Parameter List button with down-pointing arrow: click this button to display all parameters.
- **Basic Parameter List** button with up-pointing arrow: click this button to show only common (*basic*) parameters.

The figure below shows an example of a page displaying basic parameters only. If you click the **Advanced Parameter List** button (shown below), the page will also display the advanced parameters.

Figure 7-6: Toggling between Basic and Advanced View

Notes:

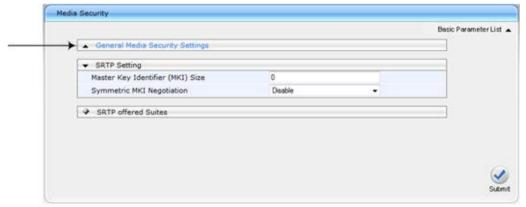

- When the Navigation tree is in Advanced display mode (see "Navigation Tree" on page 55), configuration pages display all their parameters.
- If you reset the device, the Web pages display only the basic parameters.
- The basic parameters are displayed in a different background color to the advanced parameters.

7.1.6.2.2 Showing / Hiding Parameter Groups

Some pages group parameters under sections, which can be hidden or shown. To toggle between hiding and showing a group, simply click the group title name that appears above each group. The button appears with a down-pointing or up-pointing arrow, indicating that it can be collapsed or expanded when clicked, respectively.

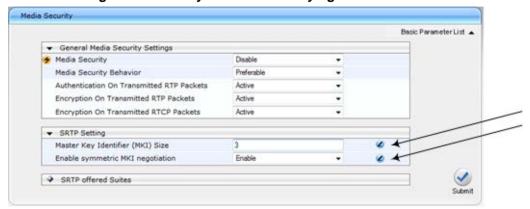

Figure 7-7: Expanding and Collapsing Parameter Groups

7.1.6.3 Modifying and Saving Parameters

When you modify a parameter value on a page, the **Edit** icon appears to the right of the parameter. This indicates that the parameter has been modified, but has yet to be applied (submitted). After you click **Submit** the icon disappears.

Figure 7-8: Edit Symbol after Modifying Parameter Value

- To save configuration changes on a page to the device's volatile memory (RAM):
- On the toolbar, click the Submit button.
- At the bottom of the page, click the Submit button

When you click **Submit**, modifications to parameters with on-the-fly capabilities are immediately applied to the device and take effect. Parameters displayed on the page with the lightning \checkmark icon take effect only after a device reset. For resetting the device, see "Resetting the Device" on page 547.

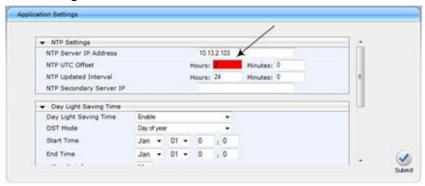

Note: Parameters saved to the volatile memory (by clicking **Submit**), revert to their previous settings after a hardware or software reset, or if the device is powered down. Thus, to ensure parameter changes (whether on-the-fly or not) are retained, save ('burn') them to the device's non-volatile memory, i.e., flash (see "Saving Configuration" on page 550).

If you enter an invalid parameter value (e.g., not in the range of permitted values) and then click **Submit**, a message box appears notifying you of the invalid value. In addition, the parameter value reverts to its previous value and is highlighted in red, as shown in the figure below:

Figure 7-9: Value Reverts to Previous Valid Value

7.1.6.4 Working with Tables

Many of the Web configuration pages provide tables for configuring various functionalities of the device. The figure below and subsequent table describe the areas of a typical configuration table:

Add + Edit > Delete g Show/flide (s)

Index. Cost Group Name Default Connection Cost Default Minute Cost

0 local calls 2 1

Selected Row #0

Cost Group Name: local calls Default Minute Cost: 1

Cost Group Name: local calls Default Minute Cost: 1

Cost Group Name: local calls Default Minute Cost: 1

Cost Group Name: local calls Default Minute Cost: 1

Cost Group Table #0 Additional Configuration Time Band [contains 0 entries]

Figure 7-10: Displayed Details Pane

Table 7-3: Enhanced Table Design Description

Item #	Button	
1	Add	Adds a new index entry row to the table. When you click this button, a dialog box appears with parameters for configuring the new entry. When you have completed configuration, click the Submit button in the dialog box to add it to the table.
2	Edit	Edits the selected row.
3	Delete	Removes the selected row from the table. When you click this button, a confirmation box appears requesting you to confirm deletion. Click Delete to accept deletion.

Item #	Button	
4	Show/Hide	Toggles between displaying and hiding the full configuration of a selected row. This configuration is displayed below the table (see Item #6) and is useful for large tables that cannot display all its columns in the work pane.
5	-	Selected index row entry for editing, deleting and showing configuration.
6	-	Displays the full configuration of the selected row when you click the Show/Hide button.
7	-	Links to access additional configuration tables related to the current configuration.

Some tables also provide the **Up** and **Down** buttons for changing the position (index number) of a selected table row. These buttons become available only if the table contains more than one row.

You can also define the number of rows to display on the page and to navigate between pages displaying multiple rows. This is done using the page navigation area located below the table, as shown in the figure below:

Figure 7-11: Viewing Table Rows per Page

Table 7-4: Row Display and Page Navigation

Item #	Description		
1	Defines the page that you want to view. Enter the required page number or use the following page navigation buttons:		
	Displays the next page		
	■ l- Displays the last page		
	Oisplays the previous page		
	■ I Displays the first page		
2	Defines the number of rows to display per page. You can select 5 or 10, where the default is 10.		
3	Displays the currently displayed page number.		

7.1.7 Searching for Configuration Parameters

You can locate the exact Web page on which a specific parameter appears, by using the Search feature. To search for a Web parameter, you must use the *ini* file parameter name as the search key. The search key can include the full parameter name (e.g., "EnableSyslog") or a substring of it (e.g., "sys"). If you search for a substring, all parameters containing the specified substring in their names are listed in the search result.

Version 6.8 61 Mediant 3000

To search for a parameter:

- 1. On the Navigation bar, click the **Search** tab; the Search engine appears in the Navigation pane.
- 2. In the field alongside the Search button, enter the parameter name or a substring of the name for which you want to search. If you have done a previous search for such a parameter, instead of entering the required string, you can use the 'Search History' drop-down list to select the string saved from a previous search.
- 3. Click **Search**; a list of found parameters based on your search key appears in the Navigation pane. Each searched result displays the following:
 - ini file parameter name
 - Link (in green) to the Web page on which the parameter appears
 - Brief description of the parameter
 - Menu navigation path to the Web page on which the parameter appears
- 4. In the searched list, click the required parameter (green link) to open the page on which the parameter appears; the relevant page opens in the Work pane and the searched parameter is highlighted in the page for easy identification, as shown in the figure below:

Configuration Maintenance Status 8 Diagn Syslog Server IP Address 10.8.2.4 Search Syslog Server Port 514 CDR Session ID Enable syslog Debug Level Activity Types to Report via 'Activity Log' Messages Parameters Value Change Auxiliary Files Loading 19 Device Reset Flash Memory Burning Device Software Update Access to Restricted Domains Non-Authorized Access Sensitive Parameters Value Change Login and Logout es the Syslog server IP address

Figure 7-12: Searched Result Screen

Table 7-5: Search Description

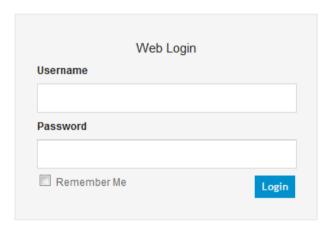

Item #	Description	
1	Search field for entering search key and Search button for activating the search process.	
2	Search results listed in Navigation pane.	
3	Found parameter, highlighted on relevant Web page	

7.1.8 Creating a Login Welcome Message

You can create a Welcome message box that is displayed on the Web Login page. The figure below displays an example of a Welcome message:

Figure 7-13: User-Defined Web Welcome Message after Login

To enable and create a Welcome message, use the WelcomeMessage table ini file parameter, as described in the table below. If this parameter is not configured, no Welcome message is displayed.

Table 7-6: ini File Parameter for Welcome Login Message

Parameter	Description	
[WelcomeMessage]	Enables and defines a Welcome message that appears on the Web Login page for logging in to the Web interface.	
	The format of this parameter is as follows: [WelcomeMessage] FORMAT WelcomeMessage_Index = WelcomeMessage_Text; [\WelcomeMessage]	
	For Example: [WelcomeMessage] FORMAT WelcomeMessage_Index = WelcomeMessage_Text; WelcomeMessage 1 = "************************; WelcomeMessage 2 = "**************************; WelcomeMessage 3 = "**********************************	
	Each index row represents a line of text in the Welcome message box. Up to 20 lines (or rows) of text can be defined.	

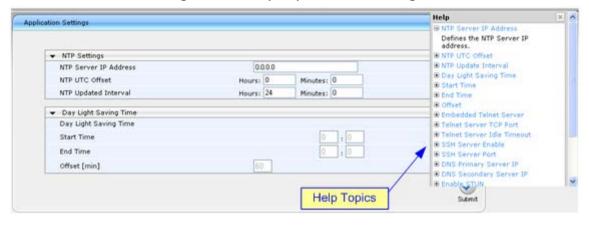

7.1.9 Getting Help

The Web interface provides you with context-sensitive Online Help. The Online Help provides brief descriptions of parameters pertaining to the currently opened page.

- > To view the Help topic of a currently opened page:
- 1. On the toolbar, click the **Help** button; the Help topic pertaining to the opened page appears, as shown below:

Figure 7-14: Help Topic for Current Page

- 3. To close the Help topic, click the **close** button located on the top-right corner of the Help topic window or simply click the **Help** button.

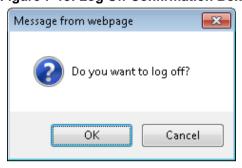

Note: Instead of clicking the **Help** button for each page you open, you can open it once for a page and then simply leave it open. Each time you open a different page, the Help topic pertaining to that page is automatically displayed.

7.1.10 Logging Off the Web Interface

The following procedure describes how to log off the Web interface.

- > To log off the Web interface:
- 1. On the toolbar, click the **Log Off** icon; the following confirmation message box appears:

Figure 7-15: Log Off Confirmation Box

2. Click **OK**; you are logged off the Web session and the Web Login dialog box appears enabling you to re-login, if required.

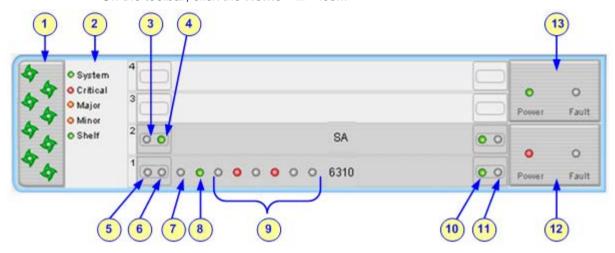

7.2 Viewing the Home Page

The Home page is displayed when you access the device's Web interface. The Home page provides you with a graphical display of the device's front panel, showing color-coded status icons for various operations device.

> To access the Home page:

On the toolbar, click the **Home**

Notes:

- The displayed PSTN interface type depends on the ordered hardware configuration. When the device houses a TP-6310 blade, the PSTN interface can be DS3 or SDH/SONET; for TP-8410 blade, the PSTN interface is E1/T1.
- The number of displayed blades depends on whether the device is in Simplex or HA mode. The figures above show examples of Simplex mode devices, whereby the device houses only one blade. For HA mode, see Viewing HA Status on Home Page on page 543.

In addition to the color-coded status information depicted on the graphical display of the device, the Home page displays various read-only information in the General Information pane:

- IP Address: IP address of the device
- **Subnet Mask:** Subnet mask address of the device
- Default Gateway Address: Default gateway used by the device
- Firmware Version: Software version running on the device
- **Protocol Type:** Signaling protocol currently used by the device (i.e. SIP)
- Gateway Operational State:
 - "LOCKED": device is locked (i.e. no new calls are accepted)
 - "UNLOCKED": device is not locked
 - "SHUTTING DOWN": device is currently shutting down

To perform these operations, see "Basic Maintenance" on page 547.

- **High Availability:** Status of the device's HA mode (see Viewing HA Status on Home Page on page 543)
- Active Board Slot Number: Slot number with the active blade if the device is in HA mode; otherwise, this field is unavailable

To view real-time status of the device's hardware components (chassis slots with blades, fans, power supplies, and PEMs), click any area (except the alarms, Ethernet, and PSTN icons) on the graphical display of the chassis. For more information, see Viewing Hardware Components Status on page 612.

The table below describes the areas of the Home page.

Table 7-7: Home Page Description

Item #	Description
1	Fan Tray unit operating status icons:
	• 🐓 (green): Normal operation
	To view current alarms, click this area to open the Active Alarms table (see Viewing Active Alarms on page 613).
2	System unit displaying chassis severity alarm icons:
	• © (green): no alarm - normal functioning
	 (red): Critical, Shelf, and / or System alarm raised (orange): Major and / or Minor alarm raised
	For a detailed description of the chassis severity LEDs, refer to the Hardware
	Installation Manual.
3	SA/M3K Alarms and Status blade's FAIL icon:
	 © (gray): Normal functioning
	• (red): Blade failure
4	SA/M3K Alarms and Status blade's ACT icon:
	 © (gray): Single blade © (green): Active blade
	• O (orange): Standby blade
5	The TP-6310/TP-8410 blade's FAIL icon:
	 © (gray): Normal functioning
	(red): Blade failure
6	The TP-6310/TP-8410 blade's ACT icon:
	• © (gray): Single blade
	
7 & 8	Dual Ethernet port status icons (Eth 1 and Eth 2):
7 & 0	• © (gray): No link
	• © (green): Active Ethernet link
	• (yellow): Redundant link
	To view detailed Ethernet port information, click this icon to open the Ethernet Port Information page (see Viewing Ethernet Port Information on page 609).
	Note: These icons are applicable only to the TP-6310 blade.
9	PSTN icons grouped in pairs, each displaying a PSTN Link icon (left) with a PSTN Alarm icon (right). The PSTN Link icon indicates the status of the PSTN link, while the

Version 6.8 67 Mediant 3000

Item #	Description		
	PSTN Alarm icon indicates the traffic loss alarm type associated with the PSTN link. PSTN Link icon: (gray): No link (green): Active link (for STM1/OC3 interface) or "DS3 Synchronized" (for DS3 interface) (yellow): Standby link (for STM1/OC3 interface) or "DS3 RAI" (for DS3 interface) PSTN Alarm icon: (gray): No alarm (for STM1/OC3 interface) or "No Near-end Alarm" (for DS3 interface) (gray): No alarm exists		
	To view and modify PSTN links (T3/DS3 or SONET/SDH), click the PSTN Link icon to open the Transmission Settings page (see Configuring Transmission Settings on page 352). Note: These icons are applicable only to the TP-6310 blade.		
10	Power status (PWR icon) of the blade: o (green): Power received by blade o (red): No power received by blade		
11	Slot status of installed blade in the chassis (SWAP Ready icon).		
12 & 13	Power supply units (PS/DC/3K modules) icons (Power Supply Number 1 & 2 icons): • ② (green): Normal functioning • ② (red): Power failure		

7.3 Configuring Web User Accounts

Web user accounts define users for the Web interface and CLI. User accounts permit login access to these interfaces as well as different levels of read and write privileges. Thus, user accounts prevent unauthorized access to these interfaces, permitting access only to users with correct credentials (i.e., username and password).

Each user account is based on the following:

- Username and password: Credentials that enable authorized login access to the Web interface.
- User level (user type): Access privileges specifying what the user can view in the Web interface and its read/write privileges. The table below describes the different types of Web user account access levels:

Table 7-8: Web User Access Levels and Privileges

User Level	Numeric Representation in RADIUS	Privileges
Security Administrator	200	Read / write privileges for all pages. It can create all user types and is the only one that can create the first Master user. Note: At least one Security Administrator user must exits.
Master	220	Read / write privileges for all pages. Can create all user types, including additional Master users and Security Administrators. It can delete all users except the last Security Administrator.
Administrator	100	Read / write privileges for all pages, except security-related pages (read-only).

User's Manual 68 Document #: LTRT-89725

User Level	Numeric Representation in RADIUS	Privileges
Monitor	50	No access to security-related and file-loading pages; read-only access to all other pages.
No Access	0	No access to any page. Note: This access level is not applicable when using advanced Web user account configuration in the Web Users table.

By default, the device is pre-configured with the following two Web user accounts:

Table 7-9: Pre-configured Web User Accounts

User Access Level	Username (Case-Sensitive)	Password (Case-Sensitive)		
Security Administrator	Admin	Admin		
Monitor	User	User		

After you log in to the Web interface, the username is displayed on the toolbar.

If the Web session is idle (i.e., no actions are performed) for more than five minutes, the Web session expires and you are once again requested to login with your username and password. Users can be blocked for a period of time upon a user-defined number of unsuccessful login attempts. Login information (such as how many login attempts were made and the last successful login time) can be presented to the user.

To prevent user access after a specific number of failed logins:

- 1. From the 'Deny Access On Fail Count' drop-down list, select the number of failed logins after which the user is prevented access to the device for a user-defined time (see next step).
- 2. In the 'Deny Authentication Timer' field, enter the interval (in seconds) that the user needs to wait before a new login attempt from the same IP address can be done after reaching the number of failed login attempts (defined in the previous step).

Notes:

- For security, it's recommended that you change the default username and password of the pre-configured users (i.e., Security Administrator and Monitor users).
- The Security Administrator user can change all attributes of all Web user accounts. Web users with access levels other than Security Administrator can change only their password and username.
- To restore the two Web user accounts to default settings (usernames and passwords), set the *ini* file parameter ResetWebPassword to 1.
- To log in to the Web interface with a different Web user, click the Log off button and then login with with a different username and password.
- You can set the entire Web interface to read-only (regardless of Web user access levels), by using the *ini* file parameter DisableWebConfig (see "Web and Telnet Parameters" on page 691).
- You can define additional Web user accounts using a RADIUS server (see "RADIUS Authentication" on page 78).

7.3.1 Basic User Accounts Configuration

This section describes basic Web user account configuration. This is relevant only if the two default, pre-configured Web user accounts--Security Administrator ("Admin") and Monitor ("User")--are sufficient for your management scheme.

The Web user account parameters that can be modified depends on the access level of the currently logged-in Web user:

Table 7-10: Allowed Modifications per Web User Level

Logged-in User	Web User Level	Allowed Modifications	
Security	(Default) Security Administrator	Username and password	
Administrator	Monitor	Username, password, and access level	
Monitor	(Default) Security Administrator	None	
	Monitor	Username and password	

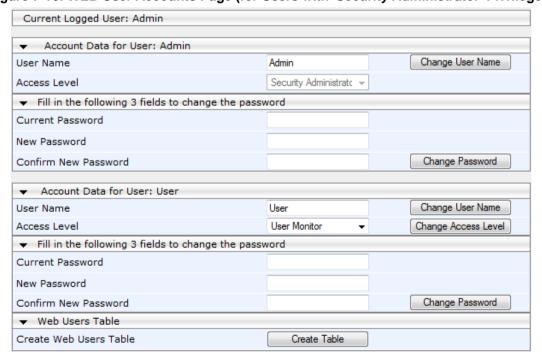

Notes:

- The username and password can be a string of up to 19 characters and are casesensitive.
- When only the basic user accounts are being used, up to two users can be concurrently logged in to the Web interface, and they can be the same user.

To configure the two pre-configured Web user accounts:

 Open the Web User Accounts page (Configuration tab > System menu > Web User Accounts). If you are logged in as Security Administrator, both Web user accounts are displayed (as shown below). If you are logged in with the second user account, only the details of this user account are displayed.

Figure 7-16: WEB User Accounts Page (for Users with 'Security Administrator' Privileges)

- 2. To change the username of an account:
 - a. In the 'User Name' field, enter the new user name.
 - **b.** Click **Change User Name**; if you are currently logged in to the Web interface with this account, the 'Web Login' dialog box appears.
 - Log in with your new user name.
- 3. To change the password of an account:
 - In the 'Current Password' field, enter the current password.
 - **b.** In the 'New Password' and 'Confirm New Password' fields, enter the new password.
 - **c.** Click **Change Password**; if you are currently logged in to the Web interface with this account, the 'Web Login' dialog box appears.
 - d. Log in with your new password.
- 4. To change the access level of the optional, second account:
 - a. Under the Account Data for User: User group, from the 'Access Level' dropdown list, select a new access level user.
 - b. Click Change Access Level; the new access level is applied immediately.

7.3.2 Advanced User Accounts Configuration

The Web Users table lets you configure advanced Web user accounts. This configuration is relevant only if you need the following management schemes:

- Enhanced security settings per Web user (e.g., limit session duration)
- More than two Web user accounts (up to 10 Web user accounts)
- Master users

Notes:

- Only the Security Administrator user can **initially** access the Web Users table.
- Only Security Administrator and Master users can add, edit, or delete users.
- Admin users have read-only privileges in the Web Users table; Monitor users have no access to this table.
- For advanced user accounts, up to five users can be concurrently logged in to the Web interface, and they can be the same user.
- If you delete a user who is currently in an active Web session, the user is immediately logged off by the device.

- To remove the Web Users table and revert to the Web User Accounts page with the pre-configured, default Web user accounts, set the ResetWebPassword *ini* file parameter to 1. This also deletes all other Web users.
- Once the Web Users table is accessed, Monitor users and Admin users can only change their passwords in the Web Security Settings page (see "Configuring Web Security Settings" on page 76). The new password must have at least four different characters than the previous password. (The Security Administrator users and Master users can change their passwords in the Web Users table and in the Web Security Settings page.)

To add Web user accounts with advanced settings:

- 1. Open the Web Users Table page:
 - Upon initial access:
 - a. Open the Web User Accounts page (Configuration tab > System menu > Web User Accounts).
 - b. Under the Web Users Table group, click the Create Table button.
 - Subsequent access: Configuration tab > System menu > Web User Accounts.

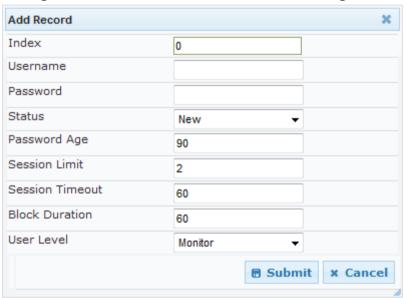

The Web Users table appears, listing the two default, pre-configured Web use accounts - Security Administrator ("Admin") and Monitor ("User"):

Figure 7-17: Web Users Table Page

Index	Username	Password	Status	Password Age	Session Limit	Session Timeout	Block Duration	User Level
0	Admin	*	Valid	0	2	60	60	SecAdmin
	User	*	Valid	0	2	60	60	Monitor

2. Click **Add**; the following dialog box is displayed:

Figure 7-18: Web Users Table - Add Record Dialog Box

- 3. Configure a Web user according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 7-11: Web User Table Parameter Descriptions

Parameter	Description		
Index	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.		
Web: Username	Defines the Web user's username. The valid value is a string of up to 40 alphanumeric characters, including the period ".", underscore "_", and hyphen "-" signs.		
Web: Password	Defines the Web user's password. The valid value is a string of 8 to 40 ASCII characters, which must adhere to the following guidelines: Include at least eight characters.		

Parameter	Description
	 Include at least two letters that are upper case (e.g., A). Include at least two letters that are lower case (e.g., a). Include at least two numbers (e.g., 4). Include at least two symbols (non-alphanumeric characters) (e.g., \$, #, %). Must contain no spaces. Include at least four new characters that were not used in the previous password.
Web: Status	 Defines the status of the Web user. New = (Default) User is required to change its password on the next login. When the user logs in to the Web interface, the user is immediately prompted to change the current password. Valid = User can log in to the Web interface as normal. Failed Access = This state is automatically set for users that exceed a user-defined number of failed login attempts, set by the 'Deny Access on Fail Count' parameter (see "Configuring Web Security Settings" on page 76). These users can log in only after a user-defined timeout configured by the 'Block Duration' parameter (see below) or if their status is changed (to New or Valid) by a System Administrator or Master. Old Account = This state is automatically set for users that have not accessed the Web interface for a user-defined number of days, set by the 'User Inactivity Timer' (see "Configuring Web Security Settings" on page 76). These users can only log in to the Web interface if their status is changed (to New or Valid) by a System Administrator or Master. Notes:
	 The Old Account status is applicable only to Admin and Monitor users; System Administrator and Master users can be inactive indefinitely. For security, it is recommended to set the status of a newly added user to New in order to enforce password change.
Web: Password Age	Defines the duration (in days) of the validity of the password. When this duration elapses, the user is prompted to change the password; otherwise, access to the Web interface is blocked. The valid value is 0 to 10000, where 0 means that the password is always valid. The default is 90.
Web: Session Limit	Defines the maximum number of Web interface sessions allowed for the user. In other words, this allows the same user account to log in to the device from different sources (i.e., IP addresses). The valid value is 0 to 5. The default is 2. Note: Up to 5 users can be concurrently logged in to the Web interface.
Web: Session Timeout	Defines the duration (in minutes) of Web inactivity of a logged-in user, after which the user is automatically logged off the Web interface. The valid value is 0 to 100000. The default value is according to the settings of the 'Session Timeout' global parameter (see "Configuring Web Security Settings" on page 76).

Parameter	Description
Web: Block Duration	Defines the duration (in seconds) for which the user is blocked when the user exceeds a user-defined number of failed login attempts. This is configured by the 'Deny Access On Fail Count' parameter (see "Configuring Web Security Settings" on page 76). The valid value is 0 to 100000, where 0 means that the user can do as many login failures without getting blocked. The default is according to the settings of the 'Deny Authentication Timer' parameter (see "Configuring Web Security Settings" on page 76). Note: The 'Deny Authentication Timer' parameter relates to failed Web logins from specific IP addresses.
Web: User Level	 Defines the user's access level. Monitor = (Default) Read-only user. This user can only view Web pages and access to security-related pages is denied. Administrator = Read/write privileges for all pages, except security-related pages including the Web Users table where this user has only read-only privileges. Security Administrator = Read/write privileges for all pages. This user is the Security Administrator. Master = Read/write privileges for all pages. This user also functions as a security administrator.
	 Notes: At least one Security Administrator must exist. The last remaining Security Administrator cannot be deleted. The first Master user can be added only by a Security Administrator user. Additional Master users can be added, edited and deleted only by Master users. If only one Master user exists, it can be deleted only by itself. Master users can add, edit, and delete Security Administrators (but cannot delete the last Security Administrator). Only Security Administrator and Master users can add, edit, and delete Administrator and Monitor users.

7.4 Displaying Login Information upon Login

The device can display login information immediately upon Web login.

- To enable display of user login information upon a successful login:
- 1. Open the WEB Security Settings page (Configuration tab > System menu > Management > WEB Security Settings).
- 2. From the 'Display Login Information' drop-down list, select Yes.
- Click Submit.

Once enabled, the Login Information window is displayed upon a successful login, as shown in the example below:

Login Information

Last Login Privilege Security Administrator

Last Failed Login Time 15: 04: 19

Last Failed Login Date 10\06\02012

Last Failed Login IP 10.13.2.11

Login Attempts Since Last Success 2

Last Success Login Time 15: 03: 32

Last Success Login Date 10\06\02012

Last Success Login IP 10.13.2.11

Figure 7-19: Login Information Window

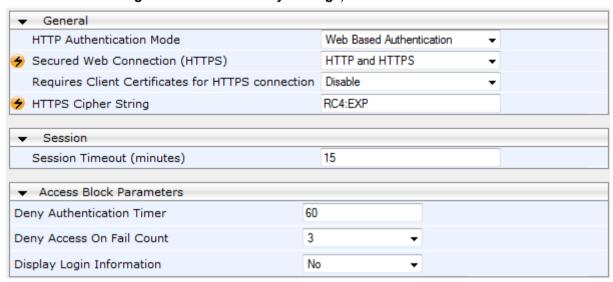

7.5 Configuring Web Security Settings

The WEB Security Settings page is used to configure security for the device's Web interface.

By default, the device accepts HTTP and HTTPS access. However, you can enforce secure Web access communication method by configuring the device to accept only HTTPS.

For a description of these parameters, see "Web and Telnet Parameters" on page 691.

- > To define Web access security:
- 1. Open the WEB Security Settings page (Configuration tab > System menu > Management > WEB Security Settings).

- 2. Set the 'Secured Web Connection (HTTPS)' parameter to HTTPS Only.
- 3. Configure the parameters as required.
- 4. Click Submit.
- 5. To save the changes to flash memory, see "Saving Configuration" on page 550.

7.6 Web Login Authentication using Smart Cards

You can enable Web login authentication using certificates from a third-party, common access card (CAC) with user identification. When a user attempts to access the device through the Web browser (HTTPS), the device retrieves the Web user's login username (and other information, if required) from the CAC. The user attempting to access the device is only required to provide the login password. Typically, a TLS connection is established between the CAC and the device's Web interface, and a RADIUS server is implemented to authenticate the password with the username. Therefore, this feature implements a two-factor authentication - what the user has (i.e., the physical card) and what the user knows (i.e., the login password).

This feature is enabled using the EnableMgmtTwoFactorAuthentication parameter.

Note: For specific integration requirements for implementing a third-party smart card for Web login authentication, contact your AudioCodes representative.

- To log in to the Web interface using CAC:
- 1. Insert the Common Access Card into the card reader.
- 2. Access the device using the following URL: https://<host name or IP address>; the device prompts for a username and password.
- 3. Enter the password only. As some browsers require that the username be provided, it's recommended to enter the username with an arbitrary value.

7.7 Configuring Web and Telnet Access List

The Web & Telnet Access List page is used to define IP addresses (up to ten) that are permitted to access the device's Web, Telnet, and SSH interfaces. Access from an undefined IP address is denied. If no IP addresses are defined, this security feature is inactive and the device can be accessed from any IP address. The Web and Telnet Access List can also be defined using the *ini* file parameter WebAccessList_x (see "Web and Telnet Parameters" on page 691).

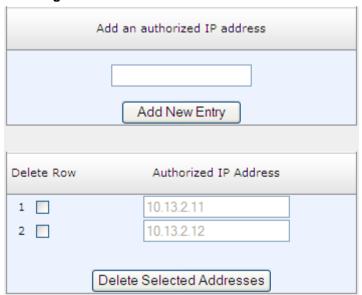

- To add authorized IP addresses for Web, Telnet, and SSH interfaces access:
- Open the Web & Telnet Access List page (Configuration tab > System menu > Management > Web & Telnet Access List).

Figure 7-20: Web & Telnet Access List Page - Add New Entry

To add an authorized IP address, in the 'Add an authorized IP address' field, enter the
required IP address, and then click Add New Entry; the IP address you entered is
added as a new entry to the Web & Telnet Access List table.

Figure 7-21: Web & Telnet Access List Table

- 3. To delete authorized IP addresses, select the Delete Row check boxes corresponding to the IP addresses that you want to delete, and then click **Delete Selected Addresses**; the IP addresses are removed from the table and these IP addresses can no longer access the Web and Telnet interfaces.
- 4. To save the changes to flash memory, see "Saving Configuration" on page 550.

Notes:

- The first authorized IP address in the list must be your PC's (terminal) IP address; otherwise, access from your PC is denied.
- Delete your PC's IP address last from the 'Web & Telnet Access List page. If it is deleted before the last, subsequent access to the device from your PC is denied.

8 CLI-Based Management

This chapter provides an overview of the CLI-based management and provides configuration relating to CLI management.

Warning: If you are using the PuTTY terminal emulator for CLI, you must enable the use of the backspace key in the CLI; otherwise, an error will be generated and your settings will not be applied. To enable backspace functionality, start PuTTY and then in the PuTTY Configuration window, expand the **Terminal** folder, click **Keyboard**, and then select the **Control-H** option under the 'The Backspace key' group.

Notes:

- For security, CLI is disabled by default.
- CLI is used only for debugging and mainly allows you to view various information regarding device configuration and performance.

8.1 Enabling CLI

Access to the device's CLI through Telnet and SSH is disabled by default. This section describes how to enable these protocols.

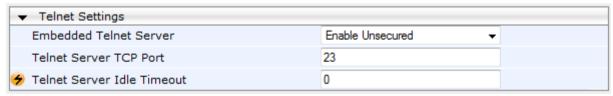

8.1.1 Enabling Telnet for CLI

The following procedure describes how to enable Telnet. You can enable a secured Telnet that uses Secure Socket Layer (SSL) where information is not transmitted in the clear. If SSL is used, a special Telnet client is required on your PC to connect to the Telnet interface over a secured connection; examples include C-Kermit for UNIX and Kermit-95 for Windows.

For security, some organizations require the display of a proprietary notice upon starting a Telnet session. You can use the configuration ini file parameter, WelcomeMessage to configure such a message (see "Creating a Login Welcome Message" on page 63).

> To enable Telnet:

1. Open the Telnet/SSH Settings page (Configuration tab > System menu > Management > Telnet/SSH Settings).

- Set the 'Embedded Telnet Server' parameter to Enable Unsecured or Enable Secured (i.e, SSL).
- **3.** Configure the other Tenet parameters as required. For a description of these parameters, see "Telnet Parameters" on page 694.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

8.1.2 Enabling SSH with RSA Public Key for CLI

Unless configured for TLS, Telnet is not secure as it requires passwords to be transmitted in clear text. To overcome this, Secure SHell (SSH) is used, which is the de-facto standard for secure CLI. SSH 2.0 is a protocol built above TCP, providing methods for key exchange, authentication, encryption, and authorization.

SSH requires appropriate client software for the management PC. Most Linux distributions have OpenSSH pre-installed; Windows-based PCs require an SSH client software such as PuTTY, which can be downloaded from http://www.chiark.greenend.org.uk/~sgtatham/putty.

By default, SSH uses the same username and password as the Telnet and Web server. SSH supports 1024/2048-bit RSA public keys, providing carrier-grade security. Follow the instructions below to configure the device with an administrator RSA key as a means of strong authentication.

To enable SSH and configure RSA public keys for Windows (using PuTTY SSH software):

- Start the PuTTY Key Generator program, and then do the following:
 - a. Under the 'Parameters' group, do the following:
 - Select the SSH-2 RSA option.
 - In the 'Number of bits in a generated key' field, enter "1024" bits.
 - **b.** Under the 'Actions' group, click **Generate** and then follow the on-screen instructions.
 - C. Under the 'Actions' group, click Save private key to save the new private key to a file (*.ppk) on your PC.
 - **d.** Under the 'Key' group, select the displayed encoded text between "ssh-rsa" and "rsa-key-....", as shown in the example below:

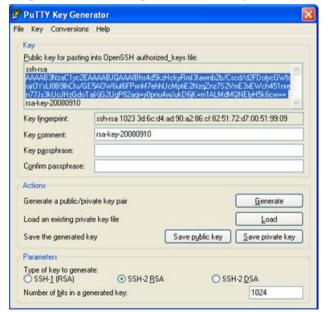

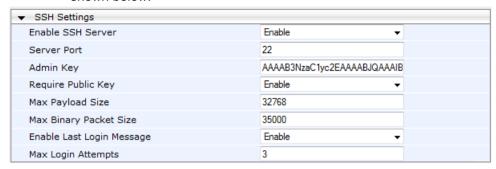

Figure 8-1: Selecting Public RSA Key in PuTTY

- Open the Telnet/SSH Settings page (Configuration tab > System menu > Management > Telnet/SSH Settings), and then do the following:
 - a. Set the 'Enable SSH Server' parameter to **Enable**.
 - b. Paste the public key that you copied in Step 1.d into the 'Admin Key' field, as shown below:

c. For additional security, you can set the 'Require Public Key' to **Enable**. This ensures that SSH access is only possible by using the RSA key and not by using user name and password.

d.

- **e.** Configure the other SSH parameters as required. For a description of these parameters, see "SSH Parameters" on page 730.
- Click Submit.
- 3. Start the PuTTY Configuration program, and then do the following:
 - a. In the 'Category' tree, drill down to Connection, then SSH, and then Auth; the 'Options controlling SSH authentication' pane appears.
 - **b.** Under the 'Authentication parameters' group, click **Browse** and then locate the private key file that you created and saved in Step 4.
- **4.** Connect to the device with SSH using the username "Admin"; RSA key negotiation occurs automatically and no password is required.
- To configure RSA public keys for Linux (using OpenSSH 4.3):
- 1. Run the following command to create a new key in the admin.key file and to save the public portion to the admin.key.pub file:

```
ssh-keygen -f admin.key -N "" -b 1024
```

- 2. Open the admin.key.pub file, and then copy the encoded string from "ssh-rsa" to the white space.
- Open the Telnet/SSH Settings page (Configuration tab > System menu > Management > Telnet/SSH Settings), and then paste the value copied in Step 2 into the 'Admin Key' field.
- 4. Click Submit.
- 5. Connect to the device with SSH, using the following command:

```
ssh -i admin.key xx.xx.xx
```

where *xx.xx.xx* is the device's IP address. RSA-key negotiation occurs automatically and no password is required.

8.2 Establishing a CLI Session

The device's CLI can be accessed using any of the following methods:

- RS-232: The device can be accessed through its RS-232 serial port, by connecting a VT100 terminal to it or using a terminal emulation program (e.g., HyperTerminal) with a PC. For connecting to the CLI through RS-232, see "CLI" on page 37.
- Secure SHell (SSH): The device can be accessed through its Ethernet interface by the SSH protocol using SSH client software. A popular and freeware SSH client software is Putty, which can be downloaded from http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html
- **Telnet:** The device can be accessed through its Ethernet interface by the Telnet protocol using Telnet client software. The following procedure describes how to establish a CLI session with the device.

The following procedure describes how to access the CLI through Telnet/SSH.

Notes:

- The CLI login credentials are the same as all the device's other management interfaces (such as Web interface). The default username and password is "Admin" and "Admin" (case-sensitive), respectively. For configuring login credentials, see "Configuring Web User Accounts" on page 68.
- Only the primary User Account, which has Security Administration access level (200), can access the device using Telnet.

> To establish a CLI session with the device:

- 1. Connect the device to the network.
- 2. Establish a Telnet or SSH session using the device's OAMP IP address.
- 3. Log in to the session using the username and password assigned to the Admin user of the Web interface:
 - a. At the login prompt, type the username, and then press Enter: login: Admin
 - **b.** At the password prompt, type the password, and then press Enter: password: Admin

Once logged in, the current directory (root), available commands, available subdirectories, and a welcome message are displayed at the CLI prompt:

login: Admin password: ready. Type "exit" to close the connection. SIP/ SECurity/ PStn/ DebugRecording/ MGmt/ ControlProtocol/ CONFiguration/ IPNetworking/ TPApp/ BSP/ PING SHow />

8.3 Configuring Maximum Telnet/SSH Sessions

You can set the maximum (up to five) number of concurrent Telnet/SSH sessions permitted on the device.

Note: Before changing this setting, make sure that not more than this number of sessions are currently active; otherwise, the new setting will not take effect.

- > To configure the maximum number of concurrent Telnet/SSH sessions:
- Open the Telnet/SSH Settings page (Configuration tab > System menu > Management > Telnet/SSH Settings).
- 2. In the 'Maximum Telnet Sessions' field, enter the maximum number of concurrent sessions.
- 3. Click Submit.

8.4 Command Shell

The Command Shell interface is used mainly to display current configuration and performance.

8.4.1 Getting Familiar with the Command Shell

This section provides a description on how to work with the CLI. This includes basic navigation commands and accessing subdirectories.

8.4.1.1 Basic Command Shell Commands

The table below describes the commands for navigating the Command Shell interface:

Table 8-1: Basic CLI Commands

Purpose	Commands	Description	
Help	h	Displays the help for a specific command, action, or parameter.	
Navigation	cd	Enters another directory.	
	cd root	Returns you to the root directory "/>".	
		Goes up one level.	
	exit	Terminates the CLI session.	

8.4.1.2 Accessing Subdirectories

The Command Shell commands are organized in subdirectories. When you establish a CLI session, you are located in the root directory, indicated by the following prompt:

/>

To access a subdirectory, type its name, and then press Enter. For example, to enter the **MGmt** subdirectory, type the following:

/>MGmt

Instead of typing the full name of the subdirectory, you can simply type its abbreviated format. The abbreviated format is shown in upper case (i.e., capital letters). For example, for the **MGmt** subdirectory, you can simply type the following:

/>MG

If you know the full path to a command inside one of the subdirectories, the short format can be used to run it directly. For example, to run the **PERFormance** command in the **MGmt** subdirectory, type the following:

/>MG/PERF

Note: The subdirectory names and commands are case-insensitive. For example, it does not matter whether you type "MGmt" or "mgmt".

8.4.2 **Status Commands**

The following table summarizes the Show commands and their corresponding options.

Table 8-2: Show CLI Commands

Command	Short Format	Arguments	Description
SHow	sh	info hw tdm dsp ip log	Displays operational data. Info: Displays general device information tdm: Displays PSTN-related information dsp: Displays DSP resource information ip: Displays information about IP interfaces
SHow INFO	sh info	-	Displays device hardware information, versions, uptime, temperature reading, and the last reset reason.
SHow HW	sh hw		Displays system information: power status, High-Availability status, and fan information.
SHow TDM	sh tdm	status perf summary	Displays the alarm status and performance statistics for E1/T1 trunks.
SHow DSP	sh dsp	status perf	Displays status and version for each DSP device, along with overall performance statistics.
SHow IP	sh ip	conf perf route	Displays IP interface status and configuration, along with performance statistics. Note: The display format may change according to the configuration.
SHow LOG	sh log	[stop]	Displays (or stops displaying) Syslog messages in the CLI session.

Example:

```
/>sh info
Board type: gateway SDH, firmware version 6.60.000.020
Uptime: 0 days, 0 hours, 3 minutes, 54 seconds
Memory usage: 63%

8.4.3 Ping Command

The Ping command is described in the following table:

Table 8-3: Ping Command

Command	Short Format	Arguments	Description
PING	ping	[-n count] [-l size] [-w timeout] [-p cos] ip-address	Sends ICMP echo request packets to a specified IP address. count: number of packets to send. size: payload size in each packet. timeout: time (in seconds) to wait for a reply to each packet. cos: Class-of-Service (as per 802.1p) to use.

Example:

```
/>ping 10.31.2.10
Ping process started for address 10.31.2.10. Process ID - 27.
Reply from 10.31.2.10: bytes=0 time<0ms
Ping statistics for 10.31.2.10:
Packets:Sent = 4, Received = 4, Lost 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 0ms, Average = 0ms</pre>
```

8.4.4 Test Call (TC) Commands

The Test Call commands can be used to simulate an IP-to-PSTN call.

Note: Only one test call can be activated at a given time.

Table 8-4: Test Call Command

Command	Short Format	Sub-Commands
/SIP/TestCall	/sip/tc	set dest set src set cid set DTMFs display connect

Table 8-5: Sub-Commands of Test (TC) Command

Sub-Command	Arguments	Description
set dest	<number></number>	Sets the Destination Number for the test call.
set src	<number></number>	Sets the Source Number for the test call.
set cid	<display string=""></display>	Sets the Display Name for the test call.
set DTMFs	<dtmf pattern=""></dtmf>	Sets the pattern of DTMFs that is played to the PSTN side after the test call is connected.
display	-	Displays all the set parameters for the test call. These values can be manually set using the set commands or defaults.
connect	<destination number> <source number> <caller ID> <time></time></caller </source </destination 	Generates the test call toward the PSTN side using the set parameters. If no arguments are defined in the connect command line, the test call uses the values defined using the set commands (or defaults).
		Note: There is no option for defining only the <time> value without specifying all the other arguments that appear before it.</time>

Example:

```
/SIP>tc
TestCall - TC
Manage Test Tel-Link Call.
Usage:

    TC set dest <number>
    TC set src <number>
    TC set cid <display string>
    TC set DTMFs <dtmf string>
    TC display
    TC connect [dest-number] [src number] [CID] [time]

/SIP>tc display
Test Call configuration
    Dest number: 402
    Src number: 700
    Cid display: TESTING
```

DTMFs String 112233
Time After DTMF are sent: 20 sec

/SIP>tc connect
Start Test call.
Receive ALERT Event
Receive Connect
Wait more 20 seconds before disconnecting
Receive SS_TIMER_EV Event
Send Release To Call
Receive RELEASE_ACK Event
Receive SS_TIMER_EV Event

8.4.5 Management Commands

The commands under the **MGmt** directory, described in the table below, display current performance values.

Table 8-6: CLI Management Command

Command	Short Format	Arguments	Description
/MGmt/PERFormance	/mg/perf	basic control dsp net ds1 reset	Displays performance statistics. The <i>reset</i> argument clears all statistics to zero.

8.4.6 Configuration Commands

The commands under the **CONFiguration** directory query and modify the current device configuration. The following commands are available:

Table 8-7: Configuration CLI Commands

Command	Short Format	Arguments	Description
SetConfigParam IP	/conf/scp ip	ip-addr subnet def- gw	Sets the IP address, subnet mask, and default gateway address of the device (on-the-fly).
			Note: This command may cause disruption of service. The CLI session may disconnect since the device changes its IP address.
RestoreFactorySettings	/conf/rfs		Restores all parameters to factory settings.
SaveAndRestart	/conf/sar		Saves all current configurations to the non-volatile memory and resets the device.
ConfigFile	/conf/cf	view get set	Retrieves the full <i>ini</i> file from the device and allows loading a new <i>ini</i> file directly in the CLI session.
			Note: The argument <i>view</i> displays the file, page by page. The argument <i>get</i> displays the file without breaks.

8.4.7 PSTN Commands

The commands under the **PSTN** directory allow you to perform various PSTN actions.

Table 8-8: PSTN CLI Command

Command	Short Format	Arguments	Description
PstnLoopCommands	PS/PH/PLC	<trunkid> <loopcode> <bchannel></bchannel></loopcode></trunkid>	Activates a loopback on a specific trunk and B-channel. For loopback on the entire trunk, set BChannel=(-1). The valid value options for LoopCode include the following: • 0 = NO_LOOPS • 1 = REMOTE_LOOP (whole trunk only) • 2 = LINE_PAYLOAD_LOOP (whole trunk only not applicable to DS3, Sonet/SDH) • 3 = LOCAL_ALL_CHANNELS_LOOP (whole trunk only - not applicable to DS3 or Sonet/SDH)
PstnSendAlarm	PS/PH/PSA	<trunkid> <alarmsendcode></alarmsendcode></trunkid>	Sends an alarm signal at the Tx interface or on a specific Trunk ID. The valid value options for AlarmSendCode include the following: • 0 = NO_ALARMS (means stop sending AIS) • 1 = AIS_ALARM • 2 = STOP_RAI_ALARM • 3 = SEND_RAI_ALARM
DeleteCasFile	PS/CAS/DCF	<tableindex></tableindex>	Deletes all the device's CAS files when <tableindex> is set to -1 (other options are currently not supported).</tableindex>

8.4.8 LDAP Commands

The commands under the **IPNetworking\OpenLdap** directory allow you to perform various Lightweight Directory Access Protocol (LDAP) actions.

Table 8-9: LDAP Commands

Sub-Command	Arguments	Description
LdapSTatus	-	Displays the LDAP connection status.
LdapSearch	<pre><search key=""> <attribute1> [<attribute 2=""><attribute 5="">]</attribute></attribute></attribute1></search></pre>	Searches an LDAP server. The parameters enclosed by [] are optional.
LDapOpen	-	Opens a connection to the LDAP server using parameters provided in the configuration file.

Sub-Command	Arguments	Description
LDapSetDebugmode	<mode></mode>	Sets the LdapDebugLevelMode parameter. Possible levels 0-3.
LDapGetDebugmode	-	Gets the LdapDebugLevelMode parameter value

This page is intentionally left blank.

9 SNMP-Based Management

The device provides an embedded SNMP Agent that allows it to be managed by AudioCodes Element Management System (EMS) or a third-party SNMP Manager (e.g., element management system). The SNMP Agent supports standard Management Information Base (MIBs) and proprietary MIBs, enabling a deeper probe into the interworking of the device. The SNMP Agent can also send unsolicited events (SNMP traps) towards the SNMP Manager. All supported MIB files are supplied to customers as part of the release.

AudioCodes EMS is an advanced solution for standards-based management that covers all areas vital for the efficient operation, administration, management and provisioning (OAM&P) of the device. The standards-compliant EMS uses distributed SNMP-based management software, optimized to support day-to-day Network Operation Center (NOC) activities, offering a feature-rich management framework. It supports fault management, configuration and security.

This section provides configuration relating to SNMP management.

Notes:

- For more information on the device's SNMP support (e.g., SNMP traps), refer to the SNMP User's Guide.
- EMS support is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see "Software License Key" on page 575.
- For more information on using the EMS tool, refer to the EMS User's Manual and EMS Server IOM Manual.

9.1 Enabling SNMP and Configuring SNMP Community Strings

The SNMP Community String page lets you configure up to five read-only and up to five read-write SNMP community strings and to configure the community string that is used for sending traps.

For detailed descriptions of the SNMP parameters, see "SNMP Parameters" on page 694.

- To configure SNMP community strings:
- 1. Open the SNMP Community String page (Configuration tab > System menu > Management > SNMP > SNMP Community String).

- 2. Configure SNMP community strings according to the table below.
- 3. Click **Submit**, and then save ("burn") your settings to flash memory.

To delete a community string, select the **Delete** check box corresponding to the community string that you want to delete, and then click **Submit**.

Table 9-1: SNMP Community String Parameter Descriptions

Parameter	Description
Community String	 Read Only [SNMPReadOnlyCommunityString_x]: Up to five read-only community strings (up to 19 characters each). The default string is 'public'. Read / Write [SNMPReadWriteCommunityString_x]: Up to five read / write community strings (up to 19 characters each). The default string is 'private'.
Trap Community String [SNMPTrapCommunityString]	Community string used in traps (up to 19 characters). The default string is 'trapuser'.

9.2 Configuring SNMP Trap Destinations

The SNMP Trap Destinations page allows you to configure up to five SNMP trap managers. You can associate a trap destination with SNMPv2 users and specific SNMPv3 users. Associating a trap destination with SNMPv3 users sends encrypted and authenticated traps to the SNMPv3 destination. By default, traps are sent unencrypted using SNMPv2.

To configure SNMP trap destinations:

Open the SNMP Trap Destinations page (Configuration tab > System menu > Management > SNMP > SNMP Trap Destinations).

Figure 9-1: SNMP Trap Destinations Page

	IP Address	Trap Port	Trap User	Trap Enable
SNMP Manager 1	0.0.0.0	162	v2cParams ▼	Enable ▼
SNMP Manager 2	0.0.0.0	162	v2cParams ▼	Enable ▼
SNMP Manager 3	0.0.0.0	162	v2cParams ▼	Enable ▼
SNMP Manager 4	0.0.0.0	162	v2cParams ▼	Enable ▼
SNMP Manager 5	0.0.0.0	162	v2cParams ▼	Enable ▼

- 2. Configure the SNMP trap manager parameters according to the table below.
- 3. Select the check box corresponding to the SNMP Manager that you wish to enable.
- 4. Click Submit.

Note: Only row entries whose corresponding check boxes are selected are applied when clicking **Submit**; otherwise, settings revert to their defaults.

Table 9-2: SNMP Trap Destinations Parameters Description

1 5 <u>2. 5</u> 1 1 1 1 1		
Parameter	Description	
Web: SNMP Manager [SNMPManagerIsUsed_x]	 Enables the SNMP Manager to receive traps and checks the validity of the configured destination (IP address and port number). [0] (check box cleared) = (Default) Disables SNMP Manager [1] (check box selected) = Enables SNMP Manager 	
Web: IP Address [SNMPManagerTableIP_x]	Defines the IP address (in dotted-decimal notation, e.g., 108.10.1.255) of the remote host used as the SNMP Manager. The device sends SNMP traps to this IP address.	
Trap Port [SNMPManagerTrapPort_x]	Defines the port number of the remote SNMP Manager. The device sends SNMP traps to this port. The valid value range is 100 to 4000. The default is 162.	
Web: Trap User [SNMPManagerTrapUser]	Associates a trap user with the trap destination. This determines the trap format, authentication level, and encryption level. • v2cParams (default) = SNMPv2 user community string • SNMPv3 user configured in "Configuring SNMP V3 Users" on page 97	
Trap Enable [SNMPManagerTrapSendingEnable_x]	Activates the sending of traps to the SNMP Manager. • [0] Disable • [1] Enable (Default)	

Configuring SNMP Trusted Managers 9.3

The SNMP Trusted Managers table lets you configure up to five SNMP Trusted Managers based on IP addresses. By default, the SNMP agent accepts SNMP Get and Set requests from any IP address as long as the correct community string is used in the request. Security can be enhanced by using Trusted Managers, which is an IP address from which the SNMP agent accepts and processes SNMP requests.

The following procedure describes how to configure SNMP trusted managers in the Web interface. You can also configure this using the table ini file parameter, SNMPTrustedMgr x.

To configure SNMP Trusted Managers:

Open the SNMP Trusted Managers page (Configuration tab > System menu > Management > SNMP > SNMP Trusted Managers).

Delete Trusted Managers IP Address SNMP Trusted Manager 1 0.0.0.0 SNMP Trusted Manager 2 0.0.0.0 SNMP Trusted Manager 3 0.0.0.0 SNMP Trusted Manager 4 0.0.0.0 0.0.0.0

Figure 9-2: SNMP Trusted Managers

- Select the check box corresponding to the SNMP Trusted Manager that you want to enable and for whom you want to define an IP address.
- 3. Define an IP address in dotted-decimal notation.

SNMP Trusted Manager 5

Click **Submit**, and then save ("burn") your settings to flash memory. 4.

9.4 Configuring SNMP V3 Users

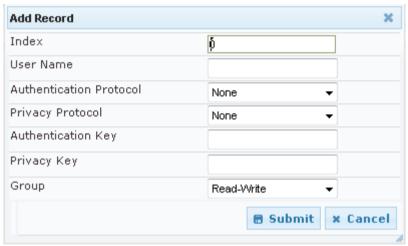

The SNMP v3 Users table lets you configure up to 10 SNMP v3 users for authentication and privacy.

The following procedure describes how to configure SNMP v3 users in the Web interface. You can also configure this using the table ini file parameter, SNMPUsers.

> To configure an SNMP v3 user:

- 1. Open the SNMP v3 Users page (Configuration tab > System menu > Management > SNMP > SNMP V3 Users).
- 2. Click Add; the following dialog box appears:

Figure 9-3: SNMP V3 Setting Page - Add Record Dialog Box

- 3. Configure the SNMP V3 Setting parameters according to the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Note: If you delete a user that is associated with a trap destination (see "Configuring SNMP Trap Destinations" on page 94), the configured trap destination becomes disabled and the trap user reverts to default (i.e., SNMPv2).

Table 9-3: SNMP V3 Users Parameters

Parameter	Description
Index [SNMPUsers_Index]	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.
User Name [SNMPUsers_Username]	Name of the SNMP v3 user. This name must be unique.
Authentication Protocol [SNMPUsers_AuthProtocol]	Authentication protocol of the SNMP v3 user. • [0] None (default) • [1] MD5 • [2] SHA-1
Privacy Protocol [SNMPUsers_PrivProtocol]	Privacy protocol of the SNMP v3 user. • [0] None (default)

Parameter	Description	
	 [1] DES [2] 3DES [3] AES-128 [4] AES-192 [5] AES-256 	
Authentication Key [SNMPUsers_AuthKey]	Authentication key. Keys can be entered in the form of a text password or long hex string. Keys are always persisted as long hex strings and keys are localized.	
Privacy Key [SNMPUsers_PrivKey]	Privacy key. Keys can be entered in the form of a text password or long hex string. Keys are always persisted as long hex strings and keys are localized.	
Group [SNMPUsers_Group]	The group with which the SNMP v3 user is associated. • [0] Read-Only (default) • [1] Read-Write • [2] Trap Note: All groups can be used to send traps.	

10 INI File-Based Management

The device can be configured using an ini file, which is a text-based file with an *ini* file extension name that can be created using any standard text-based editor such as Notepad. Each configuration element of the device has a corresponding ini file parameter that you can use in the ini file for configuring the device. When you have created the ini file with your ini file parameter settings, you apply these settings to the device by installing (loading) the ini file to the device.

Notes:

- For a list and description of the *ini* file parameters, see "Configuration Parameters Reference" on page 691.
- To restore the device to default settings using the *ini* file, see "Restoring Factory Defaults" on page 605.

10.1 INI File Format

The *ini* file can be configured with any number of parameters. These *ini* file parameters can be one of the following types:

- Individual parameters see "Configuring Individual ini File Parameters" on page 99
- Table parameters see "Configuring Table ini File Parameters" on page 100

10.1.1 Configuring Individual ini File Parameters

The syntax for configuring individual ini file parameters in the ini file is as follows:

- An optional, subsection name (or group name) enclosed in square brackets "[...]". This is used to conveniently group similar parameters by their functionality.
- Parameter name, followed by an equal "=" sign and then its value.
- Comments must be preceded by a semicolon ";".

```
[subsection name]
parameter name = value
parameter name = value
; this is a comment line
; for example:
[System Parameters]
SyslogServerIP = 10.13.2.69
EnableSyslog = 1
```

For general ini file formatting rules, see "General ini File Formatting Rules" on page 101.

10.1.2 Configuring Table ini File Parameters

The table ini file parameters allow you to configure tables, which include multiple parameters (*columns*) and row entries (*indices*). When loading an *ini* file to the device, it's recommended to include only tables that belong to applications that are to be configured (dynamic tables of other applications are empty, but static tables are not).

The table ini file parameter is composed of the following elements:

- **Title of the table:** The name of the table in square brackets, e.g., [MY_TABLE_NAME].
- Format line: Specifies the columns of the table (by their string names) that are to be configured.
 - The first word of the Format line must be "FORMAT", followed by the Index field name and then an equal "=" sign. After the equal sign, the names of the columns are listed.
 - Columns must be separated by a comma ",".
 - The Format line must only include columns that can be modified (i.e., parameters that are not specified as read-only). An exception is Index fields, which are mandatory.
 - The Format line must end with a semicolon ":".
- Data line(s): Contain the actual values of the columns (parameters). The values are interpreted according to the Format line.
 - The first word of the Data line must be the table's string name followed by the Index field.
 - Columns must be separated by a comma ",".
 - A Data line must end with a semicolon ":".
- **End-of-Table Mark:** Indicates the end of the table. The same string used for the table's title, preceded by a backslash "\", e.g., [\MY_TABLE_NAME].

The following displays an example of the structure of a table ini file parameter.

```
[Table_Title]
; This is the title of the table.
FORMAT Index = Column_Name1, Column_Name2, Column_Name3;
; This is the Format line.
Index 0 = value1, value2, value3;
Index 1 = value1, $$, value3;
; These are the Data lines.
[\Table_Title]
; This is the end-of-the-table-mark.
```

The table ini file parameter formatting rules are listed below:

- Indices (in both the Format and the Data lines) must appear in the same order. The Index field must never be omitted.
- The Format line can include a subset of the configurable fields in a table. In this case, all other fields are assigned with the pre-defined default values for each configured line.
- The order of the fields in the Format line isn't significant (as opposed to the Index fields). The fields in the Data lines are interpreted according to the order specified in the Format line.
- The double dollar sign (\$\$) in a Data line indicates the default value for the parameter.
- The order of the Data lines is insignificant.
- Data lines must match the Format line, i.e., it must contain exactly the same number of Indices and Data fields and must be in exactly the same order.

- A row in a table is identified by its table name and Index field. Each such row may appear only once in the *ini* file.
- Table dependencies: Certain tables may depend on other tables. For example, one table may include a field that specifies an entry in another table. This method is used to specify additional attributes of an entity, or to specify that a given entity is part of a larger entity. The tables must appear in the order of their dependency (i.e., if Table X is referred to by Table Y, Table X must appear in the *ini* file before Table Y).

For general *ini* file formatting rules, see "General ini File Formatting Rules" on page 101. The table below displays an example of a table ini file parameter:

```
[ CodersGroup0 ]
FORMAT CodersGroup0_Index = CodersGroup0_Name, CodersGroup0_pTime,
CodersGroup0_rate, CodersGroup0_PayloadType, CodersGroup0_Sce;
CodersGroup0 0 = g711Alaw64k, 20, 0, 255, 0;
CodersGroup0 1 = eg711Ulaw, 10, 0, 71, 0;
[ \CodersGroup0 ]
```

Note: Do not include read-only parameters in the table ini file parameter as this can cause an error when attempting to load the file to the device.

10.1.3 General ini File Formatting Rules

The ini file must adhere to the following formatting rules:

- The *ini* file name must not include hyphens "-" or spaces; if necessary, use an underscore "_" instead.
- Lines beginning with a semi-colon ";" are ignored. These can be used for adding remarks in the *ini* file.
- A carriage return (i.e., Enter) must be done at the end of each line.
- The number of spaces before and after the equals sign "=" is irrelevant.
- Subsection names for grouping parameters are optional.
- If there is a syntax error in the parameter name, the value is ignored.
- Syntax errors in the parameter's value can cause unexpected errors (parameters may be set to the incorrect values).
- Parameter string values that denote file names (e.g., CallProgressTonesFileName) must be enclosed with inverted commas, e.g., CallProgressTonesFileName = 'cpt_usa.dat'.
- The parameter name is not case-sensitive.
- The parameter value is not case-sensitive, except for coder names.
- The ini file must end with at least one carriage return.

10.2 Configuring an ini File

There are different methods that you can use for configuring the ini file before you load it to the device.

- Modifying the device's current ini file. This method is recommended if you mainly need to change the settings of parameters that you have previously configured.
 - 1. Save the device's current configuration as an *ini* file on your computer, using the Web interface (see "Saving Configuration" on page 550).
 - 2. Open the file using a text file editor, and then modify the *ini* file as required.
 - 3. Save and close the file.
 - 4. Load the file to the device.
- Creating a new ini file that includes only updated configuration:
 - 1. Open a text file editor such as Notepad.
 - 2. Add only the required parameters and their settings.
 - 3. Save the file with the ini file extension name (e.g., myconfiguration.ini).
 - 4. Load the file to the device.

For loading the ini file to the device, see "Loading an ini File to the Device" on page 102.

Note: To restore the device to default settings using the *ini* file, see "Restoring Factory Defaults" on page 605.

10.3 Loading an ini File to the Device

You can load an *ini* file to the device using the following methods:

- Web interface:
 - Load Auxiliary Files page (see "Loading Auxiliary Files" on page 555): The device updates its configuration according to the loaded ini file, while preserving the remaining current configuration.
 - Configuration File page (see "Backing Up and Loading Configuration File" on page 585): The device updates its configuration according to the loaded ini file, and applies default values to parameters that were not included in the loaded ini file. Thus, all previous configuration is overridden.
- AudioCodes AcBootP utility: Bootstrap Protocol (BootP) with TFTP is used to load the file. The device updates its configuration according to the loaded ini file, and applies default values to parameters that were not included in the loaded ini file. Thus, all previous configuration is overridden. For more information on the AcBootP utility, refer to AcBootP Utility User's Guide.
- Any standard TFTP server: The device downloads the ini file from a TFTP server. The device updates its configuration according to the loaded ini file, and applies default values to parameters that were not included in the loaded ini file. Thus, all previous configuration is overridden.

When you load an ini file to the device, its configuration settings are saved to the device's non-volatile memory.

Note: Before you load an *ini* file to the device, make sure that the file extension name is .*ini*.

10.4 Secured Encoded in File

The *ini* file contains sensitive information that is required for the functioning of the device. The file may be loaded to the device using TFTP or HTTP. These protocols are not secure and are vulnerable to potential hackers. To overcome this security threat, the AudioCodes DConvert utility allows you to binary-encode (encrypt) the *ini* file before loading it to the device. For more information, refer to the *DConvert Utility User's Guide*.

Note: If you save an ini file from the device to a folder on your PC, an *ini* file that was loaded to the device encoded is saved as a regular *ini* file (i.e., unencoded).

10.5 Configuring Password Display in ini File

Passwords can be displayed in the ini file in one of the following formats, configured by the INIPasswordsDisplayType ini file parameter:

- Obscured: The password characters are concealed and displayed as encoded. The password is displayed using the syntax, \$1\$<obscured password>, for example, \$1\$S3p+fno=.
- Hidden: the password is replaced with an asterisk (*).

When you save an ini file from the device to a PC, the passwords are displayed according to the enabled format. When you load an ini file to the device, obscured passwords are parsed and applied to the device; hidden passwords are ignored.

By default, the enabled format is obscured passwords, thus enabling their full recovery in case of configuration restore or copy to another device.

When obscured password mode is enabled, you can enter a password in the ini file using any of the following formats:

- \$1\$<obscured password>: Password in obscured format as generated by the device; useful for restoring device configuration and copying configuration from one device to another.
- \$0\$<plain text>: Password can be entered in plain text; useful for configuring a new password. When the ini file is loaded to the device and then later saved from the device to a PC, the password is displayed obscured (i.e., \$1\$<obscured password>).

10.6 INI Viewer and Editor Utility

AudioCodes INI Viewer & Editor utility provides a user-friendly graphical user interface (GUI) that lets you easily view and modify the device's ini file. This utility is available from AudioCodes Web site at www.AudioCodes.com/downloads, and can be installed on any Windows-based PC.

For more information, refer to the INI Viewer & Editor User's Guide.

Part III

General System Settings

11 Configuring SSL/TLS Certificates

The TLS Contexts page lets you configure X.509 certificates, which are used for secure management of the device, secure SIP transactions, and other security applications.

Notes:

- The device is shipped with an active, default TLS setup. Thus, configure certificates only if required.
- Since X.509 certificates have an expiration date and time, you must configure the
 device to use Network Time Protocol (NTP) to obtain the current date and time
 from an NTP server. Without the correct date and time, client certificates cannot
 work. For configuring NTP, see Configuring Automatic Date and Time using SNTP
 on page 119.

11.1.1 Configuring TLS Certificate Contexts

The TLS Contexts table lets you configure up to 20 TLS certificates, referred to as *TLS Contexts*. The Transport Layer Security (TLS), also known as Secure Socket Layer (SSL), is used to secure the device's SIP signaling connections, Web interface, and Telnet server. The TLS/SSL protocol provides confidentiality, integrity, and authenticity between two communicating applications over TCP/IP.

The device is shipped with a default TLS Context (ID 0 and string name "default"), which includes a self-generated random private key and a self-signed server certificate. The subject name for the default certificate is "ACL_nnnnnnn", where *nnnnnnn* denotes the serial number of the device. The default TLS Context can be used for SIP over TLS (SIPS) or any other supported application such as Web (HTTPS), Telnet, and SSH.The default TLS Context cannot be deleted.

The user-defined TLS Contexts are used **only** for SIP over TLS (SIPS). This enables you to use different TLS certificates for your IP Groups (SIP entities). This is done by assigning a specific TLS Context to the Proxy Set and/or SIP Interface associated with the IP Group. Each TLS Context can be configured with the following:

- Context ID and name
- TLS version SSL 2.0 (only for TLS handshake), SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2)
- Encryption ciphers for server and client DES, RC4 compatible, Advanced Encryption Standard (AES)
- Online Certificate Status Protocol (OCSP). Some Public-Key Infrastructures (PKI) can revoke a certificate after it has been issued. You can configure the device to check whether a peer's certificate has been revoked, using the OCSP. When OCSP is enabled, the device queries the OCSP server for revocation information whenever a peer certificate is received (IPSec, TLS client mode, or TLS server mode with mutual authentication).
- Private key externally created and then uploaded to device
- X.509 certificates self-signed certificates or signed as a result of a certificate signing request (CSR)
- Trusted root certificate authority (CA) store (for validating certificates)

When the device establishes a TLS connection (handshake) with a SIP user agent (UA), the TLS Context is determined as follows:

Incoming calls:

- Proxy Set: If the incoming call is successfully classified to an IP Group based on Proxy Set (i.e., IP address of calling party) and the Proxy Set is configured for TLS ('Transport Type' parameter is set to **TLS**), the TLS Context assigned to the Proxy Set is used. For configuring Proxy Sets, see Configuring Proxy Sets on page 284.
- 2. SIP Interface: If the Proxy Set is either not configured for TLS (i.e., the 'Transport Type' parameter is set to UDP) or not assigned a TLS Context, and/or classification to a Proxy Set fails, the device uses the TLS Context assigned to the SIP Interface used for the call. For configuring SIP Interfaces, see Configuring SIP Interfaces on page 270.
- Default TLS Context (ID 0): If the SIP Interface is not assigned a TLS Context or no SIP Interface is used for the call, the device uses the default TLS Context.

Outgoing calls:

- Proxy Set: If the outgoing call is sent to an IP Group associated with a Proxy Set that is assigned a TLS Context and the Proxy Set is configured for TLS (i.e., 'Transport Type' parameter is set to TLS), the TLS Context is used. If the 'Transport Type' parameter is set to UDP, the device uses UDP to communicate with the proxy and no TLS Context is used.
- 2. SIP Interface: If the Proxy Set is not assigned a TLS Context, the device uses the TLS Context assigned to the SIP Interface used for the call.
- Default TLS Context (ID 0): If the SIP Interface is not assigned a TLS Context or no SIP Interface is used for the call, the device uses the default TLS Context.

Notes:

- If the TLS Context used for an existing TLS connection is changed during the call by the user agent, the device ends the connection.
- The device does not query OCSP for its own certificate.
- Some PKIs do not support OCSP, but generate Certificate Revocation Lists (CRLs). For such scenarios, set up an OCSP server such as OCSPD.

TLS Context certification also enables employing different levels of security strength (key size) per certificate. This feature also enables the display of the list of all trusted certificates currently installed on the device. For each certificate, detailed information such as issuer and expiration date is shown. Certificates can be deleted or added from/to the Trusted Root Certificate Store.

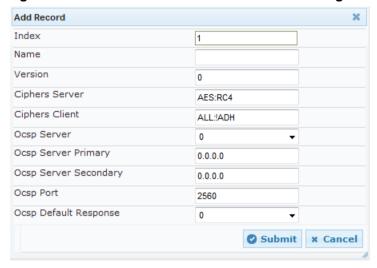

You can also configure TLS certificate expiry check, whereby the device periodically checks the validation date of the installed TLS server certificates and sends an SNMP trap event if a certificate is nearing expiry. This feature is configured globally for all TLS Contexts. For configuring TLS certificate expiry check, see 'Configuring TLS Server Certificate Expiry Check' on page 118.

The following procedure describes how to configure a TLS Context in the Web interface. You can also configure this using the table ini file parameter, TLSContexts or CLI command, configure system > tls <ID>.

To configure a TLS Context:

- 1. Open the TLS Contexts page (Configuration tab > System menu > TLS Contexts).
- 2. Click **Add**; the following dialog box appears:

Figure 11-1: TLS Contexts Table - Add Record Dialog Box

- 3. Configure the TLS Context according to the parameters described in the table below.
- 4. Click Submit, and then save ("burn") your settings to flash memory.

TLS Context Parameter Descriptions

Parameter	Description
Web: Index CLI: tls <id> [TLSContexts_Index]</id>	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.
Web: Name CLI: name [TLSContexts_Name]	Defines an arbitrary name to easily identify the TLS Context. The valid value is a string of up to 31 characters.
Web: Version CLI: tls-version [TLSContexts_TLSVersion]	 Defines the supported SSL/TLS protocol version. [0] 0 = (Default) SSL 3.0 and all TLS versions (1.0, 1.1, and 1.2) are supported. SSL/TLS handshakes always start with an SSL 2.0-compatible handshake and then switch to the highest TLS version supported by both peers. [1] 1 = Only TLS 1.0 is used. Clients attempting to contact the device using any other version are rejected.

Parameter	Description
Web: Ciphers Server CLI: ciphers-server	Defines the supported cipher suite for the TLS server (in OpenSSL cipher list format).
[TLSContexts_ServerCipherStrin g]	For valid values, refer to URL http://www.openssl.org/docs/apps/ciphers.html. The default is "AES:RC4".
	For example, use "ALL" for all ciphers suites (e.g., for ARIA encryption for TLS). The only ciphers available are RC4 and DES, and the cipher bit strength is limited to 56 bits.
	Notes:
	 If the installed Software License Key includes the Strong Encryption feature, the default of this parameter is changed to RC4:EXP, enabling RC-128-bit encryption. The value "ALL" can be used only if the installed Software License Key includes the Strong Encryption feature.
Web: Ciphers Client CLI: ciphers-client [TLSContexts_ClientCipherStrin	Defines the supported cipher suite for TLS clients. The valid value is up to 255 strings (e.g., "EXP"). The default is "ALL:!ADH".
9]	For possible values and additional details, refer to http://www.openssl.org/docs/apps/ciphers.html.
Web: Ocsp Server CLI: ocsp-server [TLSContexts_OcspEnable]	Enables or disables certificate checking using OCSP.[0] Disable (default)[1] Enable
Web: Ocsp Server Primary CLI: ocsp-server-primary	Defines the IP address (in dotted-decimal notation) of the primary OCSP server.
[TLSContexts_OcspServerPrima ry]	The default IP address is 0.0.0.0.
Web: Ocsp Server Secondary CLI: ocsp-server-secondary	Defines the IP address (in dotted-decimal notation) of the secondary OCSP server (optional).
[TLSContexts_OcspServerSecon dary]	The default IP address is 0.0.0.0.
Web: Ocsp Port	Defines the OCSP server's TCP port number.
CLI: ocsp-port [TLSContexts_OcspServerPort]	The default port number is 2560.
Web: Ocsp Default Response CLI: ocsp-default-response	Determines whether the device allows or rejects peer certificates if it cannot connect to the OCSP server.
[TLSContexts_OcspDefaultResponse]	• [0] Reject (default)
	• [1] Allow

11.1.2 Assigning CSR-based Certificates to TLS Contexts

The following procedure describes how to request a digitally signed certificate from a Certification Authority (CA) for a TLS Context. This process is referred to as a certificate signing request (CSR) and is required if your organization employs a Public Key Infrastructure (PKI) system. The CSR contains information identifying the device (such as a distinguished name in the case of an X.509 certificate).

> To assign a CSR-based certificate to a TLS Context:

- 1. Your network administrator should allocate a unique DNS name for the device (e.g., dns_name.corp.customer.com). This DNS name is used to access the device and therefore, must be listed in the server certificate.
- Open the TLS Contexts page (Configuration tab > System menu > TLS Contexts).
- 3. In the TLS Contexts table, select the required TLS Context index row, and then click the **Context Certificates** button, located at the bottom of the TLS Contexts page; the Context Certificates page appears.
- 4. Under the **Certificate Signing Request** group, do the following:
 - a. In the 'Subject Name [CN]' field, enter the DNS name.
 - Fill in the rest of the request fields according to your security provider's instructions
 - c. Click the Create CSR button; a textual certificate signing request is displayed in the area below the button:

▼ Certificate Signing Request Subject Name [CN] audio.com Organizational Unit [OU] (optional) Headquarters Company name [O] (optional) Corporate Locality or city name [L] (optional) Poughkeepsie New York State [ST] (optional) Country code [C] (optional) US Create CSR After creating the CSR, copy the text below (including the BEGIN/END lines) and send it to your Certification Authority for signing. -----BEGIN CERTIFICATE REQUEST-----MIIBtjCCAR8CAQAwdjESMBAGA1UEAxMJYXVkaW8uY29tMRUwEwYDVQQLEwxIZWFk eXVhenRlenMxEjAOBqNVBAoTCUNvenBvemF0ZTEVMBMGA1UEBxMMUG9122hrZWVW c211MREwDwYDVQQIEwhOZXcgWW9yazELMAkGA1UEBhMCVVMwgZ8wDQYJKoZIhvcN AQEBBQADgYOAMIGJAoGBAPHpf2t4OLy3FRk5Bw7Fl2FWCXQ7nvuocHtu7Nns071M xL7of8YoL63eeIK2eDo8nm6rJ0677z/AHWJmF65pAK1CbOIPgoZNS0g6+5JAmJAA llNUnoqjEsK7CF52uvolH//gFkhy5zleNvObI+25Pn38aJzEXc8DkGwZ19rROqRZ ${\tt AgMBAAGgADANBgkqhkiG9w0BAQQFAAOBgQDihdqbc1zkHdLFr+5BRuScKygUXBM6}$ q7FGjFXAfZk1MmgnBMc/MYfSGTbawrQF7p6dNJ60DivmuCPf6Gzz5m2uqC6LqoIi nLnQpVCmbdva/B1QyEpPbQhZqpULJ8CSeSrrY3ru23AZeDUbYyhO90IkRbAp//+3 ZvnZZe5M5CB3Lg== ---END CERTIFICATE REQUEST----

Figure 11-2: Certificate Signing Request Group

5. Copy the text and send it to your security provider (CA) to sign this request.

6. When the CA sends you a server certificate, save the certificate to a file (e.g., cert.txt). Ensure that the file is a plain-text file containing the "BEGIN CERTIFICATE" header, as shown in the example of a Base64-Encoded X.509 Certificate below:

----BEGIN CERTIFICATE----

MIIDkzCCAnugAwIBAgIEAgAAADANBgkqhkiG9w0BAQQFADA/MQswCQYDVQQGEW

----END CERTIFICATE----

- 7. Scroll down to the **Upload certificates files from your computer** group, click the **Browse** button corresponding to the 'Send Device Certificate...' field, navigate to the cert.txt file, and then click **Send File**.
- After the certificate successfully loads to the device, save the configuration with a device reset.
- 9. Open the TLS Contexts page again, select the TLS Context index row, and then verify that under the **Certificate Information** group, the 'Private key' field displays "OK"; otherwise, consult your security administrator:

Figure 11-3: Private key "OK" in Certificate Information Group

▼ Certificate information		
Certificate subject:	/CN=ACL_3845462	
Certificate issuer:	/CN=ACL_3845462	
Time to expiration:	7261 days	
Key size:	1024 bits	
Private key:	OK	

Notes:

- The certificate replacement process can be repeated when necessary (e.g., the new certificate expires).
- It is possible to use the IP address of the device (e.g., 10.3.3.1) instead of a
 qualified DNS name in the Subject Name. This is not recommended since the IP
 address is subject to change and may not uniquely identify the device.
- The device certificate can also be loaded via the Automatic Update Facility by using the HTTPSCertFileName *ini* file parameter.

11.1.3 Assigning Externally Created Private Keys to TLS Contexts

The following procedure describes how to assign an externally created private key to a TLS Context.

- > To assign an externally created private key to a TLS Context:
- 1. Obtain a private key in either textual PEM (PKCS #7) or PFX (PKCS #12) format (typically provided by your security administrator). The file may be encrypted with a short pass-phrase.
- 2. Open the TLS Contexts page (Configuration tab > System menu > TLS Contexts).
- 3. In the TLS Contexts table, select the required TLS Context index row, and then click the Context Certificates button, located at the bottom of the TLS Contexts page; the Context Certificates page appears.

4. Scroll down to the Upload certificate files from your computer group.

Figure 11-4: Upload Certificate Files from your Computer Group

- 5. Fill in the 'Private key pass-phrase' field, if required.
- **6.** Click the **Browse** button corresponding to the 'Send Private Key' field, navigate to the private key file (Step 1), and then click **Send File**.
- If the security administrator has provided you with a device certificate file, load it using the 'Send Device Certificate' field.
- 8. After the files successfully load to the device, save the configuration with a device reset.
- Open the TLS Contexts page again, select the TLS Context index row, and then verify that under the **Certificate Information** group, the 'Private key' field displays "OK"; otherwise, consult your security administrator.

11.1.4 Generating Private Keys for TLS Contexts

The device can generate the private key for a TLS Context, as described in the procedure below.

- > To generate a new private key for a TLS Context:
- Open the TLS Contexts page (Configuration tab > System menu > TLS Contexts).
- 2. In the TLS Contexts table, select the required TLS Context index row, and then click the **Context Certificates** button, located at the bottom of the TLS Contexts page; the Context Certificates page appears.
- 3. Scroll down to the Generate new private key and self-signed certificate group:

Figure 11-5: Generate new private key and self-signed certificate Group

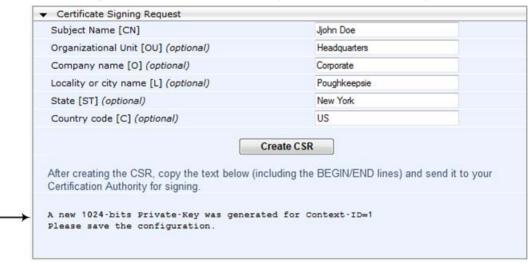

- 4. From the 'Private Key Size' drop-down list, select the desired private key size (in bits) for RSA public-key encryption for newly self-signed generated keys:
 - 512
 - 1024 (default)

- 2048
- 5. Click **Generate Private Key**; a message appears requesting you to confirm key generation.
- **6.** Click **OK** to confirm key generation; the device generates a new private key, indicated by a message in the **Certificate Signing Request** group.

Figure 11-6: Indication of Newly Generated Private Key

- Continue with the certificate configuration, by either creating a CSR or generating a new self-signed certificate.
- 8. Save the configuration with a device reset for the new certificate to take effect.

11.1.5 Creating Self-Signed Certificates for TLS Contexts

The following procedure describes how to assign a certificate that is digitally signed by the device itself to a TLS Context. In other words, the device acts as a CA.

- > To assign a self-signed certificate to a TLS Context:
- 1. Before you begin, make sure that:
 - You have a unique DNS name for the device (e.g., dns_name.corp.customer.com). This name is used to access the device and therefore, must be listed in the server certificate.
 - No traffic is running on the device. The certificate generation process is disruptive to traffic and should be done during maintenance time.
- 2. Open the TLS Contexts page (**Configuration** tab > **System** menu > **TLS Contexts**).
- 3. In the TLS Contexts table, select the required TLS Context index row, and then click the **Context Certificates** button, located at the bottom of the TLS Contexts page; the Context Certificates page appears.
- **4.** Under the **Certificate Signing Request** group, in the 'Subject Name [CN]' field, enter the fully-qualified DNS name (FQDN) as the certificate subject.

5. Scroll down the page to the **Generate new private key and self-signed certificate** group:

Figure 11-7: Generate new private key and self-signed certificate Group

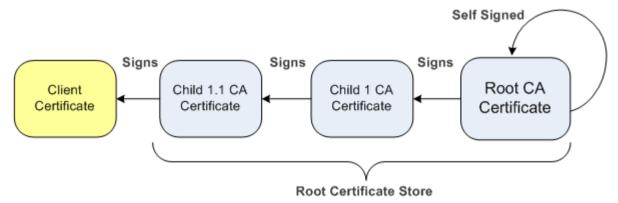

- Click Generate Self-Signed Certificate; a message appears (after a few seconds) displaying the new subject name.
- 7. Save the configuration with a device reset for the new certificate to take effect.

11.1.6 Importing Certificates and Certificate Chain into Trusted Certificate Store

The device provides its own Trusted Root Certificate Store. This lets you manage certificate trust. You can add up to 20 certificates to the store per TLS Context (but this may be less depending on certificate file size).

The trusted store can also be used for certificate chains. A certificate chain is a sequence of certificates where each certificate in the chain is signed by the subsequent certificate. The last certificate in the list of certificates is the Root CA certificate, which is self-signed. The purpose of a certificate chain is to establish a chain of trust from a child certificate to the trusted root CA certificate. The CA vouches for the identity of the child certificate by signing it. A client certificate is considered trusted if one of the CA certificates up the certificate chain is found in the server certificate directory.

Figure 11-8: Certificate Chain Hierarchy

For the device to trust a whole chain of certificates per TLS Context, you need to add them to the device's Trusted Certificates Store, as described below.

- To import certificates into device's Trusted Root Certificate Store:
- 1. Open the TLS Contexts page (Configuration tab > System menu > TLS Contexts).
- 2. In the TLS Contexts table, select the required TLS Context index row, and then click the **Context Trusted-Roots** button, located at the bottom of the TLS Contexts page; the Trusted Certificates page appears.

Version 6.8 115 Mediant 3000

3. Click the **Import** button, and then select the certificate file to load.

Figure 11-9: Importing Certificate into Trusted Certificates Store

Click OK; the certificate is loaded to the device and listed in the Trusted Certificates store.

You can also do the following with certificates that are in the Trusted Certificates store:

- Delete certificates: Select the required certificate, click Remove, and then in the Remove Certificate dialog box, click Remove.
- Save certificates to a file on your PC: Select the required certificate, click **Export**, and then in the Export Certificate dialog box, browse to the folder on your PC where you want to save the file and click **Export**.

11.1.7 Configuring Mutual TLS Authentication

11.1.7.1 TLS for SIP Clients

When Secure SIP (SIPS) is implemented using TLS, it is sometimes required to use two-way (mutual) authentication between the device and a SIP user agent (client). When the device acts as the TLS server in a specific connection, the device demands the authentication of the SIP client's certificate. Both the device and the client use certificates from a CA to authenticate each other, sending their X.509 certificates to one another during the TLS handshake. Once the sender is verified, the receiver sends its' certificate to the sender for verification. SIP signaling starts when authentication of both sides completes successfully.

TLS mutual authentication can be configured for specific calls by enabling mutual authentication on the SIP Interface used by the call. The TLS Context associated with the SIP Interface or Proxy Set belonging to these calls are used.

Note: SIP mutual authentication can also be configured globally for all calls, using the 'TLS Mutual Authentication' parameter (SIPSRequireClientCertificate) in the General Security Settings page (**Configuration** tab > **VoIP** menu > **Security** > **General Security Settings**).

To configure mutual TLS authentication for SIP messaging:

- 1. Enable two-way authentication on the specific SIP Interface:
 - a. In the SIP Interface Table page (see Configuring SIP Interfaces on page 270), set the 'TLS Mutual Authentication' parameter to **Enable** for the specific SIP Interface
 - **b.** Click **Submit**, and then reset the device with a burn-to-flash for your settings to take effect.

- Configure a TLS Context with the following certificates:
 - Import the certificate of the CA that signed the certificate of the SIP client, into the Trusted Root Store so that the device can authenticate the client (see 'Importing Certificates and Certificate Chain into Trusted Certificate Store' on page 115).
 - Make sure that the TLS certificate is signed by a CA that the SIP client trusts so that the client can authenticate the device.

11.1.7.2 TLS for Remote Device Management

By default, servers using TLS provide one-way authentication. The client is certain that the identity of the server is authentic. When an organizational PKI is used, two-way authentication may be desired - both client and server should be authenticated using X.509 certificates. This is achieved by installing a client certificate on the management PC and loading the root CA's certificate to the device's Trusted Root Certificate Store. The Trusted Root Certificate file may contain more than one CA certificate combined, using a text editor.

> To enable mutual TLS authentication for HTTPS:

- 1. Set the 'Secured Web Connection (HTTPS)' field to **HTTPS Only** in the Web Security Settings page (see Configuring Web Security Settings on page 76) to ensure you have a method for accessing the device in case the client certificate does not work. Restore the previous setting after testing the configuration.
- 2. Open the TLS Contexts page (Configuration tab > System menu > TLS Contexts).
- 3. In the TLS Contexts table, select the required TLS Context index row, and then click the **Context Trusted-Roots** button, located at the bottom of the TLS Contexts page; the Trusted Certificates page appears.
- 4. Click the **Import** button, and then select the certificate file.
- **5.** When the operation is complete, set the 'Requires Client Certificates for HTTPS connection' field to **Enable** in the Web Security Settings page.
- **6.** Save the configuration with a device reset (see Saving Configuration).

When a user connects to the secured Web interface of the device:

- If the user has a client certificate from a CA that is listed in the Trusted Root Certificate file, the connection is accepted and the user is prompted for the system password.
- If both the CA certificate and the client certificate appear in the Trusted Root Certificate file, the user is not prompted for a password (thus, providing a single-sign-on experience the authentication is performed using the X.509 digital signature).
- If the user does not have a client certificate from a listed CA or does not have a client certificate, the connection is rejected.

Notes:

- The process of installing a client certificate on your PC is beyond the scope of this document. For more information, refer to your operating system documentation, and/or consult your security administrator.
- The root certificate can also be loaded via the Automatic Update facility, using the HTTPSRootFileName *ini* file parameter.
- You can enable the device to check whether a peer's certificate has been revoked by an OCSP server, per TLS Context (see 'Configuring TLS Certificate Contexts' on page 107).

11.1.8 Configuring TLS Server Certificate Expiry Check

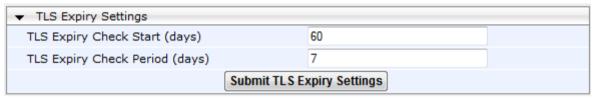

You can also configure the TLS Server Certificate Expiry Check feature, whereby the device periodically checks the validation date of the installed TLS server certificates. You can also configure the device to send a notification SNMP trap event (acCertificateExpiryNotification) at a user-defined number of days before the installed TLS server certificate is to expire. This trap event indicates the TLS Context to which the certificate belongs.

Note: TLS certificate expiry check is configured globally for all TLS Contexts.

- To configure TLS certificate expiry checks and notification:
- Open the TLS Contexts page (Configuration tab > System menu > TLS Contexts).
- Scroll down the page to the TLS Expiry Settings group:

Figure 11-10: TLS Expiry Settings Group

- 3. In the 'TLS Expiry Check Start' field, enter the number of days before the installed TLS server certificate is to expire at which time the device sends an SNMP trap event to notify of this.
- 4. In the 'TLS Expiry Check Period' field, enter the periodical interval (in days) for checking the TLS server certificate expiry date. By default, the device checks the certificate every 7 days.
- 5. Click the **Submit TLS Expiry Settings** button.

User's Manual 12. Date and Time

12 Date and Time

The date and time of the device can be configured manually or it can be obtained automatically from a Simple Network Time Protocol (SNTP) server.

12.1 Configuring Date and Time Manually

You can manually configure the date and time of the device (instead of using an NTP server), as described in the procedure below. You can also configure the following with your manually configured date and time:

- UTC time offset (e.g., GMT +1). To configure the offset, use the 'NTP UTC Offset' (NTPServerUTCOffset) parameter (see 'Configuring Automatic Date and Time using SNTP' on page 119)
- Daylight Saving Time (DST) see 'Configuring Daylight Saving Time' on page 121
- > To manually configure the device's date and time, using the Web interface:
- Open the Regional Settings page (Configuration tab > System menu > Regional Settings).

Figure 12-1: Regional Settings Page

- Enter the current date and time of the geographical location in which the device is installed
- Click Submit.

Notes:

- If the device is configured to obtain the date and time from an SNTP server, the fields on this page are read-only, displaying the received date and time.
- After performing a hardware reset, the date and time are returned to their defaults and thus, should be updated.

12.2 Configuring Automatic Date and Time using SNTP

The device's Simple Network Time Protocol (SNTP) client functionality generates requests and reacts to the resulting responses using the NTP Version 3 protocol definitions (according to RFC 1305). Through these requests and responses, the device, as an NTP client, synchronizes the system time to a time source within the network, thereby eliminating any potential issues should the local system clock 'drift' during operation. The NTP client follows a simple process in managing system time: the NTP client requests an NTP update, receives an NTP response, and then updates the local system clock based on an NTP server within the network. The client requests a time update from the user-defined NTP server (IP address or FQDN) at a user-defined update interval. Typically, this update interval is every 24 hours based on when the system was restarted.

You can also configure a time offset for the time received from the NTP server, according to your region. For example, Germany Berlin region is UTC/GMT +1 hours and therefore, you would configure the offset to "1". For USA New York, the UTC/GMT offset is -5 hours and therefore, the offset is a minus value and configured as "-5". To configure Daylight Saving Time (DST), see 'Configuring Daylight Saving Time' on page 121.

You can also configure the device to authenticate and validate the NTP messages received from the NTP server. Authentication is done using an authentication key with the MD5 cryptographic hash algorithm. When this feature is enabled, the device ignores NTP messages received without authentication.

The following procedure describes how to configure SNTP. For detailed descriptions of the configuration parameters, see NTP and Daylight Saving Time Parameters on page 712.

> To configure SNTP using the Web interface:

- Open the Application Settings page (Configuration tab > System menu > Application Settings).
- Scroll down to the 'NTP Settings' group:

Figure 12-2: SNTP Configuration in Application Settings Page

- Configure the NTP server address:
 - In the 'NTP Server Address' (NTPServerIP) field, configure the primary NTP server's address (IP or FQDN).
 - In the 'NTP Secondary Server Address' (NTPSecondaryServerIP) field, configure the secondary NTP server.
- 4. In the 'NTP UTC Offset' (NTPServerUTCOffset) field, configure the time offset in relation to the UTC. For example, if your region is GMT +1 (an hour ahead), enter "1".
- 5. In the 'NTP Updated Interval' (NTPUpdateInterval) field, configure the period after which the date and time of the device is updated.
- 6. Configure NTP message authentication:
 - In the 'NTP Authentication Key Identifier' field, configure the NTP authentication key identifier.
 - In the 'NTP Authentication Secret Key' field, configure the secret authentication key shared between the device and the NTP server.
- 7. Verify that the device has received the correct date and time from the NTP server. You can do this by viewing the date and time in the Regional Settings page (see 'Configuring Date and Time Manually' on page 119).

User's Manual 12. Date and Time

12.3 Configuring Daylight Saving Time

You can apply daylight saving time (DST) to the date and time of the device. DST defines a date range in the year (summer) where the time is brought forward so that people can experience more daylight. DST applies an offset of up to 60 minutes (default) to the local time. For example, Germany Berlin has DST from 30 March to 26 October, where the time is brought forward by an hour (e.g., 02:00 to 03:00 on 30 March). Therefore, you would configure the DST offset to 60 minutes (one hour).

- To configure DST using the Web interface:
- 1. Open the Application Settings page (Configuration tab > System menu > Application Settings).
- 2. Scroll down to the 'Day Light Saving Time' group:

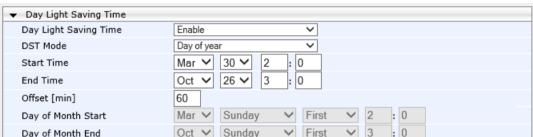

Figure 12-3: Configuring DST

- 3. From the 'Day Light Saving Time' (DayLightSavingTimeEnable) drop-down list, select **Enable**.
- **4.** From the 'DST Mode' drop-down list, select the range type for configuring the start and end dates for DST:
 - Day of year: The range is configured by exact date (day number of month), for
 example, from March 30 to October 30. If 'DST Mode' is set to Day of year, in the
 'Start Time' (DayLightSavingTimeStart) and 'End Time' (DayLightSavingTimeEnd)
 drop-down lists, configure the period for which DST is relevant.
 - Day of month: The range is configured by month and day type, for example, from the last Sunday of March to the last Sunday of October. If 'DST Mode' is set to Day of month, in the 'Day of Month Start' and 'Day of Month End' drop-down lists, configure the period for which DST is relevant.
- 5. In the 'Offset' (DayLightSavingTimeOffset) field, configure the DST offset in minutes.
- 6. If the current date falls within the DST period, verify that it has been successful applied to the device's current date and time. You can view the device's date and time in the Regional Settings page (see 'Configuring Date and Time Manually' on page 119).

This page is intentionally left blank.

Part IV

General VolP Configuration

13 Network

This section describes the network-related configuration.

13.1 Ethernet Interface Configuration

The device's Ethernet connection can be configured, using the *ini* file parameter EthernetPhyConfiguration, to one of the following modes:

Manual:

- 10Base-T Full-Duplex
- 100Base-TX Full-Duplex
- 1000Base-TX Full-Duplex
- Auto-Negotiation: chooses common transmission parameters such as speed and duplex mode

The Ethernet connection should be configured according to the following recommended guidelines:

- When the device's Ethernet port is configured for Auto-Negotiation, the opposite port must also operate in Auto-Negotiation. Any mismatch configuration can yield unexpected functioning of the Ethernet connection.
- When configuring the device's Ethernet port manually, the same mode (i.e., Full Duplex) and speed must be configured on the remote Ethernet port. In addition, when the device's Ethernet port is configured manually, it is invalid to set the remote port to Auto-Negotiation. Any mismatch configuration can yield unexpected functioning of the Ethernet connection.
- It's recommended to configure the port for best performance and highest bandwidth (i.e., Full Duplex with 1000Base-TX), but at the same time adhering to the guidelines listed above.

Note: For remote configuration, the device should be in the correct Ethernet setting prior to the time this parameter takes effect. When, for example, the device is configured using BootP/TFTP, the device performs many Ethernet-based transactions prior to reading the *ini* file containing this device configuration parameter. To resolve this problem, the device always uses the last Ethernet setup mode configured. In this way, if you want to configure the device to operate in a new network environment in which the current Ethernet setting of the device is invalid, you should first modify this parameter in the current network so that the new setting holds next time the device is restarted. After reconfiguration has completed, connect the device to the new network and restart it. As a result, the remote configuration process that occurs in the new network uses a valid Ethernet configuration

13.2 Ethernet Interface Redundancy

The device supports an Ethernet redundancy scheme. At the beginning of the start-up procedure, the device tests whether the 'primary' Ethernet interface is connected, by checking the existence of the Ethernet link carrier. If it's connected, the start-up procedure commences as usual. If not, the start-up application tries the 'secondary' Ethernet interface. If this interface is connected, the whole start-up procedure is performed using it. If both interfaces are not connected, the start-up procedure commences using the parameters, tables, and software residing on the device's non-volatile memory. Note that Ethernet switchover occurs only once during the start-up procedure (at the beginning). If

the Ethernet interface fails after the selection is made, the device does not switch over to the second port.

After start-up is complete and the operational software is running, the device continues to use the Ethernet port used for software upload. The device switches over from one Ethernet port to the other each time an Ethernet link carrier-loss is detected on the active Ethernet port, and if the Ethernet link of the other port is operational. Switchover occurs only once per link loss (i.e., the 'secondary' interface stays the active one even if the 'primary' interface has returned to life). After start-up, the device generates a gratuitous ARP message each time a switchover occurs.

For correct functionality of the redundancy mechanism, it's recommended to configure both links to the same mode. It is essential that both link partners (primary and secondary) have the same capabilities. This ensures that whenever a switchover occurs, the device is able to provide at least the same Ethernet services as were provided prior to the switchover. In addition, it's recommended to set the physical secondary link prior to resetting the device (since the MAC configuration cannot be changed thereafter).

Note that since the two Ethernet ports use the same MAC address, the external switches connected to the device can in some cases create a noticeable switchover delay due to their internal switching logic, though at the device level, the switchover delay is minimal (milliseconds).

13.3 Configuring IP Network Interfaces

You can configure a single VoIP network interface for all applications, including OAMP (management traffic), call control (SIP signaling messages), and media (RTP traffic), or you can configure multiple logical, IP network interfaces for these applications. You may need to logically separated network segments for these applications for administration and security. This can be achieved by employing Layer-2 VLANs and Layer-3 subnets. The figure below illustrates a typical network architecture where the device is configured with three network interfaces, each representing the OAMP, call control, and media applications. The device is connected to a VLAN-aware switch for directing traffic from and to the device to the three separated Layer-3 broadcast domains according to VLAN tags (middle pane).

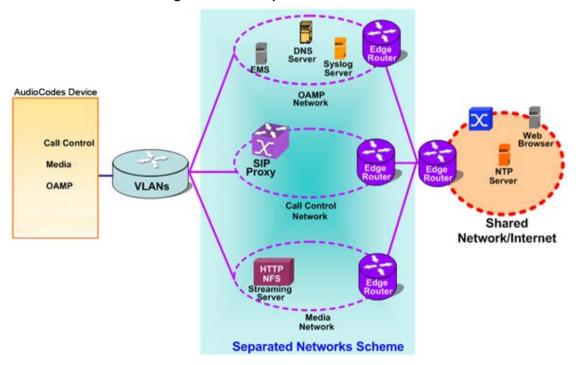

Figure 13-1: Multiple Network Interfaces

The device is shipped with a default OAMP interface. For more information, see "Default OAMP IP Address" on page 33. The Interface table lets you change this OAMP interface and configure additional network interfaces for control and media, if necessary. You can configure up to 32 interfaces, consisting of up to 31 Control and Media interfaces and 1 OAMP interface. Each IP interface is configured with the following:

- Application type allowed on the interface:
 - Control: call control signaling traffic (i.e., SIP)
 - Media: RTP traffic
 - Operations, Administration, Maintenance and Provisioning (OAMP): management (i.e., Web, CLI, and SNMP based management)
- IP address (IPv4 and IPv6) and subnet mask (prefix length)
- VLAN ID: You can enable VLAN functionality and configure a VLAN ID and the Native VLAN ID (VLAN ID to which incoming, untagged packets are assigned). You can also configure Quality of Service (QoS) by assigning VLAN priorities and Differentiated Services (DiffServ) for the supported Class of Service (CoS). For configuring Quality of Service (QoS), see "Configuring the QoS Settings" on page 137.
- Default Gateway: Traffic from this interface destined to a subnet that does not meet any of the routing rules (local or static) are forwarded to this gateway (as long as the application type is allowed on this interface).
- Primary and secondary domain name server (DNS) addresses (optional)

Complementing the Interface table is the Static Route table, which lets you configure static routing rules for non-local hosts/subnets. For more information, see "Configuring Static IP Routing" on page 134.

Notes:

- Before configuring IP interfaces, it is recommended that you read the IP interface configuration guidelines in "Interface Table Configuration Guidelines" on page 131.
- The IPv6 feature is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see Software License Key on page 575.
- When booting using BootP/DHCP protocols, the device obtains its OAMP IP
 address from the BootP/DHCP server. This address overrides the previous OAMP
 address. If you subsequently modify this OAMP address in the Interface table, it
 becomes available only after you save the configuration to the device's flash with a
 device reset.
- If you enable the Physical Network Separation feature for physical separation of network traffic, user VLANs are not supported. For more information, see Physical Network Separation Mode on page 539.

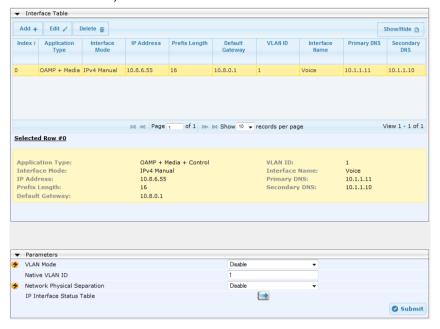

The following procedure describes how to configure the IP network interfaces in the Web interface. You can also configure IP network interfaces using the table ini file parameter, InterfaceTable.

To configure IP network interfaces:

1. Open the Interface Table page (Configuration tab > VoIP menu > Network > IP Interfaces Table).

- 2. Click **Add**; a dialog box appears.
- Configure the IP network interface according to the parameters described in the table below.
- 4. Click Submit.

To view configured network interfaces that are currently active, click the **IP Interface Status Table** button. For more information, see "Viewing Active IP Interfaces" on page 624.

Table 13-1: Interface Table Parameters Description

Parameter	Description			
Table parameters				
Index [InterfaceTable_Index]	Table index row of the interface. The range is 0 to 31.			
Web: Application Type EMS: Application Types [InterfaceTable_Applicatio nTypes]	 Defines the applications allowed on the interface. [0] OAMP = Operations, Administration, Maintenance and Provisioning (OAMP) applications (e.g., Web, Telnet, SSH, and SNMP). [1] Media = Media (i.e., RTP streams of voice). [2] Control = Call Control applications (e.g., SIP). [3] OAMP + Media = OAMP and Media applications. [4] OAMP + Control = OAMP and Call Control applications. [5] Media + Control = Media and Call Control applications. [6] OAMP + Media + Control = All application types are allowed on the interface. 			

Parameter	Description
Web: Interface Mode [InterfaceTable_InterfaceMode]	 Defines the method that the interface uses to acquire its IP address. [3] IPv6 Manual Prefix = IPv6 manual prefix IP address assignment. The IPv6 prefix (higher 64 bits) is set manually while the interface ID (the lower 64 bits) is derived from the device's MAC address. [4] IPv6 Manual = IPv6 manual IP address (128 bits) assignment. [10] IPv4 Manual = IPv4 manual IP address (32 bits) assignment.
Web/EMS: IP Address [InterfaceTable_IPAddress]	Defines the IPv4/IPv6 address, in dotted-decimal notation.
Web/EMS: Prefix Length [InterfaceTable_PrefixLeng th]	Defines the prefix length of the related IP address. This is a Classless Inter-Domain Routing (CIDR)-style representation of a dotted-decimal subnet notation. The CIDR-style representation uses a suffix indicating the number of bits which are set in the dotted-decimal format. For example, 192.168.0.0/16 is synonymous with 192.168.0.0 and subnet 255.255.0.0. This CIDR lists the number of '1' bits in the subnet mask (i.e., replaces the standard dotted-decimal representation of the subnet mask for IPv4 interfaces). For example, a subnet mask of 255.0.0.0 is represented by a prefix length of 8 (i.e., 11111111 00000000 00000000 00000000) and a subnet mask of 255.255.255.252 is represented by a prefix length of 30 (i.e., 11111111 11111111 11111111 111111100). The prefix length is a Classless Inter-Domain Routing (CIDR) style presentation of a dotted-decimal subnet notation. The CIDR-style presentation is the latest method for interpretation of IP addresses. Specifically, instead of using eight-bit address blocks, it uses the variable-length subnet masking technique to allow allocation on arbitrary-length prefixes. The prefix length for IPv4 must be set to a value from 0 to 30. The prefix length for IPv6 must be set to a value from 0 to 64.
Web/EMS: Default Gateway [InterfaceTable_Gateway]	Defines the IP address of the default gateway for the interface. When traffic is sent from this interface to an unknown destination (i.e., not in the same subnet and not defined for any static routing rule), it is forwarded to this default gateway.
Web/EMS: VLAN ID [InterfaceTable_VlanID]	Defines a VLAN ID for the interface. Incoming traffic tagged with this VLAN ID is routed to the corresponding interface. Outgoing traffic from this interface is tagged with this VLAN ID. Note: To enable VLANs, use the 'VLAN Mode' parameter.
Web/EMS: Interface Name [InterfaceTable_InterfaceN ame]	Defines a name for the interface. This name is used in various configuration tables to associate the network interface with other configuration entities such as Media Realms. It is also displayed in management interfaces (Web, CLI, and SNMP) for clarity where it has no functional use. The valid value is a string of up to 16 characters.
Web/EMS: Primary DNS [InterfaceTable_PrimaryDN SServerIPAddress]	(Optional) Defines the primary DNS server's IP address (in dotted-decimal notation), which is used for translating domain names into IP addresses for the interface. By default, no IP address is defined.

Parameter	Description		
Web/EMS: Secondary DNS [InterfaceTable_Secondary DNSServerIPAddress]	(Optional) Defines the secondary DNS server's IP address (in dotted-decimal notation), which is used for translating domain names into IP addresses for the interface.		
Con and Donorations	By default, no IP address is defined.		
General Parameters			
Web/EMS: VLAN Mode [VLANMode]	 Enables VLANs tagging (IEEE 802.1Q). [0] Disable (default) [1] Enable Notes: For this parameter to take effect, a device reset is required. To operate with multiple network interfaces, VLANs must be enabled. If this parameter is enabled, separate physical networks for Media, OAMP, and Control network types (configured with the EnableNetworkPhysicalSeparation parameter) is disabled. VLANs are available only when booting the device from flash. When booting using BootP/DHCP protocols, VLANs are disabled to allow easier maintenance access. In this scenario, multiple network interface capabilities (including IPv6) are unavailable. 		
Web/EMS: Native VLAN ID [VLANNativeVLANID]	Defines the Native VLAN ID. This is the VLAN ID to which untagged incoming traffic is assigned. Outgoing packets sent to this VLAN are sent only with a priority tag (VLAN ID = 0). When the Native VLAN ID is equal to one of the VLAN IDs listed in the Multiple Interface table (and VLANs are enabled), untagged incoming traffic is considered as incoming traffic for that interface. Outgoing traffic sent from this interface is sent with the priority tag (tagged with VLAN ID = 0). When the Native VLAN ID is different to any value in the 'VLAN ID' column in the table, untagged incoming traffic is discarded and all outgoing traffic is tagged. The default Native VLAN ID is 1. Note: If this parameter is not configured (i.e., default value is 1) and one of the interfaces has a VLAN ID set to 1, this interface is still considered the 'Native' VLAN. If you do not wish to have a 'Native' VLAN ID and want to use VLAN ID 1, set this parameter to a value other than any VLAN ID in the table.		
Network Physical Separation [EnableNetworkPhysicalSep aration]	 Enables physical separation (dedicated ports) for each network type (Media, Control, and OAMP). [0] Disable (default). [1] Enable. Notes: This parameter is applicable only to Mediant 3000 with TP-8410. For this parameter to take effect, a device reset is required. When the parameter is enabled, VLANs are not supported (i.e., VLANMode is set to 1). For a description of the Physical Network Separation feature, see Physical Network Separation Mode on page 539. 		

13.3.1 Assigning NTP Services to Application Types

You can associate the Network Time Protocol (NTP) application with the OAMP or Control application type. This is done using the EnableNTPasOAM ini file parameter.

13.3.2 Multiple Interface Table Configuration Summary and Guidelines

The Interface table configuration must adhere to the following rules:

- Subnets of different interfaces must not overlap (i.e. 10.0.0.1/8 and 10.50.10.1/24 is invalid); each interface must have its own address space.
- The prefix length replaces the dotted-decimal subnet mask presentation and **must** have a value of 0-30 for IPv4 addresses and a value of 0-64 for IPv6 addresses.
- One OAMP interface must be configured and this must be an IPv4 address. This OAMP interface can be combined with Media and Control.
- At least one Control interface **must** be configured.
- At least one Media interface **must** be configured.
- Multiple Media and/or Control interfaces can be configured with an IPv6 address.
- The network interface types can be combined:
 - Example 1:
 - One combined OAMP-Media-Control interface with an IPv4 address
 - Example 2:
 - One OAMP interface with an IPv4 address
 - One or more Control interfaces with IPv4 addresses
 - One or more Media interfaces with IPv4 interfaces
 - Example 3:
 - One OAMP with an IPv4 address
 - One combined Media-Control interface with IPv4 address
 - One combined Media-Control interface with IPv6 address
- Each network interface can be configured with a Default Gateway. The address of the Default Gateway **must** be in the same subnet as the associated interface. Additional static routing rules can be configured in the Static Route table.
- The interface name **must** be configured (mandatory) and must be unique for each interface.
- For IPv4 addresses, the 'Interface Mode' column must be set to IPv4 Manual. For IPv6 addresses, this column must be set to IPv6 Manual or IPv6 Manual Prefix.

Note: Upon device start up, the Interface table is parsed and passes comprehensive validation tests. If any errors occur during this validation phase, the device sends an error message to the Syslog server and falls back to a "safe mode", using a single interface without VLANs. Ensure that you view the Syslog messages that the device sends in system startup to see if any errors occurred.

13.3.3 Networking Configuration Examples

This section provides configuration examples of networking interfaces.

13.3.3.1 One VolP Interface for All Applications

This example describes the configuration of a single VoIP interface for all applications:

1. Interface table: Configured with a single interface for OAMP, Media and Control:

Table 13-2: Example of Single VoIP Interface in Interface Table

Index	Application Type	Interface Mode	IP Address	Prefix Length	Default Gateway	VLAN ID	Interface Name
0	OAMP, Media & Control	IPv4	192.168.85.14	16	192.168.0.1	1	myInterface

- 2. VLANS are not required and the Native VLAN ID is irrelevant. Class of Service parameters may have default values.
- 3. Static Route table: Two routes are configured for directing traffic for subnet 201.201.0.0/16 to 192.168.0.2, and all traffic for subnet 202.202.0.0/16 to 192.168.0.3:

Table 13-3: Example of Static Route Table

Destination	Prefix Length	Gateway
201.201.0.0	16	192.168.0.2
202.202.0.0	16	192.168.0.3

4. The NTP applications remain with their default application types.

13.3.3.2 VoIP Interface per Application Type

This example describes the configuration of three VoIP interfaces; one for each application type:

 Interface table: Configured with three interfaces, each for a different application type, i.e., one for OAMP, one for Call Control, and one for RTP Media, and each with a different VLAN ID and default gateway:

Table 13-4: Example of VoIP Interfaces per Application Type in Interface Table

Index	Application Type	Interface Mode	IP Address	Prefix Length	Default Gateway	VLAN ID	Interface Name
0	OAMP	IPv4 Manual	192.168.85.14	16	0.0.0.0	1	ManagementIF
1	Control	IPv4 Manual	200.200.85.14	24	200.200.85.1	200	myControlIF
2	Media	IPv4 Manual	211.211.85.14	24	211.211.85.1	211	myMedialF

2. VLANs are required and the Native VLAN ID is the same VLAN ID as the Management interface (configured for Index 0):

- 'VLAN Mode' is set to Enable.
- 'Native VLAN ID' field is set to "1".
- 3. Static Route table: A routing rule is required to allow remote management from a host in 176.85.49.0 / 24:

Table 13-5: Example Static Route Table

Destination	Prefix Length	Gateway
176.85.49.0	24	192.168.0.1

4. All other parameters are set to their respective default values. The NTP application remains with its default application types.

13.3.3.3 VoIP Interfaces for Combined Application Types

This example describes the configuration of multiple interfaces for the following applications:

- One interface for the OAMP application.
- Interfaces for Call Control and Media applications, where two of them are IPv4 interfaces and one is an IPv6 interface.
- 1. Interface table:

Table 13-6: Example of VoIP Interfaces of Combined Application Types in Interface Table

Index	Application Type	Interface Mode	IP Address	Prefix Length	Default Gateway	VLAN ID	Interface Name
0	OAMP	IPv4 Manual	192.168.85.14	16	192.168.0.1	1	Mgmt
1	Media & Control	IPv4 Manual	200.200.85.14	24	200.200.85.1	201	MediaCntrl1
2	Media & Control	IPv4 Manual	200.200.86.14	24	200.200.86.1	202	MediaCntrl2
3	Media & Control	IPv6 Manual	2000::1:200:200:86:14	64	::	202	V6CntrlMedia2

- 2. VLANs are required and the Native VLAN ID is the same VLAN ID as the Management interface (index 0):
 - 'VLAN Mode' is set to Enable.
 - 'Native VLAN ID' field is set to "1".
- 3. Static Route table: A routing rule is required to allow remote management from a host in 176.85.49.0/24:

Table 13-7: Example of Static Route Table

Destination	Prefix Length	Gateway
176.85.49.0	24	192.168.0.10

4. The NTP application is configured (using the ini file) to serve as OAMP applications: EnableNTPasOAM = 1

13.3.3.4 VolP Interfaces with Multiple Default Gateways

Below is a configuration example using default gateways per IP network interface. In this example, the default gateway 200.200.85.1 is available for applications allowed on Interface #1, whereas outgoing management traffic (originating on Interface #0) is never directed to this default gateway.

Table 13-8: Configured Default Gateway Example

Index	Application Type	Interface Mode	IP Address	Prefix Length	Default Gateway	VLAN ID	Interface Name
0	OAMP	IPv4 Manual	192.168.085.214	16	0.0.0.0	100	Mgmt
1	Media & Control	IPv4 Manual	200.200.85.14	24	200.200.85.1	200	CntrlMedia

A separate Static Route table lets you configure static routing rules. Configuring the following static routing rules enables OAMP applications to access peers on subnet 17.17.0.0 through the gateway 192.168.0.1.

Table 13-9: Separate Static Route Table Example

Destination	Prefix Length	Gateway	Interface Name
17.17.0.0	16	192.168.0.1	Mgmt

13.4 Configuring Static IP Routes

The Static Route table lets you configure up to 30 static IP routing rules. Using static routes lets you communicate with LAN networks that are not located behind the Default Gateway specified for the IP network interface, configured in the Interface table, from which the packets are sent.

Before sending an IP packet, the device searches the Static Route table for an entry that matches the requested destination host/network. If an entry is found, the device sends the packet to the gateway that is configured for the static route. If no explicit entry is found, the packet is sent to the Default Gateway configured for the IP network interface.

You can view the status of the configured static routes in the IP Routing Status Table page. This page can be accessed by clicking the **Static Route Status Table** button, located at the bottom of the Static Route table page, or it can be accessed from the Navigation tree under the **Status & Diagnostics** tab (see "Viewing Static Routes Status" on page 624).

The following procedure describes how to configure static routes in the Web interface. You can also configure this using the table ini file parameter, StaticRouteTable.

To configure a static IP route:

- Open the Static Route Table page (Configuration tab > VolP menu > Network > Static Route Table).
- Click Add; the following dialog box appears:

- 3. Configure a static route according to the parameters described in the table below.
- **4.** Click **Submit**, and then reset the device with a burn-to-flash for your settings to take effect.

Note: You can delete only static routing rules that are inactive.

Static Route Table Parameter Descriptions

Parameter	Description		
Index [StaticRouteTable_Index]	Defines an index number for the new table record. The valid value is 0 to 29. Note: Each table row must be configured with a unique index.		
Interface Name [StaticRouteTable_InterfaceN ame]	Assigns an IP network interface through which the static route's Gateway is reached. This value must be identical to the value configured for the network interface in the 'Interface Name' parameter of the Interface table (see Configuring IP Network Interfaces on page 126).		
Destination CLI: destination [StaticRouteTable_Destination]	Defines the IP address of the destination host/network. The destination can be a single host or a whole subnet, depending on the prefix length configured for this routing rule.		
Prefix Length CLI: prefix-length [StaticRouteTable_PrefixLength]	Defines the Classless Inter-Domain Routing (CIDR)-style representation of a dotted-decimal subnet notation of the destination host/network. The CIDR-style representation uses a suffix indicating the number of bits that are set in the dotted-decimal format. For example, the value 16 represents subnet 255.255.0.0. The value must be 0 to 31 for IPv4 interfaces and a value of 0 to 64 for IPv6 interfaces.		
The address of the host/network you want to reach is determined by an AND operation that is applied to the fields 'Destination' and 'Prefix Length'. For example, to reach the network 10.8.x.x, enter 10.8.0.0 in the 'Destination' field and 16 in the 'Prefix Length'. As a result of the AND operation, the value of the last two octets in the 'Destination' field is ignored. To reach a specific host, enter its IP address in the 'Destination' field and 32 in the 'Prefix Length' field.			
Gateway CLI: gateway	Defines the IP address of the Gateway (next hop) used for traffic destined to the subnet/host defined in the 'Destination' / 'Prefix		

Parameter	Description
[StaticRouteTable_Gateway]	Length' field. Notes:
	 The Gateway's address must be in the same subnet as the IP address of the network interface that is associated with the static route (using the 'Interface Name' parameter - see above). The IP network interface associated with the static route must be of the same IP address family (IPv4 or IPv6).
Description CLI: description [StaticRouteTable_Description]	Defines an arbitrary name to easily identify the static route rule. The valid value is a string of up to 20 characters.

13.4.1 Configuration Example of Static IP Routes

An example of the use for static routes is shown in the figure below. In the example scenario, the device needs to communicate with a softswitch at IP address 10.1.1.10. However, the IP network interface from which packets destined for 10.1.1.10 is sent, is configured to send the packets to a Default Gateway at 10.15.0.1. Therefore, the packets do not reach the softswitch. To resolve this problem, a static route is configured to specify the correct gateway (10.15.7.22) in order to reach the softswitch.

Note the following configuration:

- The static route is configured with a subnet mask of 24 (255.255.255.0), enabling the device to use the static route to send all packets destined for 10.1.1.x to this gateway and therefore, to the network in which the softswitch resides.
- The static route in the Static Route table is associated with the IP network interface in the Interface table, using the 'Interface Name' parameter.
- The static route's Gateway address in the Static Route table is in the same subnet as the IP address of the IP network interface in the Interface table.

Figure 13-2: Example of using Static Route

No Static Route:

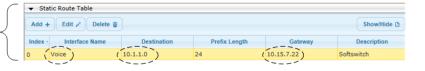

The device sends packets to 10.15.0.1, which is the <u>Default Gateway</u> defined for this IP network interface in the Interface table. Therefore, the device will not succeed in reaching the softswitch.

Static Route Configured:

A static route with the correct gateway is needed for routing to the softswitch. The device communicates with the softswitch (10.1.1.0/24) using the gateway 10.15.7.22.

Note: The device first searches for a matching route in the Static Route table. If not found, it uses the default gateway defined in the Interface table.

13.4.2 Troubleshooting the Routing Table

When adding a new static route to the Static Route table, the added rule passes a validation test. If errors are found, the static route is rejected and not added to the table. Failed static route validations may result in limited connectivity (or no connectivity) to the destinations specified in the incorrect static route. For any error found in the Static Route table or failure to configure a static route, the device sends a notification message to the Syslog server reporting the problem.

Common static routing configuration errors may include the following:

- The IP address specified in the 'Gateway' field is unreachable from the IP network interface associated with the static route.
- The same destination is configured in two different static routes.
- More than 30 static routes have been configured.

Note: If a static route is required to access OAMP applications (for remote management, for example) and the route is not configured correctly, the route is not added and the device is not accessible remotely. To restore connectivity, the device must be accessed locally from the OAMP subnet and the required routes be configured.

13.5 Configuring Quality of Service

The QoS Settings page lets you configure Layer-2 and Layer-3 Quality of Service (QoS). Differentiated Services (DiffServ) is an architecture providing different types or levels of service for IP traffic. DiffServ (according to RFC 2474), prioritizes certain traffic types based on priority, accomplishing a higher-level QoS at the expense of other traffic types. By prioritizing packets, DiffServ routers can minimize transmission delays for time-sensitive packets such as VoIP packets.

You can assign different VLAN priorities (IEEE 802.1p) and DiffServ to the following class of services (CoS):

- Network network control traffic (ICMP, ARP)
- Media Premium RTP packets sent to the LAN
- Control Premium control protocol (SIP) packets sent to the LAN
- Gold HTTP streaming packets sent to the LAN
- Bronze OAMP packets sent to the LAN

The Layer-3 QoS parameters define the values of the DiffServ field in the IP header of the frames related to a specific service class. The Layer-2 QoS parameters define the values for the 3 priority bits in the VLAN tag to a specific service class (according to the IEEE 802.1p standard).

The mapping of an application to its CoS and traffic type is shown in the table below:

Table 13-10: Traffic/Network Types and Priority

Application	Traffic / Network Types	Class-of-Service (Priority)
Debugging interface	Management	Bronze
Telnet	Management	Bronze
DHCP	Management	Network
Web server (HTTP)	Management	Bronze

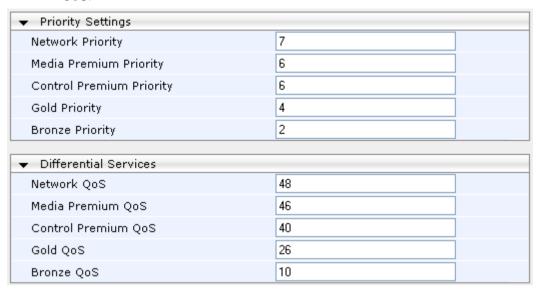

Application	Traffic / Network Types	Class-of-Service (Priority)
SNMP GET/SET	Management	Bronze
Web server (HTTPS)	Management	Bronze
IPSec IKE	Determined by the service	Determined by the service
RTP traffic	Media	Premium media
RTCP traffic	Media	Premium media
T.38 traffic	Media	Premium media
SIP	Control	Premium control
SIP over TLS (SIPS)	Control	Premium control
Syslog	Management	Bronze
ICMP	Management	Determined by the initiator of the request
ARP listener	Determined by the initiator of the request	Network
SNMP Traps	Management	Bronze
DNS client	Varies according to DNS settings: OAMP Control	Depends on traffic type: Control: Premium Control Management: Bronze
NTP	Varies according to the interface type associated with NTP (see "Assigning NTP Services to Application Types" on page 131): OAMP Control	Depends on traffic type: Control: Premium control Management: Bronze
NFS	NFSServers_VlanType in the NFSServers table	Gold

> To configure QoS:

 Open the QoS Settings page (Configuration tab > VolP menu > Network > QoS Settings).

- Under the Priority Settings group, configure the VLAN priorities (Layer-2 QoS) per CoS.
- 3. Under the Differentiated Services group, configure DiffServ (Layer-3 QoS) values per CoS.

13.6 Configuring ICMP Messages

Internet Control Message Protocol (ICMP) is one of the core protocols of the Internet Protocol suite. It is used by network devices such as routers to send error messages indicating, for example, that a requested service is unavailable.

You can configure the device to handle ICMP messages as follows:

- Send and receive ICMP Redirect messages.
- Send ICMP Destination Unreachable messages. The device sends this message in response to a packet that cannot be delivered to its destination for reasons other than congestion. The device sends a Destination Unreachable message upon any of the following:
 - Address unreachable
 - Port unreachable

This feature is applicable to IPv4 and IPv6 addressing schemes.

The following procedure describes how to configure ICMP messaging in the Web interface. You can also configure ICMP messaging using the ini file parameters DisableICMPUnreachable (ICMP Unreachable messages) and DisableICMPRedirects (ICMP Redirect messages).

- To configure handling of ICMP messages:
- Open the Network Settings page (Configuration tab > VolP menu > Network > Network Settings).

Figure 13-3: Configuring ICMP Messaging in Network Settings Page

- 2. To enable or disable sending and receipt of ICMP Redirect messages, use the 'Send and Receive ICMP Redirect Messages' parameter.
- **3.** To enable or disable the sending of ICMP Destination Unreachable messages, use the 'Send ICMP Unreachable Messages' parameter.
- 4. Click Submit.

13.7 DNS

You can use the device's embedded domain name server (DNS) or an external, third-party DNS to translate domain names into IP addresses. This is useful if domain names are used as the destination in call routing. The device supports the configuration of the following DNS types:

- Internal DNS table see "Configuring the Internal DNS Table" on page 140
- Internal SRV table see "Configuring the Internal SRV Table" on page 142

13.7.1 Configuring the Internal DNS Table

The Internal DNS table, similar to a DNS resolution, translates up to 20 host (domain) names into IP addresses. This functionality can be used when a domain name (FQDN) is configured as an IP destination in a routing rule. Up to four different IP addresses can be assigned to the same host name. This is typically used for alternative Tel-to-IP call routing.

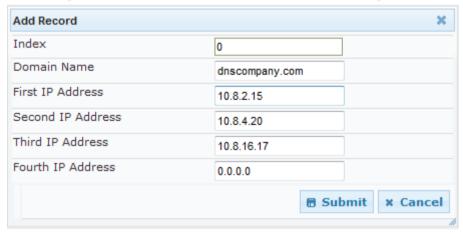

Note: The device initially attempts to resolve a domain name using the Internal DNS table. If the domain name is not configured in the table, the device performs a DNS resolution using an external DNS server for the related IP network interface (see "Configuring IP Network Interfaces" on page 126).

The following procedure describes how to configure the DNS table in the Web interface. You can also this using the table ini file parameter, DNS2IP.

> To configure the internal DNS table:

- Open the Internal DNS Table page (Configuration tab > VolP menu > Network > DNS > Internal DNS Table).
- 2. Click Add; the following dialog box appears:

Figure 13-4: Internal DNS Table - Add Record Dialog Box

- **3.** Configure the DNS rule, as required. For a description of the parameters, see the table below.
- 4. Click **Submit**; the DNS rule is added to the table.

Table 13-11: Internal DNS Table Parameter Description

Parameter	Description
Domain Name [Dns2lp_DomainName]	Defines the host name to be translated. The valid value is a string of up to 31 characters.
First IP Address [Dns2lp_FirstlpAddress]	Defines the first IP address (in dotted-decimal format notation) to which the host name is translated. The IP address can be configured as an IPv4 and/or IPv6 address.
Second IP Address [Dns2lp_SecondlpAddress]	Defines the second IP address (in dotted-decimal format notation) to which the host name is translated.
Third IP Address [Dns2lp_ThirdlpAddress]	Defines the third IP address (in dotted-decimal format notation) to which the host name is translated.
Fourth IP Address [Dns2lp_FourthlpAddress]	Defines the fourth IP address (in dotted-decimal format notation) to which the host name is translated.

13.7.2 Configuring the Internal SRV Table

The Internal SRV table resolves host names to DNS A-Records. Three different A-Records can be assigned to each host name, where each A-Record contains the host name, priority, weight, and port.

Note: If you configure the Internal SRV table, the device initially attempts to resolve a domain name using this table. If the domain is not configured in the table, the device performs a Service Record (SRV) resolution using an external DNS server, configured in the Interface table (see "Configuring IP Network Interfaces" on page 126).

The following procedure describes how to configure the Internal SRV table in the Web interface. You can also configure this using the table ini file parameter, SRV2IP.

> To configure an SRV rule:

- Open the Internal SRV Table page (Configuration tab > VolP menu > Network > DNS > Internal SRV Table).
- 2. Click **Add**; the following dialog box appears:

Figure 13-5: Internal SRV Table Page

- 3. Configure an SRV rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 13-12: Internal SRV Table Parameter Descriptions

Parameter	Description
Domain Name [Srv2lp_InternalDomain]	Defines the host name to be translated. The valid value is a string of up to 31 characters.
Transport Type [Srv2lp_TransportType]	Defines the transport type. • [0] UDP (default) • [1] TCP • [2] TLS
DNS Name (1-3) [Srv2lp_Dns1/2/3]	Defines the first, second or third DNS A-Record to which the host name is translated.
Priority (1-3) [Srv2lp_Priority1/2/3]	Defines the priority of the target host. A lower value means that it is more preferred.
Weight (1-3) [Srv2lp_Weight1/2/3]	Defines a relative weight for records with the same priority.
Port (1-3) [Srv2lp_Port1/2/3]	Defines the TCP or UDP port on which the service is to be found.

13.8 Configuring NFS Settings

Network File System (NFS) enables the device to access a remote server's shared files and directories and to handle them as if they're located locally. The device can use NFS to load *cmp*, *ini*, and auxiliary files through the Automatic Update mechanism (see Configuration using FTP or NFS).

You can configure up to 16 different NFS file systems. As a file system, the NFS is independent of machine types, operating systems and network architectures. Note that an NFS file server can share multiple file systems. There must be a separate row for each remote file system shared by the NFS file server that needs to be accessed by the device.

The following procedure describes how to configure NFS in the Web interface. You can also configure this using the table ini file parameter, NFSServers.

> To configure an NFS file systems:

- Open the Application Settings page (Configuration tab > System menu > Application Settings).
- Under the NFS Settings group, click the NFS Table button; the NFS Table page appears.

3. Click **Add**; the following dialog box appears:

Figure 13-6: NFS Table Page - Add Record

- 4. Configure the NFS parameters according to the table below.
- 5. Configure an NFS according to the parameters described in the table below.
- 6. Click Submit, and then save ("burn") your settings to flash memory. The remote NFS file system is immediately applied, which can be verified by the appearance of the "NFS mount was successful" message in the Syslog server.

Notes:

- To avoid terminating current calls, do not delete or edit a row while the device is currently accessing files on that remote NFS file system.
- The combination of 'Host Or IP' and 'Root Path' must be unique for each row in the table. For example, the table must include only one row with a Host/IP of 192.168.1.1 and Root Path of /audio.

Table 13-13: NFS Table Parameter Descriptions

Parameter	Description	
Index	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.	
Host or IP [NFSServers_HostOrIP]	The domain name or IP address of the NFS server. If a domain name is provided, a DNS server must be configured.	
Root Path [NFSServers_RootPath]	Path to the root of the remote file system in the format: /[path]. For example, '/audio'.	
NFS Version [NFSServers_NfsVersion]	NFS version used to access the remote file system. • [2] NFS Version 2 • [3] NFS Version 3 (default)	
Authentication Type [NFSServers_AuthType]	Authentication method used for accessing the remote file system. • [0] Null • [1] Unix (default)	
User ID [NFSServers_UID]	User ID used in authentication when using Unix. The valid range is 0 to 65537. The default is 0.	
Group ID [NFSServers_GID]	Group ID used in authentication when using Unix. The valid range is 0 to 65537. The default is 1.	
VLAN Type	The VLAN type for accessing the remote file system.	

User's Manual 13. Network

Parameter	Description
[NFSServers_VlanType]	 [0] OAMP [1] Media (default) Note: This parameter applies only if VLANs are enabled or if Multiple IPs is configured (see "Configuring IP Network Interfaces" on page 126).

13.9 Network Address Translation Support

Network Address Translation (NAT) is a mechanism that maps internal IP addresses (and ports) used within a private network to global IP addresses and vice versa, providing transparent routing to end hosts. The primary advantages of NAT include (1) reduction in the number of global IP addresses required in a private network (global IP addresses are only used to connect to the Internet) and (2) better network security by hiding the internal architecture.

The design of SIP creates a problem for VoIP traffic to pass through NAT. SIP uses IP addresses and port numbers in its message body. However, the NAT server is unable to modify the SIP messages and thus, can't change local addresses to global addresses.

This section discusses the device's solutions for overcoming NAT traversal issues.

13.9.1 Device Located behind NAT

Two different streams traverse through NAT - signaling and media. A device located behind a NAT that initiates a signaling path has problems receiving incoming signaling responses as they are blocked by the NAT server. Therefore, the initiating device must inform the receiving device where to send the media. To resolve this NAT problem, the following solutions are provided by the device, listed in priority of the selected method used by the device:

- a. If configured, uses an external STUN server to assign a NAT address to all interfaces
 see Configuring STUN on page 146.
- **b.** If configured, uses the single Static NAT IP address for all interfaces see "Configuring a Static NAT IP Address for All Interfaces" on page 147.
- **c.** If configured, uses the NAT Translation table which configures NAT per interface see Configuring NAT Translation per IP Interface on page 147.

If NAT is not configured by any of the above-mentioned methods, the device sends the packet according to its IP address configured in the Interface table.

Note: The priority list above is applicable only to the Gateway calls.

The figure below illustrates the NAT problem faced by the SIP networks where the device is located behind a NAT:

Enterprise LAN SIP Message: Signaling and media traverse SIP Message still has media Firewall with NAT functionality source as 192.168.61.10:8000 Media source is 192.168.61.10:8000 243.120.15.101:9020 192.168.61.10:5060 Signaling Signaling Client Media Media 192.168.61.10:8000 243.120.15.101:9000 Actual media source is now 243.120.15.101:9000

Figure 13-7: Device behind NAT and NAT Issues

13.9.1.1 Configuring STUN

Simple Traversal of UDP through NATs (STUN), based on RFC 3489 is a client / server protocol that solves most of the NAT traversal problems. The STUN server operates in the public Internet and the STUN clients are embedded in end-devices located behind NAT. STUN is used for signaling and the media streams. STUN works with many existing NAT types and does not require any special behavior.

STUN enables the device to discover the presence (and types) of NATs and firewalls located between it and the public Internet. It provides the device with the capability to determine the public IP address and port allocated to it by the NAT. This information is later embedded in outgoing SIP / SDP messages and enables remote SIP user agents to reach the device. It also discovers the binding lifetime of the NAT - the refresh rate necessary to keep NAT 'pinholes' open.

On startup, the device sends a STUN Binding Request. The information received in the STUN Binding Response (IP address:port) is used for SIP signaling. This information is updated every user-defined period (NATBindingDefaultTimeout).

At the beginning of each call and if STUN is required (i.e., not an internal NAT call), the media ports of the call are mapped. The call is delayed until the STUN Binding Response (that includes a global IP:port) for each media (RTP, RTCP and T.38) is received.

Notes:

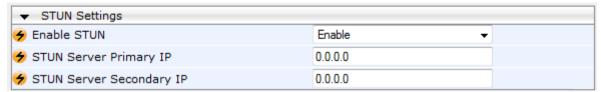

- STUN is applicable only to UDP connections (not TCP and TLS).
- STUN can't be used when the device is located behind a symmetric NAT.
- Use either the STUN server IP address (STUNServerPrimaryIP) or domain name (STUNServerDomainName) method, with priority to the first one.

User's Manual 13. Network

> To enable STUN:

1. Open the Application Settings page (Configuration tab > System menu > Application Settings).

Figure 13-8: STUN Parameters in Application Settings Page

- From the 'Enable STUN' (EnableSTUN) drop-down list, select Enable to enable the STUN feature.
- 3. Configure the STUN server address using one of the following methods:
 - Define the IP address of the primary and secondary (optional) STUN servers, using the 'STUN Server Primary IP' field (STUNServerPrimaryIP) and 'STUN Server Secondary IP' field. If the primary STUN server is unavailable, the device attempts to communicate with the second server.
 - Define the domain name of the STUN server using the *ini* file parameter, STUNServerDomainName. The STUN client retrieves all STUN servers with an SRV query to resolve this domain name to an IP address and port, sorts the server list, and uses the servers according to the sorted list.
- **4.** Configure the default NAT binding lifetime (in secondsUse) using the *ini* file parameter, NATBindingDefaultTimeout. STUN refreshes the binding information after this time expires.

13.9.1.2 Configuring a Static NAT IP Address for All Interfaces

You can configure a global (public) IP address of the router to enable static NAT between the device and the Internet for all network interfaces. Thus, the device replaces the source IP address for media of all outgoing SIP messages sent on any of its network interfaces to this public IP address.

The following procedure describes how to configure a static NAT address in the Web interface. You can also configure this using the ini file parameter, StaticNATIP.

- To configure a single static NAT IP address:
- 1. Open the SIP General Parameters page (Configuration tab > VolP menu > SIP Definitions > General Parameters).

Figure 13-9: Configuring Static NAT IP Address in SIP General Parameters Page

- 2. In the 'NAT IP Address' field, enter the NAT IP address in dotted-decimal notation.
- 3. Click **Submit**, and then reset the device with a burn-to-flash for your settings to take effect.

13.9.1.3 Configuring NAT Translation per IP Interface

The NAT Translation table lets you configure up to 32 network address translation (NAT) rules for translating source IP addresses per VoIP interface (SIP control and RTP media traffic) into NAT IP addresses (*global* or *public*), when the device is located behind NAT. This allows, for example, the separation of VoIP traffic between different ITSP's, and

topology hiding of internal IP addresses to the "public" network. Each IP interface (configured in the Interface table) can be associated with a NAT rule in this table, translating the source IP address and port of the outgoing packet into the NAT address (IP address and port range). The device's NAT traversal mechanism replaces the source IP address of SIP messages sent from a specified VoIP interface to a public IP address.

The following procedure describes how to configure NAT translation rules in the Web interface. You can also configure Bandwidth Profiles using the table ini file parameter, NATTranslation.

To configure NAT translation rules:

- Open the NAT Translation Table page (Configuration tab > VolP menu > VolP Network > NAT Translation Table).
- 2. Click **Add**; the following dialog box appears:

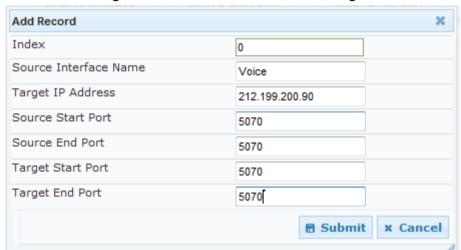

Figure 13-10: NAT Translation Table Page

- 3. Configure a NAT translation rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 13-14: NAT Translation Table Parameter Descriptions

Parameter	Description
Index [NATTranslation_Index]	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.
Source Interface Name [NATTranslation_SourcelPInterfaceName]	Defines the name of the IP interface, as configured in the Interface table.
Target IP Address [NATTranslation_TargetIPAddress]	Defines the global IP address. This address is set in the SIP Via and Contact headers as well as in the o= and c= SDP fields.
Source Start Port [NATTranslation_SourceStartPort]	Defines the optional starting port range (1-65536) of the IP interface, used as matching criteria for this NAT rule. If not configured, the match is done on the entire port range. Only IP addresses and ports of matched source ports will be replaced.

User's Manual 13. Network

Parameter	Description
Source End Port [NATTranslation_SourceEndPort]	Defines the optional ending port range (1-65536) of the IP interface, used as matching criteria for this NAT rule. If not configured, the match is done on the entire port range. Only IP addresses and ports of matched source ports will be replaced.
Target Start Port [NATTranslation_TargetStartPort]	Defines the optional, starting port range (1-65536) of the global address. If not configured, the ports are not replaced. Matching source ports are replaced with the target ports. This address is set in the SIP Via and Contact headers, as well as in the o= and c= SDP fields.
Target End Port [NATTranslation_TargetEndPort]	Defines the optional, ending port range (1-65536) of the global address. If not configured, the ports are not replaced. Matching source ports are replaced with the target ports. This address is set in the SIP Via and Contact headers, as well as in the o= and c= SDP fields.

13.9.2 Remote UA behind NAT

13.9.2.1 SIP Signaling Messages

By default, the device resolves NAT issues for SIP signaling, using its NAT Detection mechanism. The NAT Detection mechanism checks whether the endpoint is located behind NAT, by comparing the incoming packet's source IP address with the SIP Contact header's IP address. If the packet's source IP address is a public address and the Contact header's IP address a local address, the device considers the endpoint as located behind NAT. In this case, the device sends the SIP messages to the endpoint, using the packet's source IP address. Otherwise (or if you have disabled the NAT Detection mechanism), the device sends the SIP messages according to the SIP standard RFC 3261, where requests within the SIP dialog are sent using the IP address in the Contact header, and responses to INVITEs are sent using the IP address in the Via header. To enable or disable the device's NAT Detection mechanism, use the 'SIP NAT Detection' parameter.

If necessary, you can also configure the device to always consider incoming SIP INVITE messages as sent from endpoints that are located behind NAT. When this is enabled, the device sends responses to the INVITE (to the endpoint), using the the source IP address of the packet (INVITE) initially received from the endpoint. This is especially useful in scenarios where the endpoint is located behind a NAT firewall and the device (for whatever reason) is unable to identify NAT using its regular NAT Detection mechanism. This feature is enabled per specific calls using IP Groups. To configure this feature, use the 'Always Use Source Address' parameter in the IP Group table (see "Configuring IP Groups" on page 273). If this feature is disabled, the device's NAT detection is according to the settings of the global parameter. 'SIP NAT Detection' parameter.

13.9.2.2 Media (RTP/RTCP/T.38)

When a remote UA initiates a call and is not located behind a NAT server, the device sends the RTP (or RTCP, T.38) packets to the remote UA using the IP address / UDP port in the SIP message (Contact header). However, if the UA is located behind NAT, the device sends the RTP with the IP address of the UA (i.e., private IP address) as the destination, instead of that of the NAT server. Thus, the RTP will not reach the UA.

To resolve this NAT traversal problem, the device offers the following features:

- First Incoming Packet Mechanism see "First Incoming Packet Mechanism" on page 150
- RTP No-Op packets according to the avt-rtp-noop draft see "No-Op Packets" on page 151

The figure below illustrates a typical network architecture where the remote UA is located behind NAT:

Enterprise LAN Network

Private, Internal IP Address

IP Phones

Figure 13-11: Remote UA behind NAT

13.9.2.2.1 First Incoming Packet Mechanism

In scenarios where the remote user agent (UA) resides behind a NAT server, it's possible that the device, if not configured for NAT traversal, will send the media (RTP, RTCP and T.38) streams to an invalid IP address / UDP port (i.e., private IP address:port of UA and not the public address). When the UA is located behind a NAT, although the UA sends its private IP address:port in the original SIP message (INVITE), the device receives the subsequent media packets with a source address of a public IP address:port (i.e., allocated by the NAT server). Therefore, to ensure that the media reaches the UA, the device must send it to the public address.

The device identifies whether the UA is located behind NAT, by comparing the source IP address of the first received media packet, with the IP address and UDP port of the first received SIP message (INVITE) when the SIP session was started. This is done for each media type--RTP, RTCP and T.38--and therefore, they can have different destination IP addresses and UDP ports than one another.

The EnablelpAddrTranslation and EnableUdpPortTranslation parameters specify the type of compare operation that occurs on the first incoming packet. To compare only the IP address, set EnablelpAddrTranslation to 1 and EnableUdpPortTranslation to 0. In this case, if the first incoming packet arrives with only a difference in the UDP port, the sending addresses won't change. If both the IP address and UDP port need to be compared, then both parameters need to be set to 1.

You can configure the device's NAT feature to operate in one of the following modes:

- Auto-Detect: NAT is performed only if necessary. If the UA is identified as being located behind NAT, the device sends the media packets to the public IP address:port obtained from the source address of the first media packet received from the UA. Otherwise, the packets are sent using the IP address:port obtained from the first received SIP message. Note that if the SIP session is established (ACK) and the device (not the UA) sends the first packet, it sends it to the address obtained from the SIP message and only after the device receives the first packet from the UA, does it determine whether the UA is behind NAT.
- NAT Is Not Used: (Default) NAT feature is disabled. The device considers the UA as not located behind NAT and always sends the media packets to the UA using the IP address:port obtained from the first received SIP message.
- NAT Is Used: NAT is always performed. The device considers the UA as located behind NAT and always sends the media packets to the UA using the source address

User's Manual 13. Network

obtained from the first media packet received from the UA. In this mode, the device does not send any packets until it receives the first packet from the UA (in order to obtain the IP address).

- To enable NAT resolution using the First Incoming Packet mechanism:
- Open the General Settings page (Configuration tab > VolP menu > Media > General Media Settings).
- 2. Set the 'NAT Mode parameter to one of the following:
 - [0] Auto-Detect
 - [1] NAT Is Not Used
 - [2] NAT Is Used
- Click Submit.

13.9.2.2.2No-Op Packets

The device's No-Op packet support can be used to verify Real-Time Transport Protocol (RTP) and T.38 connectivity, and to keep NAT bindings and Firewall pinholes open. The No-Op packets are available for sending in RTP and T.38 formats.

You can control the activation of No-Op packets by using the *ini* file parameter NoOpEnable. If No-Op packet transmission is activated, you can control the time interval in which No-Op packets are sent in the case of silence (i.e., no RTP or T.38 traffic). This is done using the *ini* file parameter NoOpInterval. For a description of the RTP No-Op *ini* file parameters, see "Networking Parameters" on page 703.

- RTP No-Op: The RTP No-Op support complies with IETF Internet-Draft draft-wing-avt-rtp-noop-03 ("A No-Op Payload Format for RTP"). This IETF document defines a No-Op payload format for RTP. The draft defines the RTP payload type as dynamic. You can control the payload type with which the No-Op packets are sent. This is performed using the RTPNoOpPayloadType *ini* parameter (see "Networking Parameters" on page 703). The default payload type is 120.
- **T.38 No-Op:** T.38 No-Op packets are sent only while a T.38 session is activated. Sent packets are a duplication of the previously sent frame (including duplication of the sequence number).

Note: Receipt of No-Op packets is always supported.

13.10 Robust Receipt of Media Streams by Media Latching

The Robust Media mechanism (or media latching) is an AudioCodes proprietary mechanism to filter out unwanted media (RTP, RTCP, SRTP, SRTCP, and T.38) streams that are sent to the same port number of the device. Media ports may receive additional multiple unwanted media streams (from multiple sources of traffic) as result of traces of previous calls, call control errors, or deliberate malicious attacks (e.g., Denial of Service). When the device receives more than one media stream on the same port, the Robust Media mechanism detects the valid media stream and ignores the rest. Thus, this can prevent an established call been stolen by a malicious attacker on the media stream.

For a detailed description of the robust media parameters, see "General Security Parameters" on page 723.

13.11 Multiple Routers Support

Multiple routers support is designed to assist the device when it operates in a multiple routers network. The device learns the network topology by responding to Internet Control Message Protocol (ICMP) redirections and caches them as routing rules (with expiration time).

When a set of routers operating within the same subnet serve as devices to that network and intercommunicate using a dynamic routing protocol, the routers can determine the shortest path to a certain destination and signal the remote host the existence of the better route. Using multiple router support, the device can utilize these router messages to change its next hop and establish the best path.

Note: Multiple Routers support is an integral feature that doesn't require configuration.

13.12 IP Multicasting

The device supports IP Multicasting level 1, according to RFC 2236 (i.e., IGMP version 2) for RTP channels. The device is capable of transmitting and receiving multicast packets.

14 Security

This section describes the VoIP security-related configuration.

14.1 Configuring Firewall Settings

The Firewall Settings table lets you configure the device's Firewall, which defines network traffic filtering rules (*access list*). You can add up to 25 firewall rules. The access list offers the following firewall possibilities:

- Block traffic from known malicious sources
- Allow traffic only from known "friendly" sources, and block all other traffic
- Mix allowed and blocked network sources
- Limit traffic to a user-defined rate (blocking the excess)
- Limit traffic to specific protocols, and specific port ranges on the device

For each packet received on the network interface, the table is scanned from top to bottom until the first matching rule is found. This rule can either permit (*allow*) or deny (*block*) the packet. Once a rule in the table is located, subsequent rules further down the table are ignored. If the end of the table is reached without a match, the packet is accepted.

Notes:

- This firewall applies to a very low-level network layer and overrides all your other security-related configuration. Thus, if you have configured higher-level security features (e.g., on the Application level), you must also configure firewall rules to permit this necessary traffic. For example, if you have configured IP addresses to access the Web and Telnet interfaces in the Web Access List (see "Configuring Web and Telnet Access List" on page 77), you must configure a firewall rule that permits traffic from these IP addresses.
- Only Security Administrator users or Master users can configure firewall rules.
- Setting the 'Prefix Length' field to **0** means that the rule applies to **all** packets, regardless of the defined IP address in the 'Source IP' field. Thus, it is highly recommended to set this parameter to a value other than 0.
- It is recommended to add a rule at the end of your table that blocks all traffic and to add firewall rules above it that allow required traffic (with bandwidth limitations).
 To block all traffic, use the following firewall rule:
 - √ Source IP: 0.0.0.0
 - √ Prefix Length: 0 (i.e., rule matches all IP addresses)
 - √ Start Port End Port: 0-65535
 - ✓ Protocol: Any
 - √ Action Upon Match: Block
- If you are using the High Availability feature and you have configured "block" rules, ensure that you also add "allow" rules for HA traffic. For more information, see Configuring Firewall Allowed Rules.

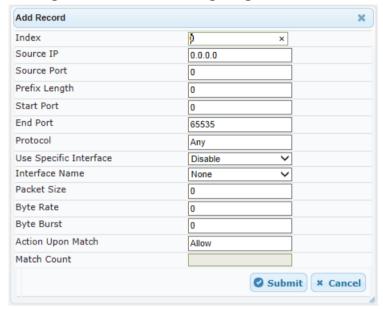

The following procedure describes how to configure Firewall rules in the Web interface. You can also configure this using the table ini file parameter, AccessList.

- To configure a Firewall rule:
- Open the Firewall Settings page (Configuration tab > VolP menu > Security > Firewall Settings).
- 2. Click Add; the following dialog box appears:

Figure 14-1: Firewall Settings Page - Add Record

- 3. Configure a Firewall rule according to the parameters described in the table below.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

Table 14-1: Firewall Settings Table Parameter Descriptions

Parameter	Description
Index	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.
Source IP [AccessList_Source_IP]	Defines the IP address (or DNS name) or a specific host name of the source network (i.e., from where the incoming packet is received).
Source Port [AccessList_Source_Port]	Defines the source UDP/TCP ports (of the remote host) from where packets are sent to the device. The valid range is 0 to 65535. Note: When set to 0, this field is ignored and any source port matches the rule.

Parameter	Description
Prefix Length [AccessList_PrefixLen]	(Mandatory) Defines the IP network mask - 32 for a single host or the appropriate value for the source IP addresses.
	 A value of 8 corresponds to IPv4 subnet class A (network mask of 255.0.0.0).
	 A value of 16 corresponds to IPv4 subnet class B (network mask of 255.255.0.0).
	 A value of 24 corresponds to IPv4 subnet class C (network mask of 255.255.255.0).
	The IP address of the sender of the incoming packet is trimmed in accordance with the prefix length (in bits) and then compared to the parameter 'Source IP'.
	The default is 0 (i.e., applies to all packets). You must change this value to any of the above options.
	Note: A value of 0 applies to all packets, regardless of the defined IP address. Therefore, you must set this parameter to a value other than 0.
Start Port [AccessList_Start_Port]	Defines the destination UDP/TCP start port (on this device) to where packets are sent.
	The valid range is 0 to 65535.
	Note: When the protocol type isn't TCP or UDP, the entire range must be provided.
End Port [AccessList_End_Port]	Defines the destination UDP/TCP end port (on this device) to where packets are sent.
	The valid range is 0 to 65535.
	Note: When the protocol type isn't TCP or UDP, the entire range must be provided.
Protocol [AccessList_Protocol]	Defines the protocol type (e.g., UDP, TCP, ICMP, ESP or 'Any') or the IANA protocol number in the range of 0 (Any) to 255.
	Note: This field also accepts the abbreviated strings 'SIP' and 'HTTP'. Specifying these strings implies selection of the TCP or UDP protocols, and the appropriate port numbers as defined on the device.
Use Specific Interface [AccessList_Use_Specific_Interface]	Determines whether you want to apply the rule to a specific network interface defined in the Interface table (i.e., packets received from that defined in the Source IP field and received on this network interface):
	[0] Disable (default)[1] Enable
	Notes:
	 If enabled, then in the 'Interface Name' field (described below), select the interface to which the rule is applied.
Interface Name	If disabled, then the rule applies to all interfaces. Defines the network interface to which you want to apply the rule.
Interface Name [AccessList_Interface_x]	Defines the network interface to which you want to apply the rule. This is applicable if you enabled the 'Use Specific Interface' field. The list displays interface names as defined in the Interface table in "Configuring IP Network Interfaces" on page 126.
Packet Size [AccessList_Packet_Size]	Defines the maximum allowed packet size. The valid range is 0 to 65535.

Parameter	Description
	Note: When filtering fragmented IP packets, this field relates to the overall (re-assembled) packet size, and not to the size of each fragment.
Byte Rate [AccessList_Byte_Rate]	Defines the expected traffic rate (bytes per second), i.e., the allowed bandwidth for the specified protocol. In addition to this field, the 'Burst Bytes' field provides additional allowance such that momentary bursts of data may utilize more than the defined byte rate, without being interrupted.
	For example, if 'Byte Rate' is set to 40000 and 'Burst Bytes' to 50000, then this implies the following: the allowed bandwidth is 40000 bytes/sec with extra allowance of 50000 bytes; if, for example, the actual traffic rate is 45000 bytes/sec, then this allowance would be consumed within 10 seconds, after which all traffic exceeding the allocated 40000 bytes/sec is dropped. If the actual traffic rate then slowed to 30000 bytes/sec, then the allowance would be replenished within 5 seconds.
Burst Bytes [AccessList_Byte_Burst]	Defines the tolerance of traffic rate limit (number of bytes). The default is 0.
Action Upon Match [AccessList_Allow_Type]	Defines the firewall action to be performed upon rule match. "Allow" = (Default) Permits these packets "Block" = Rejects these packets
Match Count [AccessList_MatchCount]	(Read-only) Displays the number of packets accepted or rejected by the rule.

The table below provides an example of configured firewall rules:

Table 14-2: Configuration Example of Firewall Rules

Parameter	Firewall Rule				
r dramoto.	1	2	3	4	5
Source IP	12.194.231.76	12.194.230.7	0.0.0.0	192.0.0.0	0.0.0.0
Prefix Length	16	16	0	8	0
Start Port and End Port	0-65535	0-65535	0-65535	0-65535	0-65535
Protocol	Any	Any	icmp	Any	Any
Use Specific Interface	Enable	Enable	Disable	Enable	Disable
Interface Name	WAN	WAN	None	Voice-Lan	None
Byte Rate	0	0	40000	40000	0
Burst Bytes	0	0	50000	50000	0
Action Upon Match	Allow	Allow	Allow	Allow	Block

The firewall rules in the above configuration example do the following:

- Rules 1 and 2: Typical firewall rules that allow packets ONLY from specified IP addresses (e.g., proxy servers). Note that the prefix length is configured.
- Rule 3: A more "advanced" firewall rule bandwidth rule for ICMP, which allows a

maximum bandwidth of 40,000 bytes/sec with an additional allowance of 50,000 bytes. If, for example, the actual traffic rate is 45,000 bytes/sec, then this allowance would be consumed within 10 seconds, after which all traffic exceeding the allocated 40,000 bytes/sec is dropped. If the actual traffic rate then slowed to 30,000 bytes/sec, the allowance would be replenished within 5 seconds.

- **Rule 4:** Allows traffic from the LAN voice interface and limits bandwidth.
- Rule 5: Blocks all other traffic.

14.2 Configuring General Security Settings

The device uses TLS over TCP to encrypt and optionally, authenticate SIP messages. This is referred to as Secure SIP (SIPS). SIPS uses the X.509 certificate exchange process, as described in 'Configuring SSL/TLS Certificates' on page 107, where you need to configure certificates (TLS Context).

Notes:

- When a TLS connection with the device is initiated by a SIP client, the device also responds using TLS, regardless of whether or not TLS was configured.
- For backward compatibility, the following parameters can be used:
 - √ SIPTransportType to enable TLS.
 - ▼ TLSLocalSIPPort to configure the device's port used for TLS traffic.

> To configure SIPS:

- 1. Configure a TLS Context as required.
- 2. Assign the TLS Context to a Proxy Set or SIP Interface (see Configuring Proxy Sets on page 284 and Configuring SIP Interfaces on page 270, respectively).
- 3. Configure a SIP Interface with a TLS port number.
- 4. Configure various SIPS parameters in the General Security Settings page (Configuration tab > VoIP menu > Security > General Security Settings).
 - For a description of the TLS parameters, see TLS Parameters on page 727.
- 5. By default, the device initiates a TLS connection only for the next network hop. To enable TLS all the way to the destination (over multiple hops), set the 'Enable SIPS' (EnableSIPS) parameter to Enable in the SIP General Parameters page (Configuration tab > VoIP menu > SIP Definitions > General Parameters).

14.3 Intrusion Detection System

The device's Intrusion Detection System (IDS) feature detects malicious attacks on the device and reacts accordingly. A remote host is considered malicious if it has reached or exceeded a user-defined threshold (counter) of specified malicious attacks.

If malicious activity is detected, the device can do the following:

- Block (blacklist) remote hosts (IP addresses / ports) considered by the device as malicious. The device automatically blacklists the malicious source for a user-defined period after which it is removed from the blacklist.
- Send SNMP traps to notify of malicious activity and/or whether an attacker has been added to or removed from the blacklist. For more information, see "Viewing IDS Alarms" on page 164.

The Intrusion Detection System (IDS) is an important feature for Enterprises to ensure legitimate calls are not being adversely affected by attacks and to prevent Theft of Service and unauthorized access.

There are many types of malicious attacks, the most common being:

- **Denial of service:** This can be Denial of Service (DoS) where an attacker wishing to prevent a server from functioning correctly directs a large amount of requests sometimes meaningless and sometimes legitimate, or it can be Distributed Denial of Service (DDoS) where the attacker controls a large group of systems to coordinate a large scale DoS attack against a system:
 - Message payload tampering: Attacker may inject harmful content into a message, e.g., by entering meaningless or wrong information, with the goal of exploiting a buffer overflow at the target. Such messages can be used to probe for vulnerabilities at the target.
 - Message flow tampering: This is a special case of DoS attacks. These attacks
 disturb the ongoing communication between users. An attacker can then target
 the connection by injecting fake signaling messages into the communication
 channel (such as CANCEL messages).
 - Message Flooding: The most common DoS attack is where an attacker sends a huge amount of messages (e.g., INVITEs) to a target. The goal is to overwhelm the target's processing capabilities, thereby rendering the target inoperable.
- SPAM over Internet Telephony (SPIT): VoIP spam is unwanted, automatically dialed, pre-recorded phone calls using VoIP. It is similar to e-mail spam.
- Theft of Service (ToS): Service theft can be exemplified by phreaking, which is a type of hacking that steals service (i.e., free calls) from a service provider, or uses a service while passing the cost to another person.

The IDS configuration is based on IDS Policies, where each policy can be configured with a set of IDS rules. Each rule defines a type of malicious attack to detect and the number of attacks during an interval (threshold) before an SNMP trap is sent. Each policy is then applied to a target under attack (SIP interface) and/or source of attack (Proxy Set and/or subnet address).

14.3.1 Enabling IDS

The following procedure describes how to enable IDS.

> To enable IDS:

Open the IDS Global Parameters page (Configuration tab > VolP menu > Security > Intrusion Detection and Prevention > Global Parameters).

Figure 14-2: Enabling IDS on IDS Global Parameters Page

- 2. From the 'Intrusion Detection System' drop-down list, select **Enable**.
- 3. Click **Submit**, and then reset the device with a burn-to-flash for the setting to take effect.

14.3.2 Configuring IDS Policies

Configuring IDS Policies is a two-stage process that includes the following tables:

- 1. **IDS Policy (parent table):** Defines a name and description for the IDS Policy. You can configure up to 20 IDS Policies.
- 2. IDS Rules table (child table): Defines the actual rules for the IDS Policy. Each IDS Policy can be configured with up to 20 rules.

Note: A maximum of 100 IDS rules can be configured (regardless of how many rules are assigned to each policy).

The device provides the following pre-configured IDS Policies that can be used in your deployment (if they meet your requirements):

- "DEFAULT FEU": IDS Policy for far-end users in the WAN
- "DEFAULT_PROXY": IDS Policy for proxy server
- "DEFAULT GLOBAL": IDS Policy with global thresholds

These default IDS Policies are read-only and cannot be modified.

> To configure an IDS Policy:

Open the IDS Policy Table page (Configuration tab > VolP menu > Security >
 Intrusion Detection and Prevention > Policy Table); the table shows the preconfigured IDS policies:

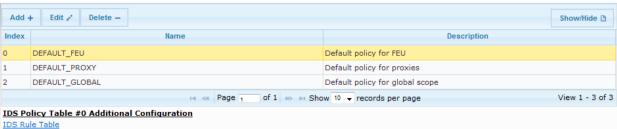

Figure 14-3: IDS Policy Table with Default Rules

2. Click **Add**; the following dialog box appears:

Figure 14-4: IDS Policy Table - Add Record

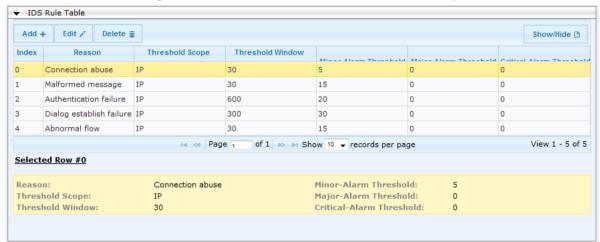

- 3. Configure an IDS Policy name according to the parameters described in the table below.
- Click Submit.

Table 14-3: IDS Policy Table Parameter Descriptions

Parameter	Description
Index [IDSPolicy_Index]	Defines an index number for the new table record.
Name [IDSPolicy_Description]	Defines an arbitrary name to easily identify the IDS Policy. The valid value is a string of up to 20 characters.
Description [IDSPolicy_Name]	Defines a brief description for the IDS Policy. The valid value is a string of up to 100 characters.

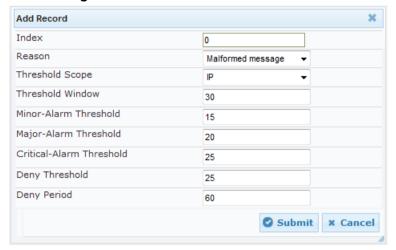

5. In the IDS Policy table, select the required IDS Policy row, and then click the **IDS Rule Table** link located below the table; the IDS Rule table opens:

Figure 14-5: IDS Rule Table of Selected IDS Policy

Click Add; the following dialog box appears:

Figure 14-6: IDS Rule Table - Add Record

The figure above shows a configuration example. If 15 malformed SIP messages are received within a period of 30 seconds, a minor alarm is sent. Every 30 seconds, the rule's counters are cleared. In addition, if more than 25 malformed SIP messages are received within this period, the device blacklists the remote IP host from where the messages were received for 60 seconds.

- 7. Configure an IDS Rule according to the parameters described in the table below.
- 8. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 14-4: IDS Rule Table Parameter Descriptions

	Table 14-4. ID3 Kule Table Farameter Descriptions		
Parameter	Description Defines an index number for the new table record.		
Index [IDSRule_RuleID]			
[IDSRule_Reason]	 Defines the type of intrusion attack (malicious event). [0] Any = All events listed below are considered as attacks and are counted together. [1] Connection abuse (default) = TLS authentication failure. [2] Malformed message = Message exceeds a user-defined maximum message length (50K) Any SIP parser error Message Policy match (see "Configuring SIP Message Policy Rules") Basic headers not present Content length header not present (for TCP) Header overflow [3] Authentication failure = Local authentication ("Bad digest" errors) Remote authentication (SIP 401/407 is sent if original message includes authentication) [4] Dialog establish failure = Classification failure (see "Configuring Classification Rules" on page 502) Routing failure Other local rejects (prior to SIP 180 response) Remote rejects (prior to SIP 180 response) 		

Parameter	Description
	 [5] Abnormal flow = ✓ Requests and responses without a matching transaction user (except ACK requests) ✓ Requests and responses without a matching transaction (except ACK requests)
Threshold Scope [IDSRule_ThresholdScope]	 Defines the source of the attacker to consider in the device's detection count. [0] Global = All attacks regardless of source are counted together during the threshold window. [2] IP = Attacks from each specific IP address are counted separately during the threshold window. [3] IP+Port = Attacks from each specific IP address:port are counted separately during the threshold window. This option is useful for NAT servers, where numerous remote machines use the same IP address but different ports. However, it is not recommended to use this option as it may degrade detection capabilities.
Threshold Window [IDSRule_ThresholdWindow]	Defines the threshold interval (in seconds) during which the device counts the attacks to check if a threshold is crossed. The counter is automatically reset at the end of the interval. The valid range is 1 to 1,000,000. The default is 1.
Minor-Alarm Threshold [IDSRule_MinorAlarmThreshold]	Defines the threshold that if crossed a minor severity alarm is sent. The valid range is 1 to 1,000,000. A value of 0 or -1 means not defined.
Major-Alarm Threshold [IDSRule_MajorAlarmThreshold]	Defines the threshold that if crossed a major severity alarm is sent. The valid range is 1 to 1,000,000. A value of 0 or -1 means not defined.
Critical-Alarm Threshold [IDSRule_CriticalAlarmThreshold]	Defines the threshold that if crossed a critical severity alarm is sent. The valid range is 1 to 1,000,000. A value of 0 or -1 means not defined.
Deny Threshold [IDSRule_DenyThreshold]	Defines the threshold that if crossed, the device blocks (blacklists) the remote host (attacker). The default is -1 (i.e., not configured). Note: This parameter is applicable only if the 'Threshold Scope' parameter is set to IP or IP+Port.
Deny Period [IDSRule_DenyPeriod]	Defines the duration (in sec) to keep the attacker on the blacklist. The valid range is 0 to 1,000,000. The default is -1 (i.e., not configured).

14.3.3 Assigning IDS Policies

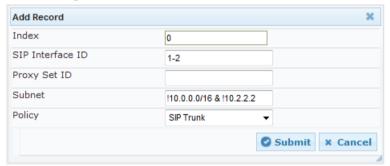

The IDS Match table lets you implement your configured IDS Policies. You do this by assigning specific IDS Policies to any, or a combination of, the following configuration entities:

- SIP Interface: For detection of malicious attacks on specific SIP Interface(s). For configuring SIP Interfaces, see "Configuring SIP Interfaces" on page 270.
- **Proxy Sets:** For detection of malicious attacks from specified Proxy Set(s). For configuring Proxy Sets, see "Configuring Proxy Sets" on page 284.
- **Subnet addresses:** For detection of malicious attacks from specified subnet addresses.

You can configure up to 20 IDS Policy-Matching rules.

- > To configure an IDS Policy-Matching rule:
- 1. Open the IDS Match Table page (Configuration tab > VolP menu > Security > Intrusion Detection and Prevention > Match Table).
- 2. Click **Add**; the following dialog box appears:

Figure 14-7: IDS Match Table - Add Record

The figure above shows a configuration example where the IDS Policy "SIP Trunk" is applied to SIP Interfaces 1 and 2, and all source IP addresses outside of subnet 10.1.0.0/16 and IP address 10.2.2.2.

- 3. Configure a rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 14-5: IDS Match Table Parameter Descriptions

Parameter	Description
Index [IDSMatch_Index]	Defines an index number for the new table record.
SIP Interface ID [IDSMatch_SIPInterface]	 Defines the SIP Interface(s) to which you want to assign the IDS Policy. This indicates the SIP Interfaces that are being attacked. The valid value is the ID of the SIP Interface. The following syntax is supported: A comma-separated list of SIP Interface IDs (e.g., 1,3,4) A hyphen "-" indicates a range of SIP Interfaces (e.g., 3,4-7 means IDs 3, and 4 through 7) A prefix of an exclamation mark "!" means negation of the set (e.g., !3,4-7 means all indexes excluding 3, and excluding 4 through 7)
Proxy Set ID [IDSMatch_ProxySet]	Defines the Proxy Set(s) to which the IDS Policy is assigned. This indicates the Proxy Sets from where the attacks are coming from. The

Parameter	Description
	 following syntax is supported: A comma-separated list of Proxy Set IDs (e.g., 1,3,4) A hyphen "-" indicates a range of Proxy Sets (e.g., 3,4-7 means IDs 3, and 4 through 7) A prefix of an exclamation mark "!" means negation of the set (e.g., !3,4-7 means all indexes excluding 3, and excluding 4 through 7) Notes: Only the IP address of the Proxy Set is considered (not port). If a Proxy Set has multiple IP addresses, the device considers the Proxy Set as one entity and includes all its IP addresses in the same IDS count.
Subnet [IDSMatch_Subnet]	 Defines the subnet to which the IDS Policy is assigned. This indicates the subnets from where the attacks are coming from. The following syntax can be used: Basic syntax is a subnet in CIDR notation (e.g., 10.1.0.0/16 means all sources with IP address in the range 10.1.0.0−10.1.255.255) An IP address can be specified without the prefix length to refer to the specific IP address. Each subnet can be negated by prefixing it with "!", which means all IP addresses outside that subnet. Multiple subnets can be specified by separating them with "&" (and) or " " (or) operations. For example: ✓ 10.1.0.0/16 10.2.2.2: includes subnet 10.1.0.0/16 and IP address 10.2.2.2. ✓ !10.1.0.0/16 & !10.2.2.2: includes all addresses except those of subnet 10.1.0.0/16 and IP address 10.2.2.2. Note that the exclamation mark "!" appears before each subnet. ✓ 10.1.0.0/16 & !10.1.1.1: includes subnet 10.1.0.0/16, except IP address 10.1.1.1.
Policy [IDSMatch_Policy]	Assigns an IDS Policy (configured in "Configuring IDS Policies" on page 159).

14.3.4 Viewing IDS Alarms

For the IDS feature, the device sends the following SNMP traps:

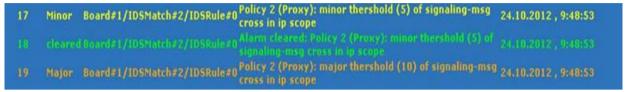

- Traps that notify the detection of malicious attacks:
 - acIDSPolicyAlarm: The device sends this alarm whenever a threshold of a specific IDS Policy rule is crossed. The trap displays the crossed severity threshold (Minor or Major), IDS Policy and IDS Rule, and the IDS Policy-Match index.
 - acIDSThresholdCrossNotification: The device sends this event for each scope (IP address) that crosses the threshold. In addition to the crossed severity threshold (Minor or Major) of the IDS Policy-Match index, this event shows the IP address (or IP address:port) of the malicious attacker.

If the severity level is raised, the alarm of the former severity is cleared and the device sends a new alarm with the new severity. The alarm is cleared after a user-defined period (configured by the ini file parameter, IDSAlarmClearPeriod) during which no thresholds have been crossed. However, this "quiet" period must be at least twice the 'Threshold Window' value (configured in "Configuring IDS Policies" on page 159). For example, if you set IDSAlarmClearPeriod to 20 sec

and 'Threshold Window' to 15 sec, the IDSAlarmClearPeriod parameter is ignored and the alarm is cleared only after 30 seconds (2 x 15 sec).

The figure below displays an example of IDS alarms in the Active Alarms table ("Viewing Active Alarms" on page 613). In this example, a Minor threshold alarm is cleared and replaced by a Major threshold alarm:

Figure 14-8: IDS Alarms in Active Alarms Table

acIDSBlacklistNotification event: The device sends this event whenever an attacker (remote host at IP address and/or port) is added to or removed from the blacklist.

The device also sends IDS notifications and alarms in Syslog messages to a Syslog server. This only occurs if you have configured Syslog (see "Enabling Syslog" on page 662). An example of a Syslog message with IDS alarms and notifications is shown below:

Figure 14-9: Syslog Message Example with IDS Alarms and Notifications

The table below lists the Syslog text messages per malicious event:

Table 14-6: Types of Malicious Events and Syslog Text String

Туре	Description	Syslog String
Connection Abuse	TLS authentication failure	abuse-tls-auth-fail
Malformed Messages	 Message exceeds a user-defined maximum message length (50K) Any SIP parser error Message policy match Basic headers not present Content length header not present (for TCP) Header overflow 	 malformed-invalid-msg-len malformed-parse-error malformed-message-policy malformed-miss-header malformed-miss-content-len malformed-header-overflow
Authentication Failure	 Local authentication ("Bad digest" errors) Remote authentication (SIP 401/407 is sent if original message includes authentication) 	auth-establish-failauth-reject-response
Dialog Establishment Failure	 Classification failure Routing failure Other local rejects (prior to SIP 180 response) Remote rejects (prior to SIP 180 response) 	 establish-classify-fail establish-route-fail establish-local-reject establish-remote-reject

Туре	Description	Syslog String
Abnormal Flow	 Requests and responses without a matching transaction user (except ACK requests) Requests and responses without a matching transaction (except ACK requests) 	flow-no-match-tuflow-no-match- transaction

14.4 IPSec and Internet Key Exchange

IP security (IPSec) and Internet Key Exchange (IKE) protocols are part of the IETF standards for establishing a secured IP connection between two applications (also referred to as peers). Providing security services at the IP layer, IPSec and IKE are transparent to IP applications. IPSec and IKE are used together to provide security for control and management (e.g., SNMP and Web) protocols, but not for media (i.e., RTP, RTCP and T.38).

IKE is used to obtain the Security Associations (SA) between peers (the device and the application it's trying to contact). The SA contains the encryption keys and profile used by IPSec to encrypt the IP stream. IKE negotiation comprises the following two phases:

- **Main Mode** (creates a secured channel for the Quick mode by obtaining a "master" encryption key, without any prior keys, and authenticates the peers to each other):
 - SA negotiation: The peers negotiate their capabilities using up to four proposals. Each proposal includes the Encryption method, Authentication algorithm, and the Diffie-Hellman (DH) group. The master key's lifetime is also negotiated. For configuring IPSec proposals, see "Configuring IP Security Proposal Table" on page 167.
 - Key exchange (DH): The DH protocol creates the master key. DH requires both peers to agree on certain mathematical parameters, known as the "group".
 - Authentication: The two peers authenticate one another using a pre-shared key (configured in "Configuring IP Security Associations Table" on page 169) or by using certificate-based authentication.
- Quick Mode (creates the encrypted IPSec tunnel once initial security is set up):
 - SA negotiation: An IPSec SA is created by negotiating encryption and authentication capabilities using the same proposal mechanism as in Main mode.
 - Key exchange: A symmetrical key is created for encrypting IPSec traffic; the
 peers communicate with each other in encrypted form, secured by the previously
 negotiated "master" key.

IKE specifications summary:

- Authentication methods: pre-shared key or certificate-based authentication
- Main mode supported for IKE Phase 1
- DH group 1 or group 2
- Encryption algorithms: Data Encryption Standard (DES), Advanced Encryption Standard (AES), and 3DES
- Hash algorithms: SHA1 and MD5

IPSec is responsible for securing the IP traffic. This is accomplished by using the Encapsulation Security Payload (ESP) protocol to encrypt (and decrypt) the IP payload. This is configured in the IPSec Security Association table (see "Configuring IP Security Associations Table" on page 169), which defines the IP peers to which IPSec security is applied.

IPSec specifications summary:

- Transport and Tunneling Mode
- Encapsulation Security Payload (ESP) only

Encryption algorithms: AES, DES, and 3DES

Hash types: SHA1 and MD5

14.4.1 Enabling IPSec

To enable IKE and IPSec processing, you must enable the IPSec feature, as described below.

To enable IPSec:

Open the General Security Settings page (Configuration tab > VolP menu > Security > General Security Settings).

Figure 14-10: Enabling IPSec

- 2. Set the 'Enable IP Security' parameter to **Enable.**
- 3. Click **Submit**, and then reset the device with a flash burn.

14.4.2 Configuring IP Security Proposal Table

The IP Security Proposal Table page is used to configure Internet Key Exchange (IKE) with up to four proposal settings. Each proposal defines an encryption algorithm, an authentication algorithm, and a Diffie-Hellman group identifier. The same set of proposals applies to both Main and Quick mode.

If no proposals are defined, the following default settings are applied:

Table 14-7: Default IPSec/IKE Proposals

Proposal	Encryption	Authentication	DH Group
Proposal 0	3DES	SHA1	Group 2 (1024 bit)
Proposal 1	3DES	MD5	Group 2 (1024 bit)
Proposal 2	3DES	SHA1	Group 1 (786 bit)
Proposal 3	3DES	MD5	Group 1 (786 bit)

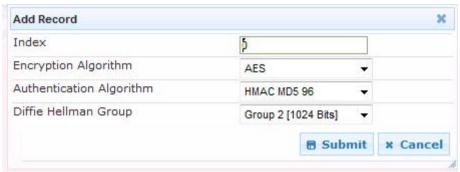

Note: You can also configure the IP Security Proposals table using the table ini file parameter IPsecProposalTable (see "Security Parameters" on page 723).

- To configure IP Security Proposals:
- 1. Open the IP Security Proposal Table page (Configuration tab > VoIP menu > Security > IPSec Proposal Table).
- 2. Click **Add**; the following dialog box appears:

Figure 14-11: IP Security Proposals Table - Add Record Dialog Box

- **3.** Configure the parameters, as required. For a description of the parameters, see the table below.
- 4. Click Submit.
- 5. To save the changes to flash memory, see "Saving Configuration" on page 550.

Table 14-8: IP Security Proposals Table Parameters

Parameter Name	Description
Encryption Algorithm [IPsecProposalTable_EncryptionAlgorithm]	Defines the encryption (privacy) algorithm. • [0] NONE • [1] DES CBC • [2] 3DES CBC • [3] AES (default)
Authentication Algorithm [IPsecProposalTable_AuthenticationAlgorithm]	Defines the message authentication (integrity) algorithm. • [0] NONE • [2] HMAC SHA1 96 • [4] HMAC MD5 96 (default)
Diffie Hellman Group [IPsecProposalTable_DHGroup]	Defines the length of the key created by the DH protocol for up to four proposals. For the <i>ini</i> file parameter, <i>X</i> denotes the proposal number (0 to 3). • [0] Group 1 (768 Bits) = DH-786-Bit • [1] Group 2 (1024 Bits) (default) = DH-1024-Bit

14.4.3 **Configuring IP Security Associations Table**

The IP Security Associations Table page allows you to configure up to 20 peers (hosts or networks) for IP security (IPSec)/IKE. Each of the entries in this table controls both Main and Quick mode configuration for a single peer. Each row in the table refers to a different IP destination. IPSec can be applied to all traffic to and from a specific IP address. Alternatively, IPSec can be applied to a specific flow, specified by port (source or destination) and protocol type.

The destination IP address (and optionally, destination port, source port and protocol type) of each outgoing packet is compared to each entry in the table. If a match is found, the device checks if an SA already exists for this entry. If no SA exists, the IKE protocol is invoked and an IPSec SA is established and the packet is encrypted and transmitted. If a match is not found, the packet is transmitted without encryption.

This table can also be used to enable Dead Peer Detection (RFC 3706), whereby the device queries the liveliness of its IKE peer at regular intervals or on-demand. When two peers communicate with IKE and IPSec, the situation may arise in which connectivity between the two goes down unexpectedly. In such cases, there is often no way for IKE and IPSec to identify the loss of peer connectivity. As such, the Security Associations (SA) remain active until their lifetimes naturally expire, resulting in a "black hole" situation where both peers discard all incoming network traffic. This situation may be resolved by performing periodic message exchanges between the peers. When no reply is received, the sender assumes SA's are no longer valid on the remote peer and attempts to renegotiate.

Notes:

If you change the device's IP address on-the-fly, you must then reset the device

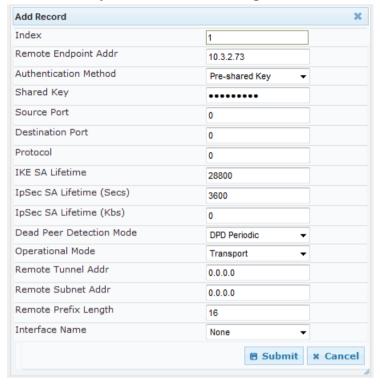

- For security, once the IKE pre-shared key is configured, it is not displayed in any of the device's management tools.
- You can also configure the IP Security Associations table using the table ini file parameter IPsecSATable (see "Security Parameters" on page 723).

- To configure the IPSec Association table:
- 1. Open the IP Security Associations Table page (Configuration tab > VoIP menu > Security > IPSec Association Table).
- 2. Click Add; the following dialog box appears:

Figure 14-12: IP Security Associations Table Page - Add Record Dialog Box

- 3. Configure the parameters, as required (for a description of these parameters, see the table below). In the above figure, a single IPSec/IKE peer (10.3.2.73) is configured. Pre-shared key authentication is selected with the pre-shared key set to 123456789. In addition, a lifetime of 28800 seconds is set for IKE and a lifetime of 3600 seconds is set for IPSec.
- 4. Click Submit.
- 5. To save the changes to flash memory, see "Saving Configuration" on page 550.

Table 14-9: IP Security Associations Table Configuration Parameters

Parameter Name	Description
Operational Mode [IPsecSATable_IPsecMode]	Defines the IPSec mode of operation. • [0] Transport (default) • [1] Tunnel
Remote Endpoint Addr [IPsecSATable_RemoteEndpointA ddressOrName]	Defines the IP address or DNS host name of the peer. Note: This parameter is applicable only if the Operational Mode is set to Transport.
Authentication Method [IPsecSATable_AuthenticationMethod]	Defines the method for peer authentication during IKE main mode. • [0] Pre-shared Key (default) • [1] RSA Signature = in X.509 certificate Note: For RSA-based authentication, both peers must be provisioned with certificates signed by a common CA. For more information on certificates, see Configuring Mutual TLS

Parameter Name	Description
	Authentication on page 116.
Shared Key [IPsecSATable_SharedKey]	Defines the pre-shared key (in textual format). Both peers must use the same pre-shared key for the authentication process to succeed. Notes:
	 This parameter is applicable only if the Authentication Method parameter is set to pre-shared key. The pre-shared key forms the basis of IPSec security and therefore, it should be handled with care (the same as sensitive passwords). It is not recommended to use the same pre-shared key for several connections.
	 Since the <i>ini</i> file is plain text, loading it to the device over a secure network connection is recommended. Use a secure transport such as HTTPS, or a direct crossed-cable connection from a management PC.
	 After it is configured, the value of the pre-shared key cannot be retrieved.
Source Port [IPsecSATable_SourcePort]	Defines the source port to which this configuration applies. The default is 0 (i.e., any port).
Destination Port [IPsecSATable_DestPort]	Defines the destination port to which this configuration applies. The default is 0 (i.e., any port).
Protocol [IPsecSATable_Protocol]	Defines the protocol type to which this configuration applies. Standard IP protocol numbers, as defined by the Internet Assigned Numbers Authority (IANA) should be used, for example:
	 0 = Any protocol (default) 17 = UDP 6 = TCP
IKE SA Lifetime [IPsecSATable_Phase1SaLifetimel nSec]	Defines the duration (in seconds) for which the negotiated IKE SA (Main mode) is valid. After this time expires, the SA is renegotiated.
	The default is 0 (i.e., unlimited).
	Note: Main mode negotiation is a processor-intensive operation; for best performance, do not set this parameter to less than 28,800 (i.e., eight hours).
IPSec SA Lifetime (sec) [IPsecSATable_Phase2SaLifetimel nSec]	Defines the duration (in seconds) for which the negotiated IPSec SA (Quick mode) is valid. After this time expires, the SA is re-negotiated.
	The default is 0 (i.e., unlimited).
	Note: For best performance, a value of 3,600 (i.e., one hour) or more is recommended.
IPSec SA Lifetime (Kbs) [IPsecSATable_Phase2SaLifetimel nKB]	Defines the maximum volume of traffic (in kilobytes) for which the negotiated IPSec SA (Quick mode) is valid. After this specified volume is reached, the SA is re-negotiated.
	The default is 0 (i.e., the value is ignored).
Dead Peer Detection Mode [IPsecSATable_DPDmode]	 Defines dead peer detection (DPD), according to RFC 3706. [0] DPD Disabled (default) [1] DPD Periodic = DPD is enabled with message

Parameter Name	Description
	 exchanges at regular intervals [2] DPD on demand = DPD is enabled with on-demand checks - message exchanges as needed (i.e., before sending data to the peer). If the liveliness of the peer is questionable, the device sends a DPD message to query the status of the peer. If the device has no traffic to send, it never sends a DPD message.
Remote Tunnel Addr [IPsecSATable_RemoteTunnelAdd ress]	Defines the IP address of the peer router. Note: This parameter is applicable only if the Operational Mode is set to Tunnel.
Remote Subnet Addr [IPsecSATable_RemoteSubnetIPA ddress]	Defines the IP address of the remote subnet. Together with the Prefix Length parameter (below), this parameter defines the network with which the IPSec tunnel allows communication. Note: This parameter is applicable only if the Operational Mode is set to Tunnel.
Remote Prefix Length [IPsecSATable_RemoteSubnetPre fixLength]	Defines the prefix length of the Remote Subnet IP Address parameter (in bits). The prefix length defines the subnet class of the remote network. A prefix length of 16 corresponds to a Class B subnet (255.255.0.0); a prefix length of 24 corresponds to a Class C subnet (255.255.255.0). Note: This parameter is applicable only if the Operational Mode is set to Tunnel.
Interface Name [IPsecSATable_InterfaceName]	Assigns a network interface to this IPSec rule. The network interfaces are defined in the Interface table ('Interface Name' column) in "Configuring IP Network Interfaces" on page 126

User's Manual 15. Media

15 Media

This section describes the media-related configuration.

15.1 Configuring Voice Settings

The Voice Settings page configures various voice parameters such as voice volume, silence suppression, and DTMF transport type. For a detailed description of these parameters, see "Configuration Parameters Reference" on page 691.

- > To configure the voice parameters:
- Open the Voice Settings page (Configuration tab > VoIP menu > Media > Voice Settings).

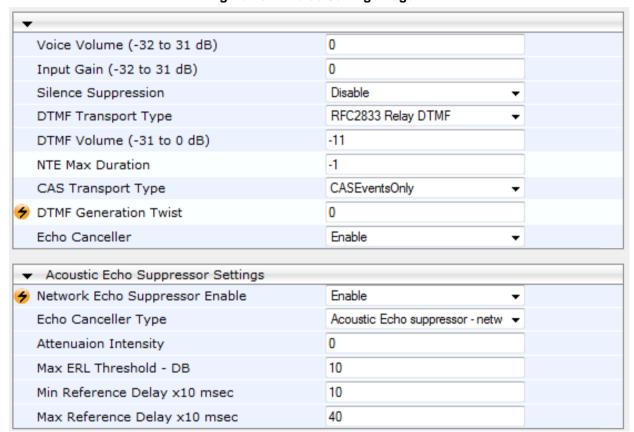

Figure 15-1: Voice Settings Page

- 2. Configure the Voice parameters as required.
- Click Submit
- 4. To save the changes to flash memory, see "Saving Configuration" on page 550.

15.1.1 Configuring Voice Gain (Volume) Control

The device allows you to configure the level of the received (input gain) Tel-to-IP signal and the level of the transmitted (output gain) IP-to-Tel signal. The gain can be set between -32 and 31 decibels (dB).

The following procedure describes how to configure gain control using the Web interface:

To configure gain control using the Web interface:

 Open the Voice Settings page (Configuration tab > VoIP menu > Media > Voice Settings).

Figure 15-2: Voice Volume Parameters in Voice Settings Page

Voice Volume (-32 to 31 dB)	0	
Input Gain (-32 to 31 dB)	0	

- 2. Configure the following parameters:
 - 'Voice Volume' (Voice Volume) Defines the voice gain control (in decibels) for IPto-Tel
 - 'Input Gain' (InputGain) Defines the PCM input gain control (in decibels) for Telto-IP
- 3. Click Submit.

15.1.2 Silence Suppression (Compression)

Silence suppression (compression) is a method for conserving bandwidth on VoIP calls by not sending packets when silence is detected. The device uses its VAD feature to detect periods of silence in the voice channel during an established call. When silence is detected, it stops sending packets in the channel.

The following procedure describes how to enable silence suppression using the Web interface.

- To enable silence suppression using the Web interface:
- Open the Voice Settings page (Configuration tab > VoIP menu > Media > Voice Settings).

Figure 15-3: Enabling Silence Suppression in Voice Settings Page

- 2. Set the 'Silence Suppression' (EnableSilenceCompression) field to Enable.
- 3. Click Submit.

15.1.3 Echo Cancellation

The device supports adaptive linear (line) echo cancellation according to G.168-2002. Echo cancellation is a mechanism that removes echo from the voice channel. Echoes are reflections of the transmitted signal.

In this line echo, echoes are generated when two-wire telephone circuits (carrying both transmitted and received signals on the same wire pair) are converted to a four-wire circuit. Echoes are reflections of the transmitted signal, which result from impedance mismatch in the hybrid (bi-directional 2-wire to 4-wire converting device).

An estimated echo signal is built by feeding the decoder output signal to an RLS-like adaptive filter, which adapts itself to the characteristics of the echo path. The 'estimated echo signal' (the output of this filter) is then subtracted from the input signal (which is the sum of the desired input signal and the undesired echo) to provide a clean signal. To suppress the remaining residual echo, a Non Linear Processor (NLP) is used, as well as a double-talk (two people speak at the same time) detector that prevents false adaptation during near-end speech.

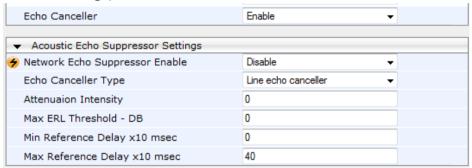

The device also supports acoustic echo cancellation for SBC calls. These echoes are composed of undesirable acoustical reflections (non-linear) of the received signal (i.e., from the speaker) which find their way from multiple reflections such as walls and windows into

User's Manual 15. Media

the transmitted signal (i.e., microphone). Therefore, the party at the far end hears his / her echo. The device removes these echoes and sends only the near-end's desired speech signal to the network (i.e., to the far-end party). The echo is composed of a linear part and a nonlinear part. However, in the Acoustic Echo Canceler, a substantial part of the echo is non-linear echo. To support this feature, the Forced Transcoding feature must be enabled so that the device uses DSPs.

The following procedure describes how to configure echo cancellation using the Web interface:

- To configure echo cancellation using the Web interface:
- 1. Configure line echo cancellation:
 - a. Open the Voice Settings page (Configuration tab > VoIP menu > Media > Voice Settings).

- **b.** Set the 'Echo Canceller' field (*EnableEchoCanceller*) to **Enable**.
- Enable acoustic echo cancellation for SBC calls:
 - **a.** In the Voice Settings page, configure the following parameters:
 - 'Network Echo Suppressor Enable' (AcousticEchoSuppressorSupport) enables the network Acoustic Echo Suppressor
 - 'Echo Canceller Type' (EchoCanceller Type) defines the echo canceller type
 - 'Attenuation Intensity' (AcousticEchoSuppAttenuationIntensity) defines the acoustic echo suppressor signals identified as echo attenuation intensity
 - 'Max ERL Threshold' (AcousticEchoSuppMaxERLThreshold) defines the acoustic echo suppressor maximum ratio between signal level and returned echo from the phone
 - 'Min Reference Delay' (AcousticEchoSuppMinRefDelayx10ms) defines the acoustic echo suppressor minimum reference delay
 - 'Max Reference Delay' (AcousticEchoSuppMaxRefDelayx10ms) defines the acoustic echo suppressor maximum reference delay
 - Open the IP Profile Settings page (Configuration tab > VoIP menu > Coders and Profiles > IP Profile Settings), and set the 'Echo Canceller' field to Acoustic.
 - c. Enable the Forced Transcoding feature (using the TranscodingMode parameter) to allow the device to use DSP channels, which are required for acoustic echo cancellation.

Note: The following additional echo cancellation parameters are configurable only through the *ini* file:

- ECHybridLoss defines the four-wire to two-wire worst-case Hybrid loss
- ECNLPMode defines the echo cancellation Non-Linear Processing (NLP) mode
- EchoCancellerAggressiveNLP enables Aggressive NLP at the first 0.5 second of the call

15.2 Fax and Modem Capabilities

This section describes the device's fax and modem capabilities and corresponding configuration. The fax and modem configuration is done in the Fax/Modem/CID Settings page.

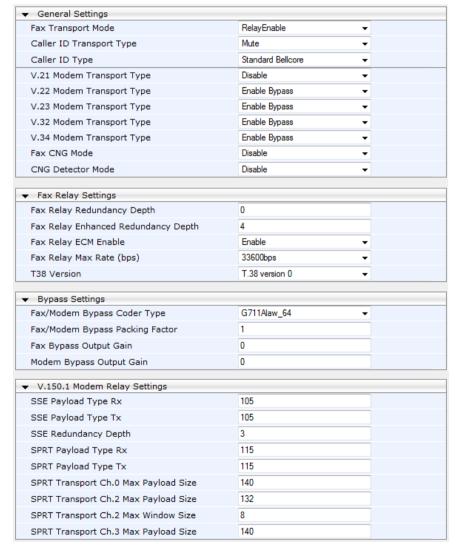

Notes:

- Unless otherwise specified, the configuration parameters mentioned in this section are available on this page.
- Some SIP parameters override these fax and modem parameters. For example, the IsFaxUsed parameter and V.152 parameters in Section "V.152 Support" on page 190.
- For a detailed description of the parameters appearing on this page, see "Configuration Parameters Reference" on page 691.

> To access the fax and modem parameters:

Open the Fax/Modem/CID Settings page (Configuration tab > VolP menu > Media > Fax/Modem/CID Settings).

- Configure the parameters, as required.
- 3. Click Submit.

User's Manual 15. Media

15.2.1 Fax/Modem Operating Modes

The device supports two modes of operation:

Fax/modem negotiation that is not performed during the establishment of the call.

Voice-band data (VBD) mode for V.152 implementation (see "V.152 Support" on page 190): fax/modem capabilities are negotiated between the device and the remote endpoint at the establishment of the call. During a call, when a fax/modem signal is detected, transition from voice to VBD (or T.38) is automatically performed and no additional SIP signaling is required. If negotiation fails (i.e., no match is achieved for any of the transport capabilities), fallback to existing logic occurs (according to the parameter IsFaxUsed).

15.2.2 Fax/Modem Transport Modes

The device supports the following transport modes for fax per modem type (V.22/V.23/Bell/V.32/V.34):

- T.38 fax relay (see "T.38 Fax Relay Mode" on page 177)
- G.711 Transport: switching to G.711 when fax/modem is detected (see "G.711 Fax / Modem Transport Mode" on page 180)
- Fax fallback to G.711 if T.38 is not supported (see "Fax Fallback" on page 180)
- Fax and modem bypass: a proprietary method that uses a high bit rate coder (see "Fax/Modem Bypass Mode" on page 181)
- NSE Cisco's Pass-through bypass mode for fax and modem (see "Fax / Modem NSE Mode" on page 182)
- Transparent with events: passing the fax / modem signal in the current voice coder with adaptations (see "Fax / Modem Transparent with Events Mode" on page 183)
- Transparent: passing the fax / modem signal in the current voice coder (see "Fax / Modem Transparent Mode" on page 183)
- RFC 2833 ANS Report upon Fax/Modem Detection (see "RFC 2833 ANS Report upon Fax/Modem Detection" on page 184)

'Adaptations' refer to automatic reconfiguration of certain DSP features for handling fax/modem streams differently than voice.

15.2.2.1 T.38 Fax Relay Mode

In Fax Relay mode, fax signals are transferred using the T.38 protocol. T.38 is the ITU standard for sending fax across IP networks in real-time mode. The device currently supports only the T.38 UDP syntax.

T.38 can be configured in the following ways:

- Switching to T.38 mode using SIP Re-INVITE messages (see "Switching to T.38 Mode using SIP Re-INVITE" on page 178)
- Automatically switching to T.38 mode without using SIP Re-INVITE messages (see "Automatically Switching to T.38 Mode without SIP Re-INVITE" on page 178)

When fax transmission ends, the reverse switching from fax relay to voice is automatically performed at both the local and remote endpoints.

You can change the fax rate declared in the SDP, using the 'Fax Relay Max Rate' parameter (FaxRelayMaxRate). This parameter does not affect the actual transmission rate. You can also enable or disable Error Correction Mode (ECM) fax mode using the 'Fax Relay ECM Enable' parameter (FaxRelayECMEnable).

When using T.38 mode, you can define a redundancy feature to improve fax transmission over congested IP networks. This feature is activated using the 'Fax Relay Redundancy Depth' parameter (FaxRelayRedundancyDepth) and the 'Fax Relay Enhanced Redundancy Depth' parameter (FaxRelayEnhancedRedundancyDepth). Although this is a proprietary redundancy scheme, it should not create problems when working with other T.38 decoders.

15.2.2.1.1 Switching to T.38 Mode using SIP Re-INVITE

In the Switching to T.38 Mode using SIP Re-INVITE mode, upon detection of a fax signal the terminating device negotiates T.38 capabilities using a Re-INVITE message. If the farend device doesn't support T.38, the fax fails. In this mode, the 'Fax Transport Mode' parameter (FaxTransportMode) is ignored.

To configure T.38 mode using SIP Re-INVITE messages:

- In the SIP General Parameters page (Configuration tab > VolP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to T.38 Relay (IsFaxUsed = 1).
- 2. In the Fax/Modem/CID Settings page, configure the following optional parameters:
 - 'Fax Relay Redundancy Depth' (FaxRelayRedundancyDepth)
 - 'Fax Relay Enhanced Redundancy Depth' (FaxRelayEnhancedRedundancyDepth)
 - 'Fax Relay ECM Enable' (FaxRelayECMEnable)
 - 'Fax Relay Max Rate' (FaxRelayMaxRate)

Note: The terminating gateway sends T.38 packets immediately after the T.38 capabilities are negotiated in SIP. The originating device sends no-op T.38 packets after the T.38 capabilities are negotiated in SIP. For this feature to function, no-op packets must be enabled (NoOpEnable = 1).

15.2.2.1.2 Automatically Switching to T.38 Mode without SIP Re-INVITE

In the Automatically Switching to T.38 Mode without SIP Re-INVITE mode, when a fax signal is detected, the channel automatically switches from the current voice coder to answer tone mode and then to T.38-compliant fax relay mode.

To configure automatic T.38 mode:

- In the SIP General Parameters page (Configuration tab > VoIP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to No Fax (IsFaxUsed = 0).
- In the Fax/Modem/CID Settings page, set the 'Fax Transport Mode' parameter to T.38 Relay (FaxTransportMode = 1).
- 3. Configure the following optional parameters:
 - 'Fax Relay Redundancy Depth' (FaxRelayRedundancyDepth)
 - 'Fax Relay Enhanced Redundancy Depth' (FaxRelayEnhancedRedundancyDepth)
 - 'Fax Relay ECM Enable' (FaxRelayECMEnable)
 - 'Fax Relay Max Rate' (FaxRelayMaxRate)

User's Manual 15. Media

15.2.2.1.3 Fax over IP using T.38 Transmission over RTP

The device supports Fax-over-IP (FoIP) transmission using T.38 over RTP, whereby the T.38 payload is encapsulated in the RTP packet, instead of being sent in dedicated T.38 packets (out-of-band). To configure this support, set the coder type to T.38 Over RTP.

To indicate T.38 over RTP, the SDP body uses "udptl" (Facsimile UDP Transport Layer) in the 'a=ftmp' line. The device supports T.38 over RTP according to this standard as well as according to AudioCodes proprietary method:

Call Parties belong to AudioCodes Devices: AudioCodes proprietary T.38-over-RTP method is used, whereby the device encapsulates the entire T.38 packet (payload with all its headers) in the sent RTP. For T.38 over RTP, AudioCodes devices use the proprietary identifier "AcUdptl" in the 'a=ftmp' line of the SDP. For example:

```
v=0
o=AudiocodesGW 1357424688 1357424660 IN IP4 10.8.6.68
s=Phone-Call
c=IN IP4 10.8.6.68
t = 0 0
m=audio 6080 RTP/AVP 18 100 96
a=ptime:20
a=sendrecv
a=rtpmap:18 G729/8000
a=fmtp:18 annexb=no
a=rtpmap:100 t38/8000
a=fmtp:100 T38FaxVersion=0
a=fmtp:100 T38MaxBitRate=0
a=fmtp:100 T38FaxMaxBuffer=3000
a=fmtp:100 T38FaxMaxDatagram=122
a=fmtp:100 T38FaxRateManagement=transferredTCF
a=fmtp:100 T38FaxUdpEC=t38UDPRedundancy
a=fmtp:100 AcUdptl
a=rtpmap:96 telephone-event/8000
a=fmtp:96 0-15
```

AudioCodes Call Party with non-AudioCodes Party: The device uses the standard T.38-over-RTP method, which encapsulates the T.38 payload only, without its headers (i.e., includes only fax data) in the sent RTP packet (RFC 4612).

The T.38-over-RTP method also depends on call initiator:

- **Device initiates a call:** The device always sends the SDP offer with the proprietary token "AcUdpTI" in the 'fmtp' attribute. If the SDP answer includes the same token, the device employs AudioCodes proprietary T.38-over-RTP mode; otherwise, the standard mode is used.
- **Device answers a call:** If the SDP offer from the remote party contains the 'fmtp' attribute with "AcUdpTI", the device answers with the same attribute and employs AudioCodes proprietary T.38-over-RTP mode; otherwise, the standard mode is used.

Note: If both T.38 (regular) and T.38 Over RTP coders are negotiated between the call parties, the device uses T.38 Over RTP.

15.2.2.2 G.711 Fax / Modem Transport Mode

In this mode, when the terminating device detects fax or modem signals (CED or AnsAM), it sends a Re-INVITE message to the originating device, requesting it to re-open the channel in G.711 VBD with the following adaptations:

- Echo Canceller = off
- Silence Compression = off
- Echo Canceller Non-Linear Processor Mode = off
- Dynamic Jitter Buffer Minimum Delay = 40
- Dynamic Jitter Buffer Optimization Factor = 13

After a few seconds upon detection of fax V.21 preamble or super G3 fax signals, the device sends a second Re-INVITE enabling the echo canceller (the echo canceller is disabled only on modem transmission).

A 'gpmd' attribute is added to the SDP according to the following format:

For G.711 A-law:

a=gpmd:0 vbd=yes;ecan=on (or off for modems)

For G.711 μ-law:

a=qpmd:8 vbd=yes;ecan=on (or off for modems)

The following parameters are ignored and automatically set to **Events Only**:

- 'Fax Transport Mode' (FaxTransportMode)
- 'Vxx ModemTransportType' (VxxModemTransportType)
- > To configure fax / modem transparent mode:
- In the SIP General Parameters page (Configuration tab > VoIP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to G.711 Transport (IsFaxUsed = 2).

15.2.2.3 Fax Fallback

In this mode, when the terminating device detects a fax signal, it sends a Re-INVITE message to the originating device with T.38. If the remote device doesn't support T.38 (replies with SIP response 415 "Media Not Supported"), the device sends a new Re-INVITE with G.711 VBD with the following adaptations:

- Echo Canceller = on
- Silence Compression = off
- Echo Canceller Non-Linear Processor Mode = off
- Dynamic Jitter Buffer Minimum Delay = 40
- Dynamic Jitter Buffer Optimization Factor = 13

When the device initiates a fax session using G.711, a 'gpmd' attribute is added to the SDP according to the following format:

For G.711A-law:

a=gpmd:0 vbd=yes;ecan=on

For G.711 μ-law:

a=gpmd:8 vbd=yes;ecan=on

In this mode, the 'Fax Transport Mode' (FaxTransportMode) parameter is ignored and automatically set to **Disable** (transparent mode).

To configure fax fallback mode:

In the SIP General Parameters page (Configuration tab > VoIP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to Fax Fallback (IsFaxUsed = 3).

15.2.2.4 Fax/Modem Bypass Mode

In this proprietary mode, when fax or modem signals are detected, the channel automatically switches from the current voice coder to a high bit-rate coder, according to the 'Fax/Modem Bypass Coder Type' parameter (FaxModemBypassCoderType). The channel is also automatically reconfigured with the following fax / modem adaptations:

- Disables silence suppression
- Enables echo cancellation for fax
- Disables echo cancellation for modem
- Performs certain jitter buffering optimizations

The network packets generated and received during the bypass period are regular voice RTP packets (per the selected bypass coder), but with a different RTP payload type according to the following parameters:

- 'Fax Bypass Payload Type' (FaxBypassPayloadType)
- ModemBypassPayloadType (ini file)

During the bypass period, the coder uses the packing factor, configured by the 'Fax/Modem Bypass Packing Factor' parameter (FaxModemBypassM). The packing factor determines the number of coder payloads (each the size of FaxModemBypassBasicRTPPacketInterval) that are used to generate a single fax/modem bypass packet. When fax/modem transmission ends, the reverse switching, from bypass coder to regular voice coder is performed.

To configure fax / modem bypass mode:

- In the SIP General Parameters page (Configuration tab > VolP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to No Fax (IsFaxUsed = 0).
- 2. In the Fax/Modem/CID Settings page, do the following:
 - a. Set the 'Fax Transport Mode' parameter to **Bypass** (FaxTransportMode = 2).
 - **b.** Set the 'V.21 Modem Transport Type' parameter to **Enable Bypass** (V21ModemTransportType = 2).
 - **c.** Set the 'V.22 Modem Transport Type' parameter to **Enable Bypass** (V22ModemTransportType = 2).
 - **d.** Set the 'V.23 Modem Transport Type' parameter to **Enable Bypass** (V23ModemTransportType = 2).
 - Set the 'V.32 Modem Transport Type' parameter to Enable Bypass (V32ModemTransportType = 2).
 - **f.** Set the 'V.34 Modem Transport Type' parameter to **Enable Bypass** (V34ModemTransportType = 2).
- 3. Set the ini file parameter, BellModemTransportType to 2 (Bypass).
- 4. Configure the following optional parameters:
 - 'Fax/Modem Bypass Coder Type' (FaxModemBypassCoderType).
 - 'Fax Bypass Payload Type' (FaxBypassPayloadType) in the RTP/RTCP Settings page (Configuration tab > VoIP menu > Media > RTP/RTCP Settings).
 - ModemBypassPayloadType (ini file).

- FaxModemBypassBasicRTPPacketInterval (ini file).
- FaxModemBypasDJBufMinDelay (ini file).

Note: When the device is configured for modem bypass and T.38 fax, V.21 low-speed modems are not supported and fail as a result.

Tip: When the remote (non-AudioCodes) gateway uses the G.711 coder for voice and doesn't change the coder payload type for fax or modem transmission, it is recommended to use the Bypass mode with the following configuration:

- EnableFaxModemInbandNetworkDetection = 1.
- 'Fax/Modem Bypass Coder Type' = same coder used for voice.
- 'Fax/Modem Bypass Packing Factor'(FaxModemBypassM) = same interval as voice.
- ModemBypassPayloadType = 8 if voice coder is A-Law or 0 if voice coder is Mu-Law.

15.2.2.5 Fax / Modem NSE Mode

In this mode, fax and modem signals are transferred using Cisco-compatible Pass-through bypass mode. Upon detection of fax or modem answering tone signal, the terminating device sends three to six special NSE RTP packets (configured by the NSEpayloadType parameter; usually to 100). These packets signal the remote device to switch to G.711 coder, according to the 'Fax/Modem Bypass Packing Factor' parameter. After a few NSE packets are exchanged between the devices, both devices start using G.711 packets with standard payload type (8 for G.711 A-Law and 0 for G.711 Mu-Law). In this mode, no Re-INVITE messages are sent. The voice channel is optimized for fax/modem transmission (same as for usual bypass mode).

The parameters defining payload type for AudioCodes proprietary Bypass mode -- 'Fax Bypass Payload Type' (RTP/RTCP Settings page) and ModemBypassPayloadType (ini file) -- are not used with NSE Bypass.

When configured for NSE mode, the device includes in its SDP the following line:

a=rtpmap:100 X-NSE/8000

Where 100 is the NSE payload type.

The Cisco gateway must include the following definition:

modem passthrough nse payload-type 100 codec g711alaw

To configure NSE mode:

- In the SIP General Parameters page (Configuration tab > VolP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to No Fax (IsFaxUsed = 0).
- 2. In the Fax/Modem/CID Settings page, do the following:
 - a. Set the 'Fax Transport Mode' parameter to **Bypass** (FaxTransportMode = 2).
 - b. Set the 'V.21 Modem Transport Type' parameter to Enable Bypass (V21ModemTransportType = 2).
 - Set the 'V.22 Modem Transport Type' parameter to Enable Bypass (V22ModemTransportType = 2).
 - **d.** Set the 'V.23 Modem Transport Type' parameter to **Enable Bypass** (V23ModemTransportType = 2).

- **e.** Set the 'V.32 Modern Transport Type' parameter to **Enable Bypass** (V32ModernTransportType = 2).
- f. Set the 'V.34 Modem Transport Type' parameter to Enable Bypass (V34ModemTransportType = 2).
- **3.** Set the ini file parameter, BellModemTransportType to 2 (Bypass).
- 4. Set the ini file parameter, NSEMode parameter to 1 (enables NSE).
- 5. Set the ini file parameter, NSEPayloadType parameter to 100.

15.2.2.6 Fax / Modem Transparent with Events Mode

In this mode, fax and modem signals are transferred using the current voice coder with the following automatic adaptations:

- Echo Canceller = on (or off for modems)
- Echo Canceller Non-Linear Processor Mode = off
- Jitter buffering optimizations
- To configure fax / modem transparent with events mode:
- In the SIP General Parameters page (Configuration tab > VoIP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to No Fax (IsFaxUsed = 0).
- 2. In the Fax/Modem/CID Settings page, do the following:
 - Set the 'Fax Transport Mode' parameter to Events Only (FaxTransportMode = 3).
 - b. Set the 'V.21 Modem Transport Type' parameter to Events Only (V21ModemTransportType = 3).
 - **c.** Set the 'V.22 Modem Transport Type' parameter to **Events Only** (V22ModemTransportType = 3).
 - d. Set the 'V.23 Modern Transport Type' parameter to Events Only (V23ModernTransportType = 3).
 - **e.** Set the 'V.32 Modem Transport Type' parameter to **Events Only** (V32ModemTransportType = 3).
 - **f.** Set the 'V.34 Modem Transport Type' parameter to **Events Only** (V34ModemTransportType = 3).
- 3. Set the ini file parameter, BellModemTransportType to 3 (transparent with events).

15.2.2.7 Fax / Modem Transparent Mode

In this mode, fax and modem signals are transferred using the current voice coder without notifications to the user and without automatic adaptations. It's possible to use Profiles (see "Coders and Profiles" on page 307) to apply certain adaptations to the channel used for fax / modem. For example, to use the coder G.711, to set the jitter buffer optimization factor to 13, and to enable echo cancellation for fax and disable it for modem.

- To configure fax / modem transparent mode:
- In the SIP General Parameters page (Configuration tab > VolP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to No Fax (IsFaxUsed = 0).
- 2. In the Fax/Modem/CID Settings page, do the following:
 - **a.** Set the 'Fax Transport Mode' parameter to **Disable** (FaxTransportMode = 0).
 - **b.** Set the 'V.21 Modem Transport Type' parameter to **Disable** (V21ModemTransportType = 0).

- **c.** Set the 'V.22 Modem Transport Type' parameter to **Disable** (V22ModemTransportType = 0).
- **d.** Set the 'V.23 Modem Transport Type' parameter to **Disable** (V23ModemTransportType = 0).
- **e.** Set the 'V.32 Modem Transport Type' parameter to **Disable** (V32ModemTransportType = 0).
- **f.** Set the 'V.34 Modem Transport Type' parameter to **Disable** (V34ModemTransportType = 0).
- 3. Set the ini file parameter, BellModemTransportType to 0 (transparent mode).
- 4. Configure the following optional parameters:
 - Coders table (Configuration tab > VolP menu > Coders and Profiles > Coders).
 - b. 'Dynamic Jitter Buffer Optimization Factor' (DJBufOptFactor) RTP/RTCP Settings page (Configuration tab > VolP menu > Media > RTP/RTCP Settings).
 - 'Silence Suppression' (EnableSilenceCompression) Voice Settings page (Configuration tab > VoIP menu > Media > Voice Settings).
 - **d.** 'Echo Canceller' (EnableEchoCanceller) Voice Settings page.

Note: This mode can be used for fax, but is not recommended for modem transmission. Instead, use the Bypass (see "Fax/Modem Bypass Mode" on page 181) or Transparent with Events modes (see "Fax / Modem Transparent with Events Mode" on page 183) for modem.

15.2.2.8 RFC 2833 ANS Report upon Fax/Modem Detection

The device (terminator gateway) sends RFC 2833 ANS/ANSam events upon detection of fax and/or modem answer tones (i.e., CED tone). This causes the originator to switch to fax/modem. This parameter is applicable only when the fax or modem transport type is set to bypass, Transparent-with-Events, V.152 VBD, or G.711 transport. When the device is located on the originator side, it ignores these RFC 2833 events

- To configure RFC 2833 ANS Report upon fax/modem detection:
- In the SIP General Parameters page (Configuration tab > VolP menu > SIP Definitions > General Parameters), set the 'Fax Signaling Method' parameter to No Fax or Fax Fallback (IsFaxUsed = 0 or 3).
- 2. In the Fax/Modem/CID Settings page, do the following:
 - a. Set the 'Fax Transport Mode' parameter to **Bypass** (FaxTransportMode = 2).
 - Set the 'V.xx Modem Transport Type' parameters to Enable Bypass (VxxModemTransportType = 2).
- 3. Set the ini file parameter, FaxModemNTEMode to 1 (enables this feature).

15.2.3 V.34 Fax Support

V.34 fax machines can transmit data over IP to the remote side using various methods. The device supports the following modes for transporting V.34 fax data over IP:

- T38 Version 3 V.34 fax relay mode
- Bypass mechanism for V.34 fax transmission (see "Bypass Mechanism for V.34 Fax Transmission" on page 185)
- T38 Version 0 relay mode, i.e., fallback to T.38 (see "Relay Mode for T.30 and V.34 Faxes" on page 186)

To configure whether to pass V.34 over T38 fax relay, or use Bypass over the High Bit Rate coder (e.g. PCM A-Law), use the 'V.34 Fax Transport Type' parameter (V34FaxTransportType).

You can use the 'SIP T.38 Version' parameter (SIPT38Version) in the Advanced Parameters page (Configuration tab > VoIP menu > SIP Definitions > Advanced Parameters) to configure one of the following:

- Pass V.34 over T.38 fax relay using bit rates of up to 33,600 bps ('SIP T.38 Version' is set to Version 3).
- Use Fax-over-T.38 fallback to T.30, using up to 14,400 bps ('SIP T.38 Version' is set to Version 0).

Notes:

- For T.38 Version 3 support, ensure that the relevant DSP firmware template is installed on the device. For a list of supported DSP templates, see DSP Templates.
- The CNG detector is disabled in all the subsequent examples. To disable the CNG detector, set the 'CNG Detector Mode' parameter (CNGDetectorMode) to Disable.

15.2.3.1 Bypass Mechanism for V.34 Fax Transmission

In this proprietary scenario, the device uses bypass (or NSE) mode to transmit V.34 faxes, enabling the full utilization of its speed.

- To use bypass mode for T.30 and V.34 faxes:
- 1. In the Fax/Modem/CID Settings page, do the following:
 - **a.** Set the 'Fax Transport Mode' parameter to **Bypass** (FaxTransportMode = 2).
 - **b.** Set the 'V.22 Modem Transport Type' parameter to **Enable Bypass** (V22ModemTransportType = 2).
 - Set the 'V.23 Modem Transport Type' parameter to Enable Bypass (V23ModemTransportType = 2).
 - **d.** Set the 'V.32 Modern Transport Type' parameter to **Enable Bypass** (V32ModernTransportType = 2).
 - e. Set the 'V.34 Modem Transport Type' parameter to Enable Bypass (V34ModemTransportType = 2).
- 2. Set the ini file parameter, V34FaxTransportType to 2 (Bypass).
- To use bypass mode for V.34 faxes, and T.38 for T.30 faxes:
- 1. In the Fax/Modem/CID Settings page, do the following:
 - a. Set the 'Fax Transport Mode' parameter to **T.38 Relay** (FaxTransportMode = 1).
 - **b.** Set the 'V.22 Modem Transport Type' parameter to **Enable Bypass** (V22ModemTransportType = 2).
 - **c.** Set the 'V.23 Modem Transport Type' parameter to **Enable Bypass** (V23ModemTransportType = 2).
 - d. Set the 'V.32 Modem Transport Type' parameter to Enable Bypass (V32ModemTransportType = 2).
 - **e.** Set the 'V.34 Modem Transport Type' parameter to **Enable Bypass** (V34ModemTransportType = 2).
- 2. Set the ini file parameter, V34FaxTransportType to 2 (Bypass).

15.2.3.2 Relay Mode for T.30 and V.34 Faxes

In this scenario, V.34 fax machines are forced to use their backward compatibility with T.30 faxes and operate in the slower T.30 mode.

To use T.38 mode for V.34 and T.30 faxes:

- 1. In the Fax/Modem/CID Settings page, do the following:
 - **a.** Set the 'Fax Transport Mode' parameter to **T.38 Relay** (FaxTransportMode = 1).
 - b. Set the 'V.22 Modem Transport Type' parameter to **Disable** (V22ModemTransportType = 0).
 - **c.** Set the 'V.23 Modem Transport Type' parameter to **Disable** (V23ModemTransportType = 0).
 - **d.** Set the 'V.32 Modem Transport Type' parameter to **Disable** (V32ModemTransportType = 0).
 - **e.** Set the 'V.34 Modem Transport Type' parameter to **Disable** (V34ModemTransportType = 0).
- 2. Set the ini file parameter, V34FaxTransportType to 1 (Relay).
- To allow V.34 fax relay over T.38:
- In the Advanced Parameters page (Configuration tab > VoIP menu > SIP Definitions > Advanced Parameters), set the 'SIP T.38 Version' parameter to Version 3 (SIPT38Version = 3).
- To force V.34 fax machines to use their backward compatibility with T.30 faxes and operate in the slower T.30 mode:
- Set the 'SIP T.38 Version' parameter to Version 0 (SIPT38Version = 0).

15.2.3.3 V.34 Fax Relay for SG3 Fax Machines

Super Group 3 (SG3) is a standard for fax machines that support speeds of up to 33.6 kbps through V.34 half duplex (HD) modulation. This procedure below describes how to configure V.34 (SG3) fax relay support based on ITU Specification T.38 version 3.

- To enable support for V.34 fax relay (T.38) at SG3 speed:
- In the IP Profile table (Configuration tab > VoIP menu > Coders and Profiles > IP Profile Settings), configure an IP Profile with the 'Fax Signaling Method' parameter (IpProfile_IsFaxUsed) set to T.38 Relay.
- 2. In the General Settings page (Configuration tab > VoIP menu > Media > General Media Settings), set the 'DSP Version Template Number' parameter (DSPVersionTemplateNumber) to "10" to support up to 1,512 channels. Reset the device for the settings to take effect.
- 3. In the Coders Table (Configuration tab > VoIP menu > Coders and Profiles > Coders), set the coder used by the device to G.729 (or any other supported codec).

Note: See DSP Templates to check the coder support for DSP Template 10.

- 4. On the Fax/Modem/CID Settings page, do the following settings:
 - a. 'SIP T.38 Version' to **Version 3** (SIPT38Version = 3).
 - **b.** 'Fax Relay Max Rate' (RelayMaxRate) to **33,600bps** (default).
 - c. 'CNG Detector Mode' (CNGDetectorMode) to **Disable** (default).

- **d.** 'V.21 Modem Transport Type' to **Disable** (V21ModemTransportType = 0).
- **e.** 'V.22 Modem Transport Type' to **Disable** (V22ModemTransportType = 0).
- **f.** 'V.23 Modem Transport Type' to **Disable** (V23ModemTransportType = 0).
- **g.** 'V.32 Modem Transport Type' to **Disable** (V32ModemTransportType = 0).
- **h.** 'V.34 Modem Transport Type' to **Disable** (V34ModemTransportType = 0).
- i. 'CED Transfer Mode' to Fax Relay or VBD (CEDTransferMode = 0).
- 5. Set the ini file parameter, V34FaxTransportType to 1 (i.e., relay).
- 6. Set the ini file parameter, T38MaxDatagramSize to 560 (default).

Notes:

- The T.38 negotiation should be completed at call start according to V.152 procedure (as shown in the INVITE example below).
- T.38 mid-call Re-INVITEs are supported.
- If the remote party supports only T.38 Version 0, the device "downgrades" the T.38 Version 3 to T.38 Version 0.

For example, the device sends or receives the following INVITE message, negotiating both audio and image media:

```
INVITE sip:2001@10.8.211.250;user=phone SIP/2.0

15.2.4 V.150.1 Modem Relay

The device can be configured to transfer modem calls using a subset of the ITU-T V.150.1 Modem Relay protocol. The device also supports V.150.1 modem relay coder negotiation in the initial SIP INVITE and 200 OK, using the SDP body according to the USA Department of Defense (DoD) UCR-2008, Change 2 specification. This eliminates the need for sending a re-INVITE to negotiate V.150.1. The device sends an INVITE's SDP offer in a format to negotiate V.150 modem relay using the same port as RTP, as shown in the example below:

```
a=cdsc:1 audio udpsprt 114\r\n
a=cpar:a=sprtmap:114 v150mr/8000\r\n
a=cpar:a=fmtp:114
mr=1;mg=0;CDSCselect=1;mrmods=1,3;jmdelay=no;versn=1.1\r\n\
```

You can configure the payload type for the outgoing SDP offer, using the NoAudioPayloadType parameter. You can set this parameter to "NoAudio", whereby RTP is not sent and the device adds an audio media only for the Modem Relay purpose. This is also in accordance to DOD UCR 2008 specification: "The AS-SIP signaling appliance MUST advertise the "NoAudio" payload type to interoperate with a "Modem Relay-Preferred" endpoint that immediately transitions to the Modem Relay state without first transmitting voice information in the Audio state."

Notes:

- The V.150.1 Modem Relay feature is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see "Software License Key" on page 575.
- The V.150.1 Modem Relay feature support is a subset of the full V.150.1 protocol and is designed according to the US DoD requirement document. It therefore, cannot be used for general purposes.
- The V.150.1 feature has been tested with certain IP phones. For more details, please contact your AudioCodes sales representative.
- The V.150.1 SSE Tx payload type is according to the offered SDP of the remote side.
- The V.150.1 SPRT Rx payload type is according to the 'Payload Type' field in the Coders table.
- The V.150.1 SPRT Tx payload type is according to the remote side offered SDP.

- ➤ To configure V.150.1 Modem relay:
- In the Coders Table (Configuration tab > VolP menu > Coders and Profiles > Coders), set the coder to V.150.
- 2. On the Fax/Modem/CID Settings page, configure the V.150.1 parameters appearing under the 'V.150.1 Modem Relay Settings' group:
 - a. Set the 'Profile Number' parameter (V1501AllocationProfile) to the amount of DSP channels allocated for regular voice and V.150.1 Modem Relay capability. Once the V.150.1 session has been negotiated and activated by SIP, a Modem Relay DSP channel is allocated alongside the existing allocated voice DSP channel. The DSP Modem Relay channel is responsible for the entire V.150.1 part of the call. The table below lists the currently supported DSP allocation options:

Blade	Profile Number Value	Number of Voice Channels	Number of Modem Channels
TP-8410 16 E1/21 T1	2	336	48
TP-8410 16 E1/21 T1	4	168	96
TP-8410	11	840	264
TP-6310	11	840	264

Table 15-1: DSP Allocation Options for V.150.1 Modem Relay

Notes:

- The TP-8410 16 E1/21 T1 blade provides 6 DSPs, supporting up to 21 DS1 spans. The TP-8410 and TP-6310 blades provide 21 DSPs, supporting up to 84 DS1 spans.
- The Number Of Voice Channels column represents channel density when the blade supports SRTP.
- a. Set the 'SSE Payload Type Rx' parameter to the V.150.1 SSE payload type that the device uses when it offers the SDP.
- **b.** Set the 'SSE Redundancy Depth' parameter to the number of sent SSE redundant packets. This parameter is important in case of network impairments.
- **c.** For additional V.150.1 related parameters, see "Fax and Modem Parameters" on page 790.

15.2.5 Simultaneous Negotiation of Fax (T.38) and Modem (V.150.1) Relay

The device can negotiate fax relay (T.38) and modem relay (V.150.1) sessions in the same, already established call channel. Fax relay sessions require bypass answering tone (CED) while modem relay requires RFC 2833 answering tone. As the device is not always aware at the start of the session whether the answering tone is fax or modem, it uses both methods for CED tone transfer and sends both answering tone types. Only when the answering tone is detected, does the device send the fax or modem.

To support this functionality, you need to configure a Coders Group (in the Coders Group table - see "Configuring Coder Groups" on page 310) that includes the T.38, V.150, and G.711/VBD coders.

15.2.6 V.152 Support

The device supports the ITU-T recommendation V.152 (Procedures for Supporting Voice-Band Data over IP Networks). Voice-band data (VBD) is the transport of modem, facsimile, and text telephony signals over a voice channel of a packet network with a codec appropriate for such signals.

For V.152 capability, the device supports T.38 as well as VBD codecs (i.e., G.711 A-law and G.711 μ -law). The selection of capabilities is performed using the coders table (see "Configuring Default Coders" on page 307).

When in VBD mode for V.152 implementation, support is negotiated between the device and the remote endpoint at the establishment of the call. During this time, initial exchange of call capabilities is exchanged in the outgoing SDP. These capabilities include whether VBD is supported and associated RTP payload types ('gpmd' SDP attribute), supported codecs, and packetization periods for all codec payload types ('ptime' SDP attribute). After this initial negotiation, no Re-INVITE messages are necessary as both endpoints are synchronized in terms of the other side's capabilities. If negotiation fails (i.e., no match was achieved for any of the transport capabilities), fallback to existing logic occurs (according to the parameter IsFaxUsed).

Below is an example of media descriptions of an SDP indicating support for V.152. In the example, V.152 implementation is supported (using the dynamic payload type 96 and G.711 u-law as the VBD codec) as well as the voice codecs G.711 µ-law and G.729.

```
v=0
o=- 0 0 IN IPV4 <IPAdressA>
s=-
t=0 0
p=+1
c=IN IP4 <IPAddressA
m=audio <udpPort A> RTP/AVP 18 0
a=ptime:10
a=rtpmap:96 PCMU/8000
a=gpmd: 96 vbd=yes
```

Instead of using VBD transport mode, the V.152 implementation can use alternative relay fax transport methods (e.g., fax relay over IP using T.38). The preferred V.152 transport method is indicated by the SDP 'pmft' attribute. Omission of this attribute in the SDP content means that VBD mode is the preferred transport mechanism for voice-band data. To configure T.38 mode, use the CodersGroup parameter.

Note: You can also configure the device to handle G.711 coders received in INVITE SDP offers as VBD coders, using the HandleG711asVBD parameter. For example, if the device is configured with G.729 and G.711 VBD coders and it receives an INVITE with an SDP offer containing G.729 and "regular" G.711 coders, it sends an SDP answer containing G.729 and G.711 VBD coders, allowing subsequent bypass (passthrough) sessions if fax / modem signals are detected during the call.

15.2.7 Fax Transmission behind NAT

The device supports transmission from fax machines (connected to the device) located inside (behind) a Network Address Translation (NAT). Generally, the firewall blocks T.38 (and other) packets received from the WAN, unless the device behind the NAT sends at least one IP packet from the LAN to the WAN through the firewall. If the firewall blocks T.38 packets sent from the termination IP fax, the fax fails.

To overcome this, the device sends No-Op ("no-signal") packets to open a pinhole in the NAT for the answering fax machine. The originating fax does not wait for an answer, but immediately starts sending T.38 packets to the terminating fax machine upon receipt of a re-INVITE with T.38 only in the SDP, or T.38 and audio media in the SDP. This feature is

configured using the T38FaxSessionImmediateStart parameter. The No-Op packets are enabled using the NoOpEnable and NoOpInterval parameters.

15.3 Configuring RTP/RTCP Settings

This section describes configuration relating to Real-Time Transport Protocol (RTP) and RTP Control Protocol (RTCP).

15.3.1 Configuring the Dynamic Jitter Buffer

Voice frames are transmitted at a fixed rate. If the frames arrive at the other end at the same rate, voice quality is perceived as good. However, some frames may arrive slightly faster or slower than the other frames. This is called jitter (delay variation) and degrades the perceived voice quality. To minimize this problem, the device uses a jitter buffer. The jitter buffer collects voice packets, stores them and sends them to the voice processor in evenly spaced intervals.

The device uses a dynamic jitter buffer that can be configured with the following:

- **Minimum delay:** Defines the starting jitter capacity of the buffer. For example, at 0 msec, there is no buffering at the start. At the default level of 10 msec, the device always buffers incoming packets by at least 10 msec worth of voice frames.
- Optimization Factor: Defines how the jitter buffer tracks to changing network conditions. When set at its maximum value of 12, the dynamic buffer aggressively tracks changes in delay (based on packet loss statistics) to increase the size of the buffer and doesn't decay back down. This results in the best packet error performance, but at the cost of extra delay. At the minimum value of 0, the buffer tracks delays only to compensate for clock drift and quickly decays back to the minimum level. This optimizes the delay performance but at the expense of a higher error rate.

The default settings of 10 msec Minimum delay and 10 Optimization Factor should provide a good compromise between delay and error rate. The jitter buffer 'holds' incoming packets for 10 msec before making them available for decoding into voice. The coder polls frames from the buffer at regular intervals in order to produce continuous speech. As long as delays in the network do not change (jitter) by more than 10 msec from one packet to the next, there is always a sample in the buffer for the coder to use. If there is more than 10 msec of delay at any time during the call, the packet arrives too late. The coder tries to access a frame and is not able to find one. The coder must produce a voice sample even if a frame is not available. It therefore compensates for the missing packet by adding a Bad-Frame-Interpolation (BFI) packet. This loss is then flagged as the buffer being too small. The dynamic algorithm then causes the size of the buffer to increase for the next voice session. The size of the buffer may decrease again if the device notices that the buffer is not filling up as much as expected. At no time does the buffer decrease to less than the minimum size configured by the Minimum delay parameter.

In certain scenarios, the **Optimization Factor is set to 13**: One of the purposes of the Jitter Buffer mechanism is to compensate for clock drift. If the two sides of the VoIP call are not synchronized to the same clock source, one RTP source generates packets at a lower rate, causing under-runs at the remote Jitter Buffer. In normal operation (optimization factor 0 to 12), the Jitter Buffer mechanism detects and compensates for the clock drift by occasionally dropping a voice packet or by adding a BFI packet.

Fax and modem devices are sensitive to small packet losses or to added BFI packets. Therefore, to achieve better performance during modem and fax calls, the Optimization Factor should be set to 13. In this special mode the clock drift correction is performed less frequently - only when the Jitter Buffer is completely empty or completely full. When such condition occurs, the correction is performed by dropping several voice packets simultaneously or by adding several BFI packets simultaneously, so that the Jitter Buffer returns to its normal condition.

The following procedure describes how to configure the jitter buffer using the Web interface.

> To configure jitter buffer using the Web interface:

Open the RTP/RTCP Settings page (Configuration tab > VolP menu > Media > RTP/RTCP Settings). The relevant parameters are listed under the 'General Settings' group, as shown below:

Figure 15-4: Jitter Buffer Parameters in the RTP/RTCP Settings Page

- 2. Set the 'Dynamic Jitter Buffer Minimum Delay' parameter (DJBufMinDelay) to the minimum delay (in msec) for the Dynamic Jitter Buffer.
- **3.** Set the 'Dynamic Jitter Buffer Optimization Factor' parameter (DJBufOptFactor) to the Dynamic Jitter Buffer frame error/delay optimization factor.
- 4. Click Submit.

15.3.2 Comfort Noise Generation

The device can generate artificial background noise, called *comfort* noise, in the voice channel during periods of silence (i.e. when no call party is speaking) for Gateway calls. This is useful in that it reassures the call parties that the call is still connected. The device detects silence using its Voice Activity Detection (VAD) mechanism. When the Calling Tone (CNG) is enabled and silence is detected, the device transmits Silence Identifier Descriptors (SIDs) parameters to reproduce the local background noise at the remote (receiving) side.

The Comfort Noise Generation (CNG) support also depends on the silence suppression (SCE) setting for the coder used in the voice channel. For more information, see the description of the CNG-related parameters.

The following procedure describes how to configure CNG using the Web interface.

To configure CNG using the Web interface:

Open the RTP/RTCP Settings page (Configuration tab > VolP menu > Media > RTP/RTCP Settings). The relevant parameters are listed under the 'General Settings' group, as shown below:

Figure 15-5: Comfort Noise Parameter in RTP/RTCP Settings Page

- 2. Set the 'Comfort Noise Generation Negotiation' parameter (ComfortNoiseNegotiation) to **Enable**.
- 3. Click Submit.

Note: This feature is applicable only to the Gateway application.

15.3.3 Dual-Tone Multi-Frequency Signaling

This section describes the configuration of Dual-Tone Multi-Frequency (DTMF) signaling.

15.3.3.1 Configuring DTMF Transport Types

The device supports various methods for transporting DTMF digits over the IP network to the remote endpoint. These methods and their configuration are configured in the DTMF & Dialing page (Configuration tab > VoIP menu > GW and IP to IP > DTMF and Supplementary > DTMF & Dialing):

- Using INFO message according to Nortel IETF draft: DTMF digits are sent to the remote side in INFO messages. To enable this mode, define the following:
 - **a.** Set the 'Declare RFC 2833 in SDP' parameter to **No** (RxDTMFOption = 0).
 - **b.** Set the '1st Tx DTMF Option' parameter to **INFO (Nortel)** (TxDTMFOption = 1).

Note: In this mode, DTMF digits are removed from the audio stream (and the 'DTMF Transport Type' parameter is automatically set to **Mute DTMF**).

- Using INFO message according to Cisco's mode: DTMF digits are sent to the remote side in INFO messages. To enable this mode, define the following:
 - a. Set the 'Declare RFC 2833 in SDP' parameter to **No** (RxDTMFOption = 0).
 - **b.** Set the '1st Tx DTMF Option' parameter to **INFO (Cisco)** (TxDTMFOption = 3).

Note: In this mode, DTMF digits are removed from the audio stream (and the 'DTMF Transport Type' parameter is automatically set to **Mute DTMF**).

- Using NOTIFY messages according to IETF Internet-Draft draft-mahy-sipping-signaled-digits-01: DTMF digits are sent to the remote side using NOTIFY messages. To enable this mode, define the following:
 - **a.** Set the 'Declare RFC 2833 in SDP' parameter to **No** (RxDTMFOption = 0).
 - **b.** Set the '1st Tx DTMF Option' parameter to **NOTIFY** (TxDTMFOption = 2).

Note: In this mode, DTMF digits are removed from the audio stream (and the 'DTMF Transport Type' parameter is automatically set to **Mute DTMF**).

- Using RFC 2833 relay with Payload type negotiation: DTMF digits are sent to the remote side as part of the RTP stream according to RFC 2833. To enable this mode, define the following:
 - **a.** Set the 'Declare RFC 2833 in SDP' parameter to **Yes** (RxDTMFOption = 3).
 - b. Set the '1st Tx DTMF Option' parameter to RFC 2833 (TxDTMFOption = 4).

Note: To set the RFC 2833 payload type with a value other than its default, use the RFC2833PayloadType parameter. The device negotiates the RFC 2833 payload type using local and remote SDP and sends packets using the payload type from the received SDP. The device expects to receive RFC 2833 packets with the same payload type as configured by this parameter. If the remote side doesn't include 'telephony-event' in its SDP, the device sends DTMF digits in transparent mode (as part of the voice stream).

- Sending DTMF digits (in RTP packets) as part of the audio stream (DTMF Relay is disabled): This method is typically used with G.711 coders. With other low-bit rate (LBR) coders, the quality of the DTMF digits is reduced. To enable this mode, define the following:
 - a. Set the 'Declare RFC 2833 in SDP' parameter to **No** (RxDTMFOption = 0).
 - **b.** Set the '1st Tx DTMF Option' parameter to **Not Supported** (TxDTMFOption = 0).
 - **c.** Set the ini file parameter, DTMFTransportType to 2 (i.e., transparent).

- Using INFO message according to Korea mode: DTMF digits are sent to the remote side in INFO messages. To enable this mode, define the following:
 - **a.** Set the 'Declare RFC 2833 in SDP' parameter to **No** (RxDTMFOption = 0).
 - **b.** Set the '1st Tx DTMF Option' parameter to **INFO (Cisco)** (TxDTMFOption = 3).

Note: In this mode, DTMF digits are removed from the audio stream (and the 'DTMF Transport Type' parameter is automatically set to **Mute DTMF**).

Notes:

- The device is always ready to receive DTMF packets over IP in all possible transport modes: INFO messages, NOTIFY, and RFC 2833 (in proper payload type) or as part of the audio stream.
- To exclude RFC 2833 Telephony event parameter from the device's SDP, set the 'Declare RFC 2833 in SDP' parameter to No.

The following parameters affect the way the device handles the DTMF digits:

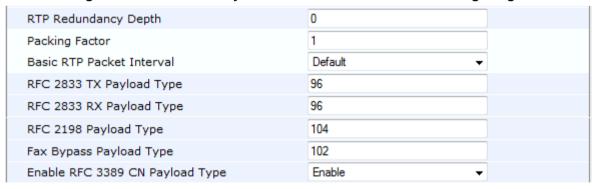

- TxDTMFOption, RxDTMFOption, RFC2833TxPayloadType, and RFC2833RxPayloadType
- MGCPDTMFDetectionPoint, DTMFVolume, DTMFTransportType, DTMFDigitLength, and DTMFInterDigitInterval

15.3.3.2 Configuring RFC 2833 Payload

The following procedure describes how to configure the RFC 2833 payload using the Web interface:

- To configure RFC 2833 payload using the Web interface:
- Open the RTP/RTCP Settings page (Configuration tab > VolP menu > Media > RTP/RTCP Settings). The relevant parameters are listed under the 'General Settings' group, as shown below:

Figure 15-6: RFC 2833 Payload Parameters in RTP/RTCP Settings Page

- **2.** Configure the following parameters:
 - 'RTP Redundancy Depth' (RTPRedundancyDepth) enables the device to generate RFC 2198 redundant packets.
 - 'Enable RTP Redundancy Negotiation' (EnableRTPRedundancyNegotiation) enables the device to include the RTP redundancy dynamic payload type in the
 SDP, according to RFC 2198.
 - 'RFC 2833 TX Payload Type' (RFC2833TxPayloadType) defines the Tx RFC 2833 DTMF relay dynamic payload type.

 'RFC 2833 RX Payload Type' (RFC2833RxPayloadType) - defines the Rx RFC 2833 DTMF relay dynamic payload type.

 'RFC 2198 Payload Type' (RFC2198PayloadType) - defines the RTP redundancy packet payload type according to RFC 2198.

Click Submit.

15.3.4 Configuring RTP Base UDP Port

You can configure the range of local UDP ports for RTP, RTCP, and T.38 media streams. The range of possible UDP ports that can be used, depending on configuration, is 6,000 through to 64,000. The device assigns ports randomly to the traffic within the configured port range.

For RTCP and T.38 traffic, the port offset from the RTP port used for the voice session (channel) is one and two, respectively. For example, if the voice session uses RTP port 6000, the RTCP port and T.38 port for the session is 6001 and 6002, respectively. However, you can configure the device to use the same port for RTP and T.38 packets, by setting the T38UseRTPPort parameter to 1.

Within the port range, the device allocates the UDP ports in "jumps" (spacing) of 10 (default). For example, if the port range starts at 6000 and the UDP port spacing is 10, the available ports include 6000, 6010, 6020, 6030, and so on.

The port range is calculated using the following equation:

BaseUDPPort to (BaseUDPPort + number of channels*10)

Where, *BaseUDPPort* is a parameter for configuring the lower boundary of the UDP port range (default is 6000).

For example, if the base UDP port is set to 6000, the port range for 20 channels is:

6000 to (6000 + 20*10) = 6000 to (6000 + 200) = 6000 to 6200

You can also configure specific port ranges per logical media-type IP network interface, using Media Realms (see Configuring Media Realms on page 263). However, the port range configured for the Media Realm must be within the range configured by the BaseUDPPort parameter.

The following procedure describes how to configure the RTP base UDP port in the Web interface.

To configure the RTP base UDP port:

Open the RTP/RTCP Settings page (Configuration tab > VolP menu > Media > RTP/RTCP Settings). The relevant parameter is listed under the 'General Settings' group, as shown below:

Figure 15-7: RTP Based UDP Port in RTP/RTCP Settings Page

6000

- 2. Set the 'RTP Base UDP Port' parameter to the required value.
- 3. Click Submit.
- 4. Reset the device for the settings to take effect.

Note: You can also configure the base UDP port for calls belonging to a specific SIP entity (IP Group), using IP Profiles (see Configuring IP Profiles on page 314).

15.4 Configuring IP Media Settings

This section describes the configuration of various IP media features.

15.4.1 Answering Machine Detection (AMD)

The device's Answering Machine Detection (AMD) feature can detect whether an outbound call has been answered by a human (including fax) or an answering machine. The device analyzes the sound (speech) patterns received in the first few seconds of the call to determine whether a human (live person) or machine has answered the call. Typically, when a human answers the call, there is a short "hello ..." followed by silence to wait for the other party to respond. In contrast, when an answering machine answers the call, there is constant speech (answering message) followed by a beep to leave a voice-mail message. Once the device detects what answered the call (human or machine), it can forward this information to, for example, a third-party, application server used for automatic dialing applications. You can also configure the device to disconnect IP-to-Tel calls upon detection of an answering machine on the Tel side. For more information, see 'Enabling IP-to-Tel Call Disconnection upon Detection of Answering Machine' on page 201.

The device's default AMD feature is based on voice detection for North American English. It uses AudioCodes sophisticated speech detection algorithms which are based on hundreds of real-life recordings of answered calls by live voice and answering machines in English. The algorithms are used to detect whether it's human or machine based on voice and silence duration as well as speech patterns. The algorithms of the language-based recordings are compiled into a file called AMD Sensitivity. This file is provided by default, pre-installed on the device.

If you wish to implement AMD in a different language or region or if you wish to fine-tune the default AMD algorithms to suit your specific deployment, please contact your AudioCodes sales representative for more information on this service. You will be typically required to provide AudioCodes with a database of recorded voices (calls) in the language on which the device's AMD feature can base its voice detector algorithms. The data needed for an accurate calibration should be recorded under the following guidelines:

- Statistical accuracy: The number of recorded calls should be as high as possible (at least 100) and varied. The calls must be made to different people. The calls must be made in the specific location in which the device's AMD feature is to operate.
- Real-life recording: The recordings should simulate real-life answering of a called person picking up the phone, and without the caller speaking.
- Normal environment interferences: The environment in which the recordings are done should simulate real-life scenarios, in other words, not sterile but not too noisy either. Interferences, for example, could include background noises of other people talking, spikes, and car noises.

Once you have provided AudioCodes with your database of recordings, AudioCodes compiles it into a loadable file. For a brief description of the file format and for installing the file on the device, see 'AMD Sensitivity File' on page 574.

Note: As the main factor (algorithm) for detecting human and machine is the voice pattern and silence duration, the language on which the detection algorithm is based, is in most cases not important as these factors are similar across most languages. Therefore, the default, pre-installed AMD Sensitivity file, which is based on North American English, may suffice your deployment even if the device is located in a region where a language other than English is used.

The device supports up to eight AMD algorithm suites called *Parameter Suites*, where each suite defines a range of detection sensitivity levels. Sensitivity levels refer to how accurately, based on AudioCodes voice detection algorithms, the device can detect whether a human or machine has answered the call. Each level supports a different

detection sensitivity to human and machine. For example, a specific sensitivity level may be more sensitive to detecting human than machine. In deployments where the likelihood of a call answered by an answering machine is low, it would be advisable to configure the device to use a sensitivity level that is more sensitive to human than machine. Each suite can support up to 16 sensitivity levels (0 to 15), except for Parameter Suite 0, which supports up to 8 levels (0 to 7). The default, pre-installed AMD Sensitivity file, based on North American English, provides the following Parameter Suites:

- Parameter Suite 0 (normal sensitivity) contains 8 sensitivity detection levels
- Parameter Suite 1 (high sensitivity) contains 16 sensitivity detection levels

As Parameter Suite 1 provides a greater range of detection sensitivity levels (i.e., higher detection resolution), this may be the preferable suite to use in your deployment.

The Parameter Suite and sensitivity level can be applied globally for all calls, or for specific calls using IP Profiles. For enabling AMD and selecting the Parameter Suite and sensitivity level, see 'Configuring AMD' on page 200.

The tables below show the success rates of the default, pre-installed AMD Sensitivity file (based on North American English) for correctly detecting "live" human voice and answering machine:

Approximate AMD Normal Detection Sensitivity - Parameter Suite 0 (Based on North American English)

AMD Detection Sensitivity	Performance		
	Success Rate for Live Calls	Success Rate for Answering Machine	
0 (Best for Answering Machine)	-	-	
1	82.56%	97.10%	
2	85.87%	96.43%	
3	88.57%	94.76%	
4	88.94%	94.31%	
5	90.42%	91.64%	
6	90.66%	91.30%	
7 (Best for Live Calls)	94.72%	76.14%	

Approximate AMD High Detection Sensitivity - Parameter Suite 1 (Based on North American English)

AMD Detection Sensitivity	Performance		
Sensitivity	Success Rate for Live Calls	Success Rate for Answering Machine	
0 (Best for Answering Machine)	72%	97%	
1	77%	96%	
2	79%	95%	

AMD Detection Sensitivity	Performance		
	Success Rate for Live Calls	Success Rate for Answering Machine	
3	80%	95%	
4	84%	94%	
5	86%	93%	
6	87%	92%	
7	88%	91%	
8	90%	89%	
9	90%	88%	
10	91%	87%	
11	94%	78%	
12	94%	73%	
13	95%	65%	
14	96%	62%	
15 (Best for Live Calls)	97%	46%	

When the device detects human or machine using its AMD feature, the device can notify an application server of the detection by sending a SIP INFO message that contains the following in its message body:

Human Voice:

```
Type= AMD
SubType= VOICE
```

Answering Machine:

```
Type= AMD
SubType= AUTOMATA
```

Silence (i.e., no voice detected):

```
Type= AMD
SubType= SILENT
```

The device can also detect beeps played by an answering machine at the end of its greeting message. The device also uses SIP INFO messages to report this detection. For more information, see 'Detecting Answering Machine Beeps' on page 199. The detected AMD type (e.g., voice) and success of detecting it correctly are also sent in CDR and Syslog messages. For information on Syslog fields for AMD, see Syslog Fields for Answering Machine Detection (AMD)' on page 661. For an example of a SIP call flow for AMD showing the SIP INFO messages, see 'SIP Call Flow Example of AMD' on page 199.

15.4.1.1 Detecting Answering Machine Beeps

The device supports the detection of the beep sound played by an answering machine to indicate the end of the answering machine's greeting message. This is useful in that the device can then notify, for example, a third-party, application server that it can now leave a voice message on the answering machine. The device supports the following methods for detecting and reporting beeps:

AMD-based Detection: The device uses its beep detector that is integrated in the AMD feature. You can configure the beep detection timeout and beep detection sensitivity level (for more information, see 'Configuring AMD' on page 200). To enable the AMD beep detection, the received INVITE message must contain an X-Detect header with the value "Request=AMD",

```
X-Detect: Request=AMD
```

and the AMDBeepDetectionMode parameter must be set to 1 or 2. If set to 1, the beep is detected only after the answering machine is detected. If set to 2, the beep is detected even if the answering machine was not detected.

Tone-based Detection (Call Progress Tone): The device detects the beep according to a call progress tone (CPT). This is enabled if the device receives a specific beep tone (Tone Type #46) that is also defined in the installed CPT file, and the received INVITE message contains an X-Detect header with the value "Request=CPT":

```
X-Detect: Request=CPT
```

For more information on the CPT file, see 'Call Progress Tones File' on page 557.

The device reports beep detections to application servers, by sending a SIP INFO message that contains a body with one of the following values, depending on the method used for detecting the beep:

AMD-detected Beep:

```
Type= AMD
SubType= Beep
```

CPT-detected Beep:

```
Type= CPT
SubType=Beep
```

15.4.1.2 SIP Call Flow Example of AMD

The SIP call flow below shows an example of implementing the device's AMD feature that enables a third-party, application server to play a recorded voice message to an answering machine:

1. Upon detection by the device of the answering machine, the device sends a SIP INFO message to the application server:

```
INFO sip:sipp@172.22.2.9:5060 SIP/2.0
Via: SIP/2.0/UDP 172.22.168.249;branch=z9hG4bKac1566945480
Max-Forwards: 70
From: sut <sip:3000@172.22.168.249:5060>;tag=1c1505895240
To: sipp <sip:sipp@172.22.2.9:5060>;tag=1
Call-ID: 1-29758@172.22.2.9
CSeq: 1 INFO
Contact: <sip:56700@172.22.168.249>
Supported: em,timer,replaces,path,resource-priority
Allow:
REGISTER,OPTIONS,INVITE,ACK,CANCEL,BYE,NOTIFY,PRACK,REFER,INFO,SUBSCRIBE,UPDATE
User-Agent: Audiocodes-Sip-Gateway/v.6.80A.227.005
```

```
Content-Type: application/x-detect
Content-Length: 30
Type= AMD
SubType= AUTOMATA
```

Upon detection by the device of the start of voice (i.e., the greeting message of the answering machine), the device sends the following INFO message to the application server:

```
INFO sip:sipp@172.22.2.9:5060 SIP/2.0
Via: SIP/2.0/UDP 172.22.168.249;branch=z9hG4bKac482466515
Max-Forwards: 70
From: sut <sip:3000@172.22.168.249:5060>;tag=1c419779142
To: sipp <sip:sipp@172.22.2.9:5060>;tag=1
Call-ID: 1-29753@172.22.2.9
CSeq: 1 INFO
Contact: <sip:56700@172.22.168.249>
Supported: em, timer, replaces, path, resource-priority
REGISTER, OPTIONS, INVITE, ACK, CANCEL, BYE, NOTIFY, PRACK, REFER, INFO
, SUBSCRIBE, UPDATE
User-Agent: Audiocodes-Sip-Gateway/v.6.80A.227.005
Content-Type: application/x-detect
Content-Length: 34
Type= PTT
SubType= SPEECH-START
```

3. Upon detection by the device of the end of voice (i.e., end of the greeting message of the answering machine), the device sends the following INFO message to the application server:

```
INFO sip:sipp@172.22.2.9:5060 SIP/2.0
Via: SIP/2.0/UDP 172.22.168.249;branch=z9hG4bKac482466515
Max-Forwards: 70
From: sut <sip:3000@172.22.168.249:5060>;tag=1c419779142
To: sipp <sip:sipp@172.22.2.9:5060>;tag=1
Call-ID: 1-29753@172.22.2.9
CSeq: 1 INFO
Contact: <sip:56700@172.22.168.249>
Supported: em, timer, replaces, path, resource-priority
Allow:
REGISTER, OPTIONS, INVITE, ACK, CANCEL, BYE, NOTIFY, PRACK, REFER, INFO
, SUBSCRIBE, UPDATE
User-Agent: Audiocodes-Sip-Gateway/v.6.80A.227.005
Content-Type: application/x-detect
Content-Length: 34
Type= PTT
SubType= SPEECH-END
```

4. The application server sends its message to leave on the answering message.

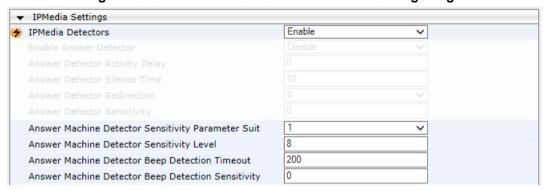

15.4.1.3 Configuring AMD

You can configure AMD for all calls using the global AMD parameters, or for specific calls using IP Profiles. The procedure below describes how to configure AMD for all calls. For configuring AMD for specific calls, use the AMD parameters in the IP Profile table (see 'Configuring IP Profiles' on page 314). You can also configure AMD per call based on the called number or Trunk Group. This is achieved by configuring AMD for a specific IP Profile and then assigning the IP Profile to a Trunk Group in the Inbound IP Routing table (see 'Configuring Inbound IP Routing' on page 416).

To enable and configure AMD for all calls:

 Open the IPMedia Settings page (Configuration tab > VoIP > Media > IPMedia Settings):

Figure 15-8: AMD Parameters on the IPMedia Settings Page

- 2. From the 'IPMedia Detectors' drop-down list (EnableDSPIPMDetectors), select **Enable** to enable AMD.
- 3. Select the AMD algorithm suite:
 - a. In the 'Answer Machine Detector Sensitivity Parameter Suit' field, select the required Parameter Suite included in the installed AMD Sensitivity file.
 - **a.** In the 'Answer Machine Detector Sensitivity' field, enter the required detection sensitivity level of the selected Parameter Suite.
- 4. Configure the answering machine beep detection:
 - a. In the 'Answer Machine Detector Beep Detection Timeout' field (AMDBeepDetectionTimeout), enter the duration that the beep detector operates from when detection is initiated.
 - In the 'Answer Machine Detector Beep Detection Sensitivity' field (AMDBeepDetectionSensitivity), enter the AMD beep detection sensitivity level.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

For a complete list of AMD-related parameters, see 'IP Media Parameters' on page 904.

15.4.1.4 Enabling IP-to-Tel Call Disconnection upon Detection of Answering Machine

The device can disconnect an IP-to-Tel call upon detection of an answering machine on the Tel side. Once detected, the device disconnects the call after the receipt of an ISDN Connect from the Tel side and then sends a SIP BYE message to the IP side to disconnect the call. You can enable this feature for all calls (globally) using the AMDmode parameter, or for specific calls using IP Profiles where the IP Profile parameter 'AMD Mode' (IpProfile_AmdMode) is set to [1] **Disconnect on AMD** (see 'Configuring IP Profiles' on page 314).

15.4.2 Automatic Gain Control (AGC)

Automatic Gain Control (AGC) adjusts the energy of the output signal to a required level (volume). This feature compensates for near-far gain differences. AGC estimates the energy of the incoming signal from the IP or PSTN, determined by the 'AGC Redirection' parameter, calculates the essential gain, and then performs amplification. Feedback ensures that the output signal is not clipped. You can configure the required Gain Slope in decibels per second using the 'AGC Slope' parameter and the required signal energy threshold using the 'AGC Target Energy' parameter.

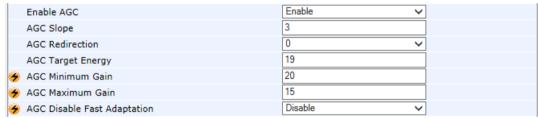

When the AGC first detects an incoming signal, it begins operating in Fast Mode, which allows the AGC to adapt quickly when a conversation starts. This means that the Gain Slope is 8 dB/sec for the first 1.5 seconds. After this period, the Gain Slope is changed to the user-defined value. You can disable or enable the AGC's Fast Mode feature, using the *ini* file parameter AGCDisableFastAdaptation. After Fast Mode is used, the signal should be off for two minutes in order to have the feature turned on again.

The following procedure describes how to configure AGC using the Web interface:

To configure AGC using the Web interface:

1. Open the IPMedia Settings page (Configuration tab > VoIP menu > Media > IPMedia Settings). The AGC parameters are shown in the figure below:

Figure 15-9: AGC Parameters in IPMedia Settings Page

- 2. Configure the following parameters:
 - 'Enable AGC' (*EnableAGC*) Enables the AGC mechanism.
 - 'AGC Slope' (AGCGainSlope) Determines the AGC convergence rate.
 - 'AGC Redirection' (AGCRedirection) Determines the AGC direction.
 - 'AGC Target Energy' Defines the signal energy value (dBm) that the AGC attempts to attain.
 - 'AGC Minimum Gain' (AGCMinGain) Defines the minimum gain (in dB) by the AGC when activated.
 - 'AGC Maximum Gain' (AGCMaxGain) Defines the maximum gain (in dB) by the AGC when activated.
 - 'AGC Disable Fast Adaptation' (AGCDisableFastAdaptation) Enables the AGC Fast Adaptation mode.
- **3.** When using AGC with the SBC application, the 'Transcoding Mode' (TranscodingMode) parameter must be set to Force. This parameter can either be the global parameter or per IP Profile.
- 4. Click Submit.

15.5 Configuring Various Codec Attributes

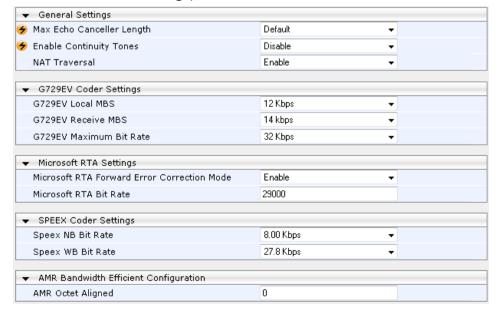

The following codec attribute settings can be configured in the General Media Settings page:

- AMR coder:
 - 'Payload Format': Defines the AMR payload format type.
- G.729EV coder:
 - 'G729EV local MBS': Defines the maximum bit rate (in kilobits per second Kbps) that can be used by the G.729EV coder for a specific channel.
 - 'G729EV Maximum Bit Rate': Defines the maximum generation bit rate for all participants in a session using G.729EV coder.
 - 'G729EV receive MBS': Defines the value of the MBS field of the sent G.729EV frames.
- Microsoft RTAudio (RTA) coder:
 - 'Microsoft RTA Bit Rate': Defines the transmit (Tx) bit rate of the Microsoft RTA NB at clock rate 8 kHz.
 - 'Microsoft RTA Forward Error Correction': Enables Forward Error Correction (FEC) for the Microsoft RTA narrowband coder (MS RTA NB).
- Speex coder
 - 'Speex NB Bit Rate': Defines the transmit (Tx) bit rate of the Speex narrowband codec at clock rate 8 kHz sampling rate
 - 'Speex WB Bit Rate': Defines the transmit (Tx) bit rate of the Speex wideband codec at clock rate 16 kHz sampling rate

For a detailed description of these parameters and for additional codec parameters, see "Coder Parameters" on page 780.

To configure codec attributes:

Open the General Media Settings page (Configuration tab > VolP menu > Media > General Media Settings).

- 2. Configure the parameters as required, and then click click **Submit**.
- 3. To save the changes to flash memory, see "Saving Configuration" on page 550.

15.6 Configuring DSP Templates

The DSP Template determines the coders that can be used by the device and various other functionalities. For a list of DSP templates and the maximum number of channels supported by each coder, see DSP Templates. You can select a single DSP Template or you can select two DSP Templates and define the percentage of DSP resources allocated per DSP Template. For example, you can assign DSP Template 1 to 50% of the device's DSPs, and DSP Template 2 to the remaining 50%.

Notes:

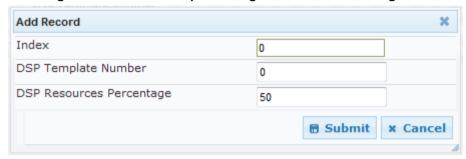

- The DSP Templates table must be used only when two concurrent DSP templates are required. When a single DSP template is required, use the 'DSP Version Template Number' parameter to select the template.
- If you do not configure a DSP template, the device uses the default DSP template (i.e., Template 0).

The following procedure describes how to configure DSP templates in the Web interface. You can also configure this using the table ini file parameter, DSPTemplates.

To select a DSP Template:

- 1. Open the DSP Templates page (Configuration tab > VoIP menu > Media > DSP Templates).
- 2. Click Add; the following dialog box appears:

Figure 15-10: DSP Templates Page - Add Record Dialog Box

- 3. Configure a DSP Template according to the parameters described in the table below.
- **4.** Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

Table 15-2: DSP Templates Table Parameter Descriptions

Parameter	Description
DSP Template Number [DspTemplates_DspTemplateNumber]	Defines the DSP Template number.
DSP Resources Percentage [DspTemplates_DspResourcesPercentage]	Defines the percentage of DSP resources allocated for the specified template. The default is 50%.

15.7 Configuring Media (SRTP) Security

The device supports Secured RTP (SRTP) according to RFC 3711. SRTP is used to encrypt RTP and RTCP transport for protecting VoIP traffic. SRTP requires a key exchange mechanism that is performed according to RFC 4568 – "Session Description Protocol (SDP) Security Descriptions for Media Streams". The key exchange is done by adding a 'crypto' attribute to the SDP. This attribute is used (by both sides) to declare the various supported cipher suites and to attach the encryption key. If negotiation of the encryption data is successful, the call is established.

SRTP supports the following cipher suites (all other suites are ignored):

- AES_CM_128_HMAC_SHA1_32
- AES CM 128 HMAC SHA1 80
- ARIA CM 128 HMAC SHA1 80
- ARIA CM 192 HMAC SHA1 80

When the device is the offering side, it generates an MKI of a size configured by the 'Master Key Identifier (MKI) Size' parameter. The length of the MKI is limited to four bytes. If the remote side sends a longer MKI, the key is ignored. The key lifetime field is not supported. However, if it is included in the key it is ignored and the call does not fail.

The device supports the following session parameters (as defined in RFC 4568, SDP Security Descriptions for Media Streams):

- UNENCRYPTED SRTP
- UNENCRYPTED SRTCP
- UNAUTHENTICATED SRTP

Session parameters should be the same for the local and remote sides. When the device is the offering side, the session parameters are configured by the following parameter - 'Authentication On Transmitted RTP Packets', 'Encryption On Transmitted RTP Packets, and 'Encryption On Transmitted RTCP Packets'. When the device is the answering side, the device adjusts these parameters according to the remote offering. Unsupported session parameters are ignored, and do not cause a call failure.

Below is an example of crypto attributes usage:

```
a=crypto:1 AES_CM_128_HMAC_SHA1_80
inline:PsKoMpHlCg+b5X0YLuSvNrImEh/dAe
a=crypto:2 AES_CM_128_HMAC_SHA1_32
inline:IsPtLoGkBf9a+c6XVzRuMqHlDnEiAd
```

The device also supports symmetric MKI negotiation, whereby it can be configured to forward the MKI size received in the SDP offer crypto line in the SDP answer crypto line.

To configure the device's mode of operation if negotiation of the cipher suite fails, use the 'Media Security Behavior' parameter. This parameter can be set to enforce SRTP, whereby incoming calls that don't include encryption information are rejected.

Notes:

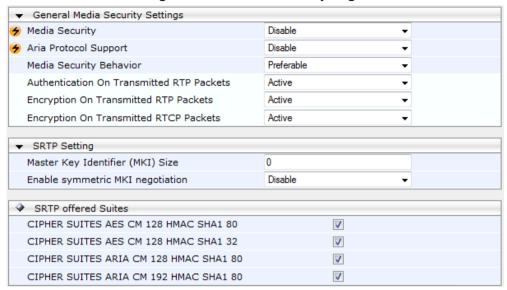

- For a detailed description of the SRTP parameters, see "SRTP Parameters" on page 725.
- When SRTP is used, the channel capacity may be reduced.

To enable and configure SRTP:

Open the Media Security page (Configuration tab > VolP menu > Media > Media Security).

Figure 15-11: Media Security Page

- 2. Set the 'Media Security' parameter to **Enable** to enable SRTP.
- 3. Configure the other SRTP parameters as required.
- Click Submit.
- 5. To save the changes to flash memory, see "Saving Configuration" on page 550.

User's Manual 16. Services

16 Services

This section describes configuration for various supported services.

16.1 SIP-based Media Recording

The device can record the SIP-based media (call sessions) traversing it. This feature is applicable to SBC and Gateway calls. This support is in accordance with the Session Recording Protocol (siprec), which describes architectures for deploying session recording solutions and specifies requirements for extensions to SIP that will manage delivery of RTP media to a recording device. The siprec protocol is based on RFC 6341 (Use Cases and Requirements for SIP-Based Media Recording), Session Recording Protocol (draft-ietf-siprec-protocol-02), and Architecture (draft-ietf-siprec-architecture-03).

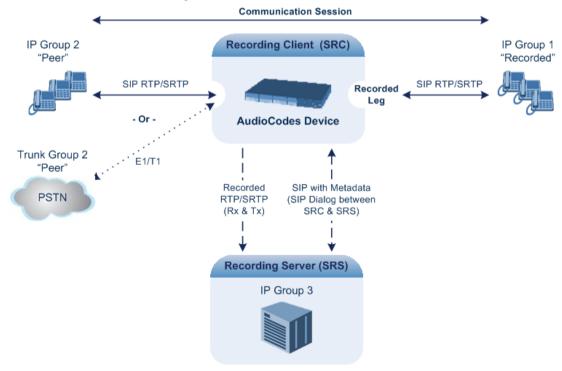

Notes:

- The SIP-based Media Recording feature is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see "Software License Key" on page 575. The Software License Key also specifies the maximum number of supported SIP recording sessions.
- For the maximum number of concurrent sessions that the device can record, contact your AudioCodes sales representative.

Session recording is a critical requirement in many business communications environments such as call centers and financial trading floors. In some of these environments, all calls must be recorded for regulatory and compliance reasons. In others, calls may be recorded for quality control or business analytics. Recording is typically performed by sending a copy of the session media to the recording devices.

The siprec protocol specifies the use of SIP, SDP, and RTP to establish a Recording Session (RS) from the Session Recording Client (SRC), which is on the path of the Communication Session (CS), to a Session Recording Server (SRS) at the recording equipment. The device functions as the SRC, sending recording sessions to a third-party SRS, as shown in the figure below.

The device can record calls between two IP Groups, or between an IP Group and a Trunk Group (for Gateway calls). The type of calls to record can be specified by source and/or destination prefix number or SIP Request-URI, as well as by call initiator. The side ("leg") on which the recording is done must be specified. This recording leg must be one that is interfacing with one of the IP Groups. Specifying the leg is important as it determines the various call media attributes of the recorded RTP (or SRTP) such as coder type.

The device can also record SRTP calls and send it to the SRS in SRTP. This applies to Gateway and SBC calls. In such scenarios, the SRTP is used on the IP leg for Gateway calls, or on one of the IP legs for SBC calls. For an SBC RTP-SRTP session, the recorded IP Group in the SIP Recording Routing table must be set to the RTP leg if recording is required to be RTP, or set to the SRTP leg if recording is required to be SRTP.

For SBC calls, the device can also be located between an SRS and an SRC and act as an RTP-SRTP translator. In such a setup, the device receives SIP recording sessions (as a server) from the SRC and translates SRTP media to RTP, or vice versa, and then forwards the recording to the SRS in the translated media format.

The device initiates a recording session by sending an INVITE message to the SRS when the recorded call is connected. The SIP From header contains the identity of the SRC and the To header contains the identity of the SRS. The SDP in the INVITE contains:

- Two 'm=' lines that represent the two RTP/SRTP streams (Rx and Tx).
- Two 'a=label:' lines that identify the streams.
- XML body (also referred to as metadata) that provides information on the participants of the call session:
 - <group id>: Logging Session ID (displayed as [SID:nnnnn] in Syslog), converted from decimal to hex. This number remains the same even if the call is forwarded or transferred. This is important for recorded calls.
 - <session id>: Originally recorded Call-ID, converted from decimal to hex.
 - <group-ref>: same as <group id>.
 - <participant id>: SIP From / To user.
 - <nameID aor>: From/To user@host.
 - <send> and <recv>: ID's for the RTP/SRTP streams in hex bits 0-31 are the same as group, bits 32-47 are the RTP/SRTP port.
 - <stream id>: Same as <send> for each participant.
 - <label>: 1 and 2 (same as in the SDP's 'a=label:' line).

The SRS can respond with 'a=recvonly' for immediate recording or 'a=inactive' if recording is not yet needed, and send re-INVITE at any later time with the desired RTP/SRTP mode change. If a re-INVITE is received in the original call (e.g. when a call is on hold), the device sends another re-INVITE with two 'm=' lines (but without metadata) to the SRS with the updated RTP/SRTP data. If the recorded leg uses SRTP, the device can send the media streams to the SRS as SRTP; otherwise, the media streams are sent as RTP to the SRS.

Below is an example of an INVITE sent by the device to an SRS:

```
INVITE sip:VSRP@1.9.64.253 SIP/2.0
Via: SIP/2.0/UDP 192.168.241.44:5060;branch=z9hG4bKac505782914
Max-Forwards: 10
From: <sip:192.168.241.44>;tag=1c505764207
To: <sip:VSRP@1.9.64.253>
Call-ID: 505763097241201011157@192.168.241.44

16.1.1 Enabling SIP-based Media Recording

The following procedure describes how to enable the SIP-based media Recording feature. Once you have enabled this feature, your SIP Recording Routing rules (configured in "Configuring SIP Recording Routing Rules" on page 210) become active.

- To enable SIP-based media recording:
- Open the SIP Recording page (Configuration tab > VoIP menu > Services > SIP Recording).
- 2. From the 'SIP Recording Application' drop-down list, select **Enable**.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

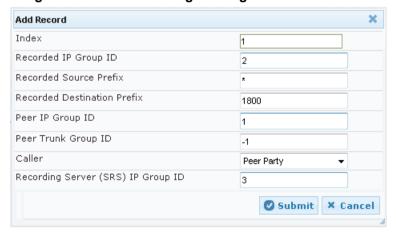

16.1.2 Configuring SIP Recording Routing Rules

The SIP Recording Routing table lets you configure up to 30 SIP-based media recording rules. A SIP Recording Routing rule defines calls that you want to record. For an overview of this feature, see "SIP-based Media Recording" on page 207.

The following procedure describes how to configure SIP Recording Routing rules in the Web interface. You can also configure SIP Recording Routing rules using the table ini file parameter, SIPRecRouting.

- > To configure a SIP Recording Routing rule:
- Open the SIP Recording page (Configuration tab > VoIP menu > Services > SIP Recording).
- 2. Click Add; the following dialog box appears:

Figure 16-1: SIP Recording Routing Table - Add Record

The figure above shows a configuration example where the device records calls made by IP Group 1 to IP Group 2 that have the destination number prefix "1800". The

User's Manual 16. Services

- device records the calls from the leg interfacing with IP Group 2, sending the recorded media to IP Group 3 (i.e., the SRS).
- 3. Configure a SIP recording route according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 16-1: SIP Recording Routing Parameter Descriptions

Parameter	Description
Index [SIPRecRouting_Index]	Defines an index number for the new table record.
Recorded IP Group ID [SIPRecRouting_RecordedIPGroupID]	Defines the IP Group participating in the call and the recording is done on the leg interfacing with this IP Group. Note: For an SBC RTP-SRTP session, the recorded IP Group must be set to the RTP leg if recording is required to be RTP, or set to the SRTP leg if recording is required to be SRTP.
Recorded Source Prefix [SIPRecRouting_RecordedSourcePrefix]	Defines calls to record based on source number or URI.
Recorded Destination Prefix [SIPRecRouting_RecordedDestinationPrefix]	Defines calls to record based on destination number or URI.
Peer IP Group ID [SIPRecRouting_PeerIPGroupID]	Defines the peer IP Group that is participating in the call.
Peer Trunk Group ID CLI: peer-trunk-group-id [SIPRecRouting_PeerTrunkGroupI D]	Defines the peer Trunk Group that is participating in the call (applicable only to Gateway calls).
Caller [SIPRecRouting_Caller]	Defines which calls to record according to which party is the caller. • [0] Both (default) = Caller can be peer or recorded side • [1] Recorded Party (in Gateway, IP-to-Tel call) • [2] Peer Party (in Gateway, Tel-to-IP call)
Recording Server (SRS) IP Group ID CLI: srs-ip-group-id [SIPRecRouting_SRSIPGroupID]	Defines the IP Group of the recording server (SRS). Note: The SIP Interface used for communicating with the SRS is according to the SRD assigned to the SRS IP Group (in the IP Group table). If two SIP Interfaces are associated with the SRD - one for "SBC" and one for "GW &IP2IP" – the device uses the "SBC" SIP Interface. If no SBC SIP Interface type is configured, the device uses the "GW & IP2IP" interface.

16.1.3 Configuring SIP User Part for SRS

You can configure the SIP user part of the Request-URI for the recording server (SRS). The device inserts this user part in the SIP To header of the INVITE message sent to the SRS.

- > To configure the SIP user part for SRS:
- Open the SIP Recording page (Configuration tab > VoIP menu > Services > SIP Recording).
- 2. In the 'Recording Server (SRS) Destination Username' field, enter a user part value (string of up to 50 characters).
- 3. Click **Submit**, and then save ("burn") your settings to flash memory.

16.1.4 Interworking SIP-based Media Recording with Third-Party Vendors

The device can interwork the SIP-based Media Recording feature with third-party vendors, as described in the following subsections.

16.1.4.1 **Genesys**

The device's SIP-based media recording can interwork with Genesys' equipment. Genesys sends its proprietary X-Genesys-CallUUID header (which identifies the session) in the first SIP message, typically in the INVITE and the first 18x response. If the device receives a SIP message with Genesys SIP header, it adds the header's information to AudioCodes' proprietary tag in the XML metadata of the SIP INVITE that it sends to the recording server, as shown below:

```
<ac:GenesysUUID
xmlns="urn:ietf:params:xml:ns:Genesys">4BOKLLA3VH66JF112M1CC9VHKS1
4F0KP</ac:GenesysUUID>
```

16.1.4.2 Avaya UCID

The device's SIP-based media recording can interwork with Avaya equipment. The Universal Call Identifier (UCID) is Avaya's proprietary call identifier used to correlate call records between different systems and identifies sessions. Avaya generates this in outgoing calls. If the device receives a SIP INVITE from Avaya, it adds the UCID value, received in the User-to-User SIP header to AudioCodes' proprietary tag in the XML metadata of the SIP INVITE that it sends to the recording server. For example, if the received SIP header is:

```
User-to-User: 00FA080019001038F725B3;encoding=hex
```

the device includes the following in the XML metadata:

```
xml metadata:
<ac:AvayaUCID xmlns="urn:ietf:params:xml:ns:Avaya">
FA080019001038F725B3</ac:AvayaUCID>
```

User's Manual 16. Services

16.2 RADIUS Authentication

You can enhance security for your device by implementing Remote Authentication Dial-In User Service (RADIUS - RFC 2865) for authenticating multiple management user accounts of the device's embedded Web and Telnet (CLI) servers. Thus, RADIUS also prevents unauthorized access to your device.

When RADIUS authentication is not used, the user's login username and password are locally authenticated by the device in its Web Users table (database). However, the Web Users table can be used as a fallback mechanism in case the RADIUS server does not respond. For configuring local user accounts, see Configuring Web User Accounts.

When RADIUS authentication is used, the RADIUS server stores the user accounts - usernames, passwords, and access levels (authorization). When a management user (client) tries to access the device, the device sends the RADIUS server the user's username and password for authentication. The RADIUS server replies with an acceptance or a rejection notification. During the RADIUS authentication process, the device's Web interface is blocked until an acceptance response is received from the RADIUS server.

Note that communication between the device and the RADIUS server is done by using a shared secret, which is not transmitted over the network.

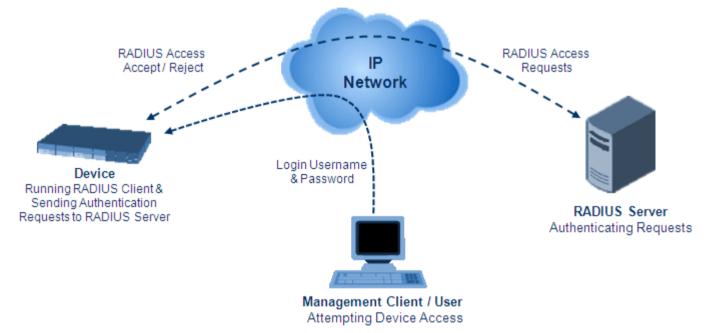

Figure 16-2: RADIUS Login Authentication for Management

For using RADIUS, you need to do the following:

- Set up a RADIUS server (third-party) to communicate with the device see 'Setting Up a Third-Party RADIUS Server' on page 214
- Configure the device as a RADIUS client for communication with the RADIUS server see 'Configuring RADIUS Authentication' on page 215

16.2.1 Setting Up a Third-Party RADIUS Server

The following procedure provides an example for setting up the third-party RADIUS sever, *FreeRADIUS*, which can be downloaded from www.freeradius.org. Follow the instructions on this Web site for installing and configuring the server. If you use a RADIUS server from a different vendor, refer to its appropriate documentation.

- To set up a third-party RADIUS server (e.g., FreeRADIUS):
- Define the AudioCodes device as an authorized client of the RADIUS server, with the following:
 - Predefined shared secret (password used to secure communication between the device and the RADIUS server)
 - Vendor ID

Below is an example of the *clients.conf* file (FreeRADIUS client configuration):

2. If access levels are required, set up a Vendor-Specific Attributes (VSA) dictionary for the RADIUS server and select an attribute ID that represents each user's access level. The example below shows a dictionary file for FreeRADIUS that defines the attribute "ACL-Auth-Level" with "ID=35". For the device's user access levels and their corresponding numeric representation in RADIUS servers, see Configuring Web User Accounts.

```
# AudioCodes VSA dictionary
#
VENDOR AudioCodes 5003
ATTRIBUTE ACL-Auth-Level 35 integer AudioCodes
VALUE ACL-Auth-Level ACL-Auth-UserLevel 50
VALUE ACL-Auth-Level ACL-Auth-AdminLevel 100
VALUE ACL-Auth-Level ACL-Auth-SecurityAdminLevel 200
```

3. Define the list of users authorized to use the device, using one of the password authentication methods supported by the server implementation. The example below shows a user configuration file for FreeRADIUS using a plain-text password:

4. Record and retain the IP address, port number, shared secret code, vendor ID, and VSA access level identifier (if access levels are implemented) used by the RADIUS server. User's Manual 16. Services

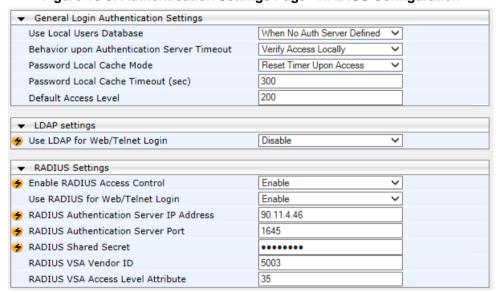

16.2.2 Configuring RADIUS Authentication

The following procedure describes how to configure the RADIUS feature. For a detailed description of the RADIUS parameters, see 'RADIUS Parameters' on page 733.

> To configure RADIUS:

 Open the Authentication Settings page (Configuration tab > System menu > Management > Authentication Settings).

Figure 16-3: Authentication Settings Page - RADIUS Configuration

- Set the 'Enable RADIUS Access Control' parameter to Enable to enable the RADIUS application.
- 3. Set the 'Use RADIUS for Web/Telnet Login' parameter to **Enable** to enable RADIUS authentication for Web and Telnet login.
- 4. Define the RADIUS server:
 - **a.** In the 'RADIUS Authentication Server IP Address' field, enter the RADIUS server's IP address.
 - **b.** In the 'RADIUS Authentication Server Port' field, enter the RADIUS server's port number.
 - **c.** In the 'RADIUS Shared Secret' field, enter the shared secret used to authenticate the device to the RADIUS server.
- In the 'RADIUS VSA Vendor ID' field, enter the same vendor ID number as set on the RADIUS server.
- 6. When implementing Web user access levels, do one of the following:
 - If the RADIUS server response includes the access level attribute: In the 'RADIUS VSA Access Level Attribute' field, enter the code that indicates the access level attribute in the VSA section of the received RADIUS packet. For defining the RADIUS server with access levels, see 'Setting Up a Third-Party RADIUS Server' on page 214.
 - If the RADIUS server response does not include the access level attribute: In the 'Default Access Level' field, enter the default access level that is applied to all users authenticated by the RADIUS server.

- Configure RADIUS timeout handling:
 - **a.** From the 'Behavior upon Authentication Server Timeout' drop-down list, select the option if the RADIUS server does not respond within five seconds:
 - Deny Access: device denies user login access.
 - Verify Access Locally: device checks the username and password configured locally for the user (in the Web User Accounts page or Web Users table), and if correct, allows access.
 - b. In the 'Password Local Cache Timeout' field, enter a time limit (in seconds) after which the username and password verified by the RADIUS server becomes invalid and a username and password needs to be re-validated with the RADIUS server.
 - c. From the 'Password Local Cache Mode' drop-down list, select the option for the local RADIUS password cache timer:
 - Reset Timer Upon Access: upon each access to a Web page, the timer resets (reverts to the initial value configured in the previous step).
 - Absolute Expiry Timer: when you access a Web page, the timer doesn't reset, but continues its count down.
- **8.** Configure when the Web Users table must be used to authenticate login users. From the 'Use Local Users Database' drop-down list, select one of the following:
 - When No Auth Server Defined (default): When no RADIUS server is configured (or as fallback if the server is inaccessible).
 - Always: Always, but if not found, use the RADIUS server to authenticate the
 user.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

16.2.3 Securing RADIUS Communication

RADIUS authentication requires HTTP basic authentication (according to RFC 2617). However, this is insecure as the usernames and passwords are transmitted in clear text over plain HTTP. Thus, as digest authentication is not supported with RADIUS, it is recommended that you use HTTPS with RADIUS so that the usernames and passwords are encrypted.

To configure the device to use HTTPS, set the 'Secured Web Connection (HTTPS)' parameter to HTTPS Only, in the WEB Security Settings page (Configuration tab > System menu > Management > WEB Security Settings).

16.2.4 Authenticating RADIUS in the URL

RADIUS authentication is typically done after the user accesses the Web interface by entering only the device's IP address in the Web browser's URL field (for example, http://10.13.4.12/), and then entering the username and password credentials in the Web interface login screen. However, authentication with the RADIUS server can also be done immediately after the user enters the URL, if the URL also contains the login credentials, for

http://10.4.4.112/Forms/RadiusAuthentication?WSBackUserName=John&WSBackPassword=1234

Note: This feature allows up to five simultaneous users only.

16.3 LDAP-based Management and SIP Services

The device supports the Lightweight Directory Access Protocol (LDAP) application protocol and can operate with third-party, LDAP-compliant servers such as Microsoft Active Directory (AD).

You can use LDAP for the following LDAP services:

■ SIP-related (Control) LDAP Queries: This can be used for routing or manipulation (e.g., calling name and destination address). The device connects and binds to the remote LDAP server (IP address or DNS/FQDN) during the service's initialization (at device start-up) or whenever you change the LDAP server's IP address and port. Binding to the LDAP server is based on username and password (Bind DN and Password). Service makes 10 attempts to connect and bind to the remote LDAP server, with a timeout of 20 seconds between attempts. If connection fails, the service remains in disconnected state until the LDAP server's IP address or port is changed. If connection to the LDAP server later fails, the service attempts to reconnect.

For the device to run a search, the path to the directory's subtree, known as the distinguished name (DN), where the search is to be done must be configured (see 'Configuring LDAP DNs (Base Paths) per LDAP Server' on page 222). The search key (filter), which defines the exact DN to search, and one or more attributes whose values must be returned to the device must also be configured. For more information on configuring these attributes and search filters, see 'Active Directory-based Routing for Microsoft Lync' on page 234.

The device can store recent LDAP queries and responses in its local cache. The cache is used for subsequent queries and/or in case of LDAP server failure. For more information, see 'Configuring the Device's LDAP Cache' on page 226.

If connection with the LDAP server disconnects (broken), the device sends the SNMP alarm, acLDAPLostConnection. Upon successful reconnection, the alarm clears. If connection with the LDAP server is disrupted during the search, all search requests are dropped and an alarm indicating a failed status is sent to client applications.

Management-related LDAP Queries: This is used for authenticating and authorizing management users (Web and CLI) and is based on the user's login username and password (credentials) when attempting login to one of the device's management platforms. When configuring the login username (LDAP Bind DN) and password (LDAP Password) to send to the LDAP server, you can use templates based on the dollar (\$) sign, which the device replaces with the actual username and password entered by the user during the login attempt. You can also configure the device to send the username and password in clear-text format or encrypted using TLS (SSL).

The device connects to the LDAP server (i.e., an LDAP session is created) only when a login attempt occurs. The LDAP Bind operation establishes the authentication of the user based on the username-password combination. The server typically checks the password against the userPassword attribute in the named entry. A successful Bind operation indicates that the username-password combination is correct; a failed Bind operation indicates that the username-password combination is incorrect.

Once the user is successfully authenticated, the established LDAP session may be used for further LDAP queries to determine the user's management access level and privileges (Operator, Admin, or Security Admin). This is known as the user authorization stage. To determine the access level, the device searches the LDAP directory for groups of which the user is a member, for example:

CN=\# Support Dept,OU=R&D
Groups,OU=Groups,OU=APC,OU=Japan,OU=ABC,DC=corp,DC=abc,DC=com
CN=\#AllCellular,OU=Groups,OU=APC,OU=Japan,OU=ABC,DC=corp,DC=a
bc,DC=com

The device then assigns the user the access level configured for that group (in 'Configuring Access Level per Management Groups Attributes' on page 224). The

location in the directory where you want to search for the user's member group(s) is configured using the following:

- Search base object (distinguished name or DN, e.g., "ou=ABC,dc=corp,dc=abc,dc=com"), which defines the location in the directory from where the LDAP search begins, and is configured in 'Configuring LDAP DNs (Base Paths) per LDAP Server' on page 222.
- Search filter, for example, (&(objectClass=person)(sAMAccountName=JohnD)), which filters the search in the subtree to include only the specific username. The search filter can be configured with the dollar (\$) sign to represent the username, for example, (sAMAccountName=\$). For configuring the search filter, see 'Configuring the LDAP Search Filter Attribute' on page 223.
- Management attribute (e.g., memberOf), from where objects that match the search filter criteria are returned. This shows the user's member groups. The attribute is configured in the LDAP Configuration table (see 'Configuring LDAP Servers' on page 219).

If the device finds a group, it assigns the user the corresponding access level and permits login; otherwise, login is denied. Once the LDAP response has been received (success or failure), the device ends the LDAP session.

For both of the previously discussed LDAP services, the following additional LDAP functionality is supported:

- Search method for searching DN object records between LDAP servers and within each LDAP server (see 'Configuring LDAP Search Methods' on page 226).
- Default access level that is assigned to the user if the queried response does not contain an access level.
- Local users database (Web Users table) for authenticating users instead of the LDAP server (for example, when a communication problem occurs with the server). For more information, see 'Configuring Local Database for Management User Authentication' on page 228.

16.3.1 Enabling the LDAP Service

Before you can configure LDAP support, you need to enable the LDAP service.

- To enable LDAP:
- Open the LDAP Settings page (Configuration tab > VolP menu > Services > LDAP > LDAP Settings).

Figure 16-4: Enabling LDAP on the LDAP Settings Page

- 2. Under LDAP Settings, from the 'LDAP Service' drop-down list, select **Enable**.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

16.3.2 Enabling LDAP-based Web/CLI User Login Authentication and Authorization

The LDAP service can be used for authenticating and authorizing device management users (Web and CLI), based on the user's login username and password (credentials). At the same, it can also be used to determine users' management access levels (privileges).

Before you can configure LDAP-based login authentication, you must enable this type of LDAP service, as described in the following procedure.

To enable LDAP-based login authentication:

 Open the Authentication Settings page (Configuration tab > System menu > Management > Authentication Settings).

Figure 16-5: Authentication Settings Page - Enabling LDAP-based Login

- Under LDAP Settings, from the 'Use LDAP for Web/Telnet Login' drop-down list, select Enable.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

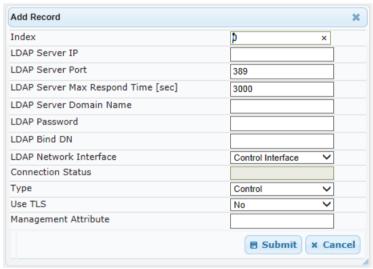

16.3.3 Configuring LDAP Servers

The LDAP Configuration table lets you configure up to four LDAP servers. This table defines the address and connectivity settings of the LDAP server. The LDAP server can be configured for SIP-related queries (e.g., routing and manipulation) or LDAP-based management user login authentication and authorization (username-password).

The following procedure describes how to configure an LDAP server in the Web interface. You can also configure this using the table ini file parameter, LdapConfiguration or CLI command, configure voip/ldap/ldap-configuration.

- To configure an LDAP server:
- Open the LDAP Configuration Table page (Configuration tab > VolP menu > Services > LDAP > LDAP Configuration Table).
- 2. Click **Add**; the following dialog box appears:

Figure 16-6: LDAP Configuration Table - Add Record

- Configure an LDAP server according to the parameters described in the table below.
- 4. Click Submit.

LDAP Configuration Table Parameter Descriptions

Parameter	Description
Index [LdapConfiguration_In	Defines an index number for the new table record.

Parameter	Description	
dex]	Note: Each table row must be configured with a unique index.	
LDAP Server IP CLI: server-ip [LdapConfiguration_Ld apConfServerIp]	Defines the IP address of the LDAP server (in dotted-decimal notation, e.g., 192.10.1.255). By default, no IP address is defined. Note: If you want to use an FQDN for the LDAP server, leave this parameter undefined and configure the FQDN in the 'LDAP Server Domain Name' parameter (see below).	
LDAP Server Port CLI: server-port [LdapConfiguration_Ld apConfServerPort]	Defines the port number of the LDAP server. The valid value range is 0 to 65535. The default port number is 389.	
LDAP Server Max Respond Time CLI: max-respond-time [LdapConfiguration_Ld apConfServerMaxResp ondTime]	Defines the duration (in msec) that the device waits for LDAP server responses. The valid value range is 0 to 86400. The default is 3000. Note: If the response time expires, you can configure the device to use its local database (Web Users table) for authenticating the user. For more information, see 'Configuring Local Database for Management User Authentication' on page 228.	
LDAP Server Domain Name CLI: domain-name [LdapConfiguration_Ld apConfServerDomainN ame]	Defines the domain name (FQDN) of the LDAP server. The device tries to connect to the LDAP server according to the IP address listed in the received DNS query. If there is no connection to the LDAP server or the connection to the LDAP server fails, the device tries to connect to the LDAP server with the next IP address in the DNS query list. Note: The 'LDAP Server IP' parameter takes precedence over this parameter. Thus, if you want to use an FQDN, leave the 'LDAP Server IP' parameter undefined.	
LDAP Password CLI: password [LdapConfiguration_Ld apConfPassword]	 Defines the user password for accessing the LDAP server during connection and binding operations. LDAP-based SIP queries: The parameter is the password used by the device to authenticate itself, as a client, to obtain LDAP service from the LDAP server. LDAP-based user login authentication: The parameter represents the login password entered by the user during a login attempt. You can use the \$ (dollar) sign in this value to enable the device to automatically replace the \$ sign with the user's login password in the search filter, which it sends to the LDAP server for authenticating the user's username-password combination. For example, \$. Note: By default, the device sends the password in clear-text format. You can enable the device to encrypt the password using TLS (see the 'Use SSL' parameter below). 	

Parameter	Description
LDAP Bind DN CLI: bind-dn [LdapConfiguration_Ld apConfBindDn]	 Defines the LDAP server's bind Distinguished Name (DN) or username. LDAP-based SIP queries: The DN is used as the username during connection and binding to the LDAP server. The DN is used to uniquely name an AD object. Below are example parameter settings: ✓ cn=administrator,cn=Users,dc=domain,dc=com ✓ administrator@domain.com ✓ domain\administrator LDAP-based user login authentication: This parameter represents the login username entered by the user during a login attempt. You can use the \$ (dollar) sign in this value to enable the device to automatically replace the \$ sign with the user's login username in the search filter, which it sends to the LDAP server for authenticating the user's username-password combination. An example configuration for this parameter is \$@sales.local, where the device replaces the \$ with the entered username, for example, JohnD@sales.local. The username can also be configured with the domain name of the LDAP server. Note: By default, the device sends the username in clear-text format. You can enable the device to encrypt the username using TLS (see the 'Use SSL' parameter below).
LDAP Network Interface CLI: interface-type [LdapConfiguration_Ld apConfInterfaceType]	 Assigns one of the device's IP network interfaces for communicating with the LDAP server. [0] Control Interface (default) = The top-most IP network interface row in the IP Interfaces table that is configured for a Control application (may be combined with other applications such as OAMP and Media) is used. [1] OAM Interface = The OAMP interface (may be combined with other applications such as Control and Media) in the IP Interfaces table is used. For configuring IP network interfaces, see Configuring IP Network Interfaces.
Type CLI: type [LdapConfiguration_Ty pe]	Defines whether the LDAP server is used for SIP-related queries or management login authentication-related queries. • [0] Control (Default) • [1] Management Note: If you use the same LDAP server for both management and SIP (Control) related applications, the device establishes different LDAP sessions for each application.
Management Attribute CLI: mgmt-attr [LdapConfiguration_M ngmAuthAtt]	Defines the LDAP attribute name to query, which contains a list of groups to which the user is a member. For Active Directory, this attribute is typically "memberOf". The attribute's values (groups) are used to determine the user's management access level; the group's corresponding access level is configured in 'Configuring Access Level per Management Groups Attributes' on page 224. Notes: This parameter is applicable only to LDAP-based login authentication and authorization (i.e., the 'Type' parameter is set to Management). If this functionality is not used, the device assigns the user the configured default access level. For more information, see 'Configuring Access Level per Management Groups Attributes' on page 224.

Parameter	Description	
Use SSL CLI: [LdapConfiguration_us	Enables the device to encrypt the username and password (for Control and Management related queries) using TLS when sending them to the LDAP server.	
eTLS]	 [0] No = (Default) Username and password are sent in clear-text format. [1] Yes 	
Connection Status CLI: connection-status [LdapConfiguration_ConnectionStatus]	 (Read-only) Displays the connection status with the LDAP server. "Not Applicable" "LDAP Connection Broken" "Connecting" "Connected" 	
	Note: For more information about a disconnected LDAP connection, see your Syslog messages generated by the device.	

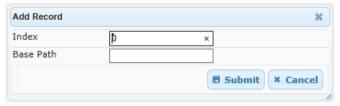

16.3.4 Configuring LDAP DNs (Base Paths) per LDAP Server

The LDAP Search DN table lets you configure LDAP base paths. The table is a "child" of the LDAP Configuration table (see 'Configuring LDAP Servers' on page 219) and configuration is done per LDAP server. For the device to run a search using the LDAP service, the base path to the directory's subtree, referred to as the distinguished name object (or DN), where the search is to be done must be configured. For each LDAP server, you can configure up to three base paths.

The following procedure describes how to configure DNs per LDAP server in the Web interface. You can also configure this using the table ini file parameter, LdapServersSearchDNs or CLI command, configure voip/ldap/ldap-servers-search-dns.

- > To configure an LDAP base path per LDAP server:
- Open the LDAP Configuration Table page (Configuration tab > VolP menu > Services > LDAP > LDAP Configuration Table).
- In the LDAP Configuration table, select the row of the LDAP server for which you want to configure DN base paths, and then click the **Search DNs** link (located at the bottom of the page); the LDAP Search DN Table page opens.
- 3. Click **Add**; the following dialog box appears:

Figure 16-7: LDAP Search DN Table - Add Record

- Configure an LDAP DN base path according to the parameters described in the table below
- 5. Click **Submit**, and then save ("burn") your settings to flash memory.

L	.DAP	Search	DN 1	Гablе	Parameter	Descri	ptions
---	------	--------	------	-------	------------------	--------	--------

Parameter	Description	
Index CLI: set internal-index [LdapServersSearchD Ns_Index]	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.	
Base Path CLI: set base-path [LdapServersSearchD Ns_Base_Path]	Defines the full path (DN) to the objects in the AD where the query is done. The valid value is a string of up to 256 characters. For example: OU=NY,DC=OCSR2,DC=local. In this example, the DN path is defined by the LDAP names, OU (organizational unit) and DC (domain component).	

16.3.5 Configuring the LDAP Search Filter Attribute

When the LDAP-based login username-password authentication succeeds, the device searches the LDAP server for all groups of which the user is a member. The LDAP query is based on the following LDAP data structure:

- Search base object (distinguished name or DN, e.g., "ou=ABC,dc=corp,dc=abc,dc=com"): The DN defines the location in the directory from which the LDAP search begins and is configured in 'Configuring LDAP DNs (Base Paths) per LDAP Server' on page 222.
- Filter (e.g., "(&(objectClass=person)(sAMAccountName=johnd))"): This filters the search in the subtree to include only the login username (and excludes others). This is configured by the 'LDAP Authentication Filter' parameter, as described in the following procedure. You can use the dollar (\$) sign to represent the username. For example, the filter can be configured as "(sAMAccountName=\$)", where if the user attempts to log in with the username "SueM", the LDAP search is done only for the attribute sAMAccountName that equals "SueM".
- Attribute (e.g., "memberOf") to return from objects that match the filter criteria: The attribute is configured by the 'Management Attribute' parameter in the LDAP Configuration table (see 'Configuring LDAP Servers' on page 219).

Therefore, the LDAP response includes only the groups of which the specific user is a member.

Notes:

- The search filter is applicable only to LDAP-based login authentication and authorization queries.
- The search filter is a global setting that applies to all LDAP-based login authentication and authorization queries, across all configured LDAP servers.

- To configure the LDAP search filter for management users:
- Open the LDAP Settings page (Configuration tab > VolP menu > Services > LDAP > LDAP Settings).

Figure 16-8: LDAP Settings Page - LDAP Search Filter

- 2. Under LDAP Settings, in the 'LDAP Authentication Filter' parameter, enter the LDAP search filter attribute for searching the login username for user authentication.
- 3. Click Submit.

16.3.6 Configuring Access Level per Management Groups Attributes

The Management LDAP Groups table lets you configure LDAP group objects and their corresponding management user access level. The table is a "child" of the LDAP Configuration table (see 'Configuring LDAP Servers' on page 219) and configuration is done per LDAP server. For each LDAP server, you can configure up to three table row entries of LDAP group(s) and their corresponding access level.

Notes:

- The Management LDAP Groups table is applicable only to LDAP-based login authentication and authorization queries.
- If the LDAP response received by the device includes multiple groups of which the user is a member and you have configured different access levels for some of these groups, the device assigns the user the highest access level. For example, if the user is a member of two groups where one has access level "Monitor" and the other "Administrator", the device assigns the user the "Administrator" access level.

- When the access level is unknown, the device assigns the default access level to the user, configured by the 'Default Access Level' parameter in the Authentication Settings page (Configuration tab > System menu > Management > Authentication Settings). This can occur in the following scenarios:
 - √ The user is not a member of any group.
 - The group of which the user is a member is not configured on the device (as described in this section).
 - The device is not configured to query the LDAP server for a management attribute (see 'Configuring LDAP Servers' on page 219).

Group objects represent groups in the LDAP server of which the user is a member. The access level represents the user account's permissions and rights in the device's management interface (e.g., Web and CLI). The access level can either be Monitor, Administrator, or Security Administrator. For an explanation on the privileges of each level, see Configuring Web User Accounts.

When the username-password authentication with the LDAP server succeeds, the device searches the LDAP server for all groups of which the user is a member. The LDAP query is based on the following LDAP data structure:

- Search base object (distinguished name or DN, e.g., "ou=ABC,dc=corp,dc=abc,dc=com"), which defines the location in the directory from which the LDAP search begins. This is configured in 'Configuring LDAP DNs (Base Paths) per LDAP Server' on page 222.
- Filter (e.g., "(&(objectClass=person)(sAMAccountName=johnd))"), which filters the search in the subtree to include only the login username (and excludes others). This is

configured by the 'LDAP Authentication Filter' parameter.

Attribute (e.g., "memberOf") to return from objects that match the filter criteria. This attribute is configured by the 'Management Attribute' parameter in the LDAP Configuration table.

The LDAP response includes all the groups of which the specific user is a member, for example:

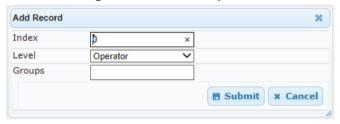

```
CN=\# Support Dept,OU=R&D
Groups,OU=Groups,OU=APC,OU=Japan,OU=ABC,DC=corp,DC=abc,DC=com
CN=\#AllCellular,OU=Groups,OU=APC,OU=Japan,OU=ABC,DC=corp,DC=abc,D
C=com
```

The device searches this LDAP response for the group names that you configured in the Management LDAP Groups table in order to determine the user's access level. If the device finds a group name, the user is assigned the corresponding access level and login is permitted; otherwise, login is denied. Once the LDAP response has been received (success or failure), the LDAP session terminates.

The following procedure describes how to configure an access level per management groups in the Web interface. You can also configure this using the table ini file parameter, MgmntLDAPGroups or CLI command, configure voip > Idap > mgmt-Idap-groups.

- To configure management groups and corresponding access level:
- 1. Open the LDAP Configuration Table page (Configuration tab > VolP menu > Services > LDAP > LDAP Configuration Table).
- 2. In the LDAP Configuration table, select the row of the LDAP server for which you want to configure management groups with a corresponding access level, and then click the Management LDAP Groups Table link (located at the bottom of the page); the Management LDAP Groups Table page opens.
- 3. Click Add; the following dialog box appears:

Figure 16-9: Management LDAP Groups Table - Add Record

- **4.** Configure a group name(s) with a corresponding access level according to the parameters described in the table below.
- 5. Click **Submit**, and then save ("burn") your settings to flash memory.

Management LDAP Groups Table Parameter Descriptions

Parameter	Description
Index [MgmntLDAPGroups_ GroupIndex]	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.
Level [MgmntLDAPGroups_L evel]	Defines the access level of the group(s). • [0] Monitor (Default) • [1] Security Administrator • [2] Administrator

Parameter Description	
Groups [MgmntLDAPGroups_ Group]	Defines the attribute names of the groups in the LDAP server. The valid value is a string of up to 256 characters. To define multiple groups, separate each group name with a semicolon (;).

16.3.7 Configuring LDAP Search Methods

You can configure the device's method for searching the LDAP server(s) for the configured DN objects:

- DN Search Method between Two LDAP Servers: When two LDAP servers are implemented, the device runs an LDAP query to search for DN object records on both LDAP servers. You can configure how the device queries the DN object record between the two LDAP servers:
 - Parallel Search: The device queries the LDAP servers simultaneously.
 - **Sequential Search:** The device first queries one of the LDAP servers, and if the DN object is not found, it queries the second LDAP server.
- **DN Search Method within an LDAP Server:** You can configure how the device queries the DN object record within each LDAP server:
 - Parallel Search: The device queries all DN objects simultaneously. For example, a search for the DN object record "JohnD" is done at the same time in the "Marketing", "Sales" and "Administration" DN objects.
 - Sequential Search: The device queries each DN object, one by one, until a result is found. For example, a search for the DN object record "JohnD" is first run in DN object "Marketing" and if a result is not found, it searches in "Sales", and if not found, it searches in "Administration", and so on.

> To configure LDAP search methods:

Open the LDAP Settings page (Configuration tab > VolP menu > Services > LDAP > LDAP Settings).

Figure 16-10: LDAP Settings Page - Search Methods

- 2. Under LDAP Settings, configure the following:
 - Search method for DN objects between two LDAP servers, using the 'LDAP Search Server Method' parameter (LDAPSearchServerMethod).
 - Search method for DN objects within an LDAP server, using the 'search dns in parallel' parameter (LdapSearchDnsInParallel).
- 3. Click Submit.

16.3.8 Configuring the Device's LDAP Cache

The device can optionally store recent LDAP queries and responses with an LDAP server in its local cache. The cache is used for subsequent queries and/or in case of LDAP server failure.

Note: The LDAP Cache feature is applicable only to LDAP-based SIP queries (Control).

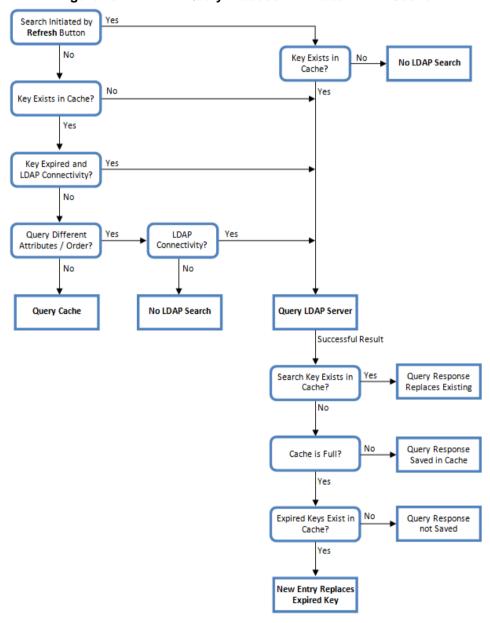

The advantage of enabling this feature includes the following:

Improves routing decision performance by using local cache for subsequent LDAP queries

- Reduces number of queries performed on an LDAP server and corresponding bandwidth consumption
- Provides partial survivability in case of intermittent LDAP server failure (or network isolation)

The handling of LDAP queries with the LDAP cache is shown in the flowchart below:

Figure 16-11: LDAP Query Process with Local LDAP Cache

Note: If for the first LDAP query, the result fails for at least one attribute and is successful for at least one, the partial result is cached. However, for subsequent queries, the device does not use the partially cached result, but does a new query with the LDAP server again.

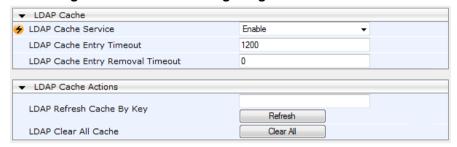

The following procedure describes how to configure the device's LDAP cache in the Web interface. For a full description of the cache parameters, see 'LDAP Parameters' on page 910.

> To configure the LDAP cache:

Open the LDAP Settings page (Configuration tab > VolP menu > Services > LDAP > LDAP Settings).

Figure 16-12: LDAP Settings Page - Cache Parameters

- Under LDAP Cache, do the following:
 - a. From the 'LDAP Cache Service' drop-down list, select Enable to enable LDAP cache.
 - **b.** In the 'LDAP Cache Entry Timeout' field, enter the duration (in minutes) for which an entry in the LDAP cache is valid.
 - c. In the 'LDAP Cache Entry Removal Timeout' field, enter the duration (in hours) after which the device removes the LDAP entry from the cache.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

The LDAP Settings page also provides you with the following buttons:

- LDAP Refresh Cache by Key: Refreshes a saved LDAP entry response in the cache of a specified LDAP search key. If a request with the specified key exists in the cache, the request is resent to the LDAP server.
- **LDAP Clear All Cache:** Removes all LDAP entries in the cache.

16.3.9 Configuring Local Database for Management User Authentication

You can configure the device to use its local database (Web Users table) to authenticate management users based on the username-password combination. You can configure the device to use the Web Users table upon the following scenarios:

- LDAP or RADIUS server is not configured (or broken connection), or always use the Web Users table and only if the user is not found, to use the server.
- Connection with the LDAP or RADIUS server fails due to a timeout. In such a scenario, the device can deny access or verify the user's credentials (username-password) locally in the Web Users table.

If user authentication using the Web Users table succeeds, the device grants management access to the user; otherwise access is denied. The access level assigned to the user is also determined by the Web Users table. To configure local Web/CLI users in the Web Users table, see Configuring Web User Accounts.

Notes:

- This feature is applicable to LDAP and RADIUS servers.
- This feature is applicable only to user management authentication.
- To use the Web Users table for authenticating management users:
- Open the Authentication Settings page (Configuration tab > System menu > Management > Authentication Settings).

Figure 16-13: Authentication Settings Page - Local Database for Login Authentication

- Under General Login Authentication Settings:
 - Configure when the Web Users table must be used to authenticate login users. From the 'Use Local Users Database' drop-down list, select one of the following:
 - When No Auth Server Defined (default): When no LDAP/RADIUS server is configured (or as fallback if the server is inaccessible).
 - Always: Always, but if not found, use the LDAP/RADIUS server to authenticate the user.
 - Configure whether the Web Users table must be used to authenticate login users upon connection timeout with the server. From the 'Behavior upon Authentication Server Timeout' drop-down list, select one of the following:
 - Deny Access: User is denied access to the management platform.
 - Verify Access Locally (default): The device verifies the user's credentials in the Web Users table.
- Click Submit.

16.3.10 LDAP-based Login Authentication Example

To facilitate your understanding on LDAP entry data structure and how to configure the device to use and obtain information from this LDAP directory, a brief configuration example is described in this section. The example applies to LDAP-based user login authentication and authorization (access level), and assumes that you are familiar with other aspects of LDAP configuration (e.g., LDAP server's address).

The LDAP server's entry data structure schema in the example is as follows:

DN (base path): OU=testMgmt,OU=QA,DC=testqa,DC=local. The DN path to search for the username in the directory is shown below:

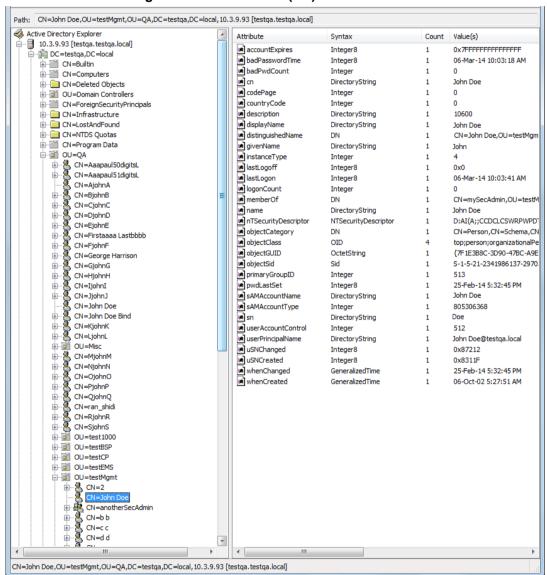

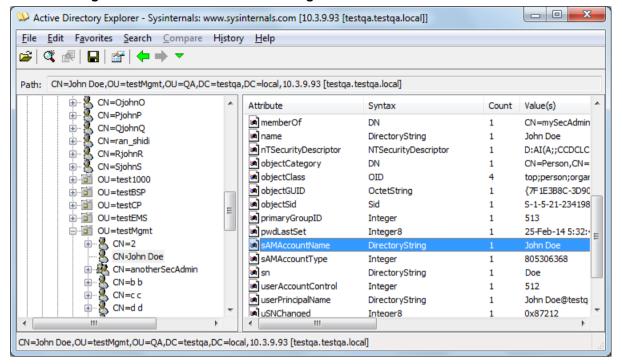

Figure 16-14: Base Path (DN) in LDAP Server

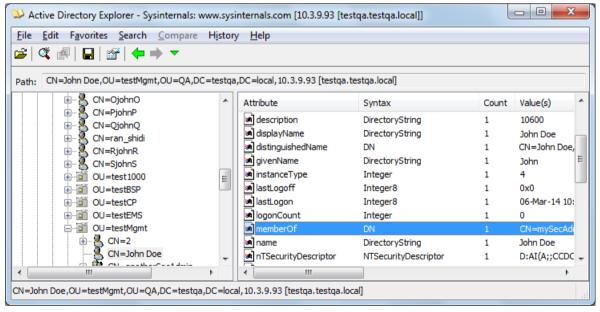

Search Attribute Filter: (sAMAccountName=\$). The login username is found based on this attribute (where the attribute's value equals the username):

Figure 16-15: Username Found using sAMAccount Attribute Search Filter

Management Attribute: memberOf. The attribute contains the member groups of the user:

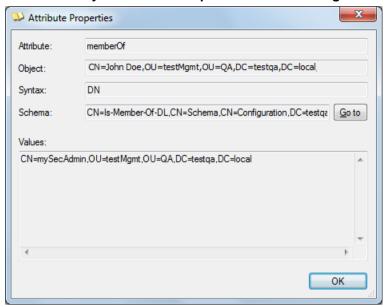

Figure 16-16: User's memberOf Attribute

Management Group: mySecAdmin. The group to which the user belongs, as listed under the memberOf attribute:

Figure 16-17: User's mySecAdmin Group in memberOf Management Attribute

The configuration to match the above LDAP data structure schema is as follows:

The DN is configured in the LDAP Configuration table (see 'Configuring LDAP Servers' on page 219):

Figure 16-18: Configuring DN

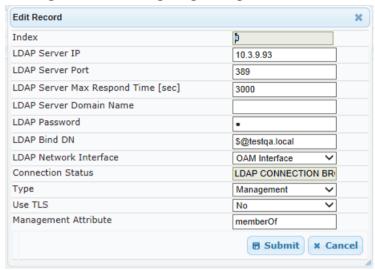

The search attribute filter based on username is configured by the 'LDAP Authentication Filter' parameter in the LDAP Settings page (see 'Configuring the LDAP Search Filter Attribute' on page 223):

Figure 16-19: Configuring Search Attribute Filter

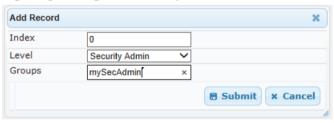

The group management attribute is configured by the 'Management Attribute' parameter in the LDAP Configuration table:

Figure 16-20: Configuring Management Attribute

The management group and its corresponding access level is configured in the Management LDAP Groups table (see 'Configuring Access Level per Management Groups Attributes' on page 224):

Figure 16-21: Configuring Management Group Attributes for Determining Access Level

16.3.11 Active Directory-based Routing for Microsoft Lync

Typically, enterprises wishing to deploy the Microsoft® Lync™ Server are faced with a complex, call routing dial plan when migrating users from their existing PBX or IP PBX to the Lync Server platform. As more and more end-users migrate to the new voice system, dialing plan management and PBX link capacity can be adversely impacted. To resolve this issue, enterprises can employ Microsoft's Active Directory (AD), which provides a central database to manage and maintain information regarding user's availability, presence, and location.

The device supports outbound IP call routing decisions based on information stored on the AD. Based on queries sent to the AD, the device can route the call to one of the following IP domains:

- Lync client users connected to Lync Server through the Mediation Server
- PBX or IP PBX users not yet migrated to Lync Server
- Mobile mobile number
- Private private telephone line for Lync users (in addition to the primary telephone line)

16.3.11.1 Querying the AD and Routing Priority

The device queries the AD using the initial destination number (i.e., called number). The query can return up to four user phone numbers, each pertaining to one of the IP domains (i.e., private number, Lync number, PBX / IP PBX number, and mobile number). The configuration parameters listed in the table below are used to configure the query attribute keys that defines the AD attribute that you wish to query in the AD:

Parameters for Configuring Query Attribute Key

Parameter	Queried User Domain (Attribute) in AD	Query or Query Result Example
MSLDAPPBXNumAttribute Name	PBX or IP PBX number (e.g., "telephoneNumber" - default)	telephoneNumber= +3233554447
MSLDAPOCSNumAttribute Name	Mediation Server / Lync client number (e.g., "msRTCSIP-line")	msRTCSIP- line=john.smith@compan y.com
MSLDAPMobileNumAttribu teName	Mobile number (e.g., "mobile")	mobile=+3247647156
MSLDAPPrivateNumAttrib uteName	Any attribute (e.g., "msRTCSIP- PrivateLine") Note: Used only if set to same value as Primary or Secondary key.	msRTCSIP-PrivateLine= +3233554480
MSLDAPPrimaryKey	Primary Key query search instead of PBX key - can be any AD attribute	msRTCSIP-PrivateLine= +3233554480
MSLDAPSecondaryKey	Secondary Key query key search if Primary Key fails - can be any attribute	-

The process for querying the AD and subsequent routing based on the query results is as follows:

1. If the Primary Key is configured, it uses the defined string as a primary key instead of the one defined in MSLDAPPBXNumAttributeName. It requests the attributes which are described below.

User's Manual 234 Document #: LTRT-89725

If the primary query is not found in the AD and the Secondary Key is configured, it
does a second query for the destination number using a second AD attribute key
name, configured by the MSLDAPSecondaryKey parameter.

- 3. If none of the queries are successful, it routes the call to the original dialed destination number according to the routing rule matching the "LDAP_ERR" destination prefix number value, or rejects the call with a SIP 404 "Not Found" response.
- **4.** For each query (primary or secondary), it queries the following attributes (if configured):
 - MSLDAPPBXNumAttributeName
 - MSLDAPOCSNumAttributeName
 - MSLDAPMobileNumAttributeName

In addition, it queries the special attribute defined in MSLDAPPrivateNumAttributeName, only if the query key (primary or secondary) is equal to its value.

- 5. If the query is found: The AD returns up to four attributes Lync, PBX / IP PBX, private (only if it equals Primary or Secondary key), and mobile.
- 6. The device adds unique prefix keywords to the query results in order to identify the query type (i.e., IP domain). These prefixes are used as the prefix destination number value in the Outbound IP Routing table to denote the IP domains:
 - "PRIVATE" (PRIVATE:<private_number>): used to match a routing rule based on query results of the private number (MSLDAPPrivateNumAttributeName)
 - "OCS" (OCS:<Lync_number>): used to match a routing rule based on query results of the Lync client number (MSLDAPOCSNumAttributeName)
 - "PBX" (PBX:<PBX_number>): used to match a routing rule based on query results of the PBX / IP PBX number (MSLDAPPBXNumAttributeName)
 - "MOBILE" (MOBILE:<mobile_number>): used to match a routing rule based on query results of the mobile number (MSLDAPMobileNumAttributeName)
 - "LDAP_ERR": used to match a routing rule based on a failed query result when no attribute is found in the AD

Note: These prefixes are involved only in the routing and manipulation processes; they are not used as the final destination number.

- 7. The device uses the Outbound IP Routing table to route the call based on the LDAP query result. The device routes the call according to the following priority:
 - 1. **Private line:** If the query is done for the private attribute and it's found, the device routes the call according to this attribute.
 - Mediation Server SIP address (Lync): If the private attribute does not exist or is not queried, the device routes the call to the Mediation Server (which then routes the call to the Lync client).
 - PBX / IP PBX: If the Lync client is not found in the AD, it routes the call to the PBX / IP PBX.
 - 4. Mobile number: If the Lync client (or Mediation Server) is unavailable (e.g., SIP response 404 "Not Found" upon INVITE sent to Lync client), and the PBX / IP PBX is also unavailable, the device routes the call to the user's mobile number (if exists in the AD).
 - 5. Alternative route: If the call routing to all the above fails (e.g., due to unavailable destination call busy), the device can route the call to an alternative destination if an alternative routing rule is configured.

"Redundant" route: If the query failed (i.e., no attribute found in the AD), the device uses the routing rule matching the "LDAP_ERR" prefix destination number value.

Note: For Enterprises implementing a PBX / IP PBX system, but yet to migrate to Lync Server, if the PBX / IP PBX system is unavailable or has failed, the device uses the AD query result for the user's mobile phone number, routing the call through the PSTN to the mobile destination.

The flowchart below summarizes the device's process for querying the AD and routing the call based on the query results:

Queries AD using PBX Attribute Name if Primary Key Unsuccessful Secondary Key not configured: Configured? No otherwise, using Primary Key Routes Call to Original Dialed Number using Yes LDAP_ERR Routing Rule Query AD Unsuccessful using Secondary Key Successful Query Successful Query Query Results Retrieves only Required Attributes (Lync / OCS attribute, PBX attribute, Mobile attribute, and Private attribute (if same as Primary / Secondary Query Key) Changes Attributes to Prefix Destination Number Keywords (PRIVATE:private number, OCS:lync number, PBX:pbx_number, MOBILE:mobile_number) Routes Call According to Priority Routes Call to Private if available Call Failure Alternative Routing Mediation Server (Lync / OCS) if available (e.g., Busy Rule, if Configured PBX if Lync / OCS does not exist Destination) Mobile if Lync / OCS or PBX were tried

Figure 16-22: LDAP Query Flowchart

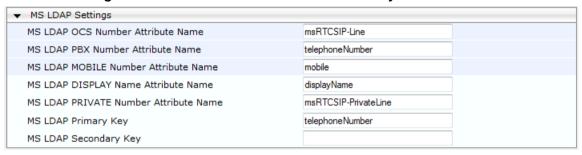

Note: If you are using the device's local LDAP cache, see 'Configuring the Device's LDAP Cache' on page 226 for the LDAP query process.

16.3.11.2 Configuring AD-Based Routing Rules

The following procedure describes how to configure outbound IP routing based on LDAP queries.

- > To configure LDAP-based IP routing for Lync Server:
- Configure the LDAP server parameters, as described in 'Configuring LDAP Servers' on page 219.
- 2. Configure the AD attribute names used in the LDAP query:
 - a. Open the Advanced Parameters page (Configuration tab > VolP menu > SIP Definitions > Advanced Parameters).

Figure 16-23: LDAP Parameters for Microsoft Lync Server 2010

- b. Configure the LDAP attribute names as desired.
- 3. Gateway application: Configure AD-based Tel-to-IP routing rules:
 - a. Open the Outbound IP Routing table (Configuration tab > VoIP menu > GW and IP to IP > Routing > Tel to IP Routing). For more information, see Configuring Outbound IP Routing Table on page 407.
 - b. Configure query-result routing rules for each IP domain (private, PBX / IP PBX, Lync clients, and mobile), using the LDAP keywords (case-sensitive) for the prefix destination number:
 - PRIVATE: Private number
 - OCS: Lync client number
 - PBX: PBX / IP PBX number
 - MOBILE: Mobile number
 - LDAP_ERR: LDAP query failure
 - **c.** Configure a routing rule for routing the initial Tel call to the LDAP server, using the value "LDAP" for denoting the IP address of the LDAP server.
 - **d.** For alternative routing, enable the alternative routing mechanism and configure corresponding SIP reasons for alternative routing. For this feature, alternative routing starts from the table row located under the LDAP query row.
- 4. SBC application: Configure AD-based IP-to-IP routing rules:
 - a. Open the IP-to-IP Routing Table page (Configuration tab > VoIP menu > SBC > Routing SBC > IP-to-IP Routing Table). For more information, see Configuring SBC IP-to-IP Routing Rules.
 - b. Configure query-result routing rules for each IP domain (private, PBX / IP PBX, Lync clients, and mobile), using the LDAP keywords (case-sensitive) in the Destination Username Prefix field:
 - PRIVATE: Private number
 - OCS: Lync client number
 - PBX: PBX / IP PBX number
 - MOBILE: Mobile number

- LDAP_ERR: LDAP query failure
- **c.** Configure a routing rule for routing the initial call (LDAP query) to the LDAP server, by setting the 'Destination Type' field to LDAP for denoting the IP address of the LDAP server.
- **d.** For alternative routing, enable the alternative routing mechanism and configure corresponding SIP reasons for alternative routing. For this feature, alternative routing starts from the table row located under the LDAP query row.

The table below shows an example for configuring AD-based Tel-to-IP routing rules in the Outbound IP Routing table:

AD-Based Tel-to-IP Routing Rule Configuration Examples

Index	Dest. Phone Prefix	Dest. IP Address
1	PRIVATE:	10.33.45.60
2	PBX:	10.33.45.65
3	OCS:	10.33.45.68
4	MOBILE:	10.33.45.100
5	LDAP_ERR	10.33.45.80
6	*	LDAP
7	*	10.33.45.72

The table below shows an example for configuring AD-based SBC routing rules in the IP-to-IP Routing Table:

AD-Based SBC IP-to-IP Routing Rule Configuration Examples

Index	Destination Username Prefix	Destination Type	Destination Address
1	PRIVATE:	Dest Address	10.33.45.60
2	PBX:	Dest Address	10.33.45.65
3	OCS:	Dest Address	10.33.45.68
4	MOBILE:	Dest Address	10.33.45.100
5	LDAP_ERR	Dest Address	10.33.45.80
6	*	LDAP	
7	*	Dest Address	10.33.45.72

The configured routing rule example is explained below:

- **Rule 1:** Sends call to private telephone line (at 10.33.45.60) upon successful AD query result for the private attribute.
- Rule 2: Sends call to IP PBX (at 10.33.45.65) upon successful AD query result for the PBX attribute.
- Rule 3: Sends call to Lync client (i.e., Mediation Server at 10.33.45.68) upon successful AD guery result for the Lync attribute.
- Rule 4: Sends call to user's mobile phone number (to PSTN through the device's IP address at 10.33.45.100) upon successful AD query result for the Mobile attribute.
- **Rule 5:** Sends call to IP address of device (10.33.45.80) if AD query failure (e.g., no response from LDAP server or attribute not found).

Rule 6: Sends query for original destination number of received call to the LDAP server

- Rule 7: Alternative routing rule that sends the call of original dialed number to IP destination 10.33.45.72. This rule is applied in any of the following cases
 - LDAP functionality is disabled.
 - LDAP query is successful but call fails (due to, for example, busy line) to all the
 relevant attribute destinations (private, Lync, PBX, and mobile), and a relevant
 Tel-to-IP Release Reason (see Alternative Routing for Tel-to-IP Calls) or SBC
 Alternative Routing Reason (see Configuring SIP Response Codes for Alternative
 Routing Reasons) has been configured.

Once the device receives the original incoming call, the first rule that it uses is Rule 6, which queries the AD server. When the AD replies, the device searches the table, from the first rule down, for the matching destination phone prefix (i.e., "PRIVATE; "PBX:", "OCS:", "MOBILE:", and "LDAP ERR:"), and then sends the call to the appropriate destination.

16.3.11.3 Querying the AD for Calling Name

The device can retrieve the calling name (display name) from an LDAP-compliant server (for example, Microsoft Active Directory / AD) for Tel-to-IP calls that are received without a calling name.

The device uses the calling number (PBX or mobile number) for the LDAP query. Upon an incoming INVITE, the device queries the AD based on the Calling Number search key (tries to match the calling number with the appropriate "telephoneNumber" or "mobile" number AD attribute entry). It then searches for the corresponding calling name attribute, configured by the MSLDAPDisplayNameAttributeName parameter (e.g., "displayName"). The device uses the resultant calling name as the display name parameter in the SIP From header of the outgoing INVITE message.

To configure this feature, the following keywords are used in the Calling Name Manipulation Table for Tel-to-IP Calls table for the 'Prefix/Suffix to Add' fields, which can be combined with other characters:

- "\$LDAP-PBX": LDAP query using the MSLDAPPBXAttrName parameter as the search key
- "\$LDAP-MOBILE": LDAP query using MSLDAPMobileAttrName parameter as the search key

If the source (calling) number of the Tel-to-IP call matches the PBX / MOBILE (e.g., "telephoneNumber" and "mobile") number in the AD server, the device uses the resultant Display Name instead of the keyword(s).

For example, assume the following configuration in the Calling Name Manipulation Table for Tel-to-IP Calls:

- 'Source Prefix' field is set to "4".
- 'Prefix to Add' field is set to "\$LDAP-PBX Office".

If the calling number is 4046 and the resultant LDAP query display name is "John Doe", the device sends the INVITE message with the following From header:

From: John Doe <sip:4064@company.com>

Notes:

- The Calling Name Manipulation Table for Tel-to-IP Calls table uses the numbers before manipulation, as inputs.
- The LDAP query uses the calling number after source number manipulation, as the search key value.

16.4 Least Cost Routing

This section provides a description of the device's least cost routing (LCR) feature and how to configure it.

16.4.1 Overview

The LCR feature enables the device to choose the outbound IP destination routing rule based on lowest call cost. This is useful in that it enables service providers to optimize routing costs for customers. For example, you may wish to define different call costs for local and international calls, or different call costs for weekends and weekdays (specifying even the time of call). The device sends the calculated cost of the call to a Syslog server (as Information messages), thereby enabling billing by third-party vendors.

LCR is implemented by defining Cost Groups and assigning them to routing rules in the Outbound IP Routing table (Gateway calls) or IP-to-IP Routing table (SBC calls). The device searches this routing table for matching routing rules, and then selects the rule with the lowest call cost. If two routing rules have identical costs, then the rule appearing higher up in the table is used (i.e., first-matched rule). If a selected route is unavailable, the device selects the next least-cost routing rule. However, even if a matched rule is not assigned a Cost Group, the device can select it as the preferred route over other matched rules with Cost Groups. This is determined according to the settings of the Default Cost parameter in the Routing Rule Groups table.

The Cost Group defines a fixed connection cost (*connection cost*) and a charge per minute (*minute cost*). Cost Groups can also be configured with time segments (*time bands*), which define connection cost and minute cost based on specific days of the week and time of day (e.g., from Saturday through Sunday, between 6:00 and 18:00). If multiple time bands are configured per Cost Group and a call spans multiple time bands, the call cost is calculated using only the time band in which the call was initially established.

In addition to Cost Groups, the device can calculate the call cost using an optional, user-defined average call duration value. The logic in using this option is that a Cost Group may be cheap if the call duration is short, but due to its high minute cost, may prove very expensive if the duration is lengthy. Thus, together with Cost Groups, the device can use this option to determine least cost routing. The device calculates the Cost Group call cost as follows: Total Call Cost = Connection Cost + (Minute Cost * Average Call Duration).

The below table shows an example of call cost when taking into consideration call duration. This example shows four defined Cost Groups and the total call cost if the average call duration is 10 minutes:

Coot Croup	Connection	Minute Cost	Total Call Cost per Duration		
Cost Group	Cost		1 Minute	10 Minutes	
Α	1	6	7	61	
В	0	10	10	100	
С	0.3	8	8.3	80.3	
D	6	1	7	16	

Table 16-2: Call Cost Comparison between Cost Groups for different Call Durations

If four matching routing rules are located in the routing table and each one is assigned a different Cost Group as listed in the table above, then the rule assigned Cost Group "D" is selected. Note that for one minute, Cost Groups "A" and "D" are identical, but due to the average call duration, Cost Group "D" is cheaper. Therefore, average call duration is an important factor in determining the cheapest routing role.

Below are a few examples of how you can implement LCR:

Example 1: This example uses two different Cost Groups for routing local calls and international calls:

Two Cost Groups are configured as shown below:

Cost Group	Connection Cost	Minute Cost
1. "Local Calls"	2	1
2. "International Calls"	6	3

The Cost Groups are assigned to routing rules for local and international calls:

Routing Index	Dest Phone Prefix	Destination IP	Cost Group ID
1	2000	x.x.x.x	1 "Local Calls"
2	00	x.x.x.x	2 "International Calls"

Example 2: This example shows how the device determines the cheapest routing rule in the Outbound IP Routing table:

The Default Cost parameter (global) in the Routing Rule Groups table is set to **Min**, meaning that if the device locates other matching LCR routing rules (with Cost Groups assigned), the routing rule without a Cost Group is considered the lowest cost route.

The following Cost Groups are configured:

Cost Group	Connection Cost	Minute Cost
1. "A"	2	1
2. "B"	6	3

The Cost Groups are assigned to routing rules:

Routing Index	Dest Phone Prefix	Destination IP	Cost Group
1	201	X.X.X.X	"A'
2	201	x.x.x.x	"B"
3	201	X.X.X.X	0
4	201	X.X.X.X	"B"

The device calculates the optimal route in the following index order: 3, 1, 2, and then 4, due to the following logic:

- Index 1 Cost Group "A" has the lowest connection cost and minute cost
- Index 2 Cost Group "B" takes precedence over Index 4 entry based on the firstmatched method rule
- Index 3 no Cost Group is assigned, but as the Default Cost parameter is set to Min, it is selected as the cheapest route
- Index 4 Cost Group "B" is only second-matched rule (Index 1 is the first)

Example 3: This example shows how the cost of a call is calculated if the call spans over multiple time bands:

Assume a Cost Group, "CG Local" is configured with two time bands, as shown below:

Cost Group	Time Band	Start Time	End Time	Connection Cost	Minute Cost
CG Local	TB1	16:00	17:00	2	1
CG Local	TB2	17:00	18:00	7	2

Assume that the call duration is 10 minutes, occurring between 16:55 and 17:05. In other words, the first 5 minutes occurs in time band "TB1" and the next 5 minutes occurs in "TB2", as shown below:

Figure 16-24: LCR using Multiple Time Bands (Example)

The device calculates the call using the time band in which the call was initially established, regardless of whether the call spans over additional time bands:

Total call cost = "TB1" Connection Cost + ("TB1" Minute Cost x call duration) = 2 + 1 x 10 min = 12

16.4.2 Configuring LCR

The following main steps need to be done to configure LCR:

- 1. Enable the LCR feature and configure the average call duration and default call connection cost see "Enabling LCR and Configuring Default LCR" on page 242.
- Configure Cost Groups see "Configuring Cost Groups" on page 244.
- 3. Configure Time Bands for a Cost Group see "Configuring Time Bands for Cost Groups" on page 245.
- **4.** Assign Cost Groups to outbound IP routing rules see "Assigning Cost Groups to Routing Rules" on page 246.

16.4.2.1 Enabling the LCR Feature

The Routing Rule Groups table lets you enable the LCR feature. This also includes configuring the average call duration and default call cost for routing rules that are not assigned Cost Groups in the Outbound IP Routing table.

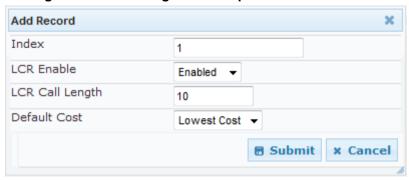

The following procedure describes how to enable LCR in the Web interface. You can also do this using the table ini file parameter, RoutingRuleGroups.

To enable LCR:

Open the Routing Rule Groups Table page (Configuration tab > VolP menu > Services > Least Cost Routing > Routing Rule Groups Table).

2. Click Add; the following dialog box appears:

Figure 16-25: Routing Rule Groups Table - Add Record

- 3. Enable LCR according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 16-3: Routing Rule Groups Table Parameter Descriptions

Table 10-3. Routing Rule Groups Table Parameter Descriptions	
Parameter	Description
Index [RoutingRuleGroups_Index]	Defines an index number for the new table record. Note: Only one index entry can be configured.
LCR Enable [RoutingRuleGroups_LCREnable]	Enables the LCR feature:[0] Disabled (default)[1] Enabled
LCR Call Length [RoutingRuleGroups_LCRAverage CallLength]	Defines the average call duration (in minutes) and is used to calculate the variable portion of the call cost. This is useful, for example, when the average call duration spans over multiple time bands. The LCR is calculated as follows: cost = call connect cost + (minute cost * average call duration)
	The valid value range is 0-65533. The default is 1. For example, assume the following Cost Groups:
	 "Weekend A": call connection cost is 1 and charge per minute is 6. Therefore, a call of 1 minute cost 7 units. "Weekend_ B": call connection cost is 6 and charge per minute is 1. Therefore, a call of 1 minute cost 7 units. Therefore, for calls under one minute, "Weekend A" carries the lower cost. However, if the average call duration is more than one minute, then "Weekend B" carries the lower cost.
Default Cost [RoutingRuleGroups_LCRDefault Cost]	Determines whether routing rules in the Outbound IP Routing table without an assigned Cost Group are considered a higher cost or lower cost route compared to other matched routing rules that are assigned Cost Groups. • [0] Lowest Cost = If the device locates other matching LCR routing rules, this routing rule is considered the lowest cost route and therefore, it is selected as the route to use (default.) • [1] Highest Cost = If the device locates other matching LCR routing rules, this routing rule is considered as the highest cost route and therefore, is not used or used only if the other cheaper routes are unavailable. Note: If more than one valid routing rule without a defined Cost Group exists, the device selects the first-matched rule.

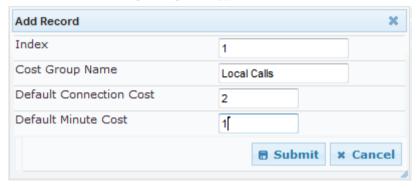

16.4.2.2 Configuring Cost Groups

The Cost Group table lets you configure Cost Groups. A Cost Group defines a fixed call connection cost and a call rate (charge per minute). Once configured, you can configure Time Bands per Cost Group. Up to 10 Cost Groups can be configured.

The following procedure describes how to configure Cost Groups in the Web interface. You can also configure this using the table ini file parameter, CostGroupTable.

> To configure a Cost Group:

- Open the Cost Group Table page (Configuration tab > VolP menu > Services > Least Cost Routing > Cost Group Table).
- 2. Click Add; the following dialog box appears:

- 3. Configure a Cost Group according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 16-4: Cost Group Table Parameter Descriptions

Parameter	Description
Index [CostGroupTable_Index]	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.
Cost Group Name [CostGroupTable_CostGroupName]	Defines an arbitrary name for the Cost Group. The valid value is a string of up to 30 characters. Note: Each Cost Group must have a unique name.
Default Connection Cost [CostGroupTable_DefaultConnectionCost]	Defines the call connection cost (added as a fixed charge to the call) for a call outside the time bands. The valid value range is 0-65533. The default is 0. Note: When calculating the cost of a call, if the current time of the call is not within a time band configured for the Cost Group, then this default connection cost is used.
Default Minute Cost [CostGroupTable_DefaultMinuteCost]	Defines the call charge per minute for a call outside the time bands. The valid value range is 0-65533. The default is 0. Note: When calculating the cost of a call, if the current time of the call is not within a time band configured for the Cost Group, then this default charge per minute is used.

16.4.2.3 Configuring Time Bands for Cost Groups

The Time Band table lets you configure Time Bands per Cost Group. A Time Band defines a day and time range (e.g., from Saturday 05:00 to Sunday 24:00), as well as the fixed call connection charge and call rate per minute for this interval. You can configure up to 70 Time Bands, where up to 21 Time Bands can be assigned to each Cost Group.

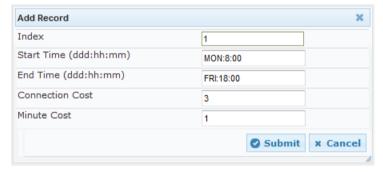

Note: You cannot configure overlapping Time Bands.

The following procedure describes how to configure Time Bands per Cost Group in the Web interface. You can also configure this using the table ini file parameter, CostGroupTimebands.

To configure a Time Band per Cost Group:

- Open the Cost Group Table page (Configuration tab > VolP menu > Services > Least Cost Routing > Cost Group Table).
- 2. Select a Cost Group for which you want to assign Time Bands, and then click the **Time Band** link located below the table; the Time Band table for the selected Cost Group appears.
- 3. Click **Add**; the following dialog box appears:

- 4. Configure a Time Band according to the parameters described in the table below.
- 5. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 16-5: Time Band Table Description

Parameter	Description
Index [CostGroupTimebands_TimebandIndex]	Defines an index number for the new table record. Note: Each table row must be configured with a unique index.
Start Time [CostGroupTimebands_StartTim	Defines the day and time of day from when this time band is applicable. The format is DDD:hh:mm, where:
e]	 DDD is the day of the week, represented by the first three letters of the day in upper case (i.e., SUN, MON, TUE, WED, THU, FRI, or SAT).
	• <i>hh</i> and <i>mm</i> denote the time of day, where <i>hh</i> is the hour (00-23) and <i>mm</i> the minutes (00-59)
	For example, SAT:22:00 denotes Saturday at 10 pm.

Parameter	Description
End Time [CostGroupTimebands_EndTime]	Defines the day and time of day until when this time band is applicable. For a description of the valid values, see the parameter above.
Connection Cost [CostGroupTimebands_ConnectionCost]	Defines the call connection cost during this time band. This is added as a fixed charge to the call. The valid value range is 0-65533. The default is 0.
	Note: The entered value must be a whole number (i.e., not a decimal).
Minute Cost [CostGroupTimebands_MinuteCost]	Defines the call cost per minute charge during this timeband. The valid value range is 0-65533. The default is 0. Note: The entered value must be a whole number (i.e., not a decimal).

16.4.2.4 Assigning Cost Groups to Routing Rules

To use your configured Cost Groups, you need to assign them to routing rules:

- Gateway application: Outbound IP Routing table see Configuring Outbound IP Routing Table on page 407
- SBC application: IP-to-IP Routing table see Configuring SBC IP-to-IP Routing Rules on page 510

16.5 Configuring Call Setup Rules

The Call Setup Rules table lets you configure up to 40 Call Setup rules. Call Setup rules define various sequences that are run upon the receipt of an incoming call (dialog) at call setup, before the device routes the call to its destination. Call Setup rules can be configured for any call direction (SBC, Tel-to-IP, or IP-to-Tel). Call Setup rules provides you with full flexibility in implementing simple or complex script-like rules that can be used for Lightweight Directory Access Protocol (LDAP) based routing as well as other advanced routing logic requirements such as manipulation. These Call Setup rules are assigned to routing rules.

Below is a summary of functions for which you can employ Call Setup rules:

- LDAP query rules: LDAP is used by the device to query Microsoft's Active Directory (AD) server for specific user details for routing, for example, office extension number, mobile number, private number, OCS (Lync) address, and display name. Call Setup rules provides full flexibility in AD-lookup configuration to suite just about any customer deployment requirement:
 - Routing based on query results.
 - Queries based on any AD attribute.
 - Queries based on any attribute value (alphanumeric), including the use of the
 asterisk (*) wildcard as well as the source number, destination number, redirect
 number, and SBC SIP messages. For example, the following Call Setup rule
 queries the attribute "proxyAddresses" for the record value "WOW:" followed by
 source number: "proxyAddresses=WOW:12345*"
 - Conditional LDAP queries, for example, where the query is based on two attributes (&(telephoneNumber=4064)(company=ABC).
 - Conditions for checking LDAP query results.
 - Manipulation of call parameters such as source number, destination number, and redirect number and SBC SIP messages, while using LDAP query results.
 - Multiple LDAP queries.
- Manipulation (similar to the Message Manipulations table) of call parameters (such as source number, destination number, and redirect number) and SBC SIP messages.
- Conditions for routing, for example, if the source number equals a specific value, then use the call routing rule.

You configure Call Setup rules with a Set ID, similar to the Message Manipulations table, where multiple rules can be associated with the same Set ID. This lets you perform multiple Call Setup rules on the same call setup dialog.

To use your Call Setup rule(s), you need to assign the Call Setup Rules Set ID to the relevant routing rule. This is done using the 'Call Setup Rules Set ID' field in the routing table:

- SBC IP-to-IP routing see Configuring SBC IP-to-IP Routing Rules on page 510
- Tel-to-IP routing rules see Configuring Outbound IP Routing Table on page 407
- IP-to-Tel routing rules see "Configuring Inbound IP Routing Table" on page 416

If an incoming call matches the characteristics of a routing rule, the device first runs the assigned Call Setup Rules Set ID. The device uses the routing rule to route the call, depending on the result of the Call Setup Rules Set ID:

- Rule's condition is met: The device performs the rule's action and then runs the next rule in the Set ID until the last rule or until a rule with an Exit Action Type. If the Exit rule is configured with a "True" Action Value, the device uses the current routing rule. If the Exit rule is configured with a "False" Action Value, the device moves to the next routing rule. If an Exit Action Type is not configured and the device has run all the rules in the Set ID, the default Action Value of the Set ID is "True" (i.e., use the current routing rule).
- Rule's condition is not met: The device runs the next rule in the Set ID. When the device reaches the end of the Set ID and no Exit was performed, the Set ID ends with a "True" result.

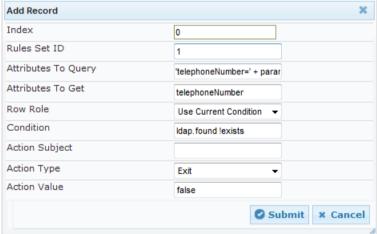

Note: If the source and/or destination numbers are manipulated by the Call Setup rules, they revert to their original values if the device moves to the next routing rule.

The following procedure describes how to configure Call Setup Rules in the Web interface. You can also configure Call Setup Rules using the table ini file parameter, Call Setup Rules.

- To configure a Call Setup rule:
- 1. Open the Call Setup Rules table (Configuration tab > VolP menu > Services > Call Setup Rules).
- 2. Click **Add**; the following dialog box appears:

Figure 16-26: Call Setup Rules Table - Add Record

- 3. Configure a Call Setup rule according to the parameters described in the table below.
- Click Submit, and then save ("burn") your settings to flash memory.

Table 16-6: Call Setup Rules Parameter Descriptions

Parameter	Description
Index [CallSetupRules_Index]	Defines an index number for the new table record. Note: Each rule must be configured with a unique index.
Rules Set ID [CallSetupRules_RulesSetID]	Defines a Set ID for the rule. You can define the same Set ID for multiple rules to create a group of rules. You can configure up to 10 Set IDs, where each Set ID can include up to 10 rules. The Set ID is used to assign the Call Setup

Parameter	Description
	rules to a routing rule in the routing table. The valid value is 0 to 9. The default is 0.
Attributes To Query [CallSetupRules_AttributesToQuery]	Defines the query string that the device sends to the LDAP server.
	The valid value is a string of up to 100 characters. Combined strings and values can be configured like in the Message Manipulations table, using the '+' operator. Single quotes (') can be used for specifying a constant string (e.g., '12345').
	For example:
	 'mobile=' + param.call.dst.user (searches for the AD attribute, "mobile" that has the value of the destination user part of the incoming call)
	 'telephoneNumber=' + param.call.redirect + '*' (searches for the AD attribute, "telephoneNumber" that has a redirect number)
Attributes To Get [CallSetupRules_AttributesToGet]	Defines the attributes of the queried LDAP record that the device must handle (e.g., retrieve value).
	The valid value is a string of up to 100 characters. Up to five attributes can be defined, each separated by a comma (e.g., msRTCSIP-PrivateLine,msRTCSIP-Line,mobile).
	Note: The device saves the retrieved attributes' values for future use in other rules, until the next LDAP query or until the call is connected. Thus, the device does not need to requery the same attributes.
Row Role [CallSetupRules_RowRole]	Determines which condition must be met in order for this rule to be performed.
	• [0] Use Current Condition = The Condition configured for this rule must be matched in order to perform the configured action (default).
	• [1] Use Previous Condition = The Condition configured for the rule located directly above this rule in the Call Setup table must be matched in order to perform the configured action. This option lets you configure multiple actions for the same Condition.
Condition [CallSetupRules_Condition]	Defines the condition that must exist for the device to perform the action.
	The valid value is a string of up to 200 characters (case-insensitive). Regular Expression (regex) can also be used, for example:
	 Idap.attr.mobile exists (attribute "mobile" exists in AD) param.call.dst.user == Idap.attr.msRTCSIP-PrivateLine (called number is the same as the number in the attribute "msRTCSIP-PrivateLine")
	Idap.found !exists (LDAP record not found)
	 Idap.err exists (LDAP error exists)

Parameter	Description
Action Subject [CallSetupRules_ActionSubject]	Defines the element (header, parameter, or body) upon which you want to perform the action. The valid value is a string of up to 100 characters (case-insensitive). Examples: header.from contains '1234' (SBC calls only) param.call.dst.user (called number) param.call.src.user (calling number) param.call.src.name (calling name) param.call.redirect (redirect number) param.call.src.host (source host) param.call.dst.host (destination host)
Action Type [CallSetupRules_ActionType]	 Defines the type of action to perform. [0] Add (default) = Adds new message header, parameter or body elements. [1] Remove = Removes message header, parameter, or body elements. [2] Modify = Sets element to the new value (all element types). [3] Add Prefix = Adds value at the beginning of the string (string element only). [4] Add Suffix = Adds value at the end of the string (string element only). [5] Remove Suffix = Removes value from the end of the string (string element only). [6] Remove Prefix = Removes value from the beginning of the string (string element only). [20] Exit = Stops the Rule Set ID and returns a result ("True" or "False"). [21 Run Rules Set = Performs a different Rule Set ID, specified in the 'Action Value' parameter (below).
Action Value [CallSetupRules_ActionValue]	Defines a value that you want to use in the action. The valid value is a string of up to 300 characters (case-insensitive). Examples: '+9723976'+Idap.attr.alternateNumber '9764000' Idap.attr.displayName true (if the 'Action Type' is set to Exit) false (if the 'Action Type' is set to Exit)

16.5.1 Call Setup Rule Examples

Below are configuration examples for using Call Setup Rules.

- **Example 1:** This example configures the device to replace (manipulate) the incoming call's source number with a number retrieved from the AD by an LDAP query. The device queries the AD server for the attribute record, "telephoneNumber" whose value is the same as the received source number (e.g., "telephoneNumber =4064"). If such an attribute is found, the device retrieves the number of the attribute record, "alternateNumber" and uses this number as the source number.
 - Call Setup Rules table configuration:
 - 'Rules Set ID': 1
 - 'Attributes to Query': 'telephoneNumber=' + param.call.src.user
 - 'Attributes to Get': alternateNumber
 - 'Row Role': Use Current Condition
 - 'Condition': Idap.attr. alternateNumber exists
 - 'Action Subject': param.call.src.user
 - 'Action Type': Modify
 - 'Action Value': Idap.attr. alternateNumber
 - Routing table configuration: A single routing rule is assigned the Call Setup Rule Set ID.
 - Index 1:
 - √ 'Call Setup Rules Set Id': 1
- **Example 2:** This example configures the device to replace (manipulate) the incoming call's calling name (caller ID) with a name retrieved from the AD by an LDAP query. The device queries the AD server for the attribute record, "telephoneNumber" whose value is the same as the received source number (e.g., "telephoneNumber =5098"). If such an attribute is found, the device retrieves the name from the attribute record, "displayName" and uses this as the calling name in the incoming call.
 - Call Setup Rules table configuration:
 - 'Rules Set ID': 2
 - 'Attributes to Query': 'telephoneNumber=' + param.call.src.user
 - 'Attributes to Get': displayName
 - 'Row Role': Use Current Condition
 - 'Condition': Idap.attr. displayName exists
 - 'Action Subject': param.call.src.name
 - 'Action Type': Modify
 - 'Action Value': Idap.attr. displayName
 - Routing table configuration: A single routing rule is assigned the Call Setup Rule Set ID.
 - Index 1:
 - ✓ 'Call Setup Rules Set Id': 2

- **Example 3:** This example configures the device to route the incoming call according to whether or not the source number of the incoming call also exists in the AD server. The device queries the AD server for the attribute record, "telephoneNumber" whose value is the same as the received source number (e.g., telephoneNumber=4064"). If such an attribute is found, the device sends the call to the Lync server; if the query fails, the device sends the call to the PBX.
 - Call Setup Rules table configuration:
 - 'Rules Set ID': 3
 - 'Attributes to Query': 'telephoneNumber=' + param.call.src.user
 - 'Attributes to Get': telephoneNumber
 - 'Row Role': Use Current Condition
 - 'Condition': Idap.found !exists
 - 'Action Subject': -'Action Type': Exit'Action Value': false

If the attribute record is found (i.e., condition is not met), the rule ends with a default exit result of true and uses the first routing rule (Lync). If the attribute record does not exist (i.e., condition is met), the rule exits with a false result and uses the second routing rule (PBX).

- Routing table configuration: Two routing rules are assigned with the same matching characteristics. Only the main routing rule is assigned a Call Setup Rules Set ID.
 - Index 1:
 - 'Call Setup Rules Set Id': 3
 - ✓ 'Destination IP Group ID': 3 (IP Group for Lync)
 - Index 2:
 - ✓ 'Destination IP Group ID': 4 (IP Group of PBX)

17 Quality of Experience

This chapter describes how to configure the Quality of Experience feature.

17.1 Reporting Voice Quality of Experience to SEM

The device can be configured to report voice (media) Quality of Experience (QoE) to AudioCodes' Session Experience Manager (SEM) server, a plug-in for AudioCodes EMS. The reports include real-time metrics of the quality of the actual call experience, which are then processed by the SEM.

SEM is a VoIP-quality monitoring and analysis tool. SEM provides comprehensive details on voice traffic quality, allowing system administrators to quickly identify, fix and prevent issues that could affect the voice calling experience in enterprise and service provider VoIP networks. IT managers and administrators can employ SEM in their VoIP networks to guarantee effective utilization, smooth performance, reliable QoS levels, and SLA fulfillment.

Note: For information on the SEM server, refer to the EMS User's Manual.

17.1.1 Configuring the SEM Server

The device can be configured to report QoE voice metrics to a single SEM server or to two SEM/EMS servers deployed in a Geographic Redundancy, High-Availability (HA) mode. Geographic Redundancy is when each SEM/EMS server is located in a different network subnet and has its own IP address. Thus, for the device to report QoE to both servers, you need to configure the IP address of each server.

For regular HA mode, when both EMS/SEM servers are located in the same subnet, a single EMS/SEM server (global, virtual) IP address is used for all network components (EMS clients and managed devices). Thus, in such a setup, you need to configure only this IP address.

To configure the SEM server to where the device sends voice metrics:

Open the Session Experience Manager Server page (Configuration tab > VolP menu > Quality of Experience > Session Experience Manager Server).

Figure 17-1: Session Experience Manager Server Page

- 2. In the 'Server IP' field, enter the primary SEM server's IP address.
- **3.** If Geographical-Redundancy HA mode exists, in the 'Redundant Server IP' field, enter the secondary SEM server's IP address.
- 4. In the 'Port' field, enter the port number for the SEM server.
- 5. In the 'Interface Name' field, enter the device's IP network interface on which the device sends the reports to the SEM server.
- 6. Click **Submit**, and then save ("burn") your settings to flash memory.

17.1.2 Configuring Clock Synchronization between Device and SEM

To ensure accurate call quality statistics and analysis by the SEM server, you must configure the device and the SEM server with the same clock source for clock synchronization. In other words, you need to configure them with the same NTP server.

The NTP server can be one of the following:

- AudioCodes EMS server (also acting as an NTP server)
- Third-party, external NTP server

Once you have determined the NTP server, all the elements--device, SEM, and EMS--must be configured with the same NTP server address.

To configure, the NTP server's address on the device, see Configuring Automatic Date and Time using SNTP on page 119.

17.1.3 Enabling RTCP XR Reporting to SEM

In order for the device to be able to send voice metric reports to the SEM, you need to enable the RTP Control Protocol Extended Reports (RTCP XR) VoIP management protocol. RTCP XR defines a set of voice metrics that contain information for assessing VoIP call quality and diagnosing problems. Enabling RTCP XR means that the device can send RTCP XR messages, containing the call-quality metrics, to the SEM server.

For enabling RTCP XR reporting, see Configuring RTCP XR on page 633. For determining what to report to the SEM, see Configuring Quality of Experience Profiles on page 254.

17.2 Configuring Quality of Experience Profiles

The Quality of Experience feature lets you monitor the quality of voice calls traversing the device in your network. Voice-metric monitoring profiles (Quality of Experience Profiles) can be configured and applied to specific network links, including IP Groups (see "Configuring IP Groups" on page 273), Media Realms (see "Configuring Media Realms" on page 263), and Remote Media Subnets (see "Configuring Remote Media Subnets" on page 265). The monitored voice metrics include the following:

- Mean Opinion Score (MOS): MOS is the average grade on a quality scale, expressed as a single number in the range of 1 to 5, where 1 is the lowest audio quality and 5 the highest audio quality.
- **Delay (or latency):** Time it takes for information to travel from source to destination (round-trip time).
- Packet Loss: Lost packets are RTP packets that are not received by the voice endpoint. Packet loss can result in choppy voice transmission.
- **Jitter:** Jitter can result from uneven delays between received voice packets. To space evenly, the device's jitter buffer adds delay. The higher the measurement, the greater the impact of the jitter buffer's delay on audio quality.
- Residual Echo Return Loss (RERL): An echo is a reflection of sound arriving at the listener at some time after the sound was initiated (often by the listener). Echo is typically caused by delay.

At any given time during a call, a voice metric can be in one of the following color-coded quality states:

- Green: Indicates good call quality
- Yellow: Indicates medium call quality
- Red: Indicates poor call quality

Quality of Experience Profiles lets you define quality thresholds per monitored voice metric. These are based on the following color-coded quality thresholds:

Green-Yellow threshold: Lower threshold that indicates changes from Green to

Yellow or vice versa when the threshold is crossed.

Yellow-Red threshold: Higher threshold that indicates changes from Yellow to Red or vice versa when the threshold is crossed.

Hysteresis is also used to configure the threshold. This defines the amount of fluctuation from a threshold in order for the threshold to be considered as crossed (i.e., change in color state). Hysteresis is used to avoid false reports being sent by the device.

Each time a configured voice metric threshold is crossed (i.e., color changes), the device can do the following, depending on configuration:

- Report the change in the measured metrics to AudioCodes' Session Experience Manager (SEM) server. The SEM displays this call quality status for the associated SEM link (IP Group, Media Realm, or Remote Media Subnet). For configuring the SEM server's address, see "Configuring SEM Server" on page 254.
- Determine access control and media enhancements based on measured metrics. Depending on the crossed threshold type, you can configure the device to accept or reject calls, or use an alternative IP Profile for the IP Group to which the call belongs. For more information, see "Configuring Media Enhancement Profiles" on page 260.
- Alternative routing based on measured metrics. If a call is rejected because of a crossed threshold, the device generates a SIP 806 response. You can configure this SIP response code as a reason for alternative routing (see "Configuring SIP Response Codes for Alternative Routing Reasons" on page 518).

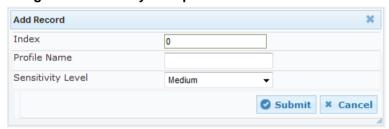

Note: For your convenience, the device provides pre-configured Quality of Experience Profiles. One of these pre-configured profiles is the default Quality of Experience Profile. Therefore, if you do not configure a Quality of Experience Profile, this default is used.

The following procedure describes how to configure Quality of Experience Profiles in the Web interface. You can also configure Quality of Experience Profiles using other management platforms:

- Quality of Experience Profile table: Table ini file parameter, QoEProfile
- Quality of Experience Color Rules table: Table ini file parameter, QOEColorRules
- To configure a QoE Profile:
- 1. Open the Quality of Experience Profile page (Configuration tab > VolP menu > Quality of Experience > Quality of Experience Profile).
- 2. Click **Add**; the following dialog box appears:

Figure 17-2: Quality of Experience Profile - Add Record

- 3. Configure a QoE Profile according to the parameters described in the table below.
- 4. Click Submit.

Table 17-1: Quality of Experience Profile Table Parameter Descriptions

Parameter	Description
Index [QOEProfile_Index]	Defines an index number for the new table record.
Profile Name [QOEProfile_Name]	Defines an arbitrary name to easily identify the QoE Profile. The valid value is a string of up to 20 characters.
Sensitivity Level [QOEProfile_SensitivityLevel]	 Defines the pre-configured threshold profile to use. [0] User Defined = Need to define thresholds per monitored parameter in the Quality of Experience Color Rules table. [1] Low = Pre-configured low sensitivity thresholds. [2] Medium = Pre-configured medium sensitivity thresholds. [3] High = Pre-configured high sensitivity thresholds. Reporting is done for small fluctuations in parameter values.

- 5. In the Quality of Experience Profile page, select the QoE Profile index row for which you want to configure QoE thresholds, and then click the Quality of Experience Color Rules link located below the table; the Quality of Experience Color Rules page appears.
- Click Add; the following dialog box appears:

Figure 17-3: Quality of Experience Page - Add Record Dialog Box

The figure above shows a configuration example where if the MOS value changes by 0.1 (hysteresis) to 3.3 or 3.5, the Green-Yellow threshold is crossed. The device considers a change to 3.3 as a Yellow state (i.e., medium quality) and a change to 3.5 as a Green state.

- 7. Configure a QoE Color rule according to the parameters described in the table below.
- 8. Click Submit, and then save ("burn") your settings to flash memory.

Table 17-2: Quality of Experience Color Rules Table Parameter Descriptions

Parameter	Description
Index [QOEColorRules_ColorRuleIndex]	Defines an index number for the new table record.

Parameter	Description
Monitored Parameter [QOEColorRules_monitoredParam]	Defines the parameter to monitor and report. • [0] MOS (default) • [1] Delay • [2] Packet Loss • [3] Jitter • [4] RERL [Echo]
Direction [QOEColorRules_direction]	Defines the monitoring direction. • [0] Device Side (default) • [1] Remote Side
Sensitivity Level [QOEColorRules_profile]	 Defines the sensitivity level of the thresholds. [0] User Defined = Need to define the thresholds in the parameters described below. [1] Low = Pre-configured low sensitivity threshold values. Thus, reporting is done only if changes in parameters' values is significant. [2] Medium = (Default) Pre-configured medium sensitivity threshold values. [3] High = Pre-configured high sensitivity threshold values. Thus, reporting is done for small fluctuations in parameter values.
Green Yellow Threshold [QOEColorRules_GreenYellowThreshold]	 Defines the parameter threshold values between Green (good quality) and Yellow (medium quality) states. The valid threshold values are as follows: MOS values are in multiples of 10. For example, to denote a MOS of 3.2, the value 32 (i.e., 3.2*10) must be entered. Delay values are in msec. Packet Loss values are in percentage (%). Jitter is in msec. Echo measures the Residual Echo Return Loss (RERL) in dB.
Green Yellow Hysteresis [QOEColorRules_GreenYellowHys teresis]	Defines the fluctuation (change) from the value configured for the Green-Yellow threshold. When the threshold is exceeded by this hysteresis, the device sends a report to the SEM indicating this change. Note: If the monitored parameter crosses two thresholds at once (e.g., from Green to Red), the device ignores the hysteresis value and reports the call state change to the SEM.
Yellow Red Threshold [QOEColorRules_YellowRedThreshold]	 Defines the parameter threshold values between Yellow (medium quality) and Red (poor quality) states. The valid threshold values are as follows: MOS values are in multiples of 10. For example, to denote a MOS of 3.2, the value 32 (i.e., 3.2*10) must be entered. Delay values are in msec. Packet Loss values are in percentage (%). Jitter is in msec. Echo measures the Residual Echo Return Loss (RERL) in dB.

Parameter	Description
Yellow Red Hysteresis [QOEColorRules_YellowRedHyste resis]	Defines the fluctuation (change) from the value configured for the Yellow-Red threshold. When the threshold is exceeded by this hysteresis value, the device sends a report to the SEM indicating this change.
	Note: If the monitored parameter crosses two thresholds at once (e.g., from Green to Red), the device ignores the hysteresis value and reports the call state change to the SEM.

17.3 Configuring Bandwidth Profiles

Bandwidth Profiles enhance the device's monitoring of bandwidth utilization. A Bandwidth Profile defines bandwidth utilization thresholds for audio and/or video traffic (incoming and outgoing). Bandwidth Profiles can be assigned to IP Groups (see "Configuring IP Groups" on page 273), Media Realms (see "Configuring Media Realms" on page 263), and Remote Media Subnets (see "Configuring Remote Media Subnets" on page 265).

Each time a configured bandwidth threshold is crossed, the device can do the following, depending on configuration:

- Determine access control and media enhancements based on bandwidth utilization. Depending on the crossed threshold type, you can configure the device to accept or reject calls, or use an alternative IP Profile for the IP Group to which the call belongs. For more information, see "Configuring Media Enhancement Profiles" on page 260.
- Alternative routing based on bandwidth utilization. If a call is rejected because of a crossed threshold, the device generates a SIP 806 response. You can configure this SIP response code as a reason for alternative routing (see "Configuring SIP Response Codes for Alternative Routing Reasons" on page 518).
- Send an SNMP alarm (acMediaRealmBWThresholdAlarm). The device clears the alarm when bandwidth utilization returns to normal (within the thresholds).

The thresholds of Bandwidth Profiles use the same color-coding as the Quality of Experience Profile:

- Green-Yellow threshold: Lower threshold that indicates that the bandwidth exceeded a user-defined percentage of the configured threshold. This is referred to as a "Warning" alarm (i.e., warning you that bandwidth is nearing the threshold). When bandwidth goes over the threshold, the device considers it as a Yellow state; when it goes below the threshold, it considers it as a Green state.
- Yellow-Red threshold: Indicates that bandwidth has exceeded the configured threshold. When bandwidth goes over the threshold, the device considers it as a Red state; when it goes below the threshold, it considers it as a Yellow state.

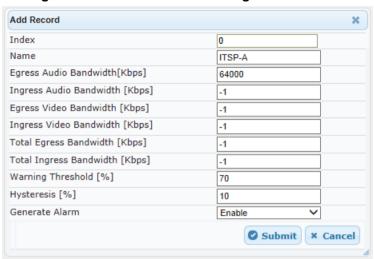

Hysteresis is also used to configure the threshold. This defines the amount of fluctuation from a threshold in order for the threshold to be considered as crossed (i.e., change in color state). Hysteresis is used to avoid false reports.

The following procedure describes how to configure Bandwidth Profiles in the Web interface. You can also configure Bandwidth Profiles using the table *ini* file parameter, BWProfile.

To configure Bandwidth Profiles:

- 1. Open the Bandwidth Profile page (Configuration tab > VoIP menu > Quality of Experience > Bandwidth Profile).
- Click Add; the following dialog box appears:

Figure 17-4: Bandwidth Profile Page - Add Record

The figure above shows a configuration example where if the outgoing voice traffic threshold of 64,000 increases by 80% (70% warning threshold plus 10% hysteresis) to 115,200 (64,000 plus 51,200), a Yellow state occurs and an alarm is sent. If the threshold increases by 10%, a Red state occurs and an alarm is sent.

- 3. Configure a Bandwidth Profile according to the parameters described in the table below.
- 4. Click **Submit**, and then reset the device with a save ("burn") to flash memory.

Table 17-3: Bandwidth Profile Table Parameter Descriptions

Parameter	Description
Index [BWProfile_Index]	Defines the index of the table row entry.
Name [BWProfile_Name]	Defines an arbitrary name to easily identify the Bandwidth Profile.
	The valid value is a string of up to 20 characters.
Egress Audio Bandwidth [BWProfile_EgressAudioBandwidth]	Defines the outgoing audio traffic threshold (in Kbps).
Ingress Audio Bandwidth [BWProfile_IngressAudioBandwidth]	Defines the incoming audio traffic threshold (in Kbps).
Egress Video Bandwidth [BWProfile_EgressVideoBandwidth]	Defines the outgoing video traffic threshold (in Kbps).
Ingress Video Bandwidth [BWProfile_IngressVideoBandwidth]	Defines the incoming video traffic threshold (in Kbps).
Total Egress Bandwidth [BWProfile_TotalEgressBandwidth]	Defines the total (video and audio) outgoing bandwidth threshold (in Kbps).
Total Ingress Bandwidth [BWProfile_TotalIngressBandwidth]	Defines the total (video and audio) incoming bandwidth threshold (in Kbps).

Parameter	Description
Warning Threshold [BWProfile_WarningThreshold]	Defines the threshold (in percentage) of the bandwidth thresholds that if exceeded is considered a Warning alarm (Green-Yellow threshold). This applies to any of the configured bandwidth thresholds. The Hysteresis is also added to this Warning threshold. For example, if set to 70% and the Hysteresis to 10%, when the current outgoing voice traffic exceeds 80% of the configured threshold, the Yellow state occurs and a Warning threshold alarm is sent if 'Generate Alarm' is set to Enable .
Hysteresis [BWProfile_hysteresis]	Defines the bandwidth fluctuation (change) from the bandwidth threshold value (in percentage). The threshold is considered crossed if bandwidth exceeds the configured threshold plus this hysteresis, and a Red state occurs. For example, assume this parameter is set to 10% and the configured bandwidth threshold is set to 64000 Kbps. If current bandwidth reaches 70,400 Kbps (additional 10%), the threshold is considered crossed.
Generate Alarm [BWProfile_GenerateAlarms]	 Enables the generation of an SNMP alarm if the threshold (with the hysteresis) is crossed. [0] Disable (default) [1] Enable If enabled, an alarm is sent if one of the following scenarios occurs: Warning threshold is exceeded (Warning severity - Yellow threshold). Any configured bandwidth threshold is exceeded (Major severity - Red threshold).

17.4 Configuring Media Enhancement Profiles

Media Enhancement Profiles provides support for access control and media quality enhancements based on call quality measurements (configured in "Configuring Quality of Experience Profiles" on page 254) and bandwidth utilization (configured in "Configuring Bandwidth Profiles" on page 258). These profiles contain color-coded thresholds that are used to trigger access control and/or media enhancements.

The Media Enhancement Profile table lets you configure any one of the following actions when a specific color-coded threshold (Green-Yellow or Yellow-Red) is crossed for a specific monitored voice metrics (e.g., MOS) or bandwidth (e.g., Egress Audio Bandwidth):

- Reject new calls until the voice metrics or bandwidth returns to below the threshold. This can be used, for example, to reject new calls when bandwidth threshold is exceeded.
- Use a different IP Profile. For example, if packet loss is detected, the IP Group (to which the Media Enhancement Rule is later assigned) can switch to an IP Profile configured with a higher RTP redundancy level. The ability to use a different IP Profile when call quality or bandwidth thresholds are crossed provides a wide range of options for media enhancement and traffic shaping. For example, it may be used to:
 - switch to a low bit-rate coder,
 - negotiate different p-time (and perform transrating if required),
 - increase RTP redundancy level,
 - or block video calls.
- Accept calls

A Media Enhancement Profile can later be assigned to an IP Group (in the IP Group table). However, when the device analyzes the call and determines whether Media Enhancement Profile should be applied or not, it searches for the "most relevant" Quality of Experience Profile or Bandwidth Profile in the following order: 1) Remote Media Subnet, 2) Media Realm, and then 3) IP Group. Thus, a Media Enhancement Profile associated with a specific IP Group may actually "respond" to Quality of Experience or bandwidth thresholds crossed at the Media Realm or Remote Media Subnet level.

Notes:

- The color-coded threshold is first calculated for the IP Group and only then for the Media Realm. The device uses the "worst" color-coded threshold crossing. For example, if a Media Realm crossed a Green-Yellow threshold and an IP Group a Yellow-Red threshold, the action defined for the Red color state is used.
- The device applies Media Enhancements Profiles on new calls only, based on the information gathered from previous and/or currently established calls.

The following procedure describes how to configure Media Enhancement Profiles in the Web interface. You can also configure Media Enhancement Profiles using other management platforms:

- Media Enhancement Profile table: Table ini file parameter, MediaEnhancementProfile
- Media Enhancement Rules table: Table ini file parameter, MediaEnhancementRules
- To configure a Media Enhancement Profile:
- Open the Media Enhancement Profile page (Configuration tab > VolP menu > Quality of Experience > Media Enhancement Profile).
- 2. Click Add; the following dialog box appears:

Figure 17-5: Media Enhancement Profile Table - Add Record

- 3. Configure a Media Enhancement Profile according to the parameters described in the table below.
- 4. Click Submit.

Table 17-4: Media Enhancement Profile Table Parameter Descriptions

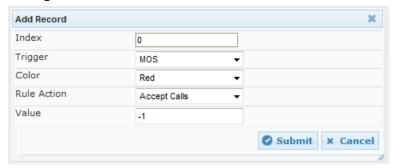

Parameter	Description
Index [MediaEnhancementProfile_Index]	Defines the index of the table row entry.
Name [MediaEnhancementProfile_ProfileName]	Defines an arbitrary name to easily identify the Media Enhancement Profile. The valid value is a string of up to 20 characters.

5. In the Media Enhancement Profile table, select the required Media Enhancement Profile index row, and then click the **Media Enhancement Rules** link located below the table; the Media Enhancement Rules page appears.

6. Click Add; the following dialog box appears:

Figure 17-6: Media Enhancement Rules - Add Record

- 7. Configure a Media Enhancement Rule according to the parameters described in the table below.
- 8. Click **Submit**, and then reset the device with a save ("burn") to flash memory.

Table 17-5: Media Enhancement Rules Table Parameter Descriptions

Table 17-5: Media Ennancement Rules Table Parameter Descriptions	
Parameter	Description
Index [MediaEnhancementRules _RuleIndex]	Defines the index of the table row entry.
Trigger [MediaEnhancementRules _Trigger]	Defines the monitored metrics parameter or bandwidth associated with this rule. • [0] MOS (default) • [1] Delay • [2] Packet Loss • [3] Jitter • [4] Bandwidth
Color [MediaEnhancementRules _Color]	Defines the color-coded threshold change of the monitored metrics or bandwidth (configured in the 'Trigger' parameter) for which this rule is done. • [0] Red (default) = Yellow-to-Red threshold is crossed. • [1] Yellow = Green-to-Yellow threshold is crossed.
Rule Action [MediaEnhancementRules _ActionRule]	Defines the action that the device performs when the color-coded threshold is crossed: • [0] Accept Calls (default) • [1] Reject Calls • [2] Alternative IP Profile = An alternative IP Profile ID is used, as configured in the 'Value' field (below). Notes: • If this parameter is set to a restrictive action (i.e., Reject Calls or Alternative IP Profile) for Yellow and no action is set for Red, the device also applies the Yellow action to Red, if this color-coded threshold occurs. • If this parameter is set to a permissive action (i.e., Accept Calls) for Red and no action is set for Yellow, the device applies the same action to Yellow, if this color-coded threshold occurs.
Value [MediaEnhancementRules _ActionValue]	Defines an alternative IP Profile ID for the IP Group that is associated with this rule, if this rule is applied. This parameter is applicable only if the 'Rule Action' parameter is set to Alternative IP Profile .

18 Control Network

This section describes configuration of the network at the SIP control level.

18.1 Configuring Media Realms

The Media Realm table lets you configure a pool of up to 64 SIP media interfaces, termed *Media Realms*. Media Realms allow you to divide a Media-type interface (configured in the Interface table) into several realms, where each realm is specified by a UDP port range. Media Realms also define the maximum number of permitted media sessions. Media Realms can later be assigned to IP Groups (see "Configuring IP Groups" on page 273) and SRDs (see "Configuring SRDs" on page 267).

You can also apply the device's Quality of Experience feature to Media Realms:

- Quality of Experience Profile: Call quality monitoring based on thresholds for voice metrics (e.g., MOS) can be applied per Media Realm. For example, if MOS is considered poor, calls on this Media Realm can be rejected. For configuring Quality of Experience Profiles, see "Configuring Quality of Experience Profiles" on page 254.
- Bandwidth Profile: Bandwidth utilization thresholds can be applied per Media Realm. For example, if bandwidth thresholds are crossed, the device can reject any new new calls on this Media Realm. For configuring Bandwidth Profiles, see "Configuring Bandwidth Profiles" on page 258.

You can also configure remote destination subnets per Media Realm and assign each subnet a Quality of Experience Profile and Bandwidth Profile. For configuring Remote Media Subnets, see "Configuring Remote Media Subnets" on page 265.

Notes:

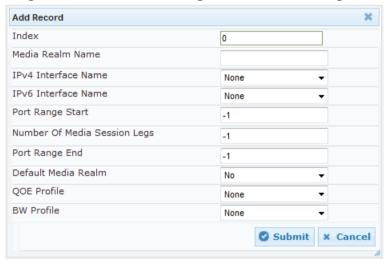

- If an IP Group is associated with an SRD and different Media Realms are assigned to the IP Group and SRD, the IP Group's Media Realm takes precedence.
- If you modify a Media Realm currently being used by a call, the device does not perform Quality of Experience for the call. If you delete the Media Realm during the call, the device maintains the call until the call parties end the call.

The following procedure describes how to configure Media Realms in the Web interface. You can also configure Media Realms using the table ini file parameter, CpMediaRealm.

- To configure a Media Realm:
- 1. Open the Media Realm Table page (Configuration tab > VoIP menu > VoIP Network > Media Realm Configuration).
- 2. Click **Add**; the following dialog box appears:

Figure 18-1: Media Realm Page - Add Record Dialog Box

- 3. Configure the Media Realm according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 18-1: Media Realm Table Parameter Descriptions

Parameter	Description
Index [CpMediaRealm_Index]	Defines an index number for the new table record. The valid value is 0 to 63.
Media Realm Name [CpMediaRealm_MediaRealmName]	Defines an arbitrary name to easily identify the Media Realm. The valid value is a string of up to 40 characters. Notes: This parameter is mandatory. The name assigned to the Media Realm must be unique.
IPv4 Interface Name [CpMediaRealm_IPv4IF]	Assigns an IPv4 network interface to the Media Realm. This is the name of the interface as configured in the 'Interface Name' field of the Interface table.
IPv6 Interface Name [CpMediaRealm_IPv6IF]	Assigns an IPv6 network interface to the Media Realm. This is the name of the interface as configured for the 'Interface Name' field of the Interface table.
Port Range Start [CpMediaRealm_PortRangeStart]	Defines the starting port for the range of Media interface UDP ports. Notes: You must either configure all Media Realms with port ranges, or all without; not some with and some without. The available UDP port range is according to the BaseUDPport parameter. For more information, see Configuring RTP Base UDP Port on page 195. Media Realms must not have overlapping port ranges.

Parameter	Description
Number of Media Session Legs [CpMediaRealm_MediaSessionLeg]	Defines the number of media sessions associated with the range of ports. This is the number of media sessions available in the port range. For example, 100 ports correspond to 10 media sessions, since ports are allocated in chunks of 10.
Port Range End [CpMediaRealm_PortRangeEnd]	(Read-only field) Displays the ending port for the range of media interface UDP ports. This field is calculated by adding the 'Media Session Leg' field (multiplied by the port chunk size) to the 'Port Range Start' field. A value appears once a row has been successfully added to the table.
Default Media Realm [CpMediaRealm_IsDefault]	Defines the Media Realm as the default Media Realm. This default Media Realm is used when no Media Realm is configured for an IP Group or SRD for a specific call. • [0] No (default) • [1] Yes Notes: • This parameter can be set to Yes for only one defined Media Realm. • If the parameter is not configured, then the first Media Realm in the table is used as default. • If the table is not configured, the default Media Realm includes all the configured media interfaces.
QoE Profile [CpMediaRealm_QoeProfile]	Assigns a QoE Profile to the Media Realm. For configuring QoE Profiles, see "Configuring Quality of Experience Profiles" on page 254.
BW Profile [CpMediaRealm_BWProfile]	Assigns a Bandwidth Profile to the Media Realm. For configuring Bandwidth Profiles, see "Configuring Bandwidth Profiles" on page 258.

18.2 Configuring Remote Media Subnets

Remote Media Subnets define destination subnets for media (RTP/SRTP) traffic on a specific Media Realm. Each Remote Media Subnet can be assigned different call quality (Quality of Experience Profile) and bandwidth utilization (Bandwidth Profile) profiles. These profiles are configured in "Configuring Quality of Experience Profiles" on page 254 and "Configuring Bandwidth Profiles" on page 258, respectively. Thus, you can apply these profiles to remote media subnets instead of Media Realms or IP Groups. You can configure up to five Remote Media Subnets per Media Realm.

The figure below illustrates an example for implementing Remote Media Subnets. IP Group #2 represents a SIP Trunk which routes international (USA and India) and local calls. As international calls are typically more prone to higher delay than local calls, different Quality of Experience Profiles are assigned to them. This is done by creating Remote Media Subnets for each of these call destinations and assigning each Remote Media Subnet a different Quality of Experience Profile. A Quality of Experience Profile that defines a packet delay threshold is assigned to the international calls, which if crossed, a different IP Profile is used that defines higher traffic priority to voice over other traffic. In addition, IP Group #2 has a 10-Mbps bandwidth threshold and a "tighter" bandwidth limitation (e.g., 1 Mbps) is allocated to local calls. If this limit is exceeded, the device rejects new calls to this Remote Media Subnet.

Remote Media Subnet Quality of +1 (USA) Experience Profile Packet Delay SIP Trunk Threshold Remote Media AudioCodes IP Group #2 IP Group #1 Subnet Device +91 (India) Bandwidth Profile 10 Mbps Threshold Local Remote Media Subnet Bandwidth Profile 1 Mbps Threshold

Figure 18-2: Remote Media Subnets Example

The following procedure describes how to configure Remote Media Subnets in the Web interface. You can also configure Remote Media Subnets using the table *ini* file parameter, RemoteMediaSubnet.

To configure a Remote Media Subnet:

- 1. Open the Media Realm Table page (Configuration tab > VoIP menu > VoIP Network > Media Realm Configuration).
- Select the Media Realm index row for which you want to add Remote Media Subnets, and then click the Remote Media Subnet link located below the table; the Remote Media Subnet table appears.
- 3. Click **Add**; the following dialog box appears:

Add Record Index 0 SubRealm Name Prefix Length 16 Address Family IPv4 Destination IP 0.0.0.0 QOE Profile Name None BW Profile Name None × Cancel Submit

Figure 18-3: Remote Media Subnet - Add Record

- Configure the Remote Media Subnet according to the parameters described in the table below.
- 5. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 18-2: Remote Media Subnet Table Parameter Descriptions

Parameter	Description
Index	Defines an index number for the new table record.

User's Manual 266 Document #: LTRT-89725

Parameter	Description
[RemoteMediaSubnet_Remote MediaSubnetIndex]	
Sub-Realm Name [RemoteMediaSubnet_Remote MediaSubnetName]	Defines an arbitrary name to easily identify the Remote Media Subnet. The valid value is a string of up to 20 characters.
Prefix Length [RemoteMediaSubnet_PrefixLe ngth]	Defines the subnet mask in Classless Inter-Domain Routing (CIDR) notation. For example, 16 denotes 255.255.0.0. The default is 16.
Address Family [RemoteMediaSubnet_Address Family]	Defines the IP address protocol. [2] IPv4 Manual (default) [10] IPv6 Manual
Destination IP [RemoteMediaSubnet_DstIPAd dress]	Defines the IP address of the destination. The default is 0.0.0.0.
QOE Profile Name [RemoteMediaSubnet_QOEProfileName]	Assigns a Quality of Experience Profile to the Remote Media Subnet.
BW Profile Name [RemoteMediaSubnet_BWProfileName]	Assigns a Bandwidth Profile to the Remote Media Subnet.

18.3 Configuring SRDs

The SRD table lets you configure up to 32 signaling routing domains (SRD). An SRD represents a logical VoIP network. Each logical or physical connection requires an SRD. For example, if the device interfaces with both the LAN and WAN, you would need to configure an SRD for each one.

The SRD is composed of the following:

- SIP Interface: The SIP Interface defines a listening port and type (TLS) for SIP signaling traffic on a specific logical IP network interface of the device.
- Media Realm: The Media Realm defines a UDP port range for RTP (media) traffic on a specific logical IP network interface of the device.

An SRD is a set of definitions together creating multiple, virtual multi-service IP gateways:

- Multiple and different SIP signaling interfaces (SRD associated with a SIP Interface) and RTP media (associated with a Media Realm) for multiple Layer-3 networks. Due to the B2BUA nature of the SBC application, different interfaces can be assigned to each leg of the call.
- Can operate with multiple gateway customers that may reside either in the same or in different Layer-3 networks as the device. This allows separation of signaling traffic between different customers. In such a scenario, the device is configured with multiple SRD's.

Typically, one SRD is defined for each SIP entity (e.g. proxies, IP phones, application servers, gateways, and softswitches) that communicate with each other. This provides these entities with VoIP services that reside on the same Layer-3 network (must be able to communicate without traversing NAT devices and must not have overlapping IP addresses). Routing from one SRD to another is possible, whereby each routing destination (IP Group or destination address) indicates the SRD to which it belongs.

Once configured, you can use the SRD as follows:

- Associate it with a SIP Interface (see "Configuring SIP Interfaces" on page 270)
- Associate it with an IP Group (see "Configuring IP Groups" on page 273)
- Associate it with a Proxy Set (see "Configuring Proxy Sets" on page 284)
- Associated it with an Admission Control rule (see Configuring Admission Control Table on page 497)
- Define it as a Classification rule for incoming SIP requests (see "Configuring Classification Rules" on page 502)
- Use it as a destination IP-to-IP routing rule (see Configuring Outbound IP Routing Table on page 407 for the Gateway application and Configuring SBC IP-to-IP Routing Rules on page 510 for the SBC application)

The following procedure describes how to configure SRDs in the Web interface. You can also configure this using the table ini file parameter, SRD.

To configure an SRD:

- Open the SRD Table page (Configuration tab > VolP menu > VolP Network > SRD Table).
- 2. Click Add; the following dialog box appears:

Figure 18-4: SRD Settings Page

- 3. Configure an SRD according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 18-3: SRD Table Parameter Descriptions

Parameter	Description
Index [SRD_Index]	Defines an index for the new table record. The valid value is 0 to 31.
SRD Name [SRD_Name]	Defines an arbitrary name to easily identify the SRD. The valid value can be a string of up to 21 characters. Note: This parameter is mandatory.
Media Realm Name [SRD_MediaRealm]	Assigns a Media Realm to the SRD. The listed Media Realms are the identifiable names that you configured for the Media Realms in the 'Media Realm Name' field

Parameter	Description
	of the Media Realm table (see "Configuring Media Realms" on page 263). Note: If the Media Realm is later deleted from the Media Realm table, this value becomes invalid in the SRD table.
Media Anchoring [SRD_IntraSRDMediaAnchoring]	Enables the Media Anchoring feature (Anti- Tromboning) per SRD, whereby RTP (media) flows directly between the call parties (i.e., does not traverse the device).
	• [0] Enable = (Default) RTP traverses the device and each leg uses a different coder or coder parameters.
	 [1] Disable = The RTP packet flow does not traverse the device; instead, the two SIP UAs establish a direct RTP/SRTP (media) flow between one another.
	Notes:
	 If this parameter is enabled and the two call endpoints belong to the same SRD, calls cannot be established if the following scenario exists:
	 a. One of the endpoints is defined as a foreign user (for example, "follow me service") b. and one endpoint is located on the WAN and the other on the LAN.
	The reason for this is that in Media Anchoring, the device does not interfere in the SIP signaling such as manipulation of IP addresses, which is necessary for calls between LAN and WAN.
	 When the global parameter SBCDirectMedia is disabled, Media Anchoring can only be enabled for calls between endpoints belonging to the same SRD.
	 For more information on Media Anchoring, see No Media Anchoring (Anti-Tromboning) on page 473.
Block Unregistered Users [SRD_BlockUnRegUsers]	Determines whether the device blocks (rejects) incoming calls (INVITE requests) from unregistered users (pertaining to User-type IP Groups) for the SRD.
	 [0] No = Calls from unregistered users are not blocked (default).
	• [1] Yes = Blocks calls from unregistered users.
	Note: When the call is blocked, the device sends a SIP 500 "Server Internal Error" response to the remote end.
Max. Number of Registered Users [SRD_MaxNumOfRegUsers]	Maximum number of users belonging to this SRD that can register with the device. By default, no limitation exists for registered users
Enable Un-Authenticated Registrations [SRD_EnableUnAuthenticatedRegistrations]	Determines whether the device blocks REGISTER requests from new users (i.e., users not registered in the device's registration database) when the destination is a User-type IP Group.
	• [0] No = The device sends REGISTER requests to the SIP proxy server and only if authenticated by the

Parameter	Description
	server does the device add the user registration to its database.
	• [1] Yes = The device adds REGISTER requests to its database even if the requests are not authenticated by a SIP proxy (default).

18.4 Configuring SIP Interfaces

The SIP Interface table lets you configure up to 32 SIP Interfaces. A SIP Interface defines a listening port and type (UDP, TCP, or TLS) for SIP signaling traffic on a specific logical IP network interface (configured in the Interface table). The SIP Interface can be configured for a specific application (i.e., Gateway\IP-to-IP, SAS, SBC) and associated with an SRD. For each SIP Interface, you can assign a SIP message policy rule, assign SIP message manipulation rules, enable TLS mutual authentication, enable TCP keepalive, assign a SSL/TLS certificate (TLS Context), and configure the SIP response sent upon classification failure.

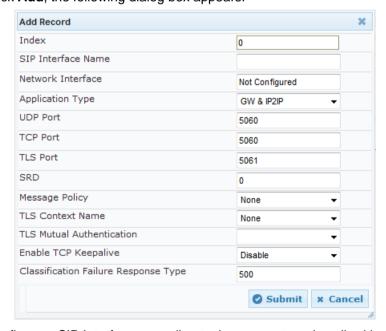

SIP Interfaces can be used, for example, for the following:

- Using SIP signaling interfaces per call leg (i.e., each SIP entity communicates with a specific SRD).
- Using different SIP listening ports for a single or for multiple IP network interfaces.
- Differentiating between applications by creating SIP Interfaces per application.
- Separating signaling traffic between networks (e.g., different customers) to use different routing tables, manipulations, SIP definitions, and so on.

The following procedure describes how to configure SIP interfaces in the Web interface. You can also configure this using the table ini file parameter, SIPInterface.

> To configure a SIP Interface:

- 1. Open the SIP Interface Table page (Configuration tab > VoIP menu > VoIP Network > SIP Interface Table).
- 2. Click Add; the following dialog box appears:

- 3. Configure a SIP Interface according to the parameters described in the table below.
- 4. Click Submit, and then save ("burn") your settings to flash memory.

Table 18-4: SIP Interface Table Parameter Descriptions

Parameter	Description
Index [SIPInterface_Index]	Defines an index for the new table record. The valid value is 0 to 31.
Interface Name [SIPInterface_InterfaceName]	Defines an arbitrary name to easily identify the SIP Interface. The valid value is a string of up to 21 characters.
Network Interface [SIPInterface_NetworkInterface]	Assigns a Control-type IP network interface to the SIP Interface. This string value must be identical (case-sensitive) to that configured in the 'Interface Name' field of the Interface table (see "Configuring IP Network Interfaces" on page 126). By default, no value is defined.
Application Type [SIPInterface_ApplicationType]	Defines the application type associated with the SIP Interface. • [0] GW/IP2IP (default) = Gateway / IP-to-IP application. • [1] SAS = Stand-Alone Survivability (SAS) application. • [2] SBC = SBC application.
UDP Port [SIPInterface_UDPPort]	Defines the listening and source UDP port. The valid range is 1 to 65534. The default is 5060. Notes: This port must be outside of the RTP port range. Each SIP Interface must have a unique signaling port (i.e., no two SIP Interfaces can share the same port - no port overlapping).
TCP Port [SIPInterface_TCPPort]	Defines the listening TCP port. The valid range is 1 to 65534. The default is 5060. Notes: This port must be outside of the RTP port range. Each SIP Interface must have a unique signaling port (i.e., no two SIP Interfaces can share the same port - no port overlapping).
TLS Port [SIPInterface_TLSPort]	Defines the listening TLS port. The valid range is 1 to 65534. The default is 5061. Notes: This port must be outside of the RTP port range. Each SIP Interface must have a unique signaling port (i.e., no two SIP Interfaces can share the same port - no port overlapping).
SRD [SIPInterface_SRD]	Assigns an SRD ID to the SIP Interface (configured in "Configuring SRDs" on page 267). The default is 0. Notes: You can assign the same SRD ID to up to two SIP Interfaces of the same application type. For the SAS application, use only SRD ID 0. Each SIP Interface of the same application type (e.g., SBC) that is assigned to the same SRD must be configured with the same IP version (IPv4 or IPv6).

Parameter	Description
	 All the SIP Interfaces that are assigned to the same SRD must have the same network interface (assigned in the 'Network Interface' parameter, above).
Message Policy [SIPInterface_MessagePolicy]	Assigns a SIP message policy to the SIP interface (configured in 'Configuring SIP Message Policy Rules' on page 304).
TLS Context Name CLI: tls-context-name [SIPInterface_TLSContext]	 Assigns a TLS Context (SSL/TLS certificate) to the SIP Interface. The TLS Context is assigned by name, as configured in the 'Name' field of the TLS Contexts table. Incoming calls: This TLS Context is used if no TLS Context is configured for the Proxy Set associated with the call or classification to an IP Group based on Proxy Set fails. Outgoing calls: This TLS Context is used if no TLS Context is configured for the Proxy Set associated with the call. For more information about how certificates are associated with calls and for configuring TLS Contexts, see Configuring SSL/TLS
TLS Mutual Authentication [SIPInterface_TLSMutualAuth entication]	 Certificates on page 107. Enables TLS mutual authentication for the SIP Interface. [-1] Not Configured = (Default) The SIPSRequireClientCertificate global parameter setting is applied. [0] Disable = Device does not request the client certificate for TLS connection on this SIP Interface. [1] Enable = Device requires receipt and verification of the client certificate to establish the TLS connection on this SIP Interface.
Enable TCP Keepalive [SIPInterface_TCPKeepaliveE nable]	Enables the TCP Keep-Alive mechanism with the IP entity on this SIP Interface. TCP keep-alive can be used, for example, to keep a NAT entry open for clients located behind a NAT server, or simply to check that the connection to the IP entity is available. • [0] Disable (default) • [1] Enable Note: For configuring TCP keepalive, use the following ini file parameters: TCPKeepAliveTime, TCPKeepAliveInterval, and TCPKeepAliveRetry.
Classification Failure Response Type [SIPInterface_ClassificationFail ureResponseType]	Defines the SIP response code that the device sends if a received SIP request (OPTIONS, REGISTER, or INVITE) has failed the SBC Classification process. The valid value can be a SIP response code from 400 through 699, or it can be set to 0 to not send any response at all. The default response code is 500 (Server Internal Error). This feature is important for preventing Denial of Service (DoS) attacks, typically initiated from the WAN. Malicious attackers can use SIP scanners to detect ports used by SIP devices. These scanners scan devices by sending UDP packets containing a SIP request to a range of specified IP addresses, listing those that return a valid SIP response. Once the scanner finds a device that supports SIP, it extracts information from the response and identifies the type of device (IP address and name) and can execute DoS attacks. A way to defend the device against such attacks is to not send a SIP reject response to these unclassified "calls" so that the attacker assumes that no device exists at such an IP address and port. Note: This parameter is applicable only if the device is set to reject

Parameter	Description
	unclassified calls. This is configured using the 'Unclassified Calls' parameter on the General Settings page (Configuration tab > VoIP menu > SBC > General Settings).
Web: Pre Classification ManSet [SIPInterface_PreClassificatio nManipulationSet]	Assigns a Message Manipulation Set ID to the SIP Interface. This lets you apply SIP message manipulation rules on incoming SIP initiating-dialog request messages (not in-dialog), received on this SIP Interface, prior to the Classification process.
	By default, no Message Manipulation Set ID is defined.
	For configuring Message Manipulation Sets, see Configuring SIP Message Manipulation on page 298.
	Notes:
	 The Message Manipulation Set assigned to a SIP Interface that is associated with an outgoing call, is ignored. Only the Message Manipulation Set assigned to the associated IP Group is applied to the outgoing call. If both the SIP Interface and IP Group associated with the incoming call are assigned a Message Manipulation Set, the one assigned to the SIP Interface is applied first. This parameter is applicable only to SBC calls.

18.5 Configuring IP Groups

The IP Group table lets you configure up to 100 IP Groups. An IP Group represents a SIP entity in the network with which the device communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set (see Configuring Proxy Sets on page 284).

IP Groups can be used for the following:

SBC application: The IP Group table can be used to classify incoming SIP dialoginitiating requests (e.g., INVITE messages) to specific IP Groups. This classification is based on the Proxy Set ID associated with the IP Group. If the source address of the incoming SIP dialog is defined for this Proxy Set, the device assigns the SIP dialog to the associated IP Group. This feature is configured using the 'Classify by Proxy Set' parameter in the IP Group table.

Note: It is highly recommended to use the Classification table for classifying incoming SIP dialogs to IP Groups (see Configuring Classification Rules on page 502).

- SBC application: IP Groups are used for configuring IP-to-IP routing rules where they represent the source and destination of the call (see Configuring SBC IP-to-IP Routing Rules on page 510).
- SIP dialog registration and authentication (digest user/password) of specific IP Groups (Served IP Group, e.g., corporate IP-PBX) with other IP Groups (Serving IP Group, e.g., ITSP). This is configured in the Account table (see "Configuring Registration Accounts" on page 291).

- Gateway application: Call routing rules:
 - Outgoing IP calls (IP-to-IP or Tel-to-IP): The IP Group identifies the source of the call and is used as the destination of the outgoing IP call (configured in the Outbound IP Routing table). For Tel-to-IP calls, the IP Group (Serving IP Group) can be used as the IP destination to where all SIP dialogs that are initiated from a Trunk Group are sent (configured in Configuring Trunk Group Settings on page 377).
 - Incoming IP calls (IP-to-IP or IP-to-Tel): The IP Group identifies the source of the IP call.
 - The IP Group can be used to associate a number manipulation rule with specific calls identified by IP Group.

You can also apply the device's Quality of Experience feature to IP Groups:

- Quality of Experience Profile: Call quality monitoring based on thresholds for voice metrics (e.g., MOS) can be applied per IP Group. For example, if MOS is considered poor, calls belonging to this IP Group can be rejected. For configuring Quality of Experience Profiles, see "Configuring Quality of Experience Profiles" on page 254.
- Bandwidth Profile: Bandwidth utilization thresholds can be applied per IP Group. For example, if bandwidth thresholds are crossed, the device can reject any new calls on this IP Group. For configuring Bandwidth Profiles, see "Configuring Bandwidth Profiles" on page 258.

Notes:

- IP Group ID 0 cannot be used. This IP Group is set to default values and is used by the device when IP Groups are not implemented.
- If different SRDs are configured in the IP Group and Proxy Set tables, the SRD defined for the Proxy Set takes precedence.

The following procedure describes how to configure IP Groups in the Web interface. You can also configure IP Groups using the table ini file parameter, IPGroup.

- To configure an IP Group:
- Open the IP Group Table page (Configuration tab > VoIP menu > VoIP Network > IP Group Table).
- 2. Click **Add**; the following dialog box appears:

Figure 18-5: IP Group Table - Add Dialog Box

- 3. Configure an IP Group according to to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 18-5: IP Group Table Parameter Descriptions

Parameter	Description
Common Parameters	
Index [IPGroup_Index]	Defines an index for the new table record.
Type [IPGroup_Type]	 [0] Server = Used when the destination address, configured by the Proxy Set, of the IP Group (e.g., ITSP, Proxy, IP-PBX, or Application server) is known. [1] User = Represents a group of users such as IP phones and softphones where their location is dynamically obtained by the device when REGISTER requests and responses traverse (or are terminated) by the device. These users are considered remote (far-end) users. Typically, this IP Group is configured with a Serving IP Group that represents an IP-PBX, Application or Proxy server that serves this User-type IP Group. Each SIP request sent by a

Parameter	Description
	user of this IP Group is proxied to the Serving IP Group. For registrations, the device updates its internal database with the AOR and contacts of the users. Digest authentication using SIP 401/407 responses (if needed) is performed by the Serving IP Group. The device forwards these responses directly to the SIP users. To route a call to a registered user, a rule must be configured in the Outbound IP Routing table or SBC IP-to-IP Routing table. The device searches the dynamic database (by using the request URI) for an entry that matches a registered AOR or Contact. Once an entry is found, the IP destination is obtained from this entry, and a SIP request is sent to the destination. The device also supports NAT traversal for the SIP clients located behind NAT. In this case, the device must be defined with a global IP address. • [2] Gateway = This is applicable only to the SBC application in scenarios where the device receives requests to and from a gateway representing multiple users. This IP Group type is necessary as the other IP Group types are not suitable: • The IP Group cannot be defined as a Server since its destination address is unknown during configuration. • The IP Group cannot be defined as a User since the SIP Contact header of the incoming REGISTER does not represent a specific user. The Request-URI user part can change and therefore, the device is unable to identify an already registered user and therefore, adds an additional record to the database. The IP address of the Gateway IP Group is obtained dynamically from the host part of the Contact header in the REGISTER request received from the IP Group. Therefore, routing to this IP Group is possible only once a REGISTER request arrives, the device updates the new location (i.e., IP address) of the IP Group. If the REGISTER fails, no update is performed. If an UN-REGISTER request arrives, the IP address associated with the IP Group is deleted and therefore, no routing to the IP Group is done. Note: This field is applicable only to the SBC an
Description [IPGroup_Description]	application. Defines a brief description for the IP Group. The valid value is a string of up to 29 characters. The default is an empty field.
Proxy Set ID [IPGroup_ProxySetId]	Assigns a Proxy Set ID to the IP Group. All INVITE messages destined to this IP Group are sent to the IP address configured for the Proxy Set. Notes: The Proxy Set is applicable only to Server-type IP Groups. The SRD configured for this Proxy Set in the Proxy Set table is automatically assigned to this IP Group (see the 'SRD' field below). To configure Proxy Sets, see "Configuring Proxy Sets" on page 284.
SIP Group Name	Defines the SIP Request-URI host name used in INVITE and

Parameter	Description
[IPGroup_SIPGroupName]	REGISTER messages sent to this IP Group, or the host name in the From header of INVITE messages received from this IP Group. The valid value is a string of up to 100 characters. The default is an empty field. Notes: If this parameter is not configured, the value of the global parameter, ProxyName is used instead (see "Configuring Proxy and Registration Parameters" on page 295). If the IP Group is of User type, this parameter is used internally as a host name in the Request-URI for Tel-to-IP initiated calls. For example, if an incoming call from the device's T1 trunk is routed to a User-type IP Group, the device first creates the Request-URI (<destination_number>@<sip group="" name="">), and then it searches the internal database for a match.</sip></destination_number>
Contact User [IPGroup_ContactUser]	Defines the user part of the From, To, and Contact headers of SIP REGISTER messages, and the user part of the Contact header of INVITE messages received from this IP Group and forwarded by the device to another IP Group. Notes: This parameter is applicable only to Server-type IP Groups. This parameter is overridden by the 'Contact User' parameter in the 'Account' table (see "Configuring Registration Accounts" on page 291).
SRD [IPGroup_SRD]	Assigns an SRD to the IP Group. The default is 0. Notes: For this parameter to take effect, a device reset is required. To configure SRDs, see Configuring SRDs on page 267. For Server-type IP Groups, if you assign the IP Group with a Proxy Set ID (in the 'Proxy Set ID' field), the SRD field is automatically set to the SRD value assigned to the Proxy Set in the Proxy Set table.
Media Realm Name [IPGroup_MediaRealm]	Assigns a Media Realm to the IP Group. The string value must be identical (including case-sensitive) to the Media Realm name defined in the Media Realm table (see Configuring Media Realms on page 263). Notes: For this parameter to take effect, a device reset is required. If the Media Realm is deleted from the Media Realm table, this value becomes invalid.
IP Profile ID [IPGroup_ProfileId]	Assigns an IP Profile to the IP Group. To configure IP Profiles, see "Configuring IP Profiles" on page 314. The default is 0.
Local Host Name [IPGroup_ContactName]	Defines the host name (string) that the device uses in the SIP message's Via and Contact headers. This is typically used to define an FQDN as the host name. The device uses this string for Via and Contact headers in outgoing INVITE messages sent to a specific IP Group, and the Contact header in SIP 18x and 200 OK responses for incoming INVITE messages received from a specific IP Group. The Inbound IP Routing table can be used to identify the source IP

Parameter	Description
	Group from where the INVITE message was received. If this parameter is not configured (default), these headers are populated with the device's dotted-decimal IP address of the network interface on which the message is sent. Note: To ensure proper device handling, this parameter should be a valid FQDN.
QoE Profile [IPGroup_QOEProfile]	Assigns a Quality of Experience Profile rule. For configuring Quality of Experience Profiles, see "Configuring Quality of Experience Profiles" on page 254.
Bandwidth Profile [IPGroup_BWProfile]	Assigns a Bandwidth Profile rule. For configuring Bandwidth Profiles, see "Configuring Bandwidth Profiles" on page 258.
Media Enhancement Profile [IPGroup_MediaEnhancement Profile]	Assigns a Media Enhancement Profile rule. For configuring Media Enhancement Profiles, see "Configuring Media Enhancement Profiles" on page 260.
Always Use Source Address [IPGroup_AlwaysUseSourceA ddr]	Enables the device to always send SIP requests and responses, within a SIP dialog, to the source IP address received in the previous SIP message packet. This feature is especially useful in scenarios where the IP Group endpoints are located behind a NAT firewall (and the device is unable to identify this using its regular NAT mechanism).
	 [0] No = (Default) The device sends SIP requests according to the settings of the global parameter, SIPNatDetection. [1] Yes = The device sends SIP requests and responses to the source IP address received in the previous SIP message packet.
	For information on NAT traversal, see Remote UA behind NAT on page 149.
[IPGroup_MsgManUserDef1]	Defines a value for the SIP user part that can be used in Message Manipulation rules configured in the Message Manipulations table. The Message Manipulation rule obtains this value from the IP Group, by using the following syntax: param.ipg. <src dst>.user-defined.<0>. The valid value is a string of up to 30 characters. For configuring Message Manipulation rules, see "Configuring SIP</src dst>
	Message Manipulation" on page 298.
[IPGroup_MsgManUserDef2]	Defines a value for the SIP user part that can be used in Message Manipulation rules configured in the Message Manipulations table. The Message Manipulation rule obtains this value from the IP Group, by using the following syntax: param.ipg. <src dst>.user-defined.<1>. The valid value is a string of up to 30 characters. For configuring Message Manipulation rules, see "Configuring SIP</src dst>
Cotowou Doromotor-	Message Manipulation" on page 298.
Always Use Route Table [IPGroup_AlwaysUseRouteTable]	 Defines the Request-URI host name in outgoing INVITE messages. [0] No (default). [1] Yes = The device uses the IP address (or domain name) defined in the Outbound IP Routing table (see Configuring the Outbound IP Routing Table on page 407) as the Request-URI host name in outgoing INVITE messages, instead of the value

Parameter	Description
	configured in the 'SIP Group Name' field.
	Note: This parameter is applicable only to Server-type IP Groups.
Routing Mode	Defines the routing mode for outgoing SIP INVITE messages.
[IPGroup_RoutingMode]	 [-1] Not Configured = (Default) The routing is according to the selected Serving IP Group. If no Serving IP Group is selected, the device routes the call according to the Outbound IP Routing table (see Configuring Outbound IP Routing Table on page 407). [0] Routing Table = The device routes the call according to the Outbound IP Routing table. [1] Serving IP Group = The device sends the SIP INVITE to the
	selected Serving IP Group. If no Serving IP Group is selected, the default IP Group is used. If the Proxy server(s) associated with the destination IP Group is not alive, the device uses the Outbound IP Routing table (if the parameter IsFallbackUsed is set 1, i.e., fallback enabled - see "Configuring Proxy and Registration Parameters" on page 295). • [2] Request-URI = The device sends the SIP INVITE to the IP
	address according to the received SIP Request-URI host name. Notes:
	 This parameter is applicable only to the IP-to-IP application. This parameter is applicable only to Server-type IP Groups.
SIP Re-Routing Mode [IPGroup_SIPReRoutingMode]	Defines the routing mode after a call redirection (i.e., a 3xx SIP response is received) or transfer (i.e., a SIP REFER request is received).
	 [-1] Not Configured (Default) [0] Standard = INVITE messages that are generated as a result of Transfer or Redirect are sent directly to the URI, according to the Refer-To header in the REFER message or Contact header in the 3xx response.
	 [1] Proxy = Sends a new INVITE to the Proxy. This is applicable only if a Proxy server is used and the parameter AlwaysSendtoProxy is set to 0.
	 [2] Routing Table = Uses the Routing table to locate the destination and then sends a new INVITE to this destination.
	 When this parameter is set to [1] and the INVITE sent to the Proxy fails, the device re-routes the call according to the Standard mode [0].
	 When this parameter is set to [2] and the INVITE fails, the device re-routes the call according to the Standard mode [0]. If DNS resolution fails, the device attempts to route the call to the Proxy. If routing to the Proxy also fails, the Redirect / Transfer request is rejected.
	 When this parameter is set to [2], the XferPrefix parameter can be used to define different routing rules for redirected calls. This parameter is ignored if the parameter AlwaysSendToProxy is set to 1.
Enable Survivability [IPGroup_EnableSurvivability]	Defines how the device handles registration messages and whether Survivability mode is enabled for User-type IP Groups.
	[0] Disable (default).

Parameter	Description
	 [1] Enable if Necessary = Survivability mode is enabled only if the Serving IP Group is unavailable. The device saves in its Registration database the registration messages sent by the clients (e.g., IP phones) belonging to the User-type IP Group. If communication with the Serving IP Group (e.g., IP-PBX) fails, the User-type IP Group enters into Survivability mode in which the device uses its database for routing calls between the clients of the User-type IP Group. In Survivability mode, the RTP packets between the clients always traverse through the device, and new registrations can also be processed. When the Serving IP Group is available again, the device returns to normal mode, sending INVITE and REGISTER messages to the Serving IP Group. [2] Always Enable = Survivability mode is always enabled. The communication with the Serving IP Group is always considered as failed. The device uses its database for routing calls between the clients of the User-type IP Group. [3] Always Terminate Register = The registration messages received from the clients are saved in the device's registration database without forwarding them to the proxy server. Upon receipt of the registration message, the device returns a SIP 200 OK to the client. Notes: This parameter is applicable only to the IP-to-IP application.
	This parameter is applicable only to User-type IP Groups.
Serving IP Group ID [IPGroup_ServingIPGroup]	If configured, INVITE messages initiated from the IP Group are sent to this Serving IP Group (range 1 to 9). In other words, the INVITEs are sent to the address defined for the Proxy Set associated with this Serving IP Group. The Request-URI host name in the INVITE messages are set to the value of the 'SIP Group Name' parameter defined for the Serving IP Group. Notes:
	This parameter is applicable only to the IP-to-IP application.
	 If the PreferRouteTable parameter is set to 1, the routing rules in the Outbound IP Routing table take precedence over this 'Serving IP Group ID' parameter.
	 If this parameter is not configured, the INVITE messages are sent to the default Proxy or according to the 'Outbound IP Routing table.
SBC Parameters	
Classify By Proxy Set [IPGroup_ClassifyByProxySet]	Defines whether the incoming INVITE is classified to the IP Group according to its associated Proxy Set. • [0] Disable • [1] Enable (default)
	This classification occurs only if classification according to the device's database fails to (i.e., received INVITE is not from a registered user). The classification proceeds with checking whether the INVITE's IP address (if host names, then according to the dynamically resolved IP address list) is defined for a Proxy Set ID (in the Proxy Set table). If a Proxy Set ID has such an IP address, the device classifies the INVITE as belonging to the IP Group associated with this Proxy Set. The Proxy Set ID is assigned to the IP Group using the IP Group table's 'Proxy Set ID' parameter (see

Parameter	Description
	 above). Notes: In cases where multiple IP Groups are associated with the same Proxy Set ID, do not enable this feature. If enabled, the device is unable to correctly classify the incoming INVITEs to their appropriate IP Groups. To enhance security, it is highly recommended to disable this parameter so that the device can use the Classification table rules to classify the call. If this parameter is enabled, the Classification table is not used if an associated Proxy Set is found. This parameter is applicable only to Server-type IP Groups.
Max. Number of Registered Users [IPGroup_MaxNumOfRegUsers]	Defines the maximum number of users in this IP Group that can register with the device. By default, no limitation exists for registered users. Note: This field is applicable only to User-type IP Groups.
Inbound Message Manipulation Set [IPGroup_InboundManSet]	Assigns a Message Manipulation Set (rule) to the IP Group for SIP message manipulation on the inbound message. To configure Message Manipulation rules, see Configuring SIP Message Manipulation on page 298.
Outbound Message Manipulation Set [IPGroup_OutboundManSet]	Assigns a Message Manipulation Set (rule) to the IP Group for SIP message manipulation on the outbound message. To configure Message Manipulation rules, see Configuring SIP Message Manipulation on page 298.
Registration Mode [IPGroup_RegistrationMode]	 Defines the registration mode for the IP Group: [0] User Initiates Registration (default) [1] SBC Initiates Registration = Used when the device serves as a client (e.g., with an IP PBX). This functions only with the User Info file. [2] Registrations not Needed = The device adds users to its database in active state.
Authentication Mode [IPGroup_AuthenticationMode]	 [0] User Authenticates = (Default) The device does not handle the authentication, but simply passes the authentication messages between the SIP user agents. [1] SBC as Client = The device authenticates as a client. It receives the 401/407 response from the proxy requesting for authentication. The device sends the proxy the authorization credentials (i.e., username and password) according to one of the following: 1) account defined in the Account table (only if authenticating Server-type IP Group), 2) global username and password parameters (only if authenticating Server-type IP Group), 3) User Information file, or 4) sends request to users requesting credentials (only if authenticating User-type IP Group). [2] SBC as Server = The device acts as an Authentication server: ✓ Authenticates SIP clients, using the usernames and passwords in the User Information table (see SBC User Information for SBC User Database on page 572). This is applicable only to User-type IP Groups.

Parameter	Description
	 Authenticates SIP severs. This is applicable only to Server- type IP Groups.
Authentication Method List [IPGroup_MethodList]	Defines SIP methods received from the IP Group that must be challenged by the device, when the device acts as an Authentication server. If this parameter is not defined (i.e., empty value), no methods are challenged.
	The default value is null. Multiple entries are separated by a backslash "\", for example, INVITE\REGISTER.
	Note: This parameter is applicable only if the 'Authentication Mode' parameter is set to SBC as Server [2].
SBC Client Forking Mode [IPGroup_EnableSBCClientFork ing]	Defines call forking of INVITE messages to up to five separate SIP outgoing legs for User-type IP Groups. This occurs if multiple contacts are registered under the same AOR in the device's registration database.
	• [0] Sequential = (Default) Sequentially sends the INVITE to each contact. If there is no answer from the first contact, it sends the INVITE to the second contact, and so on until a contact answers. If no contact answers, the call fails or is routed to an alternative destination, if configured.
	 [1] Parallel = Sends the INVITE simultaneously to all contacts. The call is established with the first contact that answers. [2] Sequential Available Only = Sequentially sends the INVITE only to available contacts (i.e., not busy). If there is no answer
	from the first available contact, it sends the INVITE to the second contact, and so on until a contact answers. If no contact answers, the call fails or is routed to an alternative destination, if configured.
	Note: The device can also fork INVITE messages received for a Request-URI of a specific contact (user) registered in the database to all other users located under the same AOR as the specific contact. This is configured using the SBCSendInviteToAllContacts parameter.
Source URI Input [IPGroup_SourceUriInput]	Defines the SIP header in the incoming INVITE that is used for call matching characteristics based on source URIs.
	[-1] Not Configured (default)
	• [0] From • [1] To
	• [2] Request-URI
	[3] P-Asserted - First Header[4] P-Asserted - Second Header
	• [5] P-Preferred
	• [6] Route
	• [7] Diversion
	[8] P-Associated-URI[9] P-Called-Party-ID
	• [10] Contact
	• [11] Referred-by
	Notes:
	 This parameter is applicable only when classification is done according to the Classification table.
	If the configured SIP header does not exist in the incoming

Parameter	Description
	 INVITE message, the classification of the message to a source IP Group fails. If the device receives an INVITE as a result of a REFER request or a 3xx response, then the incoming INVITE is routed according to the Request-URI. The device identifies such INVITEs according to a specific prefix in the Request-URI header, configured by the SBCXferPrefix parameter. Therefore, in this scenario, the device ignores this parameter setting.
Destination URI Input [IPGroup_DestUriInput]	Defines the SIP header in the incoming INVITE to use as a call matching characteristic based on destination URIs. The parameter is used for classification and routing purposes. The device first uses the parameter's settings as a matching characteristic (input) to classify the incoming INVITE to an IP Group (source IP Group) in the Classification table. Once classified, the device uses the parameter for routing the call. For example, if set to To, the URI in the To header of the incoming INVITE is used as a matching characteristic for classifying the call to an IP Group in the Classification table. Once classified, the device uses the URI in the To header as the destination. In the To header the device uses the URI in the To header as the destination. In the To header heade
Username CLI: username [IPGroup_Username]	Defines the shared username for authenticating the IP Group, when the device acts as an Authentication server. The valid value is a string of up to 51 characters. By default, no username is defined. Notes: This parameter is applicable only to Server-type IP Groups and when the 'Authentication Mode' parameter is set to SBC as

Parameter	Description
	 Server (i.e., authentication of servers). To specify the SIP request types (e.g., INVITE) that must be challenged by the device, use the 'Authentication Method List' parameter.
Password CLI: password IPGroup_Password]	Defines the shared password for authenticating the IP Group, when the device acts as an Authentication server. The valid value is a string of up to 51 characters. By default, no password is defined.
	Notes:
	 This parameter is applicable only to Server-type IP Groups and when the 'Authentication Mode' parameter is set to SBC as Server (i.e., authentication of servers). To specify the SIP request types (e.g., INVITE) that must be
	challenged by the device, use the 'Authentication Method List' parameter.

18.6 Configuring Proxy Sets

The Proxy Sets table lets you configure up to 100 Proxy Sets. A Proxy Set defines the destination address (IP address or FQDN) and transport type (e.g., UDP) of a SIP server (e.g., Proxy). Each Proxy Set can be configured with up to 10 addresses configured as an IP address and/or DNS host name (FQDN), enabling you to implement load balancing and redundancy between multiple servers. If you configure the address as an FQDN, you can configure the method (A-record DNS, SRV, or NAPTR) for resolving the domain name to an IP address. The device supports up to 30 DNS-resolved IP addresses. (If the DNS resolution provides more than this number, the device uses the first 30 IP addresses in the received list, and ignores the rest.)

You can assign each Proxy Set with a specific SSL/TLS certificate (TLS Context), enabling the use of different certificates per SIP entity (IP Group).

Proxy Sets are later assigned to **Server-type** IP Groups, in the IP Group table. When the device sends an INVITE message to an IP Group, it sends it to the address configured for the Proxy Set. You can also enable the classification of incoming SBC SIP dialogs to IP Groups based on Proxy Set. If the source address of the incoming SIP dialog is the same as the address of a Proxy Set that is assigned to an IP Group, the device classifies the SIP dialog as belonging to that IP Group. This feature is configured using the 'Classify by Proxy Set' parameter in the IP Group table. For configuring IP Groups, see "Configuring IP Groups" on page 273.

Note: For classifying incoming SIP dialogs to IP Groups, it is highly recommended to use ONLY the Classification table (see Configuring Classification Rules on page 502).

The following procedure describes how to configure Proxy Sets in the Web interface. You can also configure Proxy Sets using the following management tools:

- Proxy Set ID with IP addresses: table ini file parameter, ProxyIP
- Attributes for the Proxy Set: table ini file parameter, ProxySet

To configure a Proxy Set:

 Open the Proxy Sets Table page (Configuration tab > VolP menu > VolP Network > Proxy Sets Table).

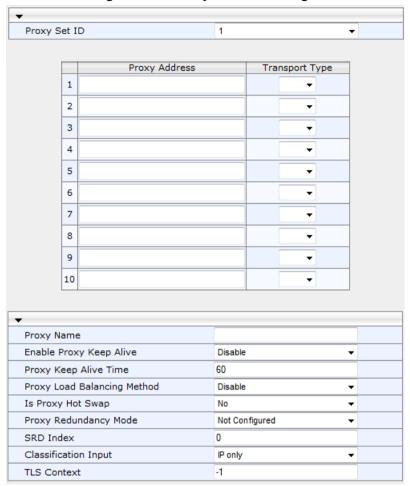

Figure 18-6: Proxy Sets Table Page

- 2. Configure a Proxy Set according to the parameters described in the table below.
- 3. Click Submit, and then save ("burn") your settings to flash memory.

Table 18-6: Proxy Sets Table Parameter Description

Parameter	Description
Web: Proxy Set ID EMS: Index [ProxySet_Index]	Defines an index number for the new table record.
Proxy Address [Proxylp_lpAddress]	Defines the address of the Proxy server. Up to 10 addresses can be configured per Proxy Set.
	The address can be defined as an IP address in dotted-decimal notation (e.g., 201.10.8.1) or FQDN. You can also specify the port in the following format:
	 IPv4 address: <ip address="">:<port> (e.g., 201.10.8.1:5060)</port></ip> IPv6 address: <[IPV6 address]>:<port> (e.g., [2000::1:200:200:86:14]:5060)</port>
Transport Type	Defines the transport type for communicating with the Proxy server.

Parameter	Description
[Proxylp_TransportType]	 [0] UDP [1] TCP [2] TLS [-1] = Undefined Note: If this parameter is not defined, the settings of the global parameter SIPTransportType is used.
Proxy Name [ProxySet_ProxyName]	Defines an arbitrary name to easily identify the Proxy Set. The valid value is a string of up to 20 characters.
DNS Resolve Method [ProxySet_DNSResolveMethod]	 Defines the DNS query record type for resolving the Proxy server's host name into an IP address. [-1] = DNS resolving is done according to the settings of the global parameter, Proxy DNS Query Type. [0] A-Record = (Default) A-record DNS query. [1] SRV = If the Proxy address is configured with a domain name without a port (e.g., domain.com), an SRV query is done. The SRV query returns the host names (and their weights). The device then performs DNS A-record queries per host name (according to the received weights). If the configured Proxy address contains a domain name with a port (e.g., domain.com:5080), the device performs a regular DNS A-record query. [2] NAPTR = NAPTR query is done. If successful, an SRV query is sent according to the information received in the NAPTR response. If the NAPTR query fails, an SRV query is done according to the configured transport type. If the configured Proxy address contains a domain name with a port (e.g., domain.com:5080), the device performs a regular DNS A-record query. If the transport type is configured for the Proxy address, a NAPTR query is not performed. Note: An SRV query can return up to four host names. For each host name, the subsequent DNS A-record query can be resolved into up to 15 IP addresses. However, the device supports up to 30 DNS-resolved IP addresses, the device uses the first 30 IP addresses in the received list, and ignores the rest.
Web/EMS: Enable Proxy Keep Alive	Enables the device's Proxy Keep-Alive mechanism, which checks communication with the Proxy server.
[ProxySet_EnableProxyKeep Alive]	 [0] Disable (default). [1] Using Options = Enables the Proxy Keep-Alive mechanism using SIP OPTIONS messages. The device sends these messages every user-defined interval, configured by the 'Proxy Keep Alive Time' parameter. If the device receives a SIP response code that is also configured in the 'Keep-Alive Failure Responses' parameter (below), the device considers the Proxy as down. You can also configure whether to use the device's IP address or string name ("gateway name") in the OPTIONS message (see the UseGatewayNameForOptions parameter). [2] Using Register = Enables the Proxy Keep-Alive mechanism using SIP REGISTER messages. The device sends the REGISTER message every user-defined interval, configured by the RegistrationTime parameter (Gateway application) or SBCProxyRegistrationTime parameter (SBC application). Any SIP response from the Proxy - success (200 OK) or failure (4xx)

Parameter	Description
	response) - is considered as if the Proxy is "alive". If the Proxy does not respond to INVITE messages sent by the device, the Proxy is considered as down (offline).
	If you enable Proxy Keep-Alive mechanism, the device can operate with multiple Proxy servers (addresses) for redundancy and load balancing (configured by the 'Proxy Load Balancing Method' parameter). Notes:
	 For Survivability mode for User-type IP Groups, this parameter must be enabled (1 or 2).
	 If this parameter is enabled and the Proxy uses the TCP/TLS transport type, you can enable CRLF Keep-Alive mechanism, using the UsePingPongKeepAlive parameter.
Web: Proxy Keep Alive Time EMS: Keep Alive Time	Defines the interval (in seconds) between Keep-Alive messages sent by the device when the Keep-Alive mechanism is enabled.
[ProxySet_ProxyKeepAliveTi me]	The valid range is 5 to 2,000,000. The default is 60. Note: This parameter is applicable only if the 'Enable Proxy Keep
	Alive' parameter is set to Using Options .
Web: Keep-Alive Failure Responses [ProxySet_KeepAliveFailureResp]	Defines SIP response codes that if any is received in response to a keep-alive message using SIP OPTIONS, the device considers the Proxy as down.
	Up to three response codes can be configured, where each code is separated by a comma (e.g., 407,404). By default, no responses are defined. If no responses are configured or responses received are not those configured, the proxy is considered "alive".
	Note: The SIP 200 response code is not supported by this feature.
Web: Proxy Load Balancing Method EMS: Load Balancing Method [ProxySet_ProxyLoadBalanci ngMethod]	 [0] Disable = Load Balancing is disabled (default) [1] Round Robin = A list of all possible Proxy IP addresses is compiled. This list includes all IP addresses per Proxy Set after necessary DNS resolutions (including NAPTR and SRV, if configured). After this list is compiled, the Proxy Keep-Alive mechanism (according to parameters EnableProxyKeepAlive and ProxyKeepAliveTime) tags each entry as 'offline' or 'online'. Load balancing is only performed on Proxy servers that are tagged as 'online'. All outgoing messages are equally distributed across the list of IP addresses. REGISTER messages are also distributed unless a RegistrarIP is configured. The IP addresses list is refreshed according to ProxyIPListRefreshTime. If a change in the order of the entries in the list occurs, all load statistics are erased and balancing starts over again. [2] Random Weights = The outgoing requests are not distributed equally among the Proxies. The weights are received from the DNS server, using SRV records. The device sends the requests in such a fashion that each Proxy receives a percentage of the requests according to its' assigned weight. A single FQDN should be configured as a Proxy IP address. Random Weights Load Balancing is not used in the following scenarios:
	 ✓ The Proxy Set includes more than one Proxy IP address. ✓ The only Proxy defined is an IP address and not an FQDN. ✓ SRV is not enabled (DNSQueryType).

Parameter	Description
	The SRV response includes several records with a different Priority value.
Web/EMS: Is Proxy Hot Swap [ProxySet_IsProxyHotSwap]	 Enables the Proxy Hot-Swap redundancy mechanism, which provides real-time switching from the primary Proxy server to redundant Proxies when no response is received from the primary. [0] No (default) [1] Yes = The device sends the SIP INVITE/REGISTER message to the first address (Proxy/Registrar server) listed in the Proxy Set. If a SIP response is received and this response code is defined in the 'Keep Alive Failure Response' parameter (above), the device assumes the Proxy as down and sends the message again; otherwise, the device assumes the proxy "alive" and does not send the message again. Each time a defined response code is received, the device re-sends the message. This can occur until a user-defined maximum number of retransmissions, configured by the HotSwapRtx parameter, after which the device sends the same message to the next address (redundant Proxy/Registrar), and so on. If there is no response from any of the Proxies, the device goes through the address list again until a "live" Proxy is located.
Web/EMS: Proxy Redundancy Mode [ProxySet_ProxyRedundancy Mode]	 Determines whether the device switches from a redundant Proxy to the primary Proxy when it becomes available again. [-1] Not configured = (Default) The global parameter, ProxyRedundancyMode applies. [0] Parking = The device continues operating with the redundant (now active) Proxy until the next failure, after which it operates with the next redundant Proxy. [1] Homing = The device always attempts to operate with the primary Proxy. The device switches back to the primary Proxy whenever it becomes available. Notes: To enable this functionality, you must also enable the Proxy Keep-Alive mechanism (using the 'Enable Proxy Keep Alive' parameter). The Homing option can only be used if the 'Enable Proxy Keep Alive' parameter is set to Using Options.
Web/EMS: SRD Index [ProxySet_SRD]	Assigns an SRD to the Proxy Set ID. The default is SRD 0. Notes: For this parameter to take effect, a device reset is required. To configure SRDs, see Configuring SRDs on page 267.
Web/EMS: Classification Input [ProxySet_ClassificationInput]	 Defines how the device classifies IP calls to the Proxy Set. [0] IP Only = (Default) The call is classified to the Proxy Set according to its IP address only. [1] IP + Port + Transport = The call is classified to the Proxy Set according to its IP address, port, and transport type. Note: This parameter is applicable only if the IP Group table's parameter, 'Classify by Proxy Set' is set to Enable.
Web/EMS: TLS Context Index CLI: tls-context-index	Assigns a TLS Context (SSL/TLS certificate) to the Proxy Set. The TLS Context is assigned by index number, as configured in the TLS Contexts table.

User's Manual 18. Control Network

Parameter	Description			
[ProxySet_TLSContext]	 Incoming calls: If the 'Transport Type' parameter (above) is set to TLS and the incoming call is successfully classified to an IP Group based on this Proxy Set, this TLS Context is used. If the 'Transport Type' parameter is set to UDP or classification to this Proxy Set fails, this TLS Context is not used. Instead, the device uses the TLS Context configured for the SIP Interface (see Configuring SIP Interfaces on page 270) used for the call; otherwise, the default TLS Context (ID 0) is used. Outgoing calls: If the 'Transport Type' parameter (above) is set to TLS and the outgoing call is sent to an IP Group that is associated with this Proxy Set, this TLS Context is used. Instead, the device uses the TLS Context configured for the SIP Interface (see Configuring SIP Interfaces) used for the call; otherwise, the default TLS Context (ID 0) is used. If the 'Transport Type' parameter is set to UDP, the device uses UDP to communicate with the proxy and no TLS Context is used. For more information about how certificates are associated with calls and for configuring TLS Contexts, see Configuring SSL/TLS Certificates on page 107. 			

This page is intentionally left blank.

19 SIP Definitions

This section describes configuration of SIP parameters.

19.1 Configuring SIP Parameters

Many of the stand-alone SIP parameters associated with various features can be configured in the following pages:

- SIP General Parameters page: Provides SIP parameters for configuring general SIP features. To access this page, use the following path: Configuration tab > VoIP menu > SIP Definitions > General Parameters.
- SIP Advanced Parameters page: Provides SIP parameters for configuring advanced SIP features. To access this page, use the following path: Configuration tab > VoIP menu > SIP Definitions > Advanced Parameters.

For a description of these parameters, refer to the section corresponding to the feature or see "Configuration Parameters Reference" on page 691.

19.2 Configuring Registration Accounts

The Account table lets you configure up to 100 Accounts. An Account defines registration information for registering and authenticating (digest) "served" Trunk Groups or IP Groups (e.g., IP PBX) with a "serving" IP Group (e.g., ITSP). Registration information includes a username, password, host name (AOR), and contact user name (AOR). The device includes this information in the REGISTER message sent to the "serving" IP Group. Up to 10 Accounts can be configured per "served" Trunk Group or IP Group.

A "served" Trunk Group or IP Group can register to more than one "serving" IP Group (e.g., multiple ITSPs). This is done by configuring multiple entries in the Account table for the same "served" Trunk Group or IP Group, but with different "serving" IP Groups, user name/password, host name, and contact user values.

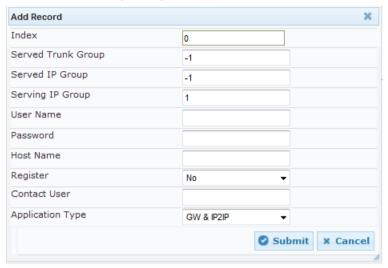

Note: If no match is found in the Account table for incoming or outgoing calls, the username and password is taken from the 'UserName' and 'Password' parameters on the Proxy & Registration page

The following procedure describes how to configure Accounts in the Web interface. You can also configure Accounts using the table ini file parameter, Account.

To configure an Account:

- Open the Account Table page (Configuration tab > VolP menu > SIP Definitions > Account Table).
- Click Add; the following dialog box appears:

- 3. Configure an account according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Once you have configured Accounts, you can register or un-register them, as described below:

To register or un-register an Account:

- 1. In the table, select the required Account entry row.
- 2. From the **Action** drop-down list, choose one of the following commands:
 - Register to register the Account.
 - Un-Register to un-register an Account.

To view Account registration status, see "Viewing Registration Status" on page 628.

If all trunks belonging to the Trunk Group are down, the device un-registers them. If any trunk belonging to the Trunk Group is returned to service, the device registers them again. This ensures, for example, that the Proxy does not send INVITEs to trunks that are out of service.

If registration with an IP Group fails for all accounts of a specific Trunk Group that includes all the channels in the Trunk Group, the Trunk Group is set to Out-Of-Service if the OOSOnRegistrationFail parameter is set to 1 (see Proxy & Registration Parameters on page 295).

Table 19-1: Account Table Parameter Descriptions

Parameter	Description		
Index	Defines an index for the new table record.		
Served Trunk Group [Account_ServedTrunkGroup]	Defines the Trunk Group ID that you want to register and/or authenticate.		
	 For Tel-to-IP calls, the served Trunk Group is the source Trunk Group from where the call originated. 		
	 For IP-to-Tel calls, the served Trunk Group is the Trunk Group ID to where the call is sent. 		
	Note: This parameter is applicable only to the Gateway application.		

Parameter	Description					
Served IP Group [Account_ServedIPGroup]	Defines the IP Group (e.g., IP-PBX) that you want to register and/or authenticate.					
	Note: This parameter is applicable only to the SBC and Gateway's IP-to-IP application.					
Serving IP Group [Account_ServingIPGroup]	Defines the IP Group to where the device sends the SIP REGISTER requests (if enabled) for registration and authentication.					
	 For Tel-to-IP calls, the serving IP Group is the destination IP Group configured in the Trunk Group Settings table or Outbound IP Routing table (see Configuring the Outbound IP Routing Table on page 407). For IP-to-Tel calls, the serving IP Group is the 'Source IP Group 					
	ID' configured in the Inbound IP Routing table (see Configuring the Inbound IP Routing Table on page 416).					
User Name [Account_Username]	Defines the digest MD5 Authentication username.					
<u> </u>	The valid value is a string of up to 50 characters.					
Password [Account_Password]	Defines the digest MD5 Authentication password.					
-	The valid value is a string of up to 50 characters.					
Host Name [Account_HostName]	Defines the Address of Record (AOR) host name. The host name appears in SIP REGISTER From/To headers as ContactUser@HostName. For a successful registration, the host name is also included in the URI of the INVITE From header.					
	The valid value is a string of up to 49 characters.					
	Note: If this parameter is not configured or if registration fails, the 'SIP Group Name' parameter value configured in the IP Group table is used instead.					
Register [Account_Register]	Enables registration.					
[/tossum_register]	 [0] No (Default) [1] Regular = Regular registration process. For more information, see "Regular Registration Mode" on page 294. 					
	• [2] GIN = Registration for legacy PBXs, using Global Identification Number (GIN). For more information, see "Single Registration for Multiple Phone Numbers using GIN" on page 294.					
	Notes:					
	 (Gateway application) To enable registration, you also need to set the 'Registration Mode' parameter to Per Account in the Trunk Group Settings table (see Configuring Trunk Group Settings on page 377). 					
	 The Trunk Group account registration is not affected by the IsRegisterNeeded parameter. 					
Contact User [Account_ContactUser]	Defines the AOR username. This appears in REGISTER From/To headers as ContactUser@HostName, and in INVITE/200 OK Contact headers as ContactUser@ <device's address="" ip="">.</device's>					
	Notes:					
	 If this parameter is not configured, the 'Contact User' parameter in the IP Group table is used instead. 					
	 If registration fails, the user part in the INVITE Contact header contains the source party number. 					
Application Type	Defines the application type:					

Parameter	Description	
[Account_ApplicationType]	 [0] GW/IP2IP = (Default) Gateway and IP-to-IP application. [2] SBC = SBC application. 	

19.2.1 Regular Registration Mode

When you configure the registration mode in the Account table to **Regular**, the device sends REGISTER requests to the Serving IP Group. The host name (in the SIP From/To headers) and contact user (user in From/To and Contact headers) are taken from the configured Account table upon successful registration. See the example below:

REGISTER sip:xyz SIP/2.0

Via: SIP/2.0/UDP 10.33.37.78; branch=z9hG4bKac1397582418

From: <sip:ContactUser@HostName>;tag=1c1397576231

To: <sip: ContactUser@HostName >

Call-ID: 1397568957261200022256@10.33.37.78

CSeq: 1 REGISTER

Contact: <sip:ContactUser@10.33.37.78>;expires=3600

Expires: 3600

User-Agent: Sip-Gateway/v.6.00A.008.002

Content-Length: 0

19.2.2 Single Registration for Multiple Phone Numbers using GIN

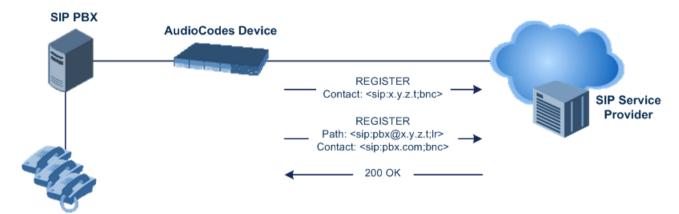

When you configure the registration mode in the Account table to **GIN**, the Global Identifiable Number (GIN) registration method is used, according to RFC 6140. The device performs GIN-based registration of users to a SIP registrar on behalf of a SIP PBX. In effect, the PBX registers with the service provider, just as a directly hosted SIP endpoint would register. However, because a PBX has multiple user agents, it needs to register a contact address on behalf of each of these. Rather than performing a separate registration procedure for each user agents, GIN registration mode does multiple registrations using a single REGISTER transaction.

According to this mechanism, the PBX delivers to the service provider in the Contact header field of a REGISTER request a template from which the service provider can construct contact URIs for each of the AORs assigned to the PBX and thus, can register these contact URIs within its location service. These registered contact URIs can then be used to deliver to the PBX inbound requests targeted at the AORs concerned. The mechanism can be used with AORs comprising SIP URIs based on global E.164 numbers and the service provider's domain name or sub-domain name.

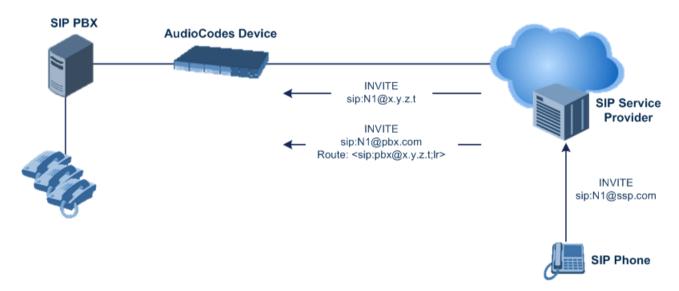

The SIP REGISTER request sent by the device for GIN registration with a SIP server provider contains the Require and Proxy-Require headers. These headers contain the token 'gin'. The Supported header contains the token 'path' and the URI in the Contact header contains the parameter 'bnc' without a user part:

Contact: <sip:198.51.100.3;bnc>;

The figure below illustrates the GIN registration process:

The figure below illustrates an incoming call using GIN:

19.3 Configuring Proxy and Registration Parameters

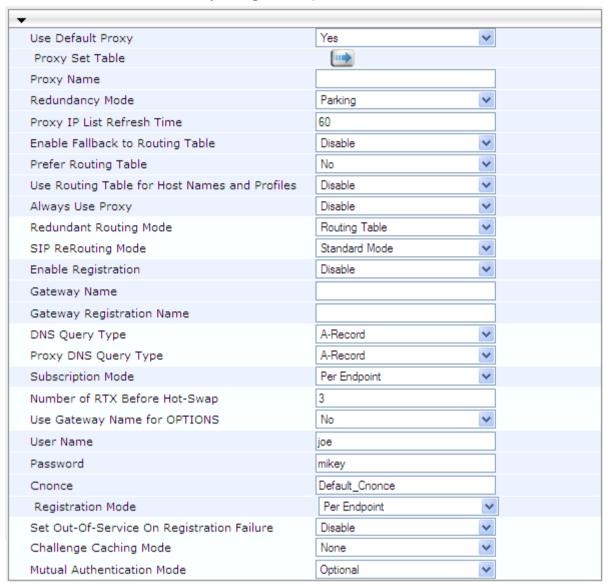

The Proxy & Registration page allows you to configure the Proxy server and registration parameters. For a description of the parameters appearing on this page, see "Configuration Parameters Reference" on page 691.

Note: To view the registration status of endpoints with a SIP Registrar/Proxy server, see "Viewing Registration Status" on page 628.

- To configure the Proxy and registration parameters:
- Open the Proxy & Registration page (Configuration tab > VolP menu > SIP Definitions > Proxy & Registration).

- **2.** Configure the parameters as required.
- 3. Click Submit.
- > To register or un-register the device to a Proxy/Registrar:
- Click the Register button to register.
- Click Un-Register button to un-register.

Instead of registering the entire device, you can register specific entities as listed below by using the **Register** button located on the page in which these entities are configured:

- Trunk Groups Trunk Group table (see Configuring Trunk Group Table on page 375)
- Accounts Account table (see "Configuring Registration Accounts" on page 291)

Click the **Proxy Set Table** button to Open the Proxy Sets Table page to configure groups of proxy addresses. Alternatively, you can open this page from the **Proxy Sets Table** page item (see "Configuring Proxy Sets" on page 284 for a description of this page).

19.3.1 SIP Message Authentication Example

The device supports basic and digest (MD5) authentication types, according to SIP RFC 3261 standard. A proxy server might require authentication before forwarding an INVITE message. A Registrar/Proxy server may also require authentication for client registration. A proxy replies to an unauthenticated INVITE with a 407 Proxy Authorization Required response, containing a Proxy-Authenticate header with the form of the challenge. After sending an ACK for the 407, the user agent can then re-send the INVITE with a Proxy-Authorization header containing the credentials.

User agents, Redirect or Registrar servers typically use the SIP 401 Unauthorized response to challenge authentication containing a WWW-Authenticate header, and expect the re-INVITE to contain an Authorization header.

The following example shows the Digest Authentication procedure, including computation of user agent credentials:

1. The REGISTER request is sent to a Registrar/Proxy server for registration:

```
REGISTER sip:10.2.2.222 SIP/2.0
Via: SIP/2.0/UDP 10.1.1.200
From: <sip: 122@10.1.1.200>;tag=1c17940
To: <sip: 122@10.1.1.200>
Call-ID: 634293194@10.1.1.200
User-Agent: Sip-Gateway/Mediant 3000/v.6.80.010.006
CSeq: 1 REGISTER
Contact: sip:122@10.1.1.200:
Expires:3600
```

Upon receipt of this request, the Registrar/Proxy returns a 401 Unauthorized response:

```
SIP/2.0 401 Unauthorized
Via: SIP/2.0/UDP 10.2.1.200
From: <sip:122@10.2.2.222 >; tag=1c17940
To: <sip:122@10.2.2.222 >
Call-ID: 634293194@10.1.1.200
Cseq: 1 REGISTER
Date: Mon, 30 Jul 2012 15:33:54 GMT
Server: Columbia-SIP-Server/1.17
Content-Length: 0
WWW-Authenticate: Digest realm="audiocodes.com",
nonce="11432d6bce58ddf02e3b5e1c77c010d2",
stale=FALSE,
algorithm=MD5
```

- **3.** According to the sub-header present in the WWW-Authenticate header, the correct REGISTER request is created.
- 4. Since the algorithm is MD5:
 - The username is equal to the endpoint phone number "122".
 - The realm return by the proxy is "audiocodes.com".
 - The password from the ini file is "AudioCodes".
 - The equation to be evaluated is "122:audiocodes.com:AudioCodes". According to the RFC, this part is called A1.
 - The MD5 algorithm is run on this equation and stored for future usage.
 - The result is "a8f17d4b41ab8dab6c95d3c14e34a9e1".
- 5. The par called A2 needs to be evaluated:
 - The method type is "REGISTER".
 - Using SIP protocol "sip".

- Proxy IP from ini file is "10.2.2.222".
- The equation to be evaluated is "REGISTER:sip:10.2.2.222".
- The MD5 algorithm is run on this equation and stored for future usage.
- The result is "a9a031cfddcb10d91c8e7b4926086f7e".
- 6. Final stage:
 - A1 result: The nonce from the proxy response is "11432d6bce58ddf02e3b5e1c77c010d2".
 - A2 result: The equation to be evaluated is "A1:11432d6bce58ddf02e3b5e1c77c010d2:A2".
 - The MD5 algorithm is run on this equation. The outcome of the calculation is the response needed by the device to register with the Proxy.
 - The response is "b9c45d0234a5abf5ddf5c704029b38cf".

At this time, a new REGISTER request is issued with the following response:

```
REGISTER sip:10.2.2.222 SIP/2.0
Via: SIP/2.0/UDP 10.1.1.200
From: <sip: 122@10.1.1.200>; tag=1c23940
To: <sip: 122@10.1.1.200>
Call-ID: 654982194@10.1.1.200
Server: Audiocodes-Sip-Gateway/Mediant 3000/v.6.80.010.006
CSeq: 1 REGISTER
Contact: sip:122@10.1.1.200:
Expires:3600
Authorization: Digest, username: 122, realm="audiocodes.com", nonce="11432d6bce58ddf02e3b5e1c77c010d2", uri="10.2.2.222", response="b9c45d0234a5abf5ddf5c704029b38cf"
```

7. Upon receiving this request and if accepted by the Proxy, the Proxy returns a 200 OK response, completing the registration transaction:

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP 10.1.1.200
From: <sip: 122@10.1.1.200>; tag=1c23940
To: <sip: 122@10.1.1.200>
Call-ID: 654982194@10.1.1.200
Cseq: 1 REGISTER
Date: Thu, 26 Jul 2012 09:34:42 GMT
Server: Columbia-SIP-Server/1.17
Content-Length: 0
Contact: <sip:122@10.1.1.200>; expires="Thu, 26 Jul 2012 10:34:42 GMT"; action=proxy; q=1.00
Contact: <122@10.1.1.200:>; expires="Tue, 19 Jan 2038 03:14:07 GMT"; action=proxy; q=0.00
Expires: Thu, 26 Jul 2012 10:34:42 GMT
```

19.4 Configuring SIP Message Manipulation

The Message Manipulations table lets you configure up to 100 Message Manipulation rules. A Message Manipulation rule defines a manipulation sequence for SIP messages. SIP message manipulation enables the normalization of SIP messaging fields between communicating network segments. For example, it allows service providers to design their own policies on the SIP messaging fields that must be present before a SIP call enters their network. Similarly, enterprises and small businesses may have policies for the information that can enter or leave their networks for policy or security reasons from a

service provider. SIP message manipulations can also be implemented to resolve incompatibilities between SIP devices inside the enterprise network.

Each Message Manipulation rule is configured with a Manipulation Set ID. You can create groups (sets) of Message Manipulation rules by assigning each of the relevant Message Manipulation rules to the same Manipulation Set ID. The Manipulation Set ID is used to assign the rules to specific calls.

- SBC application: Message manipulation rules can be applied pre- or postclassification:
 - Pre-classification Process: Message manipulation can be done on incoming SIP dialog-initiating messages (e.g., INVITE) prior to the classification process. You configure this by assigning the Manipulation Set ID to the SIP Interface on which the call is received (see Configuring SIP Interfaces on page 270).
 - **Post-classification Process:** Message manipulation can be done on inbound and/or outbound SIP messages after the call has been successfully classified. You configure this by assigning the Manipulation Set ID to the relevant IP Group in the IP Group table (see Configuring IP Groups on page 273).
- Gateway application: Message Manipulation rules are applied to calls as follows:
 - Manipulating Inbound SIP INVITE Messages: Message manipulation can be applied only to all inbound calls (not specific calls). This is done by assigning a Manipulation Set ID to the "global" ini file parameter, GWInboundManipulationSet.
 - Manipulating Outbound SIP INVITE Messages:
 - a. Message manipulation can be done for specific calls, by assigning a Manipulation Set ID to an IP Group in the IP Group table, using the 'Outbound Message Manipulation Set' parameter.
 - b. Message manipulation can be applied to all outbound calls (except for IP Groups that have been assigned a Manipulation Set ID). This is done by assigning a Manipulation Set ID to the "global" ini file parameter, GWOutboundManipulationSet.

The device also supports a built-in SIP message normalization feature that can be enabled per Message Manipulation rule. The normalization feature removes unknown SIP message elements before forwarding the message. These elements can include SIP headers, SIP header parameters, and SDP body fields.

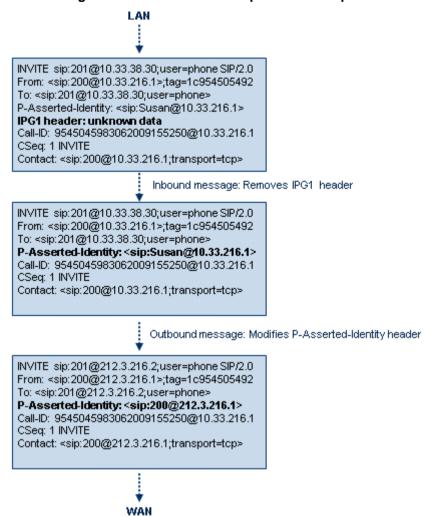

The SIP message manipulation feature supports the following:

- Manipulation on SIP message type (Method, Request/Response, and Response type)
- Addition of new SIP headers
- Removal of SIP headers ("black list")
- Modification of SIP header components such as values, header values (e.g., URI value of the P-Asserted-Identity header can be copied to the From header), call's parameter values
- Deletion of SIP body (e.g., if a message body is not supported at the destination network this body is removed)
- Translating one SIP response code to another
- Topology hiding (generally present in SIP headers such as Via, Record Route, Route and Service-Route).
- Configurable identity hiding (information related to identity of subscribers, for example, P-Asserted-Identity, Referred-By, Identity and Identity-Info)
- Apply conditions per rule the condition can be on parts of the message or call's parameters
- Multiple manipulation rules on the same SIP message

The figure below illustrates a SIP message manipulation example:

Figure 19-1: SIP Header Manipulation Example

Notes:

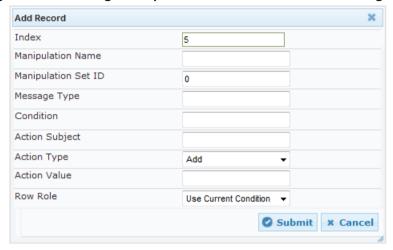

- For the SBC application, Inbound message manipulation is done only after the Classification, inbound/outbound number manipulations, and routing processes.
- Each message can be manipulated twice on the source leg and on the destination leg (i.e., source and destination IP Groups).
- Unknown SIP parts can only be added or removed.
- SIP manipulations do not allow you to remove or add mandatory SIP headers.
 They can only be modified and only on requests that initiate new dialogs.
 Mandatory SIP headers include To, From, Via, CSeq, Call-Id, and Max-Forwards.

The following procedure describes how to configure Message Manipulation rules in the Web interface. You can also configure Message Manipulation rules using the table ini file parameter, MessageManipulations.

- To configure SIP message manipulation rules:
- Open the Message Manipulations page (Configuration tab > VoIP menu > SIP Definitions > Msg Policy & Manipulation > Message Manipulations).
- 2. Click **Add**; the following dialog box appears:

Figure 19-2: Message Manipulations Table - Add Record Dialog Box

- 3. Configure a Message Manipulation rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

An example of configured message manipulation rules are shown in the figure below:

Add + Edit 🥕 Delete 🖮 Up 🕇 Down ↓ Insert + Show/Hide Index 🛊 Manipulation Set Message Type Condition Manipulation Name Action Subject Action Type Action Value '.com' ITSP A invite.response.200 header.to.url.user Add Prefix invite.response,200 header.from.url.user Modify header.p-asserted-id.url.user invite.request Modify '200' header.from.url.user invite.request header.from.url.user=='Unkown' header.from.url.user Modify param.ipg.src.user id dd Page 1 of 1 № № Show 10 🔻 records per page View 1 - 5 of 5

Figure 19-3: Message Manipulations Page

- Index 0: Adds the suffix ".com" to the host part of the To header.
- Index 1: Changes the user part of the From header to the user part of the P-Asserted-ID
- Index 2: Changes the user part of the SIP From header to "200".
- Index 3: If the user part of the From header equals "unknown", then it is changed according to the srcIPGroup call's parameter.
- Index 4: Removes the Priority header from an incoming INVITE message.

Table 19-2: Message Manipulations Parameter Descriptions

Parameter	Description
Index [MessageManipulations_Index]	Defines an index number for the new table record.

Parameter	Description		
	Note: Each rule must be configured with a unique index.		
Manipulation Name [MessageManipulations_ManipulationName]	Defines an arbitrary name to easily identify the Message Manipulation rule. The valid value is a string of up to 16 characters.		
	<u> </u>		
Manipulation Set ID [MessageManipulations_ManSetI D]	Defines a Manipulation Set ID for the rule. You can define the same Manipulation Set ID for multiple rules to create a group of rules. The Manipulation Set ID is used to assign the manipulation rules to an IP Group (in the IP Group table) for inbound and/or outbound messages.		
	The valid value is 0 to 19. The default is 0.		
Matching Characteristics			
Message Type [MessageManipulations_Messag eType]	Defines the SIP message type that you want to manipulate. The valid value is a string (case-insensitive) denoting the SIP message. For example:		
	 Empty = rule applies to all messages Invite = rule applies to all INVITE requests and responses Invite.Request = rule applies to INVITE requests Invite.Response = rule applies to INVITE responses subscribe.response.2xx = rule applies to SUBSCRIBE confirmation responses Note: Currently, SIP 100 Trying messages cannot be manipulated. 		
Condition [MessageManipulations_Condition]	Defines the condition that must exist for the rule to apply. The valid value is a string (case-insensitive). For example: header.from.url.user== '100' (indicates that the user part of the From header must have the value "100") header.contact.param.expires > '3600' header.to.url.host contains 'domain' param.call.dst.user != '100'		
Operation			
Action Subject [MessageManipulations_ActionSubject]	Defines the SIP header upon which the manipulation is performed. The valid value is a string (case-insensitive).		
Action Type [MessageManipulations_ActionT ype]	 Defines the type of manipulation. [0] Add (default) = Adds new header/param/body (header or parameter elements). [1] Remove = Removes header/param/body (header or parameter elements). [2] Modify = Sets element to the new value (all element types). [3] Add Prefix = Adds value at the beginning of the string (string element only). [4] Add Suffix = Adds value at the end of the string (string element only). 		

Parameter	Description			
	 [5] Remove Suffix = Removes value from the end of the string (string element only). [6] Remove Prefix = Removes value from the beginning of the string (string element only). [7] Normalize = Removes unknown SIP message elements before forwarding the message. 			
Action Value [MessageManipulations_ActionValue]	Defines a value that you want to use in the manipulation. The default value is a string (case-insensitive) in the following syntax: string/ <message-element>/<call-param> + string/<message-element>/<call-param> For example: 'itsp.com' header.from.url.user param.call.dst.user param.call.dst.host + '.com' param.call.src.user + '<' + header.from.url.user + '@' + header.p-asserted-id.url.host + '>' Note: Only single quotation marks must be used.</call-param></message-element></call-param></message-element>			
Row Role [MessageManipulations_RowRole]	 Determines which condition must be used for the rule of this table row. [0] Use Current Condition = The condition entered in this row must be matched in order to perform the defined action (default). [1] Use Previous Condition = The condition of the rule configured directly above this row must be used in order to perform the defined action. This option allows you to configure multiple actions for the same condition. Note: When multiple manipulations rules apply to the same header, the next rule applies to the result string of the previous rule. 			

19.5 Configuring SIP Message Policy Rules

The Message Policy table lets you configure up to 20 SIP Message Policy rules. SIP Message Policy rules are used to block (blacklist) unwanted incoming SIP messages or permit (whitelist) receipt of desired SIP messages. You can configure legal and illegal characteristics of a SIP message. This feature is helpful against VoIP fuzzing (also known as robustness testing), which sends different types of packets to its "victims" for finding bugs and vulnerabilities. For example, the attacker might try sending a SIP message containing either an oversized parameter or too many occurrences of a parameter.

To apply SIP Message Policy rules, you need to assign them to SIP Interfaces associated with the relevant IP Groups (see "Configuring SIP Interfaces" on page 270).

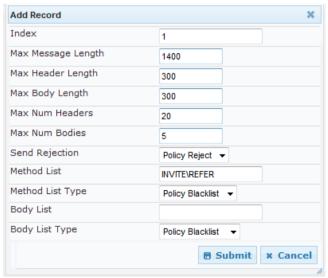

Each Message Policy rule can be configured with the following:

- Maximum message length
- Maximum header length
- Maximum message body length
- Maximum number of headers
- Maximum number of bodies
- Option to send 400 "Bad Request" response if message request is rejected
- Blacklist and whitelist for defined methods (e.g., INVITE)
- Blacklist and whitelist for defined bodies

The following procedure describes how to configure Message Policy rules in the Web interface. You can also configure Message Policy rules using the table ini file parameter, MessagePolicy.

- To configure SIP Message Policy rules:
- Open the Message Policy Table page (Configuration tab > VolP menu > SIP Definitions > Msg Policy & Manipulation > Message Policy Table).
- 2. Click **Add**; the following dialog box appears:

Figure 19-4: Message Policy Table - Add Record Dialog Box

- 3. Configure a Message Policy rule according to the parameters described in the table
- Click Submit, and then save ("burn") your settings to flash memory.

Table 19-3: Message Policy Table Parameter Descriptions

Parameter	Description			
Index [MessagePolicy_Index]	Defines an index number for the new table record.			
Max Message Length [MessagePolicy_MaxMessageLength]	Defines the maximum SIP message length. The valid value is up to 32,768 characters. The default is 32,768.			
Max Header Length [MessagePolicy_MaxHeaderLength]	Defines the maximum SIP header length. The valid value is up to 512 characters. The default is 512.			
Max Body Length [MessagePolicy_MaxBodyLength]	Defines the maximum SIP message body length. This is the value of the Content-Length header. The valid value is up to 1,024 characters. The default is 1,024.			
Max Num Headers [MessagePolicy_MaxNumHeaders]	Defines the maximum number of SIP headers. The valid value is any number up to 32. The default is 32. Note: The device supports up to 20 SIP Record-Route headers that can be received in a SIP INVITE request or 200 OK response. If it receives more than this, it responds with a SIP 513 'Message Too Large' response.			
Max Num Bodies [MessagePolicy_MaxNumBodies]	Defines the maximum number of bodies (e.g., SDP) in the SIP message. The valid value is any number up to 8. The default is 8.			
Send Rejection [MessagePolicy_SendRejection]	 Determines whether the device sends a 400 "Bad Request" response if a message request is rejected. [0] Policy Reject = (Default) If the message is a request, then the device sends a response to reject the request. [1] Policy Drop = The device ignores the message without sending any response. 			
SIP Method Blacklist-Whitelist Policy				
Method List CLI: method-list [MessagePolicy_MethodList]	Defines SIP methods (e.g., INVITE\BYE) to blacklist or whitelist. Multiple methods are separated by a backslash (\). The method values are case-insensitive.			
Method List Type CLI: method-list-type [MessagePolicy_MethodListType]	Defines the policy (blacklist or whitelist) for the SIP methods specified in the 'Method List' parameter (above). • [0] Policy Blacklist = The specified methods are rejected. • [1] Policy Whitelist = (Default) Only the specified methods are allowed; the others are rejected.			
SIP Body Blacklist-Whitelist Policy				
Body List CLI: body-list [MessagePolicy_BodyList]	Defines the SIP body type (i.e., value of the Content-Type header) to blacklist or whitelist. For example, application/sdp. The values of this parameter are case-sensitive.			

Parameter	Description
Body List Type CLI: body-list-type	Defines the policy (blacklist or whitelist) for the SIP body specified in the 'Body List' parameter (above).
[MessagePolicy_BodyListType]	 [0] Policy Blacklist =The specified SIP body is rejected. [1] Policy Whitelist = (Default) Only the specified SIP body is allowed; the others are rejected.

20 Coders and Profiles

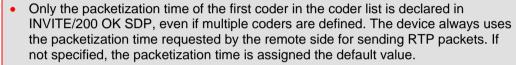

This section describes configuration of the coders and SIP profiles parameters.

20.1 Configuring Default Coders

The Coders table lets you configure up to 10 voice coders for the device. This is the default Coder Group, which is used by the device for all calls, unless a different Coder Group, configured in the Coder Group Settings table (see "Configuring Coder Groups" on page 310) is assigned to specific calls, using Tel or IP Profiles.

Each coder can be configured with packetization time (ptime), bit rate, payload type, and silence suppression. The first coder configured in the table has the highest priority and is used by the device whenever possible. If the remote side cannot use the first coder, the device attempts to use the next coder in the table, and so on.

Notes:

- The value of several fields is hard-coded according to common standards (e.g., payload type of G.711 U-law is always 0). Other values can be set dynamically. If no value is specified for a dynamic field, a default value is assigned. If a value is specified for a hard-coded field, the value is ignored.
- The G.722 coder provides Packet Loss Concealment (PLC) capabilities, ensuring higher voice quality.
- For information on V.152 and implementation of T.38 and VBD coders, see "Supporting V.152 Implementation" on page 190.

The following procedure describes how to configure the Coders table in the Web interface. You can also configure this table using the table ini file parameter, CodersGroup0.

> To configure coders:

Open the Coders page (Configuration tab > VolP menu > Coders and Profiles > Coders).

Figure 20-1: Coders Table Page

- 2. Configure coders according to the parameters described in the table below.
- 3. Click **Submit**, and then reset the device with a save ("burn") to flash memory.

Table 20-1: Coders Table Parameter Descriptions

Parameter	Description			
Coder Name [CodersGroup0_Name]	Defines the coder. Note: Each coder type (e.g., G.729) can be configured only once in the table.			
Packetization Time [CodersGroup0_pTime]	Defines the packetization time (in msec) for the coder. The packetization time determines how many coder payloads are combined into a single RTP packet.			
Rate [CodersGroup0_rate]	Defines the bit rate (in kbps) for the coder.			
Payload Type [CodersGroup0_PayloadType]	Defines the payload type if the payload type (i.e., format of the RTP payload) for the coder is dynamic. Note: Both GSM-FR and MS-GSM coders use Payload Type 3. When using SDP, it is not possible to differentiate between the two. Thus, it is recommended to configure only one of these coders in the table.			
Silence Suppression [CodersGroup0_Sce]	 [0] Disable (Default) [1] Enable [2] Enable w/o Adaptation = Applicable only to G.729. Notes: If silence suppression is not configured for a coder, the settings of the EnableSilenceCompression parameter is used. If G.729 is configured with silence suppression disabled, the device includes 'annexb=no' in the SDP of the relevant SIP messages. If silence suppression is enabled or set to Enable w/o Adaptations, 'annexb=yes' is included. An exception to this logic is when the remote gateway is Cisco equipment (IsCiscoSCEMode). Silence suppression is currently not supported for the MS RTA coder. The bit rate defines the originator bit rate in accordance to the sample time. The MS RTA coder can be used in transcoding sessions with the G.722 wideband codec. In addition, wideband Linear PCM files can be played on an MS RTA channel, preserving the file's wideband quality. 			

The table below lists the supported coders:

Table 20-2: Supported Coders

Coder Name	Packetization Time (msec)	Rate (kbps)	Payload Type	Silence Suppression
G.711 A-law [g711Alaw64k]	10, 20 (default), 30, 40, 50, 60, 80, 100, 120	64	8	[0] Disable[1] Enable
G.711 U-law [g711Ulaw64k]	10, 20 (default), 30, 40, 50, 60, 80, 100, 120	64	0	[0] Disable[1] Enable
G.711A-law_VBD [g711AlawVbd]	10, 20 (default), 30, 40, 50, 60, 80, 100, 120	64	Dynamic (0- 127); Default 180	N/A

Coder Name	Packetization Time (msec)	Rate (kbps)	Payload Type	Silence Suppression
G.711U-law_VBD [g711UlawVbd]	10, 20 (default), 30, 40, 50, 60, 80, 100, 120	64	Dynamic (0- 127); Default 120	N/A
G.722 [g 722]	20 (default), 40, 60, 80, 100, 120	64 (default)	9	N/A
G.723.1 [g7231]	30 (default), 60, 90, 120, 150	• [0] 5.3 (default) • [1] 6.3	4	[0] Disable[1] Enable
G.726 [g726]	10, 20 (default), 30, 40, 50, 60, 80	• [0] 16 • [1] 24 • [2] 32 (default) • [3] 40	Dynamic (0- 127); Default 23	• [0] Disable • [1] Enable
G.727 ADPCM	10, 20, 30 (default), 40,, 60, 80,	16, 24, 32, 40	Dynamic (0- 127)	[0] Disable[1] Enable
G.729 [g729]	10, 20 (default), 30, 40, 50, 60, 80, 100	8	18	[0] Disable[1] Enable[2] Enable w/o Adaptation s
GSM-FR [gsmFullRate]	20 (default), 40, 60, 80	13	3	[0] Disable[1] Enable
GSM-EFR [gsmEnhancedFullRate]	0, 20 (default), 30, 40, 50, 60, 80, 100	12.2	Dynamic (0- 127)	[0] Disable[1] Enable
MS-GSM [gsmMS]	40 (default)	13	3	[0] Disable[1] Enable
AMR [Amr]	20 (default)	• [0] 4.75 • [1] 5.15 • [2] 5.90 • [3] 6.70 • [4] 7.40 • [5] 7.95 • [6] 10.2 • [7] 12.2 (default)	Dynamic (0- 127)	• [0] Disable • [1] Enable
AMR-WB [Amr-WB]	20 (default)	• [0] 6.6 • [1] 8.85 • [2] 12.65 • [3] 14.25 • [4] 15.85 • [5] 18.25 • [6] 19.85 • [7] 23.05 • [8] 23.85 (default)	Dynamic (0- 127)	• [0] Disable • [1] Enable

Coder Name	Packetization Time (msec)	Rate (kbps)	Payload Type	Silence Suppression
EVRC [Evrc]	20 (default), 40,60, 80, 100	[0] Variable (default)[1] 1/8[3] 1/2[4] Full	Dynamic (0- 127)	• [0] Disable • [1] Enable
EVRC-B (4GV) [EvrcB]	20 (default), 40, 60, 80, 100, 120	 [0] Variable (default) [1] 1/8 [2] 1/4 [3] 1/2 [4] Full 	Dynamic (0- 127)	N/A
iLBC [iLBC]	20 (default), 40, 60, 80, 100, 120	15 (default)	Dynamic (0- 127);	[0] Disable[1] Enable
	30 (default), 60, 90, 120	13	Default 65	
MS RTA (NB) [ms_rta]	20 (default), 40, 60, 80	11800	115	N/A
MS RTA (WB) [ms_rta_wb]	20	29000	114	N/A
Speex NB [speex_nb]	20	2.15 (default); 5.95; 8; 11; 15; 18.2; 24.6; 3.95	78	N/A
Speex WB [speex_wb]	20	3.95 (default); 5.75; 7.75; 9.8; 12.8; 16.8; 20.6; 23.8; 27.8; 34.2; 42.2	78	N/A
T.38 [t38fax]	N/A	N/A	N/A	N/A
T.38 Version 3 [t38fax]	-	-	-	-
T.38 Over RTP	N/A	N/A	Dynamic (90 - 127); Default 106	N/A

20.2 Configuring Coder Groups

The Coder Group Settings table lets you configure up to 10 *Coder Groups*. A Coder Group is a set of configured coders (coder type, packetization time, rate, payload type, and silence suppression). Each Coder Group can include up to 10 coders.

The first coder in the Coder Group has the highest priority and is used by the device whenever possible. If the remote side cannot use the first coder, the device attempts to use the next coder in the Coder Group, and so on.

To define coders for specific calls, you can configure a Coder Group with the necessary coders and then assign the Coder Group to the calls using Tel Profiles (see Configuring Tel Profiles on page 312) or IP Profiles (see "Configuring IP Profiles" on page 314). In this

configuration, Coder Groups can be used as Extension Coders and/or Allowed Coders for the SBC application.

Notes:

- To define coders for calls that are not assigned a specific Coder Group using Tel Profiles or IP Profiles, see "Configuring Default Coders" on page 307. This group of coders is termed the *Default Coder Group*.
- For a list of supported coders, see "Configuring Default Coders" on page 307.

The following procedure describes how to configure the Coders table in the Web interface. You can also configure this table using the table ini file parameter, CodersGroupX.

To configure a Coder Group:

1. Open the Coder Group Settings page (Configuration tab > VoIP menu > Coders and Profiles > Coders Group Settings).

Figure 20-2: Coder Group Settings Page

- 2. Configure the Coder Group according to the parameters described in the table below.
- 3. Click **Submit**, and then reset the device with a save ("burn") to flash memory.

Table 20-3: Coder Group Settings Table Parameter Descriptions

Parameter	Description
Coder Group ID [CodersGroupX_Index]	Defines an ID for the Coder Group.
Coder Name [CodersGroupX_Name]	Defines the coder type. Note: Each coder type (e.g., G.729) can be configured only once in the table.
Packetization Time [CodersGroupX_pTime]	Defines the packetization time (in msec) for the coder. The packetization time determines how many coder payloads are combined into a single RTP packet.
Rate [CodersGroupX_rate]	Defines the bit rate (in kbps) for the coder.
Payload Type [CodersGroupX_PayloadType]	Defines the payload type if the payload type (i.e., format of the RTP payload) for the coder is dynamic.

Parameter	Description
Silence Suppression [CodersGroupX_Sce]	 Enables silence suppression for the coder. [0] Disable (Default) [1] Enable [2] Enable w/o Adaptation = Applicable only to G.729. Note: If silence suppression is not configured for a coder, the settings of the EnableSilenceCompression parameter is used.

20.3 Configuring Tel Profile

The Tel Profile Settings table lets you configure up to nine *Tel Profiles*. A Tel Profile is a set of parameters with specific settings which can be assigned to specific calls. The Tel Profile Settings table includes a wide range of parameters for configuring the Tel Profile. Each of these parameters has a corresponding "global" parameter, which when configured applies to all calls. The main difference, if any, between the Tel Profile parameters and their corresponding global parameters are their default values.

Tel Profiles provide high-level adaptation when the device interworks between different equipment and protocols (at both the Tel and IP sides), each of which may require different handling by the device. For example, if specific channels require the use of the G.711 coder, you can configure a Tel Profile with this coder and assign it to these channels.

To use your Tel Profile for specific calls, you need to assign it to specific channels (trunks) in the Trunk Group table (see Configuring Trunk Group Table on page 375)).

The following procedure describes how to configure Tel Profiles in the Web interface. You can also configure Tel Profiles using the table ini file parameter, TelProfile.

To configure a Tel Profile:

- Open the Tel Profile Settings page (Configuration tab > VolP menu > Coders and Profiles > Tel Profile Settings).
- Click Add; the following dialog box appears:

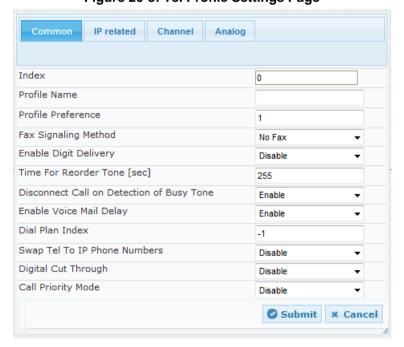

Figure 20-3: Tel Profile Settings Page

3. Configure a Tel Profile according to the parameters described in the table below. For a description of each parameter, refer to the corresponding "global" parameter.

4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 20-4: Tel Profile Table Parameters and Corresponding Global Parameters

elProfile_Index]	efines an index number for the new table record. efines an arbitrary name to easily identify the Tel Profile. ne valid value is a string of up to 20 characters.
elProfile_Index]	efines an arbitrary name to easily identify the Tel Profile.

[TelProfile_ECNlpMode]	

20.4 Configuring IP Profiles

The IP Profile Settings table lets you configure up to 40 IP Profiles. An IP Profile is a set of parameters with user-defined settings relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder type). An IP Profile can later be assigned to specific IP calls (inbound and/or outbound). Thus, IP Profiles provide high-level adaptation when the device interworks between different IP entities, each of which may require different handling by the device. This can include, for example, transcoding or even transrating (of packetization time). For example, if a specific IP entity uses the G.711 coder only, you can configure an IP Profile with G.711 for this IP entity.

To use your IP Profile for specific calls, you need to assign it to any of the following:

- IP Groups see "Configuring IP Groups" on page 273
- Gateway application: Outbound IP routing rules see Configuring Outbound IP Routing Table on page 407
- Gateway application: Inbound IP routing rules see Configuring Inbound IP Routing

Table on page 416

The device selects the IP Profile as follows:

- If you assign different IP Profiles (not default) to the same specific calls in all of the above-mentioned tables, the device uses the IP Profile that has the highest preference level (as set in the 'Profile Preference' parameter). If these IP Profiles have the same preference level, the device uses the IP Profile that you assigned in the IP Group table.
- If you assign different IP Profiles to all of the above-mentioned tables and one table is set to the default IP Profile, the device uses the IP Profile that is not the default.

Many of the parameters in the IP Profile table have a corresponding "global" parameter. For calls that are not associated with any IP Profile, the settings of the "global" parameters are applied.

Note: IP Profiles can also be implemented when using a Proxy server (when the AlwaysUseRouteTable parameter is set to 1).

The following procedure describes how to configure IP Profiles in the Web interface. You can also configure IP Profiles using the table ini file parameter, IPProfile.

To configure an IP Profile:

- 1. Open the IP Profile Settings page (Configuration tab > VoIP menu > Coders and Profiles > IP Profile Settings).
- 2. Click Add: the following dialog box appears:

- 3. Configure an IP Profile according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 20-5: IP Profile Settings Table Parameter Descriptions

Parameter	Description
Common	
Web: Index [IpProfile_Index]	Defines an index number for the new table record.
Web: Profile Name [lpProfile_ProfileName]	Defines an arbitrary name to easily identify the IP Profile. The valid value is a string of up to 20 characters.
Web: Profile Preference [IpProfile_IpPreference]	Defines the priority of the IP Profile, where 20 is the highest priority and 1 the lowest priority. Notes: If both an IP Profile and a Tel Profile apply to the same call, the coders and other common parameters of the profile with
	 the highest preference are applied to the call. If the preference of the profiles are identical, the Tel Profile parameters are applied. If the coder lists of both an IP Profile and a Tel Profile apply to the same call, only the coders common to both are used. The order of the coders is determined by the preference. This parameter is applicable only to the Gateway application.
Web: Dynamic Jitter Buffer	Defines the minimum delay (in msec) of the device's dynamic
Minimum Delay CLI: jitter-buffer-minimum-delay [lpProfile_JitterBufMinDelay]	Jitter Buffer. The valid range is 0 to 150. The default delay is 10. Notes:
	For more information on the Jitter Buffer, see Dynamic Jitter Buffer Operation on page 191. The corresponding global pagemeter is D.IBufMinDelay.
Web: Dynamic Jitter Buffer	 The corresponding global parameter is DJBufMinDelay. Defines the Dynamic Jitter Buffer frame error/delay optimization
Optimization Factor	factor.
CLI: jitter-buffer-optimization- factor	The valid range is 0 to 12. The default factor is 10. Notes:
[lpProfile_JitterBufOptFactor]	 For data (fax and modem) calls, set this parameter to 12. For more information on Jitter Buffer, see Dynamic Jitter Buffer Operation on page 191.
Web: RTP IP DiffServ	The corresponding global parameter is DJBufOptFactor. Defines the DiffServ value for Premium Media class of service
[lpProfile_IPDiffServ]	(CoS) content.
	The valid range is 0 to 63. The default is 46.
	Note: The corresponding global parameter is PremiumServiceClassMediaDiffServ.
Web: Signaling DiffServ [IpProfile_SigIPDiffServ]	Defines the DiffServ value for Premium Control CoS content (Call Control applications).
	The valid range is 0 to 63. The default is 40. Note: The corresponding global parameter is PremiumServiceClassControlDiffServ.
Web: Silence Suppression	Enables the Silence Suppression feature. When enabled, the

Parameter	Description
CLI: sce [IpProfile_SCE]	 device, upon detection of silence period during a call does not send packets, thereby conserving bandwidth during the VoIP call. [0] Disable (default) [1] Enable = Silence Suppression is enabled. [2] Enable Without Adaptation = A single silence packet is sent during a silence period (applicable only to G.729). Notes: If the coder is G.729, the value of the 'annexb' parameter of the 'fmtp' attribute in the SDP is determined by the following: This parameter is set to Disable [0]: 'annexb=no' This parameter is set to Enable [1]: 'annexb=yes' This parameter is set to Enable Without Adaptation [2] and IsCiscoSCEMode to [0]: 'annexb=yes' Enable Without Adaptation is set to Enable Without Adaptation [2] and IsCiscoSCEMode to [1]: 'annexb=no' The corresponding global parameter is EnableSilenceCompression.
Web: RTP Redundancy Depth [IpProfile_RTPRedundancyDep th]	Enables the device to generate RFC 2198 redundant packets. This can be used for packet loss where the missing information (audio) can be reconstructed at the receiver's end from the redundant data that arrives in subsequent packets. This is required, for example, in wireless networks where a high percentage (up to 50%) of packet loss can be experienced. • [0] 0 = (Default) Disable. • [1] 1 = Enable - previous voice payload packet is added to current packet. • [2] 2 = Previous two voice payload packets are added to the current packet. • [3] 3 = Previous three voice payload packets are added to the current packet. • [4] 4 = Previous four voice payload packets are added to the current packet. • [5] 5 = Previous five voice payload packets are added to the current packet. To use this RTP redundancy level, you need to set the DSPVersionTemplateNumber parameter to 4 or 7. The coders that support this redundancy level include: • DSPVersionTemplateNumber = 4 (all coders) • DSPVersionTemplateNumber = 7 (only G.729 and iLBC coders)
	 Notes: When enabled, you can configure the payload type, using the RFC2198PayloadType parameter. The RTP redundancy dynamic payload type can be included in the SDP, by using the EnableRTPRedundancyNegotiation parameter. The corresponding global parameter is RTPRedundancyDepth.
Web: Echo Canceler CLI: echo-canceller [IpProfile_EnableEchoCancelle r]	Enables echo cancellation (i.e., echo from voice calls is removed). • [0] Disable • [1] Line (default)

Parameter	Description
	 [2] Acoustic Notes: For more information on the Echo Cancellation feature, see Echo Cancellation on page 174. The corresponding global parameter is EnableEchoCanceller.
Web: Disconnect on Broken Connection [IpProfile_DisconnectOnBroke nConnection]	 Enables the device to release the call if RTP packets are not received within a user-defined timeout, configured by the BrokenConnectionEventTimeout parameter. [0] No [1] Yes (default) Notes: This feature is applicable only if the RTP session is used without Silence Compression. If Silence Compression is enabled, the device doesn't detect a broken RTP connection. During a call, if the source IP address (from where the RTP packets are received) is changed without notifying the device, the device filters these RTP packets. To overcome this, set the DisconnectOnBrokenConnection parameter to 0; the device doesn't detect RTP packets arriving from the original source IP address and switches (after 300 msec) to the RTP packets arriving from the new source IP address. The corresponding global parameter is DisconnectOnBrokenConnection.
Web: Input Gain CLI: input-gain [IpProfile_InputGain]	Defines the pulse-code modulation (PCM) input gain control (in decibels). This defines the level of the received signal for Tel-to-IP calls. The valid range is -32 to 31 dB. The default is 0 dB. Note: The corresponding global parameter is InputGain.
Web: Voice Volume CLI: voice-volume [lpProfile_VoiceVolume]	Defines the voice gain control (in decibels). This defines the level of the transmitted signal for IP-to-Tel calls. The valid range is -32 to 31 dB. The default is 0 dB. Note: The corresponding global parameter is VoiceVolume.
Web: Media IP Version Preference CLI: media-ip-version-preference [IpProfile_MediaIPVersionPrefere nce]	 Defines the preferred RTP media IP addressing version for outgoing SIP calls. This is indicated in the "c=" field (Connection Information) of the SDP. [0] Only IPv4 = (Default) SDP offer includes only IPv4 media IP addresses. [1] Only IPv6 = SDP offer includes only IPv6 media IP addresses. [2] Prefer IPv4 = SDP offer includes IPv4 and IPv6 media IP addresses, but the first media is IPv4. [3] Prefer IPv6 = SDP offer includes IPv4 and IPv6 media IP addresses, but the first media is IPv6. Notes: This parameter is applicable only when the device offers an SDP. The IP addressing version is determined according to the first SDP "m=" field. The corresponding global parameter is

Parameter	Description
	MedialPVersionPreference.
Web: Symmetric MKI [IpProfile_EnableSymmetricMK I]	Enables symmetric MKI negotiation.
	• [0] Disable = (Default) The device includes the MKI in its SIP 200 OK response according to the SRTPTxPacketMKISize parameter (if set to 0, it is not included; if set to any other value, it is included with this value).
	[1] Enable = The answer crypto line contains (or excludes) an MKI value according to the selected crypto line in the offer. For example, assume that the device receives an INVITE containing the following two crypto lines in SDP:
	<pre>a=crypto:2 AES_CM_128_HMAC_SHA1_80 inline:TAaxNnQt8/qLQMnDuG4vxYfWl6K7eBK/ufk04pR 4 2^31 1:1</pre>
	<pre>a=crypto:3 AES_CM_128_HMAC_SHA1_80 inline:bnuYZnMxSfUiGitviWJZmzr7OF3AiRO015Vnh0k H 2^31</pre>
	The first crypto line includes the MKI parameter "1:1". In the 200 OK response, the device selects one of the crypto lines (i.e., '2' or '3'). Typically, it selects the first line that supports the crypto suite. However, for SRTP-to-SRTP in SBC sessions, it can be determined by the remote side on the outgoing leg. If the device selects crypto line '2', it includes the MKI parameter in its answer SDP, for example:
	<pre>a=crypto:2 AES_CM_128_HMAC_SHA1_80 inline:R1VyA1xV/qwBjkEklu4kSJyl3wCtYeZLq1/QFux w 2^31 1:1</pre>
	If the device selects a crypto line that does not contain the MKI parameter, then the MKI parameter is not included in the crypto line in the SDP answer (even if the SRTPTxPacketMKISize parameter is set to any value other than 0).
	Note: The corresponding global parameter is EnableSymmetricMKI.
Web: MKI Size [IpProfile_MKISize]	Defines the size (in bytes) of the Master Key Identifier (MKI) in SRTP Tx packets.
	The valid value is 0 to 4. The default is 0 (i.e., new keys are generated without MKI).
	 Notes: Gateway application: The device only initiates the MKI size. SBC application: The device can forward MKI size as is for SRTP-to-SRTP flows or override the MKI size during negotiation. This can be done on the inbound or outbound leg. The corresponding global parameter is SRTPTxPacketMKISize.
Web: Reset SRTP Upon Re-key [IpProfile_ResetSRTPStateUpo nRekey]	Enables synchronization of the SRTP state between the device and a server when a new SRTP key is generated upon a SIP session expire. This feature ensures that the roll-over counter (ROC), one of the parameters used in the SRTP encryption/decryption process of the SRTP packets, is synchronized on both sides for transmit and receive packets. • [0] Disable = (Default) ROC is not reset on the device side.

Parameter	Description
	 [1] Enable = If the session expires causing a session refresh through a re-INVITE, the device or server generates a new key and the device resets the ROC index (and other SRTP fields) as done by the server, resulting in a synchronized SRTP. Notes: If this feature is disabled and the server resets the ROC upon a re-key generation, one-way voice may occur. The corresponding global parameter is
Generate SRTP keys mode [IpProfile_GenerateSRTPKeys]	ResetSRTPStateUponRekey. Enables the device to generate a new SRTP key upon receipt of a re-INVITE with this SIP entity. [0] Only If Required= (Default) The device generates an SRTP key only if necessary. [1] Always = The device always generates a new SRTP key.
Jitter Buffer Max Delay CLI: jitter-buffer-max-delay [IpProfile_JitterBufMaxDelay]	Defines the maximum delay and length (in msec) of the Jitter Buffer. The valid range is 150 to 2,000. The default is 250.
GW	
Web: Coders Group ID [IpProfile_CodersGroupID]	Defines coders supported by this SIP entity, by assigning a Coders Group.
	The value, Default Coders Group represents the coders configured in the Coders table (see Configuring Coders on page 307). All other optional values (e.g., Coders Group 1), represent the coders defined for the specific Coder Group configured in the Coder Group Settings table (see Configuring Coder Groups on page 310).
Web: Fax Signaling Method [IpProfile_IsFaxUsed]	 Defines the SIP signaling method for establishing and transmitting a fax session when the device detects a fax. [0] No Fax = (Default) No fax negotiation using SIP signaling. The fax transport method is according to the FaxTransportMode parameter. [1] T.38 Relay = Initiates T.38 fax relay. [2] G.711 Transport = Initiates fax/modem using the coder G.711 A-law/Mu-law with adaptations (see Note below). [3] Fax Fallback = Initiates T.38 fax relay. If the T.38 negotiation fails, the device re-initiates a fax session using the coder G.711 A-law/□law with adaptations (see the Note below). Notes: Fax adaptations (for options 2 and 3): ✓ Echo Canceller = On ✓ Silence Compression = Off ✓ Echo Canceller Non-Linear Processor Mode = Off ✓ Dynamic Jitter Buffer Minimum Delay = 40 ✓ Dynamic Jitter Buffer Optimization Factor = 13 If the device initiates a fax session using G.711 (option 2 or 3), a 'gpmd' attribute is added to the SDP in the following format: ✓ For A-law: 'a=gpmd:8 vbd=yes;ecan=on' ✓ For Mu-law: 'a=gpmd:0 vbd=yes;ecan=on'

Parameter	Description
	 When this parameter is set to 1, 2, or 3, the parameter FaxTransportMode is ignored. When this parameter is set to 0, T.38 might still be used without the control protocol's involvement. To completely disable T.38, set FaxTransportMode to a value other than 1. For more information on fax transport methods, see Fax/Modem Transport Modes on page 177. The corresponding global parameter is IsFaxUsed.
Web: Remote RTP Base UDP Port [IpProfile_RemoteBaseUDPPort]	Defines the lower boundary of the UDP port used for RTP, RTCP (RTP port + 1) and T.38 (RTP port + 2). For example, if the Base UDP Port is set to 6000, then one channel may use the ports RTP 6000, RTCP 6001, and T.38 6002, while another channel may use RTP 6010, RTCP 6011, and T.38 6012, and so on. For more information on determining the port range, see Configuring RTP Base UDP Port on page 195.
	 The range of possible UDP ports is 6,000 to 64,000. The default base UDP port is 6000. Notes: For this parameter to take effect, a device reset is required. If you set this parameter to a value that is not a factor of 10, the following message is generated: "invalid local RTP port". The UDP ports are allocated randomly to channels. You can also configure a UDP port range per Media Realm (see Configuring Media Realms on page 263). The corresponding global parameter is BaseUDPPort.
Web: CNG Detector Mode [IpProfile_CNGmode]	 Enables the detection of the fax calling tone (CNG) and defines the detection method. [0] Disable = (Default) The originating fax does not detect CNG; the device passes the CNG signal transparently to the remote side. [1] Relay = The originating fax detects CNG. The device sends CNG packets to the remote side according to T.38 (if IsFaxUsed is set to 1) and the fax session is started. A SIP Re-INVITE message is not sent and the fax session starts by the terminating fax. This option is useful, for example, when the originating fax is located behind a firewall that blocks incoming T.38 packets on ports that have not yet received T.38 packets from the internal network (i.e., originating fax). To also send a Re-INVITE message upon detection of a fax CNG tone in this mode, set the parameter FaxCNGMode to 1 or 2. [2] Event Only = The originating fax detects CNG and a fax session is started by the originating fax, using the Re-INVITE message. Typically, T.38 fax session starts when the preamble signal is detected by the answering fax. Some SIP devices do not support the detection of this fax signal on the answering fax and thus, in these cases, it is possible to configure the device to start the T.38 fax session when the CNG tone is detected by the originating fax. However, this mode is not recommended. Note: The corresponding global parameter is CNGDetectorMode.

Parameter	Description
Web: Vxx Modem Transport Type [IpProfile_VxxTransportType]	 [-1] Not Configured = The settings of the global parameters are used: V21ModemTransportType V22ModemTransportType V23ModemTransportType V32ModemTransportType V34ModemTransportType [0] Disable = Transparent. [2] Enable Bypass (Default) [3] Events Only = Transparent with Events. For a detailed description of this parameter per modem type, see the relevant global parameter (listed above).
Web: NSE Mode [IpProfile_NSEMode]	Enables Cisco's compatible fax and modem bypass mode, Named Signaling Event (NSE) packets. [0] Disable (Default) [1] Enable In NSE bypass mode, the device starts using G.711 A-Law (default) or G.711 \[\] Law, according to the FaxModemBypassCoderType parameter. The payload type for these G.711 coders is a standard one (8 for G.711 A-Law and 0 for G.711 \[\] Law). The parameters defining payload type for the 'old' Bypass mode FaxBypassPayloadType and ModemBypassPayloadType are not used with NSE Bypass. The bypass packet interval is configured according to the FaxModemBypassBasicRtpPacketInterval parameter. The SDP contains the following line: 'a=rtpmap:100 X-NSE/8000'. Notes: When enabled, the following conditions must also be met: ' The Cisco gateway must include the following definition: 'modem passthrough nse payload-type 100 codec g711alaw'. Set the Modem transport type to Bypass mode (VxxModemTransportType is set to 2) for all modems. Set the NSEPayloadType parameter to 100. The corresponding global parameter is NSEMode.
Web: Play RB Tone to IP [IpProfile_PlayRBTone2IP]	 Enables the device to play a ringback tone to the IP side for IP-to-Tel calls. [0] Disable (Default) [1] Enable = Plays a ringback tone after a SIP 183 session progress response is sent. Notes: To enable the device to send a 183/180+SDP responses, set the EnableEarlyMedia parameter to 1. If the EnableDigitDelivery parameter is set to 1, the device doesn't play a ringback tone to IP and doesn't send 183 or 180+SDP responses. If this parameter is enabled and EnableEarlyMedia is set to 1, the device plays a ringback tone according to the following:

Parameter	Description
	 ✓ CAS: The device opens a voice channel, sends a 183+SDP response, and then plays a ringback tone to IP. ✓ ISDN: If a Progress or an Alerting message with PI (1 or 8) is received from the ISDN, the device opens a voice channel, sends a 183+SDP or 180+SDP response, but doesn't play a ringback tone to IP. If PI (1 or 8) is received from the ISDN, the device assumes that ringback tone is played by the ISDN switch; otherwise, the device plays a ringback tone to IP after receiving an Alerting message from the ISDN. It sends a 180+SDP response, signaling to the calling party to open a voice channel to hear the played ringback tone. The corresponding global parameter is PlayRBTone2IP.
Web: Early Media [IpProfile_EnableEarlyMedia]	Enables the Early Media feature for sending media (e.g., ringing)
	before the call is established.
	[0] Disable (default) [1] Enable
	 [1] Enable ✓ The device sends a SIP 18x response with SDP, allowing the media stream to be established before the call is answered.
	Notes:
	The inclusion of the SDP in the 18x response depends on the ISDN Progress Indicator (PI). The SDP is sent only if PI is set to 1 or 8 in the received Proceeding, Alerting, or Progress PRI messages. See also the ProgressIndicator2IP parameter, which if set to 1 or 8, the device behaves as if it received the ISDN messages with the PI.
	 ✓ CAS: See the ProgressIndicator2IP parameter. ✓ ISDN: Sending a 183 response depends on the ISDN PI. It is sent only if PI is set to 1 or 8 in the received Proceeding or Alerting PRI messages. Sending 183 response also depends on the ReleaseIP2ISDNCallOnProgressWithCause parameter, which must be set to any value other than 2.
	 See also the IgnoreAlertAfterEarlyMedia parameter. This parameter allows, for example, to interwork Alert with PI to SIP 183 with SDP instead of 180 with SDP.
	 You can also configure early SIP 183 response immediately upon the receipt of an INVITE, using the EnableEarly183 parameter. The corresponding global parameter is EnableEarlyMedia.
Web: Progress Indicator to IP	Defines the progress indicator (PI) sent to the IP.
[IpProfile_ProgressIndicator2IP]	• [-1] Not Configured = (Default)
	 Digital ISDN: The PI received in ISDN Proceeding, Progress, and Alerting messages is used, as described in the options below.
	• [0] No PI =
	Digital: For IP-to-Tel calls, the device sends 180 Ringing response to IP after receiving ISDN Alerting or (for CAS) after placing a call to PBX/PSTN.
	• [1] PI = 1:
	✓ Digital: For IP-to-Tel calls, if the parameter

Parameter	Description
	EnableEarlyMedia is set to 1, the device sends 180 Ringing with SDP in response to an ISDN Alerting or it sends a 183 Session Progress message with SDP in response to only the first received ISDN Proceeding or Progress message after a call is placed to PBX/PSTN over the trunk. • [8] PI = 8: same as PI = 1. Note: The corresponding global parameter is ProgressIndicator2IP.
Web: Copy Destination Number to Redirect Number [IpProfile_CopyDest2RedirectNumber]	 Enables the device to copy the called number, received in the SIP INVITE message, to the redirect number in the outgoing Q.931 Setup message, for IP-to-Tel calls. Thus, even if there is no SIP Diversion or History header in the incoming INVITE message, the outgoing Q.931 Setup message will contain a redirect number. [0] Disable (default). [1] After Manipulation = Copies the called number after manipulation. The device first performs IP-to-Tel destination phone number manipulation, and only then copies the manipulated called number to the redirect number sent in the Q.931 Setup message to the Tel. Thus, the called and redirect numbers are the same. [2] Before Manipulation = Copies the called number before manipulation. The device first copies the original called number to the SIP Diversion header, and then performs IP-to-Tel destination phone number manipulation. Thus, the called (i.e., SIP To header) and redirect (i.e., SIP Diversion header) numbers are different. Note: The corresponding global parameter is CopyDest2RedirectNumber.
Web: Media Security Behavior [IpProfile_MediaSecurityBehavio ur]	 [-1] Not Configured = Applies the settings of the corresponding global parameter, MediaSecurityBehaviour. [0] Preferable = (Default) The device initiates encrypted calls to this SIP entity. However, if negotiation of the cipher suite fails, an unencrypted call is established. The device accepts incoming calls received from the SIP entity that don't include encryption information. [1] Mandatory = The device initiates encrypted calls to this SIP entity, but if negotiation of the cipher suite fails, the call is terminated. The device rejects incoming calls received from the SIP entity that don't include encryption information. [2] Disable = This SIP entity does not support encrypted calls (i.e., SRTP). [3] Preferable - Single Media = The device sends SDP with a single media ('m=') line only (e.g., m=audio 6000 RTP/AVP 4 0 70 96) with RTP/AVP and crypto keys. The SIP entity can respond with SRTP or RTP parameters: ✓ If the SIP entity does not support SRTP, it uses RTP and ignores the crypto lines. ✓ If the device receives an SDP offer with a single media (as shown above) from the SIP entity, it responds with SRTP (RTP/SAVP) if the EnableMediaSecurity parameter is set to 1. If SRTP is not supported (i.e., EnableMediaSecurity

Parameter	Description
	 is set to 0), it responds with RTP. Notes: This parameter is applicable only when the EnableMediaSecurity parameter is set to 1. If this parameter is set to Preferable [3] and two 'm=' lines are received in the SDP offer, the device prefers the SAVP (secure audio video profile), regardless of the order in the SDP. The corresponding global parameter is MediaSecurityBehaviour.
Web: Number of Calls Limit [IpProfile_CallLimit]	Defines the maximum number of concurrent calls (incoming and outgoing). If the number of concurrent calls reaches this limit, the device rejects any new incoming and outgoing calls belonging to this IP Profile. This parameter can also be set to the following: [-1] = (Default) No limitation on calls. [0] = All calls are rejected. Note: For Gateway IP-to-IP calls, you can configure the device to route calls to an alternative IP Group when this maximum number of concurrent calls is reached. To do so, you need to add an alternative routing rule in the Outbound IP Routing table that reroutes the call to an alternative IP Group. You also need to add a rule to the Reason for Alternative Routing table to initiate an alternative rule for Tel-to-IP calls using cause 805.
Web: First Tx DTMF Option [IpProfile_FirstTxDtmfOption]	 Defines the first preferred transmit DTMF negotiation method. [0] Not Supported = No negotiation - DTMF digits are sent according to the parameters DTMFTransportType and RFC2833PayloadType (for transmit and receive). [1] INFO (Nortel) = Sends DTMF digits according to IETF Internet-Draft draft-choudhuri-sip-info-digit-00. [2] NOTIFY = Sends DTMF digits according to IETF Internet-Draft draft-mahy-sipping-signaled-digits-01. [3] INFO (Cisco) = Sends DTMF digits according to the Cisco format. [4] RFC 2833 (Default) = The device: ✓ negotiates RFC 2833 payload type using local and remote SDPs. ✓ sends DTMF packets using RFC 2833 payload type according to the payload type in the received SDP. ✓ expects to receive RFC 2833 packets with the same payload type as configured by the parameter RFC2833PayloadType. ✓ removes DTMF digits in transparent mode (as part of the voice stream). [5] INFO (Korea) = Sends DTMF digits according to the Korea Telecom format. Notes: When out-of-band DTMF transfer is used ([1], [2], [3], or [5]), the DTMFTransportType parameter is automatically set to 0 (DTMF digits are removed from the RTP stream). The corresponding global parameter is TxDTMFOption.

Parameter	Description
Web: Second Tx DTMF Option [IpProfile_SecondTxDtmfOption]	Defines the second preferred transmit DTMF negotiation method. For a description, see IpProfile_FirstTxDtmfOption (above).
	Note: The corresponding global parameter is TxDTMFOption
Web: Rx DTMF Option [IpProfile_RxDTMFOption]	Enables the device to declare the RFC 2833 'telephony-event' parameter in the SDP.
	• [0] Not Supported
	 [3] Supported (default) The device is always receptive to RFC 2833 DTMF relay packets.
	Thus, it is always receptive to RFC 2003 DTMF Telay packets. Thus, it is always correct to include the 'telephony-event' parameter by default in the SDP. However, some devices use the absence of the 'telephony-event' in the SDP to decide to send DTMF digits in-band using G.711 coder. If this is the case, set this parameter to 0.
	Note: The corresponding global parameter is RxDTMFOption.
Web: Hold [lpProfile_EnableHold]	Enables the interworking of the Hold/Retrieve supplementary service from ISDN PRI to SIP.
	• [0] Disable
	[1] Enable (default) Notes:
	To interwork the Hold/Retrieve supplementary service from
	SIP to ISDN (Euro ISDN), set the EnableHold2ISDN parameter to 1.
	The corresponding global parameter is EnableHold.
Web: Add IE In Setup [IpProfile_AddIEInSetup]	Defines an optional Information Element (IE) data (in hex format) which is added to ISDN Setup messages. For example, to add IE '0x20,0x02,0x00,0xe1', enter the value "200200e1".
	Notes:
	 This IE is sent from the Trunk Group IDs that are defined by the SendlEonTG parameter.
	 You can configure different IE data for Trunk Groups by configuring this parameter for different IP Profiles and then assigning the required IP Profile ID in the Inbound IP Routing table (PSTNPrefix).
	 This feature is similar to that of the EnableISDNTunnelingIP2Tel parameter. If both parameters are configured, the EnableISDNTunnelingIP2Tel parameter takes precedence.
	The corresponding global parameter is AddlEinSetup.
Web: AMD Sensitivity Parameter Suite	Defines the AMD Parameter Suite to use for the Answering Machine Detection (AMD) feature.
CLI: amd-sensitivity-parameter- suit [lpProfile_AMDSensitivityParame terSuit]	 [0] 0 = (Default) Parameter Suite 0 based on North American English with standard detection sensitivity resolution (8 sensitivity levels, from 0 to 7). This AMD Parameter Suite is provided by the AMD Sensitivity file, which is shipped pre- installed on the device.
	 [1] 1 = Parameter Suite 1 based on North American English with high detection sensitivity resolution (16 sensitivity levels, from 0 to 15). This AMD Parameter Suite is provided by the AMD Sensitivity file, which is shipped pre-installed on the device.

Parameter	Description
	• [2] 2 to [7] 7 = Optional Parameter Suites that you can create based on any language (16 sensitivity levels, from 0 to 15). This requires a customized AMD Sensitivity file that needs to be installed on the device. For more information, contact your AudioCodes sales representative.
	Notes:
	 To configure the detection sensitivity level, use the 'AMD Sensitivity Level' parameter.
	 For more information on the AMD feature, see 'Answering Machine Detection (AMD)' on page 196.
	 The corresponding global parameter is AMDSensitivityParameterSuit.
Web: AMD Sensitivity Level [IpProfile_AMDSensitivityLevel]	Defines the AMD detection sensitivity level of the selected AMD Parameter Suite (using the 'AMD Sensitivity Parameter Suite' parameter).
	For Parameter Suite 0, the valid range is 0 to 7, where 0 is for best detection of an answering machine and 7 for best detection of a live call. For any Parameter Suite other than 0, the valid range is 0 to 15, where 0 is for best detection of an answering machine and 15 for best detection of a live call.
	Note: The corresponding global parameter is AMDSensitivityLevel.
Web: AMD Max Greeting Time [IpProfile_AMDMaxGreetingTime]	Defines the maximum duration (in 5-msec units) that the device can take to detect a greeting message.
	The valid range value is 0 to 32767. The default is 300.
	Note: The corresponding global parameter is AMDMaxGreetingTime.
Web: AMD Max Post Silence Greeting Time [lpProfile_AMDMaxPostSilenceG	Defines the maximum duration of silence from after the greeting time is over (configured by AMDMaxGreetingTime) until the device's AMD decision.
reetingTime]	Note: The corresponding global parameter is AMDMaxPostGreetingSilenceTime.
Web: AMD Mode [lpProfile_AmdMode]	Enables the device to disconnect the IP-to-Tel call upon detection of an answering machine on the Tel side.
	• [0] Don't Disconnect = (Default) Device does not disconnect call upon detection of an answering machine.
	• [1] Disconnect on AMD = Device disconnects call upon detection of an answering machine. It disconnects the call only after receipt of an ISDN Connect from the Tel side. In such a scenario, the device sends a SIP BYE message upon AMD
	Notes:
	 This feature (when set to [1]) cannot work together when the EnableEarlyAMD parameter is set to [1].
	 This feature does not need the receipt of the SIP X-Detect header in the incoming INVITE to activate the AMD.
	The corresponding global parameter is AMDmode.
Web: QSIG Tunneling [IpProfile_EnableQSIGTunneling]	Enables QSIG tunneling-over-SIP for this SIP entity. This is according to IETF Internet-Draft draft-elwell-sipping-qsig-tunnel-03 and ECMA-355 and ETSI TS 102 345.
	• [0] Disable (default).

	Description
	 [1] Enable = Enables QSIG tunneling from QSIG to SIP, and vice versa. All QSIG messages are sent as raw data in corresponding SIP messages using a dedicated message body. Notes: QSIG tunneling must be enabled on originating and terminating devices. To enable this function, set the ISDNDuplicateQ931BuffMode parameter to 128 (i.e., duplicate all messages). To define the format of encapsulated QSIG messages, use the QSIGTunnelingMode parameter. Tunneling according to ECMA-355 is applicable to all ISDN variants (in addition to the QSIG protocol). For more information on QSIG tunneling, see QSIG Tunneling on page 360.
	 The corresponding global parameter is EnableQSIGTunneling.
Web: Early 183 [IpProfile_EnableEarly183]	 Enables the device to send SIP 183 responses with SDP to the IP upon receipt of INVITE messages. This parameter is applicable to IP-to-Tel (ISDN) and IP-to-IP calls, and applies to all calls. [0] Disable (default) [1] Enable = IP-to-Tel calls: By sending the 183 response, the device opens an RTP channel before receiving the "progress" tone from the ISDN side. The device sends RTP packets immediately upon receipt of an ISDN Progress, Alerting with Progress indicator, or Connect message according to the initial negotiation without sending the 183 response again, thereby saving response time and avoiding early media clipping. IP-to-IP calls: Sending the 183 response enables SIP servers that require a stream of early media, to keep sessions open. Notes: To enable this feature, set the EnableEarlyMedia parameter to 1. When the BChannelNegotiation parameter is set to a non-Exclusive value (Preferred or Any), the EnableEarly183 parameter is ignored and a SIP 183 is not sent upon receipt of an INVITE. In such a case, you can set the ProgressIndicator2IP parameter to 1 (PI = 1) for the device to send a SIP 183 upon receipt of an ISDN Call Proceeding message. The corresponding global parameter is EnableEarly183.
Web: Early Answer Timeout [IpProfile_EarlyAnswerTimeout]	Defines the duration (in seconds) that the device waits for an ISDN Connect message from the called party (Tel side), started from when it sends a Setup message. If this timer expires, the call is answered by sending a SIP 200 OK message (to the IP side). The valid range is 0 to 2400. The default is 0 (i.e., disabled). Note: The corresponding global parameter is EarlyAnswerTimeout.
SBC	

Parameter	Description
Web: Extension Coders Group ID [IpProfile_SBCExtensionCodersG roupID]	Assigns a Coder Group ID used for Extended (additional) coders, added to the outgoing leg for this SIP entity. This is used when transcoding is required between two IP entities (i.e., the SDP answer from one doesn't include any coder included in the offer previously sent by the other). Therefore, to allow IP entities to communicate with each other regardless of their capabilities, an Extended coders table with at least one coder that is supported by each IP entity needs to be assigned to each IP Group. Therefore, each offer destined to specific IP Groups includes this coder. Note: To configure Coders Groups, see Configuring Coder
Web: Transcoding Mode [IpProfile_TranscodingMode]	 Groups on page 310. Defines the voice transcoding mode (media negotiation) for this SIP entity. [0] Only if Required = (Default) Transcoding is done only when necessary. Many of the media settings (such as gain control) are not implemented on the voice stream. The device forwards RTP packets transparently (RTP-to-RTP), without processing them. [1] Force = Transcoding is always done on the outgoing leg. The device interworks the media between for this SIP entity (as both legs have different media capabilities), by implementing DSP transcoding. This enables the device to receive capabilities that are not negotiated between the SIP entities. For example, it can enforce Gain Control to use voice transcoding even though both legs have negotiated without
	the device's intervention (such as Extension coders). Notes:
	 To implement transcoding, you must configure the number of required DSP channels for transcoding (using the MediaChannels parameter). Each transcoding session uses two DSP resources. The corresponding global parameter is TranscodingMode.
Allowed Media Types [IPProfile_SBCAllowedMediaTypes]	Defines media types permitted for this SIP entity. The media type appears in the SDP 'm=' line (e.g., 'm=audio'). The device permits only media types that appear in both the SDP offer and this configured list. If no common media types exist between the SDP offer and this list, the device drops the call. The valid value is a string of up to 64 characters. To configure multiple media types, separate the strings with a comma, e.g., "media, audio" (without quotes). By default, no media types are
	configured (i.e., all media types are permitted).
Web: Allowed Coders Group ID [IpProfile_SBCAllowedCodersGroupID]	Assigns an Allowed Coders Group to this SIP entity. This defines audio (voice) coders that can be used for this SIP entity. To configure Allowed Coders Groups, see Configuring Allowed Audio Coder Groups on page 500. For a description of the Allowed Coders feature, see "Restricting Coders" on page 475.
Web: Allowed Video Coders Group ID [IPProfile_SBCAllowedVideoCod	Assigns an Allowed Video Coders Group to this SIP entity. This defines permitted video coders when forwarding video streams to the SIP entity. The video coders are listed in the "video" media

Parameter	Description
ersGroupID]	type in the SDP (i.e., 'm=video' line). For this SIP entity, the device uses only video coders that appear in both the SDP offer and the Allowed Video Coders Group ID.
	By default, no Allowed Video Coders Group is assigned (i.e., all video coders are allowed).
	To configure Allowed Video Coders Groups, see Configuring Allowed Video Coder Groups on page 501.
Web: Allowed Coders Mode [IpProfile_SBCAllowedCodersMode]	 Defines the mode of the Allowed Coders feature for this SIP entity. [0] Restriction = In the incoming SDP offer, the device uses only Allowed coders; the rest are removed from the SDP offer (i.e., only coders common between those in the received SDP offer and the Allowed coders are used). If an Extension Coders Group is also assigned (using the 'Extension Coders
	 Group ID' parameter, above), these coders are added to the SDP offer. [1] Preference = The device re-arranges the priority (order) of the coders in the incoming SDP offer according to their order of appearance in the Allowed Coders Group or Allowed Video Coders tables. The coders received in the SDP offer are listed after the Allowed coders. [2] Restriction and Preference = Performs both Restriction and Preference.
	Notes:
	This parameter is applicable only if Allowed coders are assigned to the IP Profile (using the 'Allowed Coders Group ID' or 'Allowed Video Coders Group ID' parameters).
	 For more information on the Allowed Coders feature, see Restricting Coders on page 475.
Web: SBC Media Security	Defines the handling of RTP and SRTP for this SIP entity.
Behavior [IpProfile_SBCMediaSecurityBeh	• [0] As is = (Default) No special handling for RTP\SRTP is done.
aviour]	 [1] SRTP = SBC legs negotiate only SRTP media lines, and RTP media lines are removed from the incoming SDP offer\answer.
	 [2] RTP = SBC legs negotiate only RTP media lines, and SRTP media lines are removed from the incoming offer\answer.
	 [3] Both = Each offer\answer is extended (if not already) to two media lines - one RTP and the other SRTP.
	If two SBC legs (after offer\answer negotiation) use different security types (i.e., one RTP and the other SRTP), the device performs RTP-SRTP transcoding. To transcode between RTP and SRTP, the following prerequisites must be met:
	At least one supported SDP "crypto" attribute and parameters.
	EnableMediaSecurity must be set to 1.
	If one of the above transcoding prerequisites is not met, then:
	any value other than "As is" is discarded. if the incoming offer is SPTP, force transceding, coder.
	if the incoming offer is SRTP, force transcoding, coder transcoding, and DTMF extensions are not applied.
Web: RFC 2833 Behavior	Defines the handling of RFC 2833 SDP offer\answer negotiation

Parameter	Description
[lpProfile_SBCRFC2833Behavior]	 for this SIP entity. [0] As is = (Default) The device does not intervene in the RFC 2833 negotiation. [1] Extend = Each outgoing offer\answer includes RFC 2833 in the offered SDP (the device adds RFC 2833 only if the incoming offer does not include RFC 2833). [2] Disallow = The device removes RFC 2833 from the incoming offer. Note: If the device interworks between different DTMF methods and one of the methods is in-band DTMF packets (RFC 2833), detection and generation of DTMF methods requires DSP resources.
Web: Alternative DTMF Method [IpProfile_SBCAlternativeDTMFM ethod]	The device's first priority for DTMF method at each leg is RFC 2833. Thus, if the device successfully negotiates RFC 2833 for this SIP entity, the chosen DTMF method for this leg is RFC 2833. When RFC 2833 negotiation fails, the device uses this parameter to define the DTMF method for the leg. • [0] As Is = (Default) The device does not attempt to interwork any special DTMF method. • [1] In Band • [2] INFO - Cisco • [3] INFO - Nortel • [4] INFO - Lucent = INFO, Korea Note: If the device interworks between different DTMF methods and one of the methods is in-band DTMF packets (RFC 2833), detection and generation of DTMF methods requires DSP resources.
Web: P-Asserted-Identity [IpProfile_SBCAssertIdentity]	Defines the device's handling of the SIP P-Asserted-Identity header for this SIP entity. This header indicates how the outgoing SIP message asserts identity. • [0] As Is = (Default) P-Asserted Identity header is not affected and the device uses the same P-Asserted-Identity header (if present) in the incoming message for the outgoing message. • [1] Add = Adds a P-Asserted-Identity header. The header's values are taken from the source URL. • [2] Remove = Removes the P-Asserted-Identity header. Notes: • This parameter affects only the initial INVITE request. • The corresponding global parameter is SBCAssertIdentity.
Web: Diversion Mode [IpProfile_SBCDiversionMode]	 Defines the device's handling of the SIP Diversion header for this SIP entity. For more information on interworking of the History-Info and Diversion headers, see Interworking SIP Diversion and History-Info Headers on page 482. [0] As Is = (Default) Diversion header is not handled. [1] Add = History-Info header is converted to a Diversion header. [2] Remove = Removes the Diversion header and the conversion to the History-Info header depends on the settings of the SBCHistoryInfoMode parameter. Note: If the Diversion header is used, you can specify the URI

Parameter	Description
	type (e.g., "tel:") to use in the header, using the SBCDiversionUriType parameter.
Web: History-Info Mode [IpProfile_SBCHistoryInfoMode]	Defines the device's handling of the SIP History-Info header for this SIP entity. For more information on interworking of the History-Info and Diversion headers, see Interworking SIP Diversion and History-Info Headers on page 482.
	 [0] As Is = (Default) History-Info header is not handled. [1] Add = Diversion header is converted to a History-Info header.
	 [2] Remove = History-Info header is removed from the SIP dialog and the conversion to the Diversion header depends on the settings of the SBCDiversionMode parameter.
Web: Fax Coders Group ID [IpProfile_SBCFaxCodersGroupI D]	Assigns a Coders Group ID to define the supported fax coders for fax negotiation for this SIP entity. For configuring Coder Groups, see Configuring Coder Groups on page 310.
	Note: The parameter is applicable only if you set the IpProfile_SBCFaxBehavior parameter to a value other than [0].
Web: Fax Behavior [IpProfile_SBCFaxBehavior]	Defines the fax-offer negotiation method for this SIP entity. • [0] As Is = (Default) Pass fax transparently, without interference.
	• [1] Handle always = Handle fax according to fax settings in the IP Profile for all offer-answer transactions (including the initial INVITE).
	 [2] Handle on re-INVITE = Handle fax according to fax settings in the IP Profile for all re-INVITE offer-answer transactions (except for initial INVITE).
	Note: The fax settings in the IP Profile include IpProfile_SBCFaxCodersGroupID, IpProfile_SBCFaxOfferMode, and IpProfile_SBCFaxAnswerMode.
Web: Fax Offer Mode [IpProfile_SBCFaxOfferMode]	Defines the coders included in the outgoing SDP offer (sent to the called "fax") for this SIP entity.
	 [0] All coders = (Default) Use only (and all) the coders of the selected Coders Group ID configured using the SBCFaxCodersGroupID parameter.
	• [1] Single coder = Use only one coder. If a coder in the incoming offer (from the calling "fax") matches a coder in the SBCFaxCodersGroupID, then the device uses this coder. If no match exists, then the device uses the first coder listed in the Coders Group ID (SBCFaxCodersGroupID).
	Note: The parameter is applicable only if you set the IpProfile_SBCFaxBehavior parameter to a value other than [0].
Web: Fax Answer Mode [IpProfile_SBCFaxAnswerMode]	Defines the coders included in the outgoing SDP answer (sent to the calling "fax") for this SIP entity.
•	• [0] All coders = Use matched coders between the incoming offer coders (from the calling "fax") and the coders of the selected Coders Group ID (configured using the SBCFaxCodersGroupID parameter).
	[1] Single coder = (Default) Use only one coder. If the incoming answer (from the called "fax") includes a coder that matches a coder match between the incoming offer coders (from the calling "fax") and the coders of the selected Coders

Parameter	Description
	Group ID (SBCFaxCodersGroupID, then the device uses this coder. If no match exists, the device uses the first listed coder of the matched coders between the incoming offer coders (from the calling "fax") and the coders of the selected Coders Group ID.
	Note: The parameter is applicable only if you set the IpProfile_SBCFaxBehavior parameter to a value other than [0].
Web: PRACK Mode [IpProfile_SbcPrackMode]	 Defines the device's handling of SIP PRACK messages for this SIP entity. [1] Optional = PRACK is optional. If required, the device performs the PRACK process on behalf of the SIP entity. [2] Mandatory = PRACK is required for this SIP entity. Calls from endpoints that do not support PRACK are rejected. Calls destined to these endpoints are also required to support PRACK. [3] Transparent (default) = The device does not intervene with the PRACK process and forwards the request as is.
Web: Session Expires Mode [IpProfile_SBCSessionExpiresMode]	 Defines the required session expires mode for this SIP entity. [0] Transparent = (Default) The device does not interfere with the session expires negotiation. [1] Observer = If the SIP Session-Expires header is present, the device does not interfere, but maintains an independent timer for each leg to monitor the session. If the session is not refreshed on time, the device disconnects the call. [2] Not Supported = The device does not allow a session timer with this SIP entity. [3] Supported = The device enables the session timer with this SIP entity. If the incoming SIP message does not include any session timers, the device adds the session timer information to the sent message. You can configure the value of the Session-Expires and Min-SE headers, using the SBCSessionExpires and SBCMinSE parameters, respectively.
Web: Remote Update Support [IpProfile_SBCRemoteUpdateSupport]	Defines whether this SIP entity supports the SIP UPDATE message. • [0] Not Supported = UPDATE message is not supported. • [1] Supported Only After Connect = UPDATE message is supported only after the call is connected. • [2] Supported = (Default) UPDATE message is supported during call setup and after call establishment.
Web: Remote re-INVITE [IpProfile_SBCRemoteReinviteSupport]	 Defines whether the destination UA of the re-INVITE request supports re-INVITE messages and if so, whether it supports re-INVITE with or without SDP. [0] Not Supported = re-INVITE is not supported and the device does not forward re-INVITE requests. The device sends a SIP response to the re-INVITE request, which can either be a success or a failure, depending on whether the device can bridge the media between the endpoints. [1] Supported only with SDP = re-INVITE is supported, but only with SDP. If the incoming re-INVITE arrives without SDP, the device creates an SDP and adds it to the outgoing re-INVITE.

Parameter	Description
	 [2] Supported = (Default) re-INVITE is supported with or without SDP.
Web: Remote Delayed Offer Support [IpProfile_SBCRemoteDelayedOf ferSupport]	 Defines whether the remote endpoint supports delayed offer (i.e., initial INVITEs without an SDP offer). [0] Not Supported = Initial INVITE requests without SDP are not supported. [1] Supported = (Default) Initial INVITE requests without SDP are supported. Note: For this parameter to function, you need to configure a valid Extension Coders Group ID for IP Profiles that do not
Web: Remote REFER Behavior	support delayed offer. Defines the device's handling of REFER requests for this SIP
[IpProfile_SBCRemoteReferBeha vior]	 [0] Regular = (Default) Refer-To header is unchanged and the device forwards the REFER as is. [1] Database URL = Changes the Refer-To header so that the re-routed INVITE is sent through the SBC: a. Before forwarding the REFER request, the device changes the host part to the device's IP address and adds a special prefix ("T~&R_") to the Contact user part. b. The incoming INVITE is identified as a REFER-resultant INVITE according to this special prefix. c. The device replaces the host part in the Request-URI with the host from the REFER contact. The special prefix remains in the user part for regular classification, manipulation, and routing. The special prefix can also be used for specific routing rules for REFER-resultant INVITEs. d. The special prefix is removed before the resultant INVITE is sent to the destination. [2] IP Group Name = Sets the host part in the REFER message to the name defined for the IP Group (in the IP Group table). [3] Handle Locally = Handles the incoming REFER request itself without forwarding the REFER. The device generates a new INVITE to the alternative destination according to the rules in the IP-to-IP Routing table (the 'Call Trigger' field must be set to REFER). Note: The corresponding global parameter is SBCReferBehavior.
Web: Remote 3xx Behavior [IpProfile_SBCRemote3xxBehavi or]	Defines the device's handling of SIP 3xx redirect responses for this SIP entity. By default, the device's handling of SIP 3xx responses is to send the Contact header unchanged. However, some SIP entities may support different versions of the SIP 3xx standard while others may not even support SIP 3xx. When enabled, the device handles SIP redirections between different subnets (e.g., between LAN and WAN sides). This is required when the new address provided by the redirector (Redirect sever) may not be reachable by the far-end user (FEU) located in another subnet. For example, a far-end user (FEU) in the WAN sends a SIP request via the device to a Redirect server in the LAN, and the Redirect server replies with a SIP 3xx response to a PBX in the LAN in the Contact header. If the device

Parameter	Description
Parameter	 Description sends this response as is (i.e., with the original Contact header), the FEU is unable to reach the new destination. [0] Transparent = (Default) The device forwards the received SIP 3xx response as is, without changing the Contact header (i.e.,transparent handling). [1] Database URL = The device changes the Contact header so that the re-route request is sent through the device. The device changes the URI in the Contact header of the received SIP 3xx response to its own URI and adds a special user prefix ("T~&R_"), which is then sent to the FEU. The FEU then sends a new INVITE to the device, which the device then sends to the correct destination. [2] Handle Locally = The device handles SIP 3xx responses on behalf of the dialog-initiating UA and retries the request (e.g., INVITE) using one or more alternative URIs included in the 3xx response. The device sends the new request to the alternative destination according to the IP-to-IP Routing table (the 'Call Trigger' field must be set to 3xx). Notes: When this parameter is changed from 1 to 0, new 3xx Contact headers remain unchanged. However, requests with the special prefix continue using the device's database to locate the new destination.
	 Only one database entry is supported for the same host, port, and transport combination. For example, the following URLs cannot be distinguished by the device: ✓ sip:10.10.10.10:5060;transport=tcp;param=a ✓ sip:10.10.10.10:5060;transport=tcp;param=b The database entry expires two hours after the last use. The maximum number of destinations (i.e., database entries) is 50. The corresponding global parameter is SBC3xxBehavior.
Web: Remote Multiple 18x [IpProfile_SBCRemoteMultiple18 xSupport]	Defines whether multiple 18x responses including 180 Ringing, 181 Call is Being Forwarded, 182 Call Queued, and 183 Session Progress are forwarded to the caller, for this SIP entity. [0] Not Supported = Only the first 18x response is forwarded to the caller. [1] Supported = (Default) Multiple 18x responses are forwarded to the caller.
Web: Remote Early Media Response Type [IpProfile_SBCRemoteEarlyMedi aResponseType]	 Defines the SIP provisional response type - 180 or 183 - for forwarding early media to the caller, for this SIP entity. [0] Transparent = (Default) All early media response types are supported; the device forwards all responses as is (unchanged). [1] 180 = Early media is sent as 180 response only. [2] 183 = Early media is sent as 183 response only.
Web: Remote Early Media [IpProfile_SBCRemoteEarlyMediaSupport]	 Defines whether the remote side can accept early media or not. [0] Not Supported = Early media is not supported. [1] Supported = (Default) Early media is supported.
Web: Enforce MKI Size	Enables MKI length negotiation for SRTP-to-SRTP flows between SIP networks (i.e., IP Groups). This includes the capability of

Parameter	Description
[lpProfile_SBCEnforceMKISize]	 modifying the MKI length on the inbound or outbound SBC call leg for this SIP entity. [0] Don't enforce = (Default) Device forwards the MKI size as is. [1] Enforce = Device changes the MKI length according to the settings of the IP Profile parameter, MKISize.
Web: Remote Early Media RTP Behavior [IpProfile_SBCRemoteEarlyMediaRTP]	 Defines whether the destination UA sends RTP immediately after it sends 18x response. [0] Immediate = (Default) Remote client sends RTP immediately after it sends 18x response with early media. Device forwards 18x and RTP as is. [1] Delayed = After sending 18x response, the remote client waits before sending RTP (e.g., Microsoft Lync environment). For the device's handling of this remote UA support, see Interworking SIP Early Media on page 484.
Web: Remote RFC 3960 Gateway Model Support [IpProfile_SBCRemoteSupportsR FC3960]	 Defines whether the destination UA is capable of receiving 18x messages with delayed RTP. [0] Not Supported = (Default) UA does not support receipt of 18x messages with delayed RTP. For the device's handling of this remote UA support, see Interworking SIP Early Media on page 484. [1] Supported = UA is capable of receiving 18x messages with delayed RTP.
Web: Remote Can Play Ringback [IpProfile_SBCRemoteCanPlayRingback]	 Defines whether the destination UA can play a local ringback tone. [0] No = UA does not support local ringback tone. The device sends 18x with delayed SDP to the UA. [1] Yes = (Default) UA supports local ringback tone. For the device's handling of this remote UA support, see Interworking SIP Early Media on page 484.
Web: RFC 2833 DTMF Payload Type [IpProfile_SBC2833DTMFPayloa dType]	Defines the payload type of DTMF digits for this SIP entity. This enables the interworking of the DTMF payload type for RFC 2833 between different SBC call legs. For example, if two entities require different DTMF payload types, the SDP offer received by the device from one entity is forwarded to the destination entity with its payload type replaced with the configured payload type, and vice versa. The value range is 0 to 200. The default is 0 (i.e., the device forwards the received payload type as is).
Web: User Registration Time [IpProfile_SBCUserRegistrationTime]	Defines the duration (in seconds) of the periodic registrations that occur between the users of this SIP entity and the device (the device responds with this value to the user). The valid range is 0 to 2,000,000 seconds. The default is 0. When set to 0, the device does not change the Expires header's value received in the user's REGISTER request. If no Expires header is received in the REGISTER message and this parameter is set to 0, the Expires header's value is set to 180 seconds, by default. Note: The corresponding global parameter is SBCUserRegistrationTime.
Web: Reliable Held Tone Source	Enables the device to consider the received call-hold request (re-

Parameter	Description
[IPProfile_ReliableHoldToneSour ce]	 INVITE/UPDATE) with SDP containing 'a=sendonly', as genuine. [0] No (default) = Even if the received SDP contains 'a=sendonly', the device plays a held tone to the held party. This is useful in cases where the initiator of the call hold does not support the generation of held tones. [1] Yes = If the received SDP contains 'a=sendonly', the device does not play a held tone to the held party (and assumes that the initiator of the call hold plays the held tone). Note: The device plays a held tone only if the 'SBC Play Held Tone' parameter is set to Yes.
Web: Play Held Tone [IpProfile_SBCPlayHeldTone]	Enables the device to play a held tone to the held party. This is useful if the held party does not support playing a local held tone, or for IP entities initiating call hold that do not support the generation of held tones. • [0] No (default) • [1] Yes Note: If this parameter is set to Yes, the device plays the tone only if the 'SBC Remote Hold Format' parameter is set to transparent, send-only, send only 0.0.0.0, or not supported.
Web: Remote Hold Format [IPProfile_SBCRemoteHoldForm at]	 Defines the format of the SDP in the re-INVITE for call hold that the device sends to the held party. [0] Transparent = Device forwards SDP as is. [1] Send Only = Device sends SDP with 'a=sendonly'. [2] Send Only Zero ip = Device sends SDP with 'a=sendonly' and 'c=0.0.0.0'. [3] Inactive = Device sends SDP with 'a=inactive'. [4] Inactive Zero ip = Device sends SDP with 'a=inactive' and 'c=0.0.0.0'. [5] Not Supported = Used when remote side cannot identify a call-hold message. The device terminates the received call-hold message (re-INVITE / UPDATE) and sends a 200 OK to the initiator of the call hold. The device plays a held tone to the held party if the 'SBC Play Held Tone' parameter is set to Yes.
Web: Remote Replaces Behavior [IpProfile_SBCRemoteReplacesB ehavior]	 Enables the device to handle an incoming INVITE with the Replaces header for this SIP entity (which does not support this header). The Replaces header is used to replace an existing SIP dialog with a new dialog such as in call transfer or call pickup [0] Transparent = (Default) SIP entity supports the Replaces header. The device forwards the received INVITE with the Replaces header as is to the SIP entity. [1] Handle Locally = The SIP entity does not support INVITE with the Replaces header. The device terminates the received INVITE with the Replaces header and establishes a new call between the SIP entity and the new call party. It then disconnects the call with the initial call party, by sending it a SIP BYE request. For example, assume that the device establishes a call between A and B. If B initiates a call transfer to C, the device receives an INVITE with the Replaces header from C. If A supports the Replaces header, the device simply forwards the INVITE as is to A; a new call is established between A and C and the call

Parameter	Description
	between A and B is disconnected. However, if A does not support the Replaces header, the device uses this feature to terminate the INVITE with Replaces header and handles the transfer for A. The device does this by connecting A to C, and disconnecting the call between A and B, by sending a SIP BYE request to B. Note that if media transcoding is required, the device sends an INVITE to C on behalf of A with a new SDP offer.
Web: SDP Ptime Answer [IpProfile_SBCSDPPtimeAnswer]	 Defines the packetization time (ptime) of the coder in RTP packets for this SIP entity. This is useful when implementing transrating. [0] Remote Answer (Default) = Use ptime according to SDP answer. [1] Original Offer = Use ptime according to SDP offer. [2] Preferred Value= Use preferred ptime for negotiation, if configured by the 'Preferred Ptime' parameter. Note: Additional DSPs are required for this functionality.
Web: Preferred Ptime [IpProfile_SBCPreferredPTime]	Defines the packetization time (in msec) for this SIP entity if the 'SBC SDP Ptime Answer' parameter is set to Preferred Value. The valid range is 0 to 200. The default is 0 (i.e., preferred ptime is not used).
Web: Use Silence Suppression CLI: sbc-use-silence-supp [IpProfile_SBCUseSilenceSupp]	 Defines silence suppression support for this SIP entity. [0] Transparent (default) = Forward as is. [1] Add = Enable silence suppression for each relevant coder listed in the SDP. [2] Remove = Disable silence suppression for each relevant coder listed in the SDP.
Web: Play RBT To Transferee [IpProfile_SBCPlayRBTToTransf eree]	Enables the device to play a ringback tone to the transferred party (transferee) during a blind call transfer, for this SIP entity (which does not support such a tone generation during call transfer). The ringback tone indicates to the transferee of the ringing of the transfer target (to where the transferee is being transferred). • [0] No (Default) • [1] Yes Typically, the transferee hears a ringback tone only if the transfer target sends it early media. However, if the transferee is put onhold before being transferred, no ringback tone is heard. When this feature is enabled, the device generates a ringback tone to the transferee during call transfer in the following scenarios: • Transfer target sends a SIP 180 (Ringing) to the device. • For non-blind transfer, if the call is transferred while the transfer target is ringing and no early media occurs. • The 'Remote Early Media RTP Behavior parameter is set to Delayed (used in the Lync environment), and transfer target sends a 183 Session progress with SDP offer. If early media from the transfer target has already been detected, the transferee receives RTP stream from the transfer target. If it has not been detected, the device generates a ringback tone to the transferee and stops the tone generation once RTP has been detected from the transfer target.

Parameter	Description
	For any of these scenarios, if the transferee is put on-hold by the transferor, the device retrieves the transferee from hold, sends a re-INVITE if necessary, and then plays the ringback tone. Note: For the device to play the ringback tone, it must be loaded with a Prerecorded Tones (PRT) file. For more information, see Prerecorded Tones File on page 560.
Web: RTCP Mode [IPProfile_SBCRTCPMode]	Defines how the device handles RTCP packets during call sessions for this SIP entity. This is useful for interworking RTCP between SIP entities. For example, this may be necessary when incoming RTCP is not compatible with the destination SIP entity's (this IP Profile) RTCP support. In such a scenario, the device can generate the RTCP and send it to the SIP entity. • [0] Transparent (default) = RTCP is forwarded as is (unless transcoding is done, in which case, the device generates RTCP on both legs). • [1] Generate Always = Generates RTCP packets during active and inactive (e.g., during call hold) RTP periods (i.e., media is 'a=recvonly' or 'a=inactive' in the INVITE SDP). • [2] Generate only if RTP Active = Generates RTCP packets only during active RTP periods. In other words, the device does not generate RTCP when there is no RTP traffic (such as when a call is on hold). Note: The corresponding global parameter is SBCRTCPMode.
Web: Jitter Compensation CLI: sbc-jitter-compensation [IpProfile_SBCJitterCompensation]	Enables the on-demand jitter buffer for SBC calls. This jitter buffer can be used when other functionality such as voice transcoding are not done on the call. This jitter buffer is useful when incoming packets are received at inconsistent intervals (i.e., packet delay variation). The jitter buffer stores the packets and sends them out at a constant rate (according to the coder's settings). • [0] Disable (default) • [1] Enable Notes: • The jitter buffer parameters, 'Dynamic Jitter Buffer Minimum Delay' (DJBufMinDelay) and 'Dynamic Jitter Buffer Optimization Factor' (DJBufOptFactor) can be used to configure minimum packet delay only when transcoding is employed. • This functionality may require DSP resources. For more information, contact your AudioCodes sales representative.

Parameter	Description
Web: Remote Renegotiate on Fax Detection CLI: sbc-rmt-renegotiate-on-fax-detect	Enables local handling of fax detection and negotiation by the device on behalf of the SIP entity (to which the IP Profile is assigned). This applies to faxes sent immediately upon the establishment of a voice channel (i.e., after 200 OK).
[IPProfile_SBCRemoteRenegoti ateOnFaxDetection]	The device attempts to detect the fax (CNG tone) from the originating SIP entity within a user-defined interval (see the SBCFaxDetectionTimeout parameter) immediately after the voice call is established.
	Once fax is detected, the device can handle the subsequent fax negotiation by sending re-INVITE messages to both SIP entities. The device also negotiates the fax coders between the two SIP entities. The negotiated coders are according to the list of fax coders assigned to each SIP entity, using the IP Profile parameter 'Fax Coders Group ID'.
	• [0] Don't Care = (Default) Device does not interfere in the fax transaction and assumes that the SIP entity fully supports fax renegotiation upon fax detection.
	 [1] Only on Answer Side = The SIP entity supports fax renegotiation upon fax detection only if it is the terminating (answering) fax, and does not support renegotiation if it is the originating fax.
	• [2] No = The SIP entity does not support fax re-negotiation upon fax detection when it is the originating or terminating fax.
	Notes:
	This feature is applicable only when both SIP entities do not fully support fax detection (receive or send) and negotiation: one SIP entity must be assigned an IP Profile where this parameter is set to [1] or [2], while the peer SIP entity must be assigned an IP Profile where this parameter is set to [2].
	 This feature is supported only if at least one of the SIP entities uses the G.711 coder.
	 This feature utilizes DSP resources. If there are insufficient resources, the fax transaction fails.

Part V

Gateway Application

User's Manual 21. Introduction

21 Introduction

This section describes configuration of the Gateway application. The Gateway application refers to IP-to-Tel (PSTN) call routing and vice versa.

Notes:

- The IP-to-IP application has been superseded by the SBC application.
- In some areas of the Web interface, the term "GW" refers to the Gateway application.
- The terms IP-to-Tel and Tel-to-IP refer to the direction of the call relative to the
 device. IP-to-Tel refers to calls received from the IP network and destined to the
 PSTN/PBX (i.e., telephone connected directly or indirectly to the device); Tel-to-IP
 refers to calls received from the PSTN/PBX, and destined for the IP network.

This page is intentionally left blank.

22 Digital PSTN

This section describes the configuration of the public switched telephone network (PSTN) related parameters.

22.1 Configuring Trunk Settings

the trunk's physical integrity.

The Trunk Settings page allows you to configure the device's trunks. This includes selecting the PSTN protocol and configuring related parameters.

This page also enables the following maintenance procedures:

- Taking a Trunk Out of Service: Some parameters can be configured when the trunk is in service, while others require you to take the trunk out of service. This is done by
 - clicking the **Stop** button. Once you have "stopped" a trunk, all current calls are dropped and no new calls can be made on the trunk.
- Deactivating a Trunk: You can deactivate a trunk for maintenance. This is done by clicking the Deactivate Deactivate button. Deactivation temporarily disconnects (logically) the trunk from the PSTN network. Upon trunk deactivation, the device generates an AIS alarm on the trunk to the far-end. As a result, an RAI alarm signal may be received by the device. A subsequent trunk activation, done by clicking the Activate button, reconnects the trunk to the PSTN network and clears the AIS alarm. Trunk deactivation is typically used for maintenance such as checking
- Creating a Loopback Line: You can create (and remove) remote loopback for DS1 and DS3 lines. This is done by clicking the Create Loopback Create Loopback button.
 To remove the loopback, click the Remove Loopback
 Remove Loopback
 Button.

Notes:

- To delete a previously configured trunk, set the 'Protocol Type' parameter to NONE.
- For a description of the trunk parameters, see "PSTN Parameters" on page 817.
- During trunk deactivation, you cannot configure trunks.
- You cannot activate or deactivate a stopped trunk.
- If the trunk can't be stopped because it provides the device's clock (assuming the
 device is synchronized with the E1/T1 clock), assign a different E1/T1 trunk to
 provide the device's clock or enable 'TDM Bus PSTN Auto Clock' in the TDM Bus
 Settings page (see "TDM and Timing" on page 347).

- The displayed parameters depend on the protocol selected.
- All PRI trunks of the device must be of the same line type (i.e., E1 or T1).
 However, different variants of the same line type can be configured on different trunks, for example, E1 Euro ISDN and E1 CAS (subject to the constraints in the device's Release Notes).
- If the protocol type is CAS, you can assign or modify a dial plan (in the 'Dial Plan' field) and perform this without stopping the trunk.

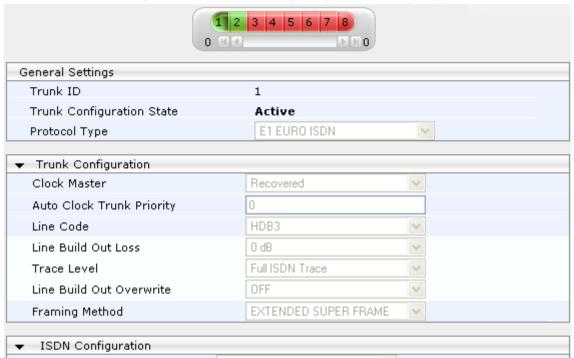

To configure trunks:

 Open the Trunk Settings page (Configuration tab > VolP menu > PSTN > Trunk Settings).

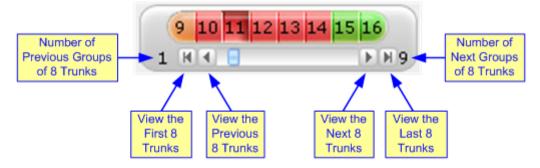

Figure 22-1: Trunk Settings Page (Partial Display)

On the top of the page, a bar with Trunk number icons displays the status of each trunk, according to the following color codes:

- Grey: DisabledGreen: Active
- Yellow: RAI alarm (also appears when you deactivate a Trunk by clicking the Deactivate button)
- Red: LOS/LOF alarmBlue: AIS alarm
- Orange: D-channel alarm (ISDN only)
- 2. Select the trunk that you want to configure by clicking the desired Trunk number icon. The bar initially displays the first eight trunk number icons (i.e., trunks 1 through 8). To scroll through the trunk number icons (i.e., view the next/last or previous/first group of eight trunks), see the figure below:

Figure 22-2: Trunk Scroll Bar (Used Only as an Example)

User's Manual 346 Document #: LTRT-89725

Note: If the Trunk scroll bar displays all available trunks, the scroll bar buttons are unavailable.

After you have selected a trunk, the following is displayed:

- The read-only 'Trunk ID' field displays the selected trunk number.
- The read-only 'Trunk Configuration State' displays the state of the trunk ('Active' or 'Inactive').
- The displayed parameters pertain to the selected trunk only.
- 3. Click the **Stop Trunk** button (located at the bottom of the page) to take the trunk out of service so that you can configure the currently grayed out (unavailable) parameters. (Skip this step if you want to configure parameters that are available when the trunk is active). The stopped trunk is indicated by the following:
 - The 'Trunk Configuration State' field displays 'Inactive'.
 - The Stop Trunk button is replaced by the Apply Trunk Settings button.

When all trunks are stopped, the **Apply to All Trunks** button also appears.

- All the parameters are available and can be modified.
- 4. Configure the trunk parameters as required.
- 5. Click the Apply Trunk Settings button to apply the changes to the selected trunk (or click Apply to All Trunks to apply the changes to all trunks); the Stop Trunk button replaces Apply Trunk Settings and the 'Trunk Configuration State' displays 'Active'.
- 6. To save the changes to flash memory, see "Saving Configuration" on page 550.
- 7. To reset the device, see "Resetting the Device" on page 547.

22.2 TDM and Timing

This section describes the configuration of the TDM and clock timing parameters.

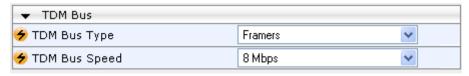

Note: If you are modifying multiple pages, perform a device reset (if required) only after you have completed modifying all the required pages (and not after each page). This ensures that your configuration settings are applied.

22.2.1 Configuring TDM Bus Settings

The TDM page allows you to configure the device's Time-Division Multiplexing (TDM) bus settings. For a description of these parameters, see "PSTN Parameters" on page 817.

- To configure the TDM Bus settings:
- Open the TDM page (Configuration tab > VolP menu > TDM & Timing > TDM).

2. Configure the parameters as required.

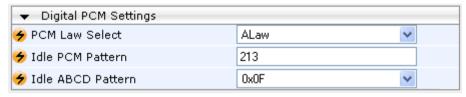

- Click Submit.
- 4. Save the changes to flash memory, see "Saving Configuration" on page 550.

22.2.2 Configuring Digital PCM Settings

The Digital PCM Settings page allows you to configure the PCM companding law in input/output TDM bus, and PCM and ABCD patterns. For a description of these parameters, see "PSTN Parameters" on page 817.

- > To configure the digital PCM settings:
- Open the Digital PCM Settings page (Configuration tab > VolP menu > TDM & Timing > Digital PCM Settings).

Figure 22-3: Digital PCM Settings Page

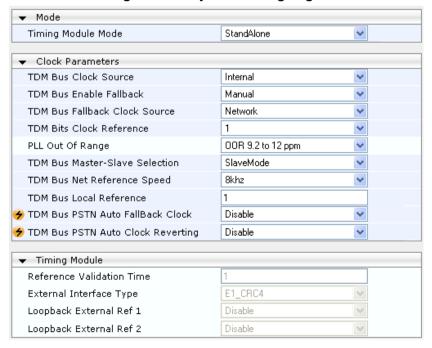

- 2. Configure the parameters as required.
- 3. Click Submit.
- 4. Save the changes to flash memory, see "Saving Configuration" on page 550.

22.2.3 Configuring System Timing

The System Timing page allows you to configure the device's clock synchronization mechanism. For a description of these parameters, see "PSTN Parameters" on page 817.

- To configure the device's system timing:
- Open the System Timing page (Configuration tab > VolP menu > TDM & Timing > System Timing).

Figure 22-4: System Timing Page

User's Manual 348 Document #: LTRT-89725

- 2. Configure the parameters as required.
- 3. Click Submit.
- 4. Save the changes to flash memory, see "Saving Configuration" on page 550.

22.2.4 Clock Settings

In a traditional TDM service network such as PSTN, both ends of the TDM connection must be synchronized. If synchronization is not achieved, voice frames are either dropped (to prevent a buffer overflow condition) or inserted (to prevent an underflow condition). In both cases, connection quality and reliability is affected.

- PSTN line clock (see "Recovering Clock from PSTN Line" on page 349)
- BITS synchronization (see Configuring BITS Synchronization Mode on page 350)
- Internal clock (see "Configuring Internal Clock as Clock Source" on page 351)

Note: When the device is used in a 'non-span' configuration, the internal device clock must be used (as explained above).

22.2.4.1 Recovering Clock from PSTN Line Interface

This section provides a brief description for configuring synchronization based on recovering clock from the PSTN line interface. For a full description of the clock parameters, see "PSTN Parameters" on page 817.

- > To configure synchronization based on clock from PSTN line:
- 1. In the System Timing page, do the following:
 - a. Set the 'TDM Bus Clock Source' parameter (TDMBusClockSource) to Network to recover the clock from the line interface.
 - **b.** For E1/T1 trunks only: Select the trunk from which the clock is derived, using the 'TDM Bus Local Reference' parameter (TDMBusLocalReference).

Note: The E1/T1 trunk should recover the clock from the remote side (see below description of the 'Clock Master' parameter).

- c. For E1/T1 trunks only: Enable automatic switchover to the next available "slave" trunk if the device detects that the local-reference trunk is no longer capable of supplying the clock to the system:
 - **a.** Set the 'TDM Bus PSTN Auto FallBack Clock' parameter (TDMBusPSTNAutoClockEnable) to **Enable**.
 - **b.** Enable the device to switch back to a previous trunk that returns to service if it has higher switchover priority, using the 'TDM Bus PSTN Auto Clock Reverting' parameter (TDMBusPSTNAutoClockRevertingEnable).
 - c. In the Trunk Settings page, configure the priority level of the trunk for taking over as a local-reference trunk, using the 'Auto Clock Trunk Priority' parameter (AutoClockTrunkPriority). A value of 100 means that it never uses the trunk as local reference.
- **d.** If the device has BITS capability, set the 'Timing Module Mode' parameter (TMMode) to LineSync to use the line interface clock.

- 2. For E1/T1 trunks only: Set the PSTN trunk to recover/derive clock from/to the remote side of the PSTN trunk (i.e. clock slave or clock master): In the Trunk Settings page, set the 'Clock Master' parameter (ClockMaster) to one of the following:
 - Recovered to recover clock (i.e. slave)
 - Generated to transmit clock (i.e. master)

Notes:

- When operating with SDH/OC-3 PSTN, the following parameters are not applicable: 'TDM Bus Local Reference', 'TDM Bus PSTN Auto FallBack Clock', 'Auto Clock Trunk Priority', and 'TDM Bus PSTN Auto Clock Reverting'.
- When operating in line recovery mode and the device is installed with the BITS timing hardware, when the source link/trunk clock reference fails, both active and redundant blades change to hold-over mode.
- When the device does not have the BITS timing hardware installed, set the 'Timing Module Mode' parameter to StandAlone.

22.2.4.2 Configuring BITS Synchronization Mode

The device can use Building Integrated Timing Source (BITS) clock inputs to synchronize the system to an external BITS source. In BITS synchronization mode, the clock flows from the BITS to the line interfaces. In this mode, both active and redundant blades are synchronized by two BITS input trunks. The BITS trunks flow through two SAT blades (housed in the chassis), each with a designated timing module. Two SAT blades are required to ensure seamless clock operation in case of failure of one of the SATs timing modules (i.e., clock redundancy).

To configure BITS synchronization:

- 1. Configure the external BITS reference transmission type for primary and secondary interfaces connected to the device. In the System Timing page, set the 'External Interface Type' parameter (TMExternalIFType) to one of the following:
 - [0] E1 CRC4 (default)
 - [1] E1 CAS
 - [2] E1 FAS
 - [3] T1 D4
 - [4] T1 ESF
 - [5] T12
- Configure the transmission power between the timing module on the SAT blade and the T1 external reference clock (External Reference Transmit Line Build Out), using the TMT1LineBuildOut parameter:
 - [0] = DSX 1.0 to 133 feet 0 dB CSU
 - [1] = DSX 1.133 to 266 feet (default)
 - [2] = DSX 1.266 to 399_feet
 - [3] = DSX 1.399 to 533 feet
 - [4] = DSX 1.533 to 655 feet
 - [7] = DSX 1.0 to 133 feet 0 dB CSU pulse enable transmit and receive gapped clock

3. Configure the transmission power (in Ohm) between the timing module on the SAT blade and the E1 external reference clock, using the TME1LineBuildOut parameter:

- [0] E 75 ohms normal
- [1] E 120 ohms normal (default)
- [4] E 75 ohms with high return loss
- [5] E 120 ohms with high return loss
- [6] E 75 ohms normal plus enable transmit and receive gapped clock
- [7] E 120 ohms normal plus enable transmit and receive gapped clock
- **4.** For a BITS reference to return to service, the device must validate the clock. In the System Timing page, configure the time were reference must have an alarm cleared before the device declares it as a valid reference, using the 'Reference Validation Time' parameter (TMReference Validation Time).
- 5. In the System Timing page, set the 'Timing Module Mode' parameter (TMMode) to **External** to use BITS inputs.

When one of the BITS reference clock sources fails, the device automatically switches to the secondary BITS reference source for the device. When a BITS reference clock source with a higher priority returns to service after failure, the device may either revert to the higher-priority clock source or continue using the lower-priority clock source. When both BITS reference clock sources fail, the device enters into clock holdover.

> To configure BITS reference clock source redundancy:

- In the System Timing page, set the 'TDM Bus Enable Fallback' parameter (TDMBusEnableFallback) to one of the following:
 - Auto Non-Revertive enables non-revertive clock fallback between BITS interfaces.
 - Auto Revertive enables auto-revertive clock fallback between BITS interfaces.

- BITS synchronization is applicable only when the device's hardware supports BITS capability.
- For a full description of the BITS parameters, see "PSTN Parameters" on page 817

22.2.4.3 Configuring Internal Clock as Clock Source

This section describes how to configure the device to use its internal clock source. The internal clock source is a stratum 4E-compliant clock source. When the device has no line interfaces, the device should be configured in this mode.

To configure internal clock as clock source:

- 1. Set the clock source to be from the device's internal oscillator. In the System Timing page, set the 'TDM Bus Clock Source' parameter (TDMBusClockSource) to Internal.
- 2. For E1/T1 trunks only, set the line to drive the clock on all trunks: In the Trunk Settings page, set the 'Clock Master' parameter (ClockMaster) to **Generated** (for all trunks).
- 3. If the device has BITS capability, then in the System Timing page, set the 'Timing Module Mode' parameter (TMMode) to StandAlone (default).

22.3 Configuring Transmission Settings

The Transmission Settings page allows you to define the PSTN transmission type (i.e., T3/DS3 or SONET/SDH). For a description of the parameters related to transmission type, see "PSTN Parameters" on page 817.

Notes:

- Transmission settings are applicable only to Mediant 3000 with TP-6310.
- When applying your settings, traffic disturbances may be experienced.

> To define the transmission type:

- Open the Transmission Settings page (Configuration tab > VolP menu > PSTN > Transmission Settings).
- 2. From the 'Transmission Type' drop-down list, select the required transmission type.

Figure 22-5: Transmission Settings Page (SONET/SDH)

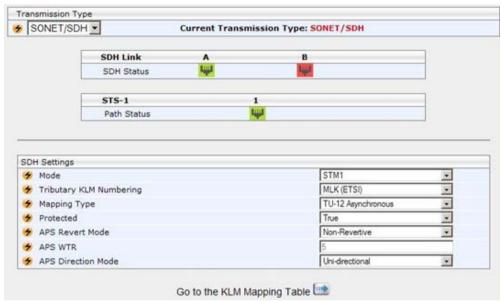

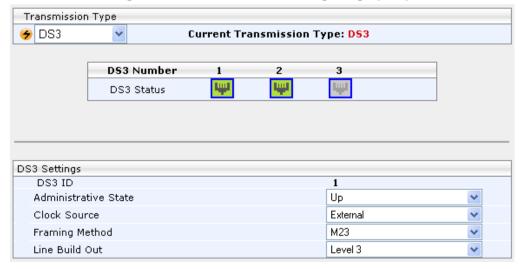

Figure 22-6: Transmission Settings Page (DS3)

3. Click the channel icon (**SDH Link** for SONET/SDH, or **DS3 Number** for DS3), and then define the transmission settings as required.

- Click Submit.
- **5.** Reset the device and save your settings to the flash memory (see "Resetting the Device" on page 547).

For SDH/SONET, to view the KLM Numbering Mapping Table page, click **Go to the KLM Mapping Table** button. For a description on KLM numbering, see "Trunk Numbering (KLM Numbering)" on page 368.

22.4 Configuring CAS State Machines

The CAS State Machine page allows you to modify various timers and other basic parameters to define the initialization of the CAS state machine without changing the state machine itself (no compilation is required). The change doesn't affect the state machine itself, but rather the configuration.

The CAS table used can be chosen in two ways (using the parameter CasChannelIndex):

- Single CAS table per trunk
- Different CAS table per group of B-channels in a trunk
- > To modify the CAS state machine parameters:
- Open the CAS State Machine page (Configuration tab > VolP menu > PSTN > CAS State Machines).

CAS Table Name	Generate Digit On Time	Generate Inter Digit Time	DTMF Max Detection Time	DTMF Min Detection Time	Max Incoming Address Digits	Max Incoming ANI Digits
E_M_FGDWinkTable.dat	-1	-1	-1	-1	-1	-1
E_M_FGDWinkTable.dat	-1	-1	-1	-1	-1	-1
E_M_FGDWinkTable.dat	-1	-1	-1	-1	-1	-1

Figure 22-7: CAS State Machine Page

- 2. Ensure that the trunk is inactive. The trunk number displayed in the 'Related Trunks' field must be green. If it is red, indicating that the trunk is active, click the trunk number to open the Trunk Settings page (see "Configuring Trunk Settings" on page 345), select the required Trunk number icon, and then click Stop Trunk.
- 3. In the CAS State Machine page, modify the required parameters according to the table below.
- 4. Once you have completed the configuration, activate the trunk if required in the Trunk Settings page, by clicking the trunk number in the 'Related Trunks' field, and in the Trunk Settings page, select the required Trunk number icon, and then click Apply Trunk Settings.
- 5. Click **Submit**, and then reset the device (see "Resetting the Device" on page 547).

Notes:

- Don't modify the default values unless you fully understand the implications of the changes and know the default values. Every change affects the configuration of the state machine parameters and the call process related to the trunk you are using with this state machine.
- You can modify CAS state machine parameters only if the following conditions are met:
 - 1) Trunks are inactive (stopped), i.e., the 'Related Trunks' field displays the trunk number in green.
 - 2) State machine is not in use or is in reset, or when it is not related to any trunk. If it is related to a trunk, you must delete the trunk or de-activate (*Stop*) the trunk.
- Field values displaying '-1' indicate CAS default values. In other words, CAS state machine values are used.
- The modification of the CAS state machine occurs at the CAS application initialization only for non-default values (-1).
- For more information on the CAS Protocol table, refer to the CAS Protocol Table Configuration Note.

Table 22-1: CAS State Machine Parameters Description

Table 22-1. CAS State Machine Parameters Description		
Parameter	Description	
Generate Digit On Time [CasStateMachineGenerateDigitOn Time]	Generates digit on-time (in msec). The value must be a positive value. The default is -1 (use value from CAS state machine).	
Generate Inter Digit Time [CasStateMachineGenerateInterDigitTime]	Generates digit off-time (in msec). The value must be a positive value. The default is -1 (use value from CAS state machine).	
DTMF Max Detection Time [CasStateMachineDTMFMaxOnDete ctionTime]	Detects digit maximum on time (according to DSP detection information event) in msec units. The value must be a positive value. The default is -1 (use value from CAS state machine).	
DTMF Min Detection Time [CasStateMachineDTMFMinOnDete ctionTime]	Detects digit minimum on time (according to DSP detection information event) in msec units. The digit time length must be longer than this value to receive a detection. Any number may be used, but the value must be less than CasStateMachineDTMFMaxOnDetectionTime. The value must be a positive value. The default is -1 (use value from CAS state machine).	
MAX Incoming Address Digits [CasStateMachineMaxNumOfIncomingAddressDigits]	Defines the limitation for the maximum address digits that need to be collected. After reaching this number of digits, the collection of address digits is stopped. The value must be an integer. The default is -1 (use value from CAS state machine).	
MAX Incoming ANI Digits [CasStateMachineMaxNumOfIncomingANIDigits]	Defines the limitation for the maximum ANI digits that need to be collected. After reaching this number of digits, the collection of ANI digits is stopped. The value must be an integer. The default is -1 (use value from CAS state machine).	
Collet ANI [CasStateMachineCollectANI]	In some cases, when the state machine handles the ANI collection (not related to MFCR2), you can control the state machine to collect ANI or discard ANI.	

Parameter	Description
	 [0] No = Don't collect ANI. [1] Yes = Collect ANI. [-1] Default = Default value - use value from CAS state machine.
Digit Signaling System [CasStateMachineDigitSignalingSystem]	Defines which Signaling System to use in both directions (detection\generation). • [0] DTMF = Uses DTMF signaling. • [1] MF = Uses MF signaling (default). • [-1] Default = Default value - use value from CAS state machine.

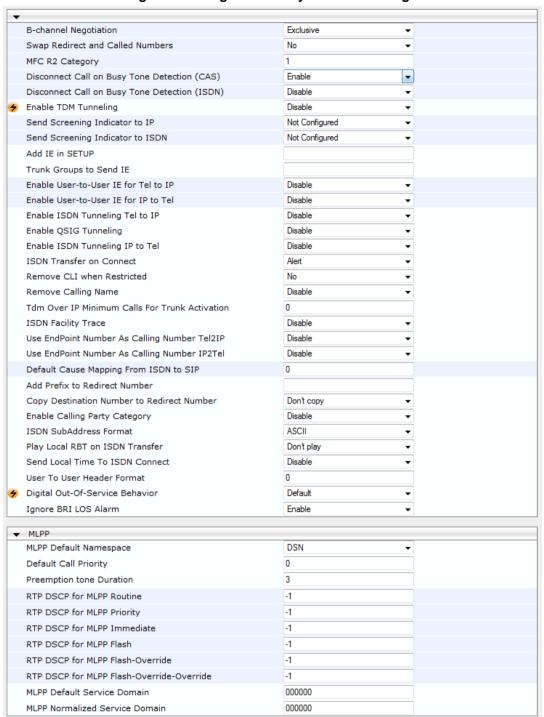

22.5 Configuring Digital Gateway Parameters

The Digital Gateway Parameters page allows you to configure miscellaneous digital parameters. For a description of these parameters, see "Configuration Parameters Reference" on page 691.

- To configure the digital gateway parameters:
- Open the Digital Gateway Parameters page (Configuration tab > VolP menu > GW and IP to IP > Digital Gateway > Digital Gateway Parameters).

Figure 22-8: Digital Gateway Parameters Page

- 2. Configure the parameters as required.
- Click Submit.
- 4. To save the changes to flash memory, see "Saving Configuration" on page 550.

22.6 Tunneling Applications

This section discusses the device's support for VoIP tunneling applications.

22.6.1 TDM Tunneling

The device's TDM Tunneling feature allows you to tunnel groups of digital trunk spans or timeslots (B-channels) over the IP network. TDM Tunneling utilizes the device's internal routing (without Proxy control) capabilities to receive voice and data streams from TDM spans or individual timeslots, convert them into packets, and then transmit them over the IP network (using point-to-point or point-to-multipoint device distributions). A device opposite it (or several devices when point-to-multipoint distribution is used) converts the IP packets back into TDM traffic. Each timeslot can be targeted to any other timeslot within a trunk in the opposite device.

Note: TDM tunneling is applicable to PRI.

When TDM Tunneling is enabled (the parameter EnableTDMoverIP is set to '1') on the originating device, the originating device automatically initiates SIP calls from all enabled B-channels belonging to the spans that are configured with the protocol type 'Transparent' (for ISDN trunks) or 'Raw CAS' (for CAS trunks). The called number of each call is the internal phone number of the B-channel from where the call originates. The Inbound IP Routing table is used to define the destination IP address of the terminating device. The terminating device automatically answers these calls if the protocol type is set to 'Transparent' (ProtocolType = 5) or 'Raw CAS' (ProtocolType = 3 for T1 and 9 for E1) and the parameter ChannelSelectMode is set to 0 (By Dest Phone Number).

Note: It's possible to configure both devices to also operate in symmetric mode. To do so, set EnableTDMOverIP to 1 and configure the Outbound IP Routing table in both devices. In this mode, each device (after it's reset) initiates calls to the second device. The first call for each B-channel is answered by the second device.

The device continuously monitors the established connections. If for some reason, one or more calls are released, the device automatically re-establishes these 'broken' connections. When a failure in a physical trunk or in the IP network occurs, the device re-establishes the tunneling connections when the network is restored.

Note: It's recommended to use the keep-alive mechanism for each connection, by activating the 'session expires' timeout and using Re-INVITE messages.

The device supports the configuration (TDMoIPInitiateInviteTime and TDMoIPInviteRetryTime parameters) of the following timers for the TDM-over-IP tunneling application:

- Time between successive INVITEs sent from the same trunk.
- Time between call release and the new INVITE that is sent on the same channel. The call can be released if the device receives a 4xx or 5xx response.

By utilizing the 'Profiles' mechanism (see "Coders and Profiles" on page 307), you can configure the TDM Tunneling feature to choose different settings based on a timeslot or groups of timeslots. For example, you can use low-bit-rate vocoders to transport voice and 'Transparent' coder to transport data (e.g., for D-channel). You can also use Profiles to assign ToS (for DiffServ) per source - a timeslot carrying data or signaling is assigned a higher priority value than a timeslot carrying voice.

For tunneling CAS trunks, set the protocol type to 'Raw CAS' (ProtocolType = 3 / 9) and enable RFC 2833 CAS relay mode ('CAS Transport Type' parameter is set to 'CAS RFC2833 Relay').

Note: For TDM over IP, the parameter CallerIDTransportType must be set to '0' (disabled), i.e., transparent.

Below is an example of *ini* files for two devices implementing TDM Tunneling for four E1 spans. Note that in this example both devices are dedicated to TDM tunneling.

22.6.1.1 DSP Pattern Detector

For TDM tunneling applications, you can use the DSP pattern detector feature to initiate the echo canceller at call start. The device can be configured to support detection of a specific one-byte idle data pattern transmitted over digital E1/T1 timeslots. The device can be configured to detect up to four different one-byte data patterns. When the defined idle data pattern is detected, the channel resets its echo canceller.

To configure DSP pattern detector:

- 1. In the IPMedia Settings page (Configuration tab > VoIP menu > Media > IPMedia Settings), do the following:
 - a. Set the 'IPMedia Detectors' parameter (EnableDSPIPMDetectors) to **Enable**.
 - b. Set the 'Enable Pattern Detector' parameter (EnablePatternDetector) to **Enable**.
- 2. Configure the number (e.g., 5) of consecutive patterns to trigger the pattern detection event, using the ini file parameter, PDThreshold.
- **3.** Configure the patterns that can be detected by the Pattern Detector, using the ini file parameter, PDPattern. For example:

```
PDPattern = 84, 85, 212, 213; for idle patterns 54, 55, D4 and D5
```

22.6.2 QSIG Tunneling

The device supports QSIG tunneling over SIP, according to IETF Internet-Draft draft-elwell-sipping-qsig-tunnel-03 ("Tunnelling of QSIG over SIP") and ECMA-355/ISO/IEC 22535. This is applicable to all ISDN variants. QSIG tunneling can be applied to all calls or to specific calls using IP Profiles.

Note: TDM tunneling is applicable to PRI.

QSIG tunneling sends all QSIG messages as raw data in corresponding SIP messages using a dedicated message body. This is used, for example, to enable two QSIG subscribers connected to the same or different QSIG PBX to communicate with each other over an IP network. Tunneling is supported in both directions (Tel-to-IP and IP-to-Tel).

The term tunneling means that messages are transferred 'as is' to the remote side without being converted (QSIG > SIP > QSIG). The advantage of tunneling over QSIG-to-SIP interworking is that by using interworking, QSIG functionality can only be partially achieved. When tunneling is used, all QSIG capabilities are supported and the tunneling medium (the SIP network) does not need to process these messages.

QSIG messages are transferred in SIP messages in a separate Multipurpose Internet Mail Extensions (MIME) body. Therefore, if a message contains more than one body (e.g., SDP and QSIG), multipart MIME must be used. The Content-Type of the QSIG tunneled

message is 'application/QSIG'. The device also adds a Content-Disposition header in the following format:

Content-Disposition: signal; handling=required.

QSIG tunneling is done as follows:

- Call setup (originating device): The QSIG Setup request is encapsulated in the SIP INVITE message without being altered. After the SIP INVITE request is sent, the device does not encapsulate the subsequent QSIG message until a SIP 200 OK response is received. If the originating device receives a 4xx, 5xx, or 6xx response, it disconnects the QSIG call with a 'no route to destination' cause.
- Call setup (terminating device): After the terminating device receives a SIP INVITE request with a 'Content-Type: application/QSIG', it sends the encapsulated QSIG Setup message to the Tel side and sends a 200 OK response (no 1xx response is sent) to IP. The 200 OK response includes an encapsulated QSIG Call Proceeding message (without waiting for a Call Proceeding message from the Tel side). If tunneling is disabled and the incoming INVITE includes a QSIG body, a 415 response is sent.
- **Mid-call communication:** After the SIP connection is established, all QSIG messages are encapsulated in SIP INFO messages.
- Call tear-down: The SIP connection is terminated once the QSIG call is complete. The Release Complete message is encapsulated in the SIP BYE message that terminates the session.

> To enable QSIG tunneling:

- In the Digital Gateway Parameters page (Configuration tab > VoIP menu > GW and IP to IP > Digital Gateway > Digital Gateway Parameters), set the 'Enable QSIG Tunneling' parameter (EnableQSIGTunneling) to Enable on the originating and terminating devices.
- Configure the QSIGTunnelingMode parameter for defining the format of encapsulated QSIG message data in the SIP message MIME body (0 for ASCII presentation; 1 for binary encoding).
- 3. Set the ISDNDuplicateQ931BuffMode parameter to 128 to duplicate all messages.
- 4. Set the ISDNInCallsBehavior parameter to 4096.
- 5. Set the ISDNRxOverlap parameter to 0 for tunneling of QSIG overlap-dialed digits (see below for description).

The configuration of the ISDNInCallsBehavior and ISDNRxOverlap parameters allows tunneling of QSIG overlap-dialed digits (Tel to IP). In this configuration, the device **delays** the sending of the QSIG Setup Ack message upon receipt of the QSIG Setup message. Instead, the device sends the Setup Ack message to QSIG only when it receives the SIP INFO message with Setup Ack encapsulated in its MIME body. The PBX sends QSIG Information messages (to complete the Called Party Number) only after it receives the Setup Ack. The device relays these Information messages encapsulated in SIP INFO messages to the remote party.

Version 6.8 361 Mediant 3000

22.7 ISDN Non-Facility Associated Signaling (NFAS)

In regular T1 ISDN trunks, a single 64 kbps channel carries signaling for the other 23 B-channels of that particular T1 trunk. This channel is called the D-channel and usually resides on timeslot # 24. ISDN Non-Facility Associated Signaling (NFAS) enables the use of a single D-channel to control multiple PRI interfaces.

Note: NFAS is applicable only to T1 trunks.

With NFAS it is possible to define a group of T1 trunks, called an *NFAS group*, in which a single D-channel carries ISDN signaling messages for the entire group. The NFAS group's B-channels are used to carry traffic such as voice or data. The NFAS mechanism also enables definition of a backup D-channel on a different T1 trunk, to be used if the primary D-channel fails.

The device supports up to 12 NFAS groups. Each group can comprise up to 16 T1 trunks and each group must contain different T1 trunks. Each T1 trunk is called an "NFAS member". The T1 trunk whose D-channel is used for signaling is called the "Primary NFAS Trunk". The T1 trunk whose D-channel is used for backup signaling is called the "Backup NFAS Trunk". The primary and backup trunks each carry 23 B-channels while all other NFAS trunks each carry 24 B-channels.

The NFAS group is identified by an NFAS GroupID number (possible values are 1 to 12). To assign a number of T1 trunks to the same NFAS group, use the NFASGroupNumber_x = groupID (where x is the physical trunk ID (0 to the maximum number of trunks) or the Web interface (see "Configuring Trunk Settings" on page 345).

The parameter $DchConfig_x = Trunk_type$ defines the type of NFAS trunk. Trunk_type is set to 0 for the primary trunk, to 1 for the backup trunk, and to 2 for an ordinary NFAS trunk. 'x' denotes the physical trunk ID (0 to the maximum number of trunks). You can also use the Web interface (see "Configuring Trunk Settings" on page 345).

For example, to assign the first four T1 trunks to NFAS group #1, in which trunk #0 is the primary trunk and trunk #1 is the backup trunk, use the following configuration:

The NFAS parameters are described in "PSTN Parameters" on page 817.

22.7.1 NFAS Interface ID

Several ISDN switches require an additional configuration parameter per T1 trunk that is called 'Interface Identifier'. In NFAS T1 trunks, the Interface Identifier is sent explicitly in Q.931 Setup / Channel Identification IE for all NFAS trunks, except for the B-channels of the Primary trunk (see note below).

The Interface ID can be defined per member (T1 trunk) of the NFAS group, and must be coordinated with the configuration of the Switch. The default value of the Interface ID is identical to the number of the physical T1 trunk (0 for the first trunk, 1 for the second T1 trunk, and so on, up to the maximum number of trunks).

User's Manual 362 Document #: LTRT-89725

To define an explicit Interface ID for a T1 trunk (that is different from the default), use the following parameters:

- ISDNIBehavior_x = 512 (x = 0 to the maximum number of trunks identifying the device's physical trunk)
- ISDNNFASInterfaceID_x = ID (x = 0 to 255)

Notes:

- Usually the Interface Identifier is included in the Q.931 Setup/Channel
 Identification IE only on T1 trunks that doesn't contain the D-channel. Calls
 initiated on B-channels of the Primary T1 trunk, by default, don't contain the
 Interface Identifier. Setting the parameter ISDNIBehavior_x to 2048' forces the
 inclusion of the Channel Identifier parameter also for the Primary trunk.
- The parameter ISDNNFASInterfaceID_x = ID can define the 'Interface ID' for any Primary T1 trunk, even if the T1 trunk is not a part of an NFAS group. However, to include the Interface Identifier in Q.931 Setup/Channel Identification IE configure ISDNIBehavior_x = 2048 in the *ini* file.

22.7.2 Working with DMS-100 Switches

The DMS-100 switch requires the following NFAS Interface ID definitions:

- InterfaceID #0 for the Primary trunk
- InterfaceID #1 for the Backup trunk
- InterfaceID #2 for a 24 B-channel T1 trunk
- InterfaceID #3 for a 24 B-channel T1 trunk, and so on for subsequent T1 trunks

For example, if four T1 trunks on a device are configured as a single NFAS group with Primary and Backup T1 trunks that is used with a DMS-100 switch, the following parameters should be used:

```
NFASGroupNumber_0 = 1
NFASGroupNumber_1 = 1
NFASGroupNumber_2 = 1
NFASGroupNumber_3 = 1
DchConfig_0 = 0    ;Primary T1 trunk
DchConfig_1 = 1    ;Backup T1 trunk
DchConfig_2 = 2    ;B-Channel NFAS trunk
DchConfig_3 = 2    ;B-channel NFAS trunk
```

If there is no NFAS Backup trunk, the following configuration should be used:

```
ISDNNFASInterfaceID_0 = 0
ISDNNFASInterfaceID_1 = 2
ISDNNFASInterfaceID_2 = 3
ISDNNFASInterfaceID_3 = 4
ISDNIBehavior = 512   ;This parameter should be added because of
;ISDNNFASInterfaceID coniguration above
NFASGroupNumber_0 = 1
NFASGroupNumber_1 = 1
NFASGroupNumber_2 = 1
NFASGroupNumber_3 = 1
DchConfig_0 = 0   ;Primary T1 trunk
DchConfig_1 = 2   ;B-Channel NFAS trunk
DchConfig_3 = 2   ;B-Channel NFAS trunk
```

22.7.3 Creating an NFAS-Related Trunk Configuration

The procedures for creating and deleting an NFAS group must be performed in the correct order, as described below.

> To create an NFAS Group:

- 1. If there's a backup ('secondary') trunk for this group, it must be configured first.
- 2. Configure the primary trunk before configuring any NFAS ('slave') trunk.
- 3. Configure NFAS ('slave') trunks.

To stop / delete an NFAS Group:

- 1. Stop or delete (by setting ProtocolType to 0, i.e., 'None') all NFAS ('slave') trunks.
- 2. Stop or delete (by setting ProtocolType to 0, i.e., 'None') the backup trunk if a backup trunk exists.
- 3. Stop or delete (by setting ProtocolType to 0, i.e., 'None') the primary trunk.

Notes:

- All trunks in the group must be configured with the same values for trunk parameters TerminationSide, ProtocolType, FramingMethod, and LineCode.
- After stopping or deleting the backup trunk, delete the group and then reconfigure
 it.

22.7.4 Performing Manual D-Channel Switchover in NFAS Group

If an NFAS group is configured with two D-channels (Primary and Backup), you can do a manual switchover between these D-channels.

- > To manually switchover from active to standby D-channel:
- 1. Open the NFAS Group & D-Channel Status page (Status & Diagnostics tab > VolP Status menu > NFAS Group & D-Channel Status).
- 2. Select the required NFAS group, and then click the **Switch Activity** button.

Notes:

- The **Switch Activity** button is unavailable (i.e, grayed out) if a switchover cannot be done due to, for example, alarms or unsuitable states.
- This feature is applicable only to T1 ISDN protocols supporting NFAS, and only if the NFAS group is configured with two D-channels.

22.8 ISDN Overlap Dialing

Overlap dialing is a dialing scheme used by several ISDN variants to send and/or receive called number digits one after the other (or several at a time). This is in contrast to en-bloc dialing in which a complete number is sent in one message.

The device supports the following ISDN overlap dialing methods:

- Collects ISDN called party number digits and then sends the SIP INVITE to the IP side with the complete destination number (see "Collecting ISDN Digits and Sending Complete Number in SIP" on page 365)
- Interworks ISDN overlap dialing with SIP, according to RFC 3578 (see "Interworking ISDN Overlap Dialing with SIP According to RFC 3578" on page 366)

22.8.1 Collecting ISDN Digits and Sending Complete Number in SIP

The device can support an overlap dialing mode whereby the device collects the called party number digits from ISDN Q.931 Information messages or DTMF signals, and then sends a SIP INVITE message to the IP side containing the complete destination number.

ISDN overlap dialing for incoming ISDN calls can be configured for the entire device or per ISDN trunk. This is configured using the global, ISDNRxOverlap parameter or the ISDNRxOverlap_x parameter (where *x* denotes the trunk number), respectively.

By default (see the ISDNINCallsBehavior parameter), the device plays a dial tone to the ISDN user side when it receives an empty called number from the ISDN. In this scenario, the device includes the Progress Indicator in the SetupAck ISDN message that it sends to the ISDN side.

The device can also mute in-band DTMF detection until it receives the complete destination number from the ISDN. This is configured using the MuteDTMFInOverlap parameter. The Information digits can be sent in-band in the voice stream, or out-of-band using Q.931 Information messages. If Q.931 Information messages are used, the DTMF in-band detector must be disabled. Note that when at least one digit is received in the ISDN Setup message, the device stops playing a dial tone.

The device stops collecting digits (from the ISDN) upon the following scenarios:

- The device receives a Sending Complete IE in the ISDN Setup or Information messages, indicating no more digits.
- The timeout between received digits expires (configured by the TimeBetweenDigits parameter).
- The maximum number of received digits has been reached (configured by the MaxDigits parameter).
- A match is found with the defined digit map (configured by the DigitMapping parameter).

Relevant parameters (described in "PSTN Parameters" on page 817):

- ISDNRxOverlap_x = 1 (can be configured per trunk)
- TimeBetweenDigits
- MaxDigits
- MuteDTMFInOverlap
- DigitMapping

For configuring ISDN overlap dialing using the Web interface, see "Configuring Trunk Settings" on page 345.

22.8.2 Interworking ISDN Overlap Dialing with SIP According to RFC 3578

The device supports the interworking of ISDN overlap dialing to SIP and vice versa, according to RFC 3578.

- Interworking ISDN overlap dialing to SIP (Tel to IP): The device sends collected digits each time it receives them (initially from the ISDN Setup message and then from subsequent Q.931 Information messages) to the IP side, using subsequent SIP INVITE messages. You can also define the minimum number of overlap digits to collect before sending the first SIP message (INVITE) for routing the call, using the MinOverlapDigitsForRouting parameter.
- Interworking SIP to ISDN overlap dialing (IP to TeI): For each received SIP INVITE pertaining to the same dialog session, the device sends an ISDN Setup message (and subsequent Q.931 Information messages) with the collected digits to the Tel side. For all subsequent INVITEs received, the device sends a SIP 484 "Address Incomplete" response to the IP in order to maintain the current dialog session and to receive additional digits from subsequent INVITEs.

Relevant parameters (described in "PSTN Parameters" on page 817):

- ISDNRxOverlap = 2
- ISDNTxOverlap
- ISDNOutCallsBehavior = 2
- MinOverlapDigitsForRouting
- TimeBetweenDigits
- MaxDigits
- DigitMapping
- MuteDTMFInOverlap

For configuring ISDN overlap dialing using the Web interface, see "Configuring Trunk Settings" on page 345.

22.9 Redirect Number and Calling Name (Display)

The following tables define the device's redirect number and calling name (Display) support for various ISDN variants according to NT (Network Termination) / TE (Termination Equipment) interface direction:

Table 22-2: Calling Name (Display)

NT/TE Interface	DMS-100	NI-2	4/5ESS	Euro ISDN	QSIG
NT-to-TE	Yes	Yes	Yes	Yes	Yes
TE-to-NT	Yes	Yes	Yes	No	Yes

Table 22-3: Redirect Number

NT/TE Interface	DMS-100	NI-2	4/5ESS	Euro ISDN	QSIG
NT-to-TE	Yes	Yes	Yes	Yes	Yes
TE-to-NT	Yes	Yes	Yes	Yes*	Yes

^{*} When using ETSI DivertingLegInformation2 in a Facility IE (not Redirecting Number IE).

22.10 SDH / SONET Configuration

Note: This section is applicable only to PSTN STM-1 / OC-3 ports on the TP-6310 blade.

The device supports STM-1 and OC-3 optical fiber transmission modes. Optical fiber transmission is configured using the PSTNTransmissionType parameter (set to 1) and the fiber mode is defined using the SdhFbrGrp_SdhSonetMode parameter (set to 1 for STM-1, or 2 for OC-3). The device supports Automatic Protection Switch (APS) for these interfaces.

■ STM-1 interface: provides short range Synchronous Digital Hierarchy (SDH) STM-1 interface compliant with ITU-T G.707 and ITU-T G.957. The interface operates at 155.52 Mbps over a single-mode fiber span. The device supports VC-4 payload at the STM-1 signal level. The device supports the asynchronous VC-12 mapping (mapping of E1s into VC12s and multiplexing of 63 VC12 into an STM-1 frame).

Relevant parameters:

- PSTNTransmissionType set to 'Optical SONET or SDH' (1).
- SDHFbrGrp_SDHSONETMode set to 'STM1' (1)
- SDHFbrGrp_Mapping_Type set to 'Asynchronous TU12 and E1' (1)
- OC-3 interface: provides short range SONET OC-3 interface compliant to GR-253-CORE and ANSI T1.105. The interface operates at 155.52 Mbps over a single-mode fiber span. The following mapping types in OC-3 are supported:
 - Asynchronous VT1.5 (DS1 > VT1.5 > STS-1 > OC3) mapping of T1s into VT1.5s and multiplexing of 84 VT1.5 into an OC-3 frame
 - Byte-synchronous VT1.5 (DS1 > VT1.5 > STS-1 > OC3)
 - Asynchronous mapping of DS3 in STS1, DS3 channelized to DS1s (DS1 > DS3 > STS-1 > OC3)

Relevant parameters:

- PSTNTransmissionType set to 'Optical SONET or SDH' (1).
- SDHFbrGrp_SDHSONETMode set to "OC3" (2)
- SDHFbrGrp Mapping Type set to one of the following:
 - 'Asynchronous VT1.5 and DS1' (0) for Asynchronous VT.15 application
 - 'Byte-synchronous TU11 and DS1' (2) for Byte-synchronous VT.15 application
 - 'Asynchronous mapping of DS3 in STS1, DS3 channelized to DS1s' (3) for Asynchronous mapping of DS3 in STS1.
 - Trunks can be DS1s only configured using the parameter ProtocolType

The blade supports Trunk Numbering:

- STM-1: trunk numbers are in the range of 0 to 62 (E1s)
- OC-3: trunk numbers are in the range of 0 to 83 (T1s)

Trunks are numbered according to ETSI EN 300 417-1-1, Annex D recommendation.

22.10.1 Trunk Numbering (KLM Numbering)

Trunks are numbered sequentially while corresponding SDH/SONET instances (timeslots/columns) have three referenced numbers built hierarchically. These complex triple numbering is referred to as KLM numbering. Selection of a KLM numbering scheme is important when interconnecting different equipment, e.g., the device and a multiplexer. If different KLM numbering schemes are selected on either equipment, a mismatch occurs in the trunk sequential numbering.

The device supports the following three KLM numbering schemes (selected using the SDHFbrGrp_KLM_Numbering_Scheme parameter - see "Configuring Transmission Settings" on page 352):

- ETSI scheme according to ETSI EN 300 417-1-1, Annex D
- GR-253 scheme according to GR-253-CORE Issue 3 September 2000
- Timeslots scheme according to ITU-T G.707 clause 7.3.9. (Hardware timeslots)

Once the scheme has been selected, the corresponding table is automatically determined for 63 or 84 tributaries (trunks).

Note: This section is only applicable to Mediant 3000 with the TP-6310 blade(s).

22.10.1.1 E1 Trunk Enumeration (SDH Mappings)

The following table is used for converting internal STM-1 (KLM) numbering to sequential trunk numbering for API references. The three numbers - TUG3 ('K'), TUG2 ('L') and TU ('M') - set the position of the E1 (V-12) trunk inside the STM-1 frame.

Table 22-4: STM-1 Numbering Conversion Table

23 Trunk Group

This section describes the configuration of the device's channels, which includes assigning them to Trunk Groups.

23.1 Configuring Trunk Group Table

The Trunk Group table lets you configure up to 240 Trunk Groups. A Trunk Group is a logical group of physical trunks and channels. A Trunk Group can include multiple trunks and ranges of channels. To enable and activate the channels of the device, Trunk Groups need to be configured and assigned with telephone numbers. Channels that are not configured in this table are disabled.

Once you have configured your Trunk Groups, you need to use them for routing incoming IP calls to the Tel side, which is represented by a specific Trunk Group (ID). For configuring IP-to-Tel routing rules, see "Configuring Inbound IP Routing Table" on page 416. You can also use Trunk Groups for routing Tel calls to the IP side. For configuring Tel-to-IP routing rules, see "Configuring Outbound IP Routing Table" on page 407.

The following procedure describes how to configure Trunk Groups in the Web interface. You can also configure this using the table ini file parameter, TrunkGroup_x.

To configure a Trunk Group:

1. Open the Trunk Group Table page (Configuration tab > VoIP menu > GW and IP to IP > Trunk Group > Trunk Group).

Add Phone Context As Prefix Disable 1-12 Trunk Group Index Group From To Trunk Channels Phone Number Tel Profile ID Index Trunk Trunk Group ID 2 2 1 6000 7000 2 0 2 3 3 1-25 3 3 3 26-30 8000 3 1 4

Figure 23-1: Trunk Group Table Page

- 2. Configure a Trunk Group according to the parameters described in the table below.
- 3. Click Submit, and then save ("burn") your settings to flash memory.

You can also register all your Trunk Groups. The registration method per Trunk Group is configured by the 'Registration Mode' parameter in the Trunk Group Settings page (see "Configuring Trunk Group Settings" on page 377).

- To register the Trunk Groups, click the **Register** button, located below the Trunk Group table.
- To unregister the Trunk Groups, click the **Unregister** button, located below the Trunk Group table.

Table 23-1: Trunk Group Table Parameter Descriptions

Parameter	Description
From Trunk [TrunkGroup_FirstTrunkId]	Defines the starting physical Trunk number in the Trunk Group. The number of listed Trunks depends on the device's hardware configuration.
To Trunk [TrunkGroup_LastTrunkId]	Defines the ending physical Trunk number in the Trunk Group. The number of listed Trunks depends on the device's hardware configuration.
Channels [TrunkGroup_FirstBChannel]	Defines the device's Trunk B-channels. To enable channels, enter the channel numbers.
[TrunkGroup_LastBChannel]	You can enter a range of channels by using the syntax n - m , where n represents the lower channel number and m the higher channel number. For example, "1-4" specifies channels 1 through 4. To represent all the Trunk's B-channels, enter a single asterisk (*).
	Note: The number of defined channels must not exceed the maximum number of the Trunk's B-channels.
Phone Number	Defines the telephone number(s) of the channels.
[TrunkGroup_FirstPhoneNumber]	The valid value can be up to 50 characters.
	For a range of channels, enter only the first telephone number. Subsequent channels are assigned the next consecutive telephone number. For example, if you enter 400 for channels 1 to 4, then channel 1 is assigned phone number 400, channel 2 is assigned phone number 401, and so on.
	These numbers are also used for channel allocation for IP-to- Tel calls if the Trunk Group's 'Channel Select Mode' parameter is set to By Dest Phone Number .
	Notes:
	 If this field includes alphabetical characters and the phone number is defined for a range of channels (e.g., 1-4), then the phone number must end with a number (e.g., 'user1').
	 This field is optional. The logical numbers defined in this field are used when an incoming PSTN/PBX call doesn't contain the calling number or called number (the latter being determined by the ReplaceEmptyDstWithPortNumber parameter). These numbers are used to replace them. This field is ignored if routing of IP-to-Tel calls is done
	according to the Supp Services table, where multiple line extension numbers are configured per port (see Configuring ISDN BRI Supplementary Services). For this routing method, the 'Channel Select Mode' must be set to Select Trunk By Supplementary Services Table in the Trunk Group Settings table (see "Configuring Trunk Group Settings" on page 377).
Trunk Group ID [TrunkGroup_TrunkGroupNum]	Defines the Trunk Group ID for the specified channels. The same Trunk Group ID can be assigned to more than one group of channels. If an IP-to-Tel call is assigned to a Trunk Group, the IP call is routed to the channel(s) pertaining to that Trunk Group ID. The valid value can be 0 to 119.
	The valid value can be 0 to 119.
Tel Profile ID	Assigns a Tel Profile ID to the Trunk Group.

Parameter	Description
[TrunkGroup_ProfileId]	Note: For configuring Tel Profiles, see "Configuring Tel Profiles" on page 312.

23.2 Configuring Trunk Group Settings

The Trunk Group Settings lets you configure various settings per Trunk Group. The main settings include:

- Channel select method, which defines how the device allocates IP-to-Tel calls to the channels of a Trunk Group.
- Registration method for registering Trunk Groups to remote IP servers (Serving IP Group).

For configuring Trunk Groups, see Configuring Trunk Group Table on page 375.

The following procedure describes how to configure settings for Trunk Groups in the Web interface. You can also configure this using the table ini file parameter, TrunkGroupSettings.

- To configure settings for Trunk Group Settings:
- 1. Open the Trunk Group Settings page (Configuration tab > VolP menu > GW and IP to IP > Trunk Group > Trunk Group Settings).

	Trunk Group ID	Channel Select Mode	Registration Mode	Serving IP Group ID	Gateway Name	Contact User	MWI Interrogation Type
1		-	_	-			Not Configured ▼
2		_	_	-			Not Configured ▼
3		▼	_	-			Not Configured ▼
4		▼	_	-			Not Configured ▼
5		▼	-	-			Not Configured ▼
6		_	_	-			Not Configured ▼
7		▼	_	-			Not Configured ▼
8		_	_	-			Not Configured ▼
9			-	-			Not Configured ▼
10			_	▼			Not Configured ▼

- 2. Configure a Trunk Group according to the parameters described in the table below.
- 3. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 23-2: Trunk Group Settings Parameter Descriptions

Parameter	Description
Trunk Group ID [TrunkGroupSettings_TrunkGroupId]	Defines the Trunk Group ID that you want to configure.
Channel Select Mode [TrunkGroupSettings_ChannelS electMode]	Defines the method by which IP-to-Tel calls are assigned to the channels of the Trunk Group. • [0] By Dest Phone Number = The channel is selected according to the called (destination) number. If the number is not located, the call is released. If the channel is unavailable (e.g., busy), the call is put on call waiting (if call waiting is enabled and no other call is on call waiting); otherwise, the call is released.

Parameter	Description
	 [1] Cyclic Ascending = The next available channel in the Trunk Group, in ascending cyclic order is selected. After the device reaches the highest channel number in the Trunk Group, it selects the lowest channel number in the Trunk Group, and then starts ascending again. [2] Ascending = The lowest available channel in the Trunk Group is selected, and if unavailable, the next higher channel is selected.
	• [3] Cyclic Descending = The next available channel in descending cyclic order is selected. The next lower channel number in the Trunk Group is always selected. When the device reaches the lowest channel number in the Trunk Group, it selects the highest channel number in the Trunk Group, and then starts descending again.
	 [4] Descending = The highest available channel in the Trunk Group is selected, and if unavailable, the next lower channel is selected.
	• [5] Dest Number + Cyclic Ascending = The channel is selected according to the called number. If the called number isn't found, the next available channel in ascending cyclic order is selected.
	Note: If the called number is located, but the port associated with the number is busy, the call is released.
	• [6] By Source Phone Number = The channel is selected according to the calling number.
	 [7] Trunk Cyclic Ascending = The channel from the first channel of the next trunk (adjacent to the trunk from which the previous channel was selected) is selected.
	• [8] Trunk & Channel Cyclic Ascending = The device implements the Trunk Cyclic Ascending and Cyclic Ascending methods to select the channel. This method selects the next physical trunk in the Trunk Group, and then selects the B-channel of this trunk according to the Cyclic Ascending method (i.e., selects the channel after the last allocated channel). For example, if the Trunk Group includes two physical trunks, 0 and 1:
	 ✓ For the first incoming call, the first channel of Trunk 0 is selected.
	 For the second incoming call, the first channel of Trunk 1 is selected. For the third incoming call, the second channel of Trunk 0 is selected.
	 [11] Dest Number + Ascending = The device allocates a channels to incoming IP-to-Tel calls as follows:
	 a. The device attempts to route the call to the channel that is associated with the destination (called) number. If located, the call is sent to that channel. b. If the number is not located or the channel is unavailable (e.g., busy), the device searches in ascending order for the next available channel in the Trunk Group. If located, the call is sent to that channel. c. If all the channels are unavailable, the call is released.
	Note: If this parameter is not configured, the Trunk Group's channel select method is according to the global parameter,

Parameter	Description
	ChannelSelectMode.
Registration Mode	Defines the registration method for the Trunk Group:
[TrunkGroupSettings_Registrati onMode]	 [1] Per Gateway = (Default) Single registration for the entire device. This is applicable only if a default Proxy or Registrar IP is configured and Registration is enabled (i.e., parameter IsRegisterUsed is set to 1). In this mode, the SIP URI user part in the From, To, and Contact headers is set to the value of the global registration parameter, GWRegistrationName or username if GWRegistrationName is not configured. [0] Per Endpoint = Each channel in the Trunk Group registers individually. The registrations are sent to the 'Serving IP Group ID' if defined in the table, otherwise, it is sent to the default Proxy, and if no default Proxy, then to the Registrar IP. [4] Don't Register = No registrations are sent by endpoints pertaining to the Trunk Group. For example, if the device is configured globally to register all its endpoints (using the parameter ChannelSelectMode), you can exclude some endpoints from being registered by assigning them to a Trunk Group and configuring the Trunk Group registration
	mode to 'Don't Register'. • [5] Per Account = Registrations are sent (or not) to an IP Group, according to the settings in the Account table (see "Configuring Registration Accounts" on page 291).
	An example is shown below of a REGISTER message for registering endpoint "101" using the registration Per Endpoint mode:
	REGISTER sip:SipGroupName SIP/2.0 Via: SIP/2.0/UDP 10.33.37.78;branch=z9hG4bKac862428454 From: <sip:101@gatewayname>;tag=1c862422082 To: <sip:101@gatewayname> Call-ID: 9907977062512000232825@10.33.37.78 CSeq: 3 REGISTER Contact: <sip:101@10.33.37.78>;expires=3600 Expires: 3600 User-Agent: Sip-Gateway/v.6.80A.011.002 Content-Length: 0</sip:101@10.33.37.78></sip:101@gatewayname></sip:101@gatewayname>
	The "SipGroupName" in the Request-URI is configured in the IP Group table (see "Configuring IP Groups" on page 273).
	Notes:
	 If this parameter is not configured, the registration is performed according to the global registration parameter, ChannelSelectMode.
	 To enable Trunk Group registration, set the global parameter, IsRegisterNeeded to 1. This is unnecessary for 'Per Account' registration mode.
	 If the device is configured globally to register Per Endpoint and an channel group includes four channels to register Per Gateway, the device registers all channels except the first four channels. The group of these four channels sends a single registration request.
Serving IP Group ID	Assigns an IP Group to where INVITE messages received from

Parameter	Description
[TrunkGroupSettings_ServingIP Group]	this Trunk Group are sent. The actual destination to where these INVITE messages are sent is according to the Proxy Set ID associated with the IP Group. The Request-URI host name in the INVITE and REGISTER messages (except for 'Per Account' registration modes) is set to the value of the 'SIP Group Name' parameter configured in the IP Group table (see "Configuring IP Groups" on page 273). Notes: If this parameter is not configured, the INVITE messages are
	sent to the default Proxy or according to the Outbound IP Routing table (see "Configuring Outbound IP Routing Table" on page 407). If the PreferRouteTable parameter is set to 1 (see "Configuring Proxy and Registration Parameters" on page 295), the routing rules in the Outbound IP Routing table take precedence over the selected Serving IP Group ID.
Gateway Name [TrunkGroupSettings_GatewayName]	Defines the host name for the SIP From header in INVITE messages and for the From/To headers in REGISTER requests. Note: If this parameter is not configured, the global parameter, SIPGatewayName is used.
Contact User [TrunkGroupSettings_ContactUs er]	Defines the user part for the SIP Contact URI in INVITE messages and for the From, To, and Contact headers in REGISTER requests. Notes: This parameter is applicable only if the 'Registration Mode' parameter is set to 'Per Account' and registration through the Account table is successful. If registration fails, the user part in the INVITE Contact header is set to the source party number. The 'Contact User' parameter in the Account table overrides this parameter (see "Configuring Registration Accounts" on
Trunk Group Name [TrunkGroupSettings_TrunkGroupName]	page 291). Defines a name for the Trunk Group. This name represents the Trunk Group in the SIP 'tgrp' parameter of the outgoing INVITE messages (according to RFC 4904). For example: sip:+16305550100;tgrp=TG-1;trunk-context=+1-630@isp.example.net;user=phone The valid value can be a string of up to 20 characters. By default, no name is configured. Notes: If this parameter is not configured, the Trunk Group decimal number is used in the SIP 'tgrp' parameter. This feature is enabled by any of the following parameters: UseSIPtgrp UseBroadsoftDTG Currently, this parameter can only be configured using the ini file.
MWI Interrogation Type [TrunkGroupSettings_MWIInterrog ationType]	Defines MWI QSIG-to-IP interworking for interrogating MWI supplementary services: [255] Not Configured [0] None = Disables the feature.

Parameter	Description
	• [1] Use Activate Only = MWI Interrogation messages are not sent and only "passively" responds to MWI Activate requests from the PBX.
	 [2] Result Not Used = MWI Interrogation messages are sent, but the result is not used. Instead, the device waits for MWI Activate requests from the PBX.
	 [3] Use Result = MWI Interrogation messages are sent, its results are used, and the MWI Activate requests are used. MWI Activate requests are interworked to SIP NOTIFY MWI messages. The SIP NOTIFY messages are sent to the IP Group defined by the NotificationIPGroupID parameter.
	Note: This parameter appears in the table only if the VoiceMailInterface parameter is set to 3 (QSIG). Configuring Voice Mail on page 460.

This page is intentionally left blank.

24 Manipulation

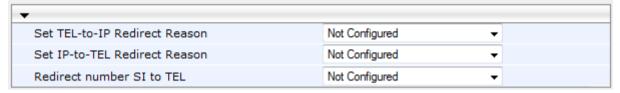

This section describes the configuration of various manipulation processes.

24.1 Configuring General Settings

The General Settings page allows you to configure general manipulation parameters. For a description of the parameters appearing on this page, see "Configuration Parameters Reference" on page 691.

- To configure the general manipulation parameters:
- Open the General Settings page (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > General Settings).

Figure 24-1: General Settings Page

- 2. Configure the parameters as required.
- 3. Click Submit.

24.2 Configuring Source/Destination Number Manipulation Rules

The number manipulation table lets you configure rules for manipulating source and destination telephone numbers for IP-to-Tel and Tel-to-IP calls. The number manipulation tables include the following:

Tel-to-IP calls:

- Source Phone Number Manipulation Table for Tel > IP Calls (up to 120 entries)
- Destination Phone Number Manipulation Table for Tel > IP Calls (up to 120 entries)

IP-to-Tel calls:

- Source Phone Number Manipulation Table for IP > Tel Calls (up to 120 entries)
- Destination Phone Number Manipulation Table for IP > Tel Calls (up to 120 entries)

The number manipulation tables provide two configuration areas:

- Matching characteristics (Rule) of incoming call, for example, prefix of destination number.
- Manipulation operation (Action), for example, remove user-defined number of digits from the left of the number.

If the incoming call matches the characteristics of a rule, its manipulation action is applied. The device searches a matching manipulation rule starting from the first entry (i.e., top of the table). In other words, a rule at the top of the table takes precedence over a rule defined lower down in the table. Thus, define more specific rules above more generic rules. For example, if you enter 551 in Index 1 and 55 in Index 2, the device applies rule 1 to numbers that start with 551 and applies rule 2 to numbers that start with 550, 552, 553, and so on until 559. However, if you enter 55 in Index 1 and 551 in Index 2, the device applies rule 1 to all numbers that start with 55, including numbers that start with 551.

You can perform a second "round" (additional) of source and destination number manipulations for IP-to-Tel calls, on an already manipulated number. The initial and additional number manipulation rules are both configured in the number manipulation tables for Ip-to-Tel calls. The additional manipulation is performed on the initially manipulated number. Thus, for complex number manipulation schemes, you only need to configure relatively few manipulation rules in these tables (that would otherwise require many rules). To enable this additional manipulation, use the following parameters:

- Source number manipulation PerformAdditionalIP2TELSourceManipulation
- Destination number manipulation PerformAdditionalIP2TELDestinationManipulation

Telephone number manipulation can be useful, for example, for the following:

- Stripping or adding dialing plan digits from or to the number, respectively. For example, a user may need to first dial 9 before dialing the phone number to indicate an external line. This number 9 can then be removed by number manipulation before the call is setup.
- Allowing or blocking Caller ID information according to destination or source prefixes.
- Assigning Numbering Plan Indicator (NPI) and Type of Numbering (TON) to IP-to-Tel calls. The device can use a single global setting for NPI/TON classification or it can use the setting in the manipulation tables on a call-by-call basis.

Number manipulation can occur before or after a routing decision is made. For example, you can route a call to a specific Trunk Group according to its original number, and then you can remove or add a prefix to that number before it is routed. To determine when number manipulation is performed, use the 'IP to Tel Routing Mode' parameter (RouteModeIP2Tel) described in "Configuring Inbound IP Routing Table" on page 416, and 'Tel to IP Routing Mode' parameter (RouteModeTel2IP) described in "Configuring Outbound IP Routing Table" on page 407.

The device manipulates the number in the following order: 1) strips digits from the left of the number, 2) strips digits from the right of the number, 3) retains the defined number of digits, 4) adds the defined prefix, and then 5) adds the defined suffix.

The following procedure describes how to configure number manipulation rules in the Web interface. You can also configure this using the following management tools:

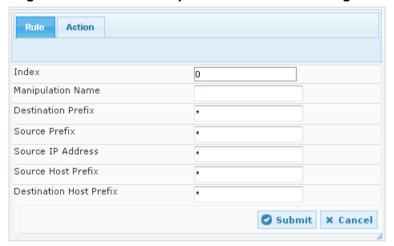

- Destination Phone Number Manipulation Table for IP > Tel Calls table: ini file table parameter, NumberMapIP2Tel
- Destination Phone Number Manipulation Table for Tel > IP Calls table: ini file table parameter, NumberMapTel2IP
- Source Phone Number Manipulation Table for IP > Tel Calls table: ini file table parameter, SourceNumberMapIP2Tel
- Source Phone Number Manipulation Table for Tel > IP Calls table: ini file table parameter, SourceNumberMapTel2IP

To configure a number manipulation rule:

Open the required Number Manipulation page (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > Dest Number IP->Tel, Dest Number Tel->IP, Source Number IP->Tel, or Source Number Tel->IP); the relevant Manipulation table page is displayed.

2. Click **Add**; the following dialog box appears:

Figure 24-2: Number Manipulation Table - Add Dialog Box

- Configure a number manipulation rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

The table below shows configuration examples of Tel-to-IP source phone number manipulation rules, where:

- **Rule 1:** When the destination number has the prefix 03 (e.g., 035000), source number prefix 201 (e.g., 20155), and from source IP Group ID 2, the source number is changed to, for example, 97120155.
- **Rule 2:** When the source number has prefix 1001 (e.g., 1001876), it is changed to 587623.
- **Rule 3:** When the source number has prefix 123451001 (e.g., 1234510012001), it is changed to 20018.
- **Rule 4:** When the source number has prefix from 30 to 40 and a digit (e.g., 3122), it is changed to 2312.
- Rule 5: When the destination number has the prefix 6, 7, or 8 (e.g., 85262146), source number prefix 2001, it is changed to 3146.

Parameter	Rule 1	Rule 2	Rule 3	Rule 4	Rule 5
Source IP Group	2	0	-	-	-
Destination Prefix	03		*	*	[6,7,8]
Source Prefix	201	1001	123451001#	[30-40]x	2001
Stripped Digits from Left	-	4	-	-	5
Stripped Digits from Right	-	-	-	1	-

Parameter	Rule 1	Rule 2	Rule 3	Rule 4	Rule 5
Prefix to Add	971	5	-	2	3
Suffix to Add	-	23	8	-	-
Number of Digits to Leave	-	-	4	-	-
Presentation	Allowed	Restricted	-	-	-

Table 24-1: Number Manipulation Tables Parameter Descriptions

Parameter	Description
Index [_Index]	Defines an index number for the new table record.
Manipulation Name [_ManipulationName]	Defines an arbitrary name to easily identify the manipulation rule. The valid value is a string of up to 20 characters. By default, no value is defined.
Matching Characteristics (Rule)
Web: Destination Prefix EMS: Prefix [_DestinationPrefix]	Defines the destination (called) telephone number prefix and/or suffix. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. You can also use the \$ sign to denote calls without a called number. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689.
Web/EMS: Source Prefix [_SourcePrefix]	Defines the source (calling) telephone number prefix and/or suffix. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. You can also use the \$ sign to denote calls without a calling number. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689.
Web/EMS: Source IP Address [_SourceAddress]	 Defines the source IP address of the caller. This is obtained from the Contact header in the INVITE message. Notes: This parameter is applicable only to the number manipulation tables for IP-to-Tel calls. The source IP address can include the 'x' wildcard to represent single digits. For example: 10.8.8.xx represents all IP addresses between 10.8.8.10 to 10.8.8.99. The source IP address can include the asterisk (*) wildcard to represent any number between 0 and 255. For example, 10.8.8.* represents all IP addresses between 10.8.8.0 and 10.8.8.255.
Web: Source Host Prefix [_SrcHost]	Defines the URI host name prefix of the incoming SIP INVITE message in the From header. Notes: This parameter is applicable only to the number manipulation tables for IP-to-Tel calls. The asterisk (*) wildcard can be used to denote any prefix. If the P-Asserted-Identity header is present in the incoming INVITE message, then the value of this parameter is compared to the P-

Parameter	Description
	Asserted-Identity URI host name (instead of the From header).
Web: Destination Host Prefix [_DestHost]	Defines the Request-URI host name prefix of the incoming SIP INVITE message. Notes: This parameter is applicable only to the number manipulation tables for IP-to-Tel calls. The asterisk (*) wildcard can be used to denote any prefix.
Web: Source Trunk Group [_SrcTrunkGroupID]	Defines the source Trunk Group ID for Tel-to-IP calls. To denote all Trunk Groups, leave this field empty. Notes: The value -1 indicates that this field is ignored in the rule. This parameter is applicable only to the number manipulation tables for Tel-to-IP calls. For IP-to-IP call routing, this parameter is not required (i.e., leave the field empty).
Web: Source IP Group [_SrcIPGroupID]	Defines the IP Group from where the IP call originated. Typically, the IP Group of an incoming INVITE is determined or classified using the Inbound IP Routing table. If not used (i.e., any IP Group), leave the field empty. Notes: The value -1 indicates that this field is ignored. This parameter is applicable only to the number manipulation tables for Tel-to-IP calls. If this Source IP Group has a Serving IP Group, then all calls from this Source IP Group are sent to the Serving IP Group. In this scenario, this table is used only if the PreferRouteTable parameter is set to 1.
Web: Destination IP Group [_DestIPGroupID]	Defines the IP Group to where the call is sent. Notes: The value -1 indicates that this field is ignored. This parameter is applicable only to the Destination Phone Number Manipulation Table for Tel -> IP Calls.
Operation (Action)	
Web: Stripped Digits From Left EMS: Number Of Stripped Digits [_RemoveFromLeft]	Defines the number of digits to remove from the left of the telephone number prefix. For example, if you enter 3 and the phone number is 5551234, the new phone number is 1234.
Web: Stripped Digits From Right EMS: Number Of Stripped Digits [RemoveFromRight]	Defines the number of digits to remove from the right of the telephone number prefix. For example, if you enter 3 and the phone number is 5551234, the new phone number is 5551.
Web: Prefix to Add EMS: Prefix/Suffix To Add [Prefix2Add]	Defines the number or string that you want added to the front of the telephone number. For example, if you enter 9 and the phone number is 1234, the new number is 91234.
Web: Suffix to Add EMS: Prefix/Suffix To Add	Defines the number or string that you want added to the end of the telephone number. For example, if you enter 00 and the phone number

Parameter	Description
[Suffix2Add]	is 1234, the new number is 123400.
Web/EMS: Number of Digits to Leave [LeaveFromRight]	Defines the number of digits that you want to keep from the right of the phone number. For example, if you enter 4 and the phone number is 00165751234, then the new number is 1234.
Web: NPI EMS: Number Plan [NumberPlan]	 Defines the Numbering Plan Indicator (NPI). [0] Unknown (default) [9] Private [1] E.164 Public [-1] Not Configured = value received from PSTN/IP is used Notes: This parameter is applicable only to number manipulation tables for IP-to-Tel calls. NPI can be used in the SIP Remote-Party-ID header by using the EnableRPIHeader and AddTON2RPI parameters. For more information on available NPI/TON values, see Numbering Plans and Type of Number on page 404.
Web: TON EMS: Number Type [NumberType]	 Defines the Type of Number (TON). If you selected 'Unknown' for the NPI, you can select Unknown [0]. If you selected 'Private' for the NPI, you can select Unknown [0], Level 2 Regional [1], Level 1 Regional [2], PISN Specific [3] or Level 0 Regional (Local) [4]. If you selected 'E.164 Public' for the NPI, you can select Unknown [0], International [1], National [2], Network Specific [3], Subscriber [4] or Abbreviated [6]. The default is 'Unknown'. Notes: This parameter is applicable only to number manipulation tables for IP-to-Tel calls. TON can be used in the SIP Remote-Party-ID header by using the EnableRPIHeader and AddTON2RPI parameters. For more information on available NPI/TON values, see Numbering Plans and Type of Number on page 404.
Web: Presentation EMS: Is Presentation Restricted [IsPresentationRestricted]	 Enables caller ID. [0] Allowed = Sends Caller ID information when a call is made using these destination/source prefixes. [1] Restricted = Restricts Caller ID information for these prefixes. Notes: This field is applicable only to number manipulation tables for source phone number manipulation. If this field is set to Restricted and the 'Asserted Identity Mode' (AssertedIdMode) parameter is set to Add P-Asserted-Identity, the From header in the INVITE message includes the following: From: 'anonymous' <sip: anonymous@anonymous.invalid=""> and 'privacy: id' header.</sip:>

24.3 Manipulating Number Prefix

The device supports a notation for adding a prefix where part of the prefix is first extracted from a user-defined location in the original destination or source number. This notation is entered in the 'Prefix to Add' field in the Number Manipulation tables (see "Configuring Source/Destination Number Manipulation" on page 383): x[n,l]y... where,

- x = any number of characters/digits to add at the beginning of the number (i.e. first digits in the prefix).
- [n,l] = defines the location in the original destination or source number where the digits y are added:
 - n = location (number of digits counted from the left of the number) of a specific string in the original destination or source number.
 - I = number of digits that this string includes.
- y = prefix to add at the specified location.

For example, assume that you want to manipulate an incoming IP call with destination number +5492028888888 (area code 202 and phone number 8888888) to the number 0202158888888. To perform such a manipulation, the following configuration is required in the Number Manipulation table:

 The following notation is used in the 'Prefix to Add' field: 0[5,3]15

where,

- 0 is the number to add at the beginning of the original destination number.
- [5,3] denotes a string that is located after (and including) the fifth character (i.e., the first '2' in the example) of the original destination number, and its length being three digits (i.e., the area code 202, in the example).
- 15 is the number to add immediately after the string denoted by [5,3] in other words, 15 is added after (i.e. to the right of) the digits 202.
- 2. The first seven digits from the left are removed from the original number, by entering "7" in the 'Stripped Digits From Left' field.

Table 24-2: Example of Configured Rule for Manipulating Prefix using Special Notation

Parameter	Rule 1
Destination Prefix	+5492028888888
Source Prefix	*
Source IP Address	*
Stripped Digits from Left	7
Prefix to Add	0[5,3]15

In this configuration example, the following manipulation process occurs:

- 1. The prefix is calculated as 020215.
- 2. The first seven digits from the left are removed from the original number, thereby changing the number to 8888888.
- 3. The prefix that was previously calculated is then added.

24.4 SIP Calling Name Manipulations

The calling name manipulation tables lets you configure up to 120 manipulation rules for manipulating the calling name (i.e., caller ID) in SIP messages, for IP-to-Tel and Tel-to-IP calls. Manipulation includes modifying or removing the calling name. The calling name manipulation tables include the following:

- Calling Name Manipulation Table for IP-to-Tel Calls table
- Calling Name Manipulation Table for Tel-to-IP Calls table

For example, assume that an incoming SIP INVITE message includes the following header:

```
P-Asserted-Identity: "company:john" sip:6666@78.97.79.104
```

Using the Calling Name Manipulation Table for IP-to-Tel table, the text "company" can be changed to "worker" in the outgoing INVITE, as shown below:

```
P-Asserted-Identity: "worker:john" sip:996666@10.13.83.10
```

The calling name manipulation tables provide two configuration areas:

- Matching characteristics (Rule) of incoming call, for example, prefix of destination number.
- Manipulation operation (Action), for example, remove user-defined number of digits from the left of the calling name.

If the incoming call matches the characteristics of a rule, its manipulation action is applied.

Note: For using the Calling Name Manipulation Table for Tel-to-IP Calls table for retrieving the calling name (display name) from an Active Directory using LDAP queries, see Querying the AD for Calling Name on page 239.

The following procedure describes how to configure calling name manipulation rules in the Web interface. You can also configure these rules using the the following management tools:

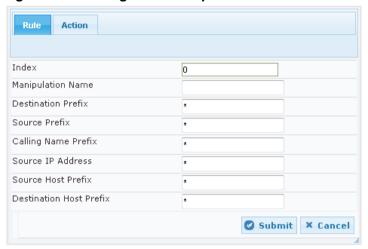

- Calling Name Manipulation Table for Tel-to-IP Calls table: table ini file parameter, CallingNameMapTel2Ip
- Calling Name Manipulation Table for IP-to-Tel Calls table: table ini file parameter, CallingNameMaplp2Tel

> To configure calling name manipulation rules:

Open the required calling name manipulations page (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > Calling Name IP->Tel or Calling Name Tel->IP).

2. Click Add; the following dialog box appears:

Figure 24-3: Calling Name Manipulation IP2Tel - Rule Tab

- 3. Configure a manipulation rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 24-3: Calling Name Manipulation Tables Parameter Descriptions

Parameter	Description
Index [_Index]	Defines an index number for the new table record.
Manipulation Name [_ManipulationName]	Defines an arbitrary name to easily identify the manipulation rule. The valid value is a string of up to 20 characters.
Matching Characteristics (Rule)
Web: Destination Prefix [_DestinationPrefix]	Defines the destination (called) telephone number prefix and/or suffix. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. You can also use the \$ sign to denote calls without a called number. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689. The default value is the asterisk (*) symbol (i.e., any destination prefix).
Web/EMS: Source Prefix [_SourcePrefix]	Defines the source (calling) telephone number prefix and/or suffix. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. You can also use the \$ sign to denote calls without a calling number. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689. The default value is the asterisk (*) symbol (i.e., any source prefix).
Web: Calling Name Prefix	Defines the caller name (i.e., caller ID) prefix.

Parameter	Description
[_CallingNamePrefix]	You can use special notations for denoting the prefix. For example, to denote calls without a calling name, use the \$ sign. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689.
	The default value is the asterisk (*) symbol (i.e., any calling name prefix).
Web: Source Trunk Group ID [_SrcTrunkGroupID]	Defines the source Trunk Group ID from where the Tel-to-IP call was received.
	The default value is -1, which denotes any Trunk Group.
	Note: This parameter is applicable only to the Calling Name Manipulation Table for Tel-to-IP Calls table.
Web: Source IP Group ID [_SrcIPGroupID]	Defines the IP Group from where the IP call was received.
	The default value is -1, which denotes any IP Group. Notes:
	This parameter is applicable only to the IP-to-IP application.
	 This parameter is applicable only to the Calling Name Manipulation Table for Tel-to-IP Calls table.
Web/EMS: Source IP Address [_SourceAddress]	Defines the source IP address of the caller, for IP-to-Tel calls. The source IP address appears in the SIP Contact header in the INVITE message.
	The default value is the asterisk (*) symbol (i.e., any IP address). The source IP address can include the following wildcards:
	 "x" wildcard: represents single digits. For example, 10.8.8.xx represents all IP addresses between 10.8.8.10 to 10.8.8.99.
	 "*" (asterisk) wildcard: represents any number between 0 and 255. For example, 10.8.8.* represents all IP addresses between 10.8.8.0 and 10.8.8.255.
	Note: This parameter is applicable only to the Calling Name Manipulation Table for IP-to-Tel Calls table.
Web: Source Host Prefix [_SrcHost]	Defines the URI host name prefix of the incoming SIP INVITE message in the From header.
	The default value is the asterisk (*) symbol (i.e., any source host prefix). Notes:
	This parameter is applicable only to the Calling Name Manipulation Table for IP-to-Tel Calls table.
	 If the P-Asserted-Identity header is present in the incoming INVITE message, then the value of this parameter is compared to the P- Asserted-Identity URI host name (instead of the From header).
Web: Destination Host Prefix [_DestHost]	Defines the Request-URI host name prefix of the incoming SIP INVITE message.
	The default value is the asterisk (*) symbol (i.e., any destination host prefix).
	Note: This parameter is applicable only to the Calling Name Manipulation Table for IP-to-Tel Calls table.
Operation (Action)	
Web: Stripped Digits From Left EMS: Number Of Stripped Digits	Defines the number of characters to remove from the left of the calling name. For example, if you enter 3 and the calling name is "company:john", the new calling name is "pany:john".

Parameter	Description
[_RemoveFromLeft]	
Web: Stripped Digits From Right EMS: Number Of Stripped Digits [_RemoveFromRight]	Defines the number of characters to remove from the right of the calling name. For example, if you enter 3 and the calling name is "company:name", the new name is "company:n".
Web/EMS: Number of Digits to Leave [LeaveFromRight]	Defines the number of characters that you want to keep from the right of the calling name. For example, if you enter 4 and the calling name is "company:name", the new name is "name".
Web: Prefix to Add EMS: Prefix/Suffix To Add [_Prefix2Add]	Defines the number or string to add at the front of the calling name. For example, if you enter ITSP and the calling name is "company:name", the new name is ITSPcompany:john".
Web: Suffix to Add EMS: Prefix/Suffix To Add [_Suffix2Add]	Defines the number or string to add at the end of the calling name. For example, if you enter 00 and calling name is "company:name", the new name is "company:name00".

24.5 Configuring Redirect Number IP to Tel

The redirect number manipulation tables let you configure rules for manipulating the redirect number received in SIP messages. The redirect number manipulation tables include:

- Redirect Number IP-to-Tel table: This table defines IP-to-Tel redirect number manipulation. You can manipulate the value of the received SIP Diversion, Resource-Priority, or History-Info headers, which is then added to the Redirecting Number Information Element (IE) in the ISDN Setup message sent to the Tel side. This also includes the reason for the call redirection. This is configured in the Redirect Number IP > Tel table.
- Redirect Number Tel to IP table: This table defines Tel-to-IP redirect number manipulation. You can manipulate the prefix of the redirect number, received from the Tel side, in the outgoing SIP Diversion, Resource-Priority, or History-Info headers sent to the IP side. This is configured in the Redirect Number Tel > IP table.

The redirect number manipulation tables provide two configuration areas:

- Matching characteristics (Rule) of incoming call, for example, prefix of redirect number.
- Manipulation operation (Action), for example, remove user-defined number of digits from the left of the redirect number.

If the incoming call matches the characteristics of a rule, its manipulation action is applied.

Notes:

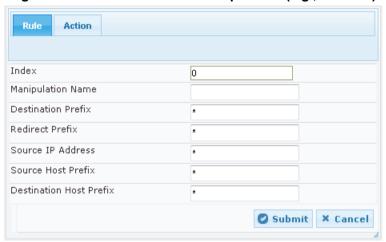

- If the device copies the received destination number to the outgoing SIP redirect number (enabled by the CopyDest2RedirectNumber parameter), no redirect number Tel-to-IP manipulation is done.
- The manipulation rules are done in the following order: Stripped Digits From Left, Stripped Digits From Right, Number of Digits to Leave, Prefix to Add, and then Suffix to Add.
- The device uses the 'Redirect Prefix' parameter before it manipulates the prefixi.

The following procedure describes how to configure redirect number manipulation rules in the Web interface. You can also configure these rules using the following management tools:

- Redirect Number IP to Tel table: ini file parameter, RedirectNumberMaplp2Tel
- Redirect Number Tel to IP table: ini file parameter, RedirectNumberMapTel2Ip
- To configure a redirect number manipulation rule:
- Open the redirect number manipulation table (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > Redirect Number Tel > IP or Redirect Number IP > Tel).
- 2. Click **Add**; the following dialog box appears (e.g., Redirect Number Tel-to-IP table):

Figure 24-4: Redirect Number Manipulation (e.g., Tel to IP)

- Configure a manipulation rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 24-4: Redirect Number Manipulation Tables Parameter Description

Parameter	Description	
Index [_Index]	Defines an index number for the new table record.	
Manipulation Name [_ManipulationName]	Defines an arbitrary name to easily identify the manipulation rule. The valid value is a string of up to 20 characters.	
Matching Characteristics - Rule		
Web/EMS: Destination Prefix [_DestinationPrefix]	Defines the destination (called) telephone number prefix. The default value is the asterisk (*) symbol (i.e., any number). For manipulating the diverting and redirected numbers for call diversion, you can use the strings "DN" and "RN" to denote the destination prefix of these numbers. For more information, see Manipulating Redirected and Diverted Numbers for Call Diversion on page 396.	
Web/EMS: Redirect Prefix [_RedirectPrefix]	Defines the redirect telephone number prefix. The default value is the asterisk (*) symbol (i.e., any number prefix).	
Web: Source Trunk Group ID [_SrcTrunkGroupID]	Defines the Trunk Group from where the Tel call is received. To denote any Trunk Group, leave this field empty. The value -1 indicates that this field is ignored in the rule.	

User's Manual 394 Document #: LTRT-89725

Parameter	Description
	Notes:
	 This parameter is applicable only to the Redirect Number Tel > IP table.
	This parameter is not applicable to IP-to-IP call routing.
Source IP Group ID [_SrcIPGroupID]	Defines the IP Group from where the IP call originated. Typically, the IP Group of an incoming INVITE is determined or classified by the Inbound IP Routing table.
	If not used (i.e., any IP Group), leave the field empty. The value -1 indicates that it is ignored in the rule. Notes:
	 This parameter is applicable only to the Redirect Number Tel > IP table.
	This parameter is applicable only to the IP-to-IP application.
Web/EMS: Source IP Address [_SourceAddress]	Defines the IP address of the caller. The IP address appears in the SIP Contact header of the incoming INVITE message.
	The default value is the asterisk (*) symbol (i.e., any IP address). The value can include the following wildcards:
	 "x": represents single digits, for example, 10.8.8.xx denotes all addresses between 10.8.8.10 and 10.8.8.99.
	 "*": represents any number between 0 and 255, for example, 10.8.8.* denotes all addresses between 10.8.8.0 and 10.8.8.255.
	Note: This parameter is applicable only to the Redirect Number IP-to-Tel table.
Web: Source Host Prefix [_SrcHost]	Defines the URI host name prefix of the caller. The host name appears in the SIP From header of the incoming SIP INVITE message.
	The default value is the asterisk (*) symbol (i.e., any host name prefix).
	Notes:
	 This parameter is applicable only to the Redirect Number IP-to-Tel table.
	 If the P-Asserted-Identity header is present in the incoming INVITE message, then the value of this parameter is compared to the P- Asserted-Identity URI host name (instead of to the From header).
Web: Destination Host Prefix [_DestHost]	Defines the Request-URI host name prefix, which appears in the incoming SIP INVITE message.
	The default value is the asterisk (*) symbol (i.e., any prefix).
	Note: This parameter is applicable only to the Redirect Number IP-to-Tel table.
Operation (Action)	
Web: Stripped Digits From Left EMS: Remove From Left [_RemoveFromLeft]	Defines the number of digits to remove from the left of the redirect number prefix. For example, if you enter 3 and the redirect number is 5551234, the new number is 1234.
Web: Stripped Digits From Right EMS: Remove From Right [_RemoveFromRight]	Defines the number of digits to remove from the right of the redirect number prefix. For example, if you enter 3 and the redirect number is 5551234, the new number is 5551.

Parameter	Description
Web/EMS: Number of Digits to Leave [_LeaveFromRight]	Defines the number of digits that you want to retain from the right of the redirect number.
Web/EMS: Prefix to Add [_Prefix2Add]	Defines the number or string that you want added to the front of the redirect number. For example, if you enter 9 and the redirect number is 1234, the new number is 91234.
Web/EMS: Suffix to Add [_Suffix2Add]	Defines the number or string that you want added to the end of the redirect number. For example, if you enter 00 and the redirect number is 1234, the new number is 123400.
Web: Presentation EMS: Is Presentation Restricted [_IsPresentationRestricted]	 Enables caller ID. [0] Allowed = Sends Caller ID information when a call is made using these destination / source prefixes. [1] Restricted = Restricts Caller ID information for these prefixes. Note: If this parameter is set to Restricted and the 'AssertedIdMode' parameter is set to Add P-Asserted-Identity, the From header in the INVITE message includes the following: From: 'anonymous' <sip: anonymous@anonymous.invalid=""> and 'privacy: id' header.</sip:>
Web: TON EMS: Number Type [_NumberType]	 Defines the Type of Number (TON). The default is Not Configured [-1]. If NPI is set to Unknown, you can set TON to Unknown [0]. If NPI is set to Private, you can set TON to Unknown [0], International [1], National [2], Network Specific [3] or Subscriber [4]. If NPI is set to E.164 Public, you can set TON to Unknown [0], International [1], National [2], Network Specific [3], Subscriber [4] or Abbreviated [6]. For more information on available NPI/TON values, see Numbering Plans and Type of Number on page 404.
Web: NPI EMS: Number Plan [_NumberPlan]	 Defines the Numbering Plan Indicator (NPI). [-1] Not Configured = (Default) Value received from PSTN/IP is used [0] Unknown [1] E.164 Public [9] Private For more information on available NPI/TON values, see Numbering Plans and Type of Number on page 404.

24.6 Manipulating Redirected and Diverted Numbers for Call Diversion

You can configure manipulation rules to manipulate the Diverted-to and Diverting numbers received in the incoming Call Redirection Facility message for call diversion, which is interworked to outgoing SIP 302 responses. This feature is applicable to the Euro ISDN and QSIG variants, and to IP-to-Tel calls.

The incoming redirection Facility message includes, among other parameters, the Diverted-to number and Diverting number. The Diverted-to number (i.e., new destination) is

User's Manual 24. Manipulation

mapped to the user part in the Contact header of the SIP 302 response. The Diverting number is mapped to the user part in the Diversion header of the SIP 302 response.

These two numbers can be manipulated by entering the following special strings in the 'Destination Prefix' field of the Redirect Number Tel-to-IP table:

- "RN" used in the rule to manipulate the Redirected number (i.e., originally called number or Diverting number).
- "DN" used in the rule to manipulate the Diverted-to number (i.e., the new called number or destination). This manipulation is done on the user part in the Contact header of the SIP 302 response.

For example, assume the following required manipulation:

- Manipulate Redirected number 6001 (originally called number) to 6005
- Manipulate Diverted-to number 8002 (the new called number or destination) to 8005

The configuration in the Redirect Number Tel-to-IP table is as follows:

Table 24-5: Redirect Number Configuration Example

Parameter	Rule 1	Rule 2
Destination Prefix	RN	DN
Redirect Prefix	6	8
Stripped Digits From Right	1	1
Suffix to Add	5	5
Number of Digits to Leave	5	-

After the above manipulation is done, the device sends the following outgoing SIP 302 response:

```
SIP/2.0 302 Moved Temporarily
```

Via: SIP/2.0/TLS 10.33.45.68; branch=z9hG4bKac54132643; alias

From: "MP118 1" <sip:8001@10.33.45.68>;tag=1c54119560
To: <sip:6001@10.33.45.69;user=phone>;tag=1c664560944

Call-ID: 541189832710201115142@10.33.45.68

CSeq: 1 INVITE

Contact: <sip:8005@10.33.45.68;user=phone>

Supported: em,timer,replaces,path,early-session,resource-priority

Allow:

REGISTER, OPTIONS, INVITE, ACK, CANCEL, BYE, NOTIFY, PRACK, REFER, INFO, SUBSCRIBE, UPDATE

Diversion: <tel:6005>;reason=unknown;counter=1

Server: Audiocodes-Sip-Gateway-IPmedia 260_UN/v.6.20A.043.001

Reason: SIP ;cause=302 ;text="302 Moved Temporarily"

Content-Length: 0

24.7 Mapping NPI/TON to SIP Phone-Context

The Phone Context table lets you configure rules for mapping the Numbering Plan Indication (NPI) and Type of Number (TON) to the SIP 'phone-context' parameter, and vice versa. The 'phone-context' parameter appears in the standard SIP headers where a phone number is used (i.e., Request-URI, To, From, and Diversion). When a call is received from the ISDN side, the NPI and TON are compared against the table and the matching 'phone-

context' value is used in the outgoing SIP INVITE message. The same mapping occurs when an INVITE with a 'phone-context' parameter is received.

For example, for a Tel-to-IP call with NPI/TON set as E164 National (values 1/2), the device can send the following SIP INVITE URI:

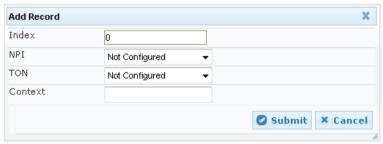

sip:12365432; phone-context= na.e.164.nt.com

For an IP-to-Tel call, if the incoming INVITE contains this 'phone-context' (e.g. "phone-context= na.e.164.nt.com"), the NPI/TON of the called number in the outgoing Setup message is changed to E164 National.

The following procedure describes how to configure NPI/TON-SIP phone-context mapping rules in the Web interface. You can also configure this using the table ini file parameter, PhoneContext.

- To configure NPI/TON-SIP phone-context mapping rules:
- 1. Open the Phone Context Table page (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > Phone Context).
- 2. Click Add; the following dialog box appears:

Figure 24-5: Phone Context Table Page

- 3. Configure a mapping rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Note: You can configure multiple rows with the same NPI/TON or same SIP 'phone-context'. In such a configuration, a Tel-to-IP call uses the first matching rule in the table.

Table 24-6: Phone Context Table Parameter Description

Parameter	Description
Index [PhoneContext_Index]	Defines an index number for the new table record.
Add Phone Context As Prefix [AddPhoneContextAsPrefix]	Determines whether the received SIP 'phone-context' parameter is added as a prefix to the outgoing ISDN Setup message with called and calling numbers. • [0] Disable (default) • [1] Enable
NPI [PhoneContext_Npi]	Defines the Number Plan Indicator (NPI). • [0] Unknown (default) • [1] E.164 Public • [9] Private For a detailed list of the available NPI/TON values, see Numbering Plans and Type of Number on page 404.
TON	Defines the Type of Number (TON).

User's Manual 24. Manipulation

Parameter	Description
[PhoneContext_Ton]	 If you selected Unknown as the NPI, you can select Unknown [0]. If you selected Private as the NPI, you can select one of the following: [0] Unknown [1] Level 2 Regional [2] Level 1 Regional [3] PSTN Specific [4] Level 0 Regional (Local) If you selected E.164 Public as the NPI, you can select one of the following: [0] Unknown [1] International [2] National [3] Network Specific [4] Subscriber [6] Abbreviated
Phone Context [PhoneContext_Context]	Defines the SIP 'phone-context' URI parameter.

24.8 Configuring Release Cause Mapping

The release cause mapping tables let you configure rules to map up to 12 different ISDN ITU-T Q.850 release cause codes (call failure) to SIP response codes, and vice versa. These tables allow you to override the default ISDN-SIP release cause mappings, described in "Fixed Mapping of ISDN Release Reason to SIP Response" on page 402 and "Fixed Mapping of SIP Response to ISDN Release Reason" on page 400.

The release cause mapping tables include:

- Release Cause Mapping from SIP to ISDN table: Maps SIP release codes to ISDN cause codes. When a SIP response is received from the IP side, the device searches this table for a match. If the SIP response is found, the Q.850 Release Cause assigned to it is sent to the PSTN. If no match is found, the default static mapping is used.
- Release Cause Mapping from ISDN to SIP table: Maps ISDN cause codes to SIP release codes. When a Release Cause is received from the PSTN, the device searches this table for a match. If the Q.850 Release Cause is found, the SIP response assigned to it is sent to the IP side. If no match is found, the default static mapping is used.

Note: For Tel-to-IP calls, you can also map the less commonly used SIP responses to a single default ISDN Release Cause, using the DefaultCauseMapISDN2IP parameter. This parameter defines a default ISDN Cause that is always used except when the following Release Causes are received: Normal Call Clearing (16), User Busy (17), No User Responding (18) or No Answer from User (19).

The following procedure describes how to configure ISDN-SIP release cause mapping in the Web interface. You can also configure this mapping using the following management platforms:

- Release Cause Mapping from ISDN to SIP table: ini file parameter, CauseMapISDN2SIP
- Release Cause Mapping from SIP to ISDN table:ini file parameter, CauseMapSIP2ISDN

- To configure an ISDN-SIP release cause mapping rule:
- Open the required release cause mapping table (Configuration tab > VoIP menu >
 GW and IP to IP > Manipulations > Release Cause SIP > ISDN or Release Cause
 ISDN > SIP).
- Click Add; the following dialog box appears:

Figure 24-6: Release Cause Mapping - Add Record

- 3. Configure a mapping rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 24-7: Release Cause Mapping Tables Parameter Descriptions

Parameter	Description
Index [CauseMapSip2Isdn_Index] [CauseMapIsdn2Sip_Index]	Defines an index number for the new table record.
Sip Response [CauseMapSip2lsdn_SipResponse] [CauseMapIsdn2Sip_SipResponse]	Defines the SIP response code (e.g., 406).
Q.850 Causes [CauseMapSip2lsdn_lsdnReleaseCause] [CauseMapIsdn2Sip_lsdnReleaseCause]	Defines the ISDN Q.850 cause code (e.g., 6).

24.8.1 Fixed Mapping of SIP Response to ISDN Release Reason

The following table describes the mapping of SIP response to ISDN release reason.

Table 24-8: Mapping of SIP Response to ISDN Release Reason

SIP Response	Description	ISDN Release Reason	Description	
400*	Bad request	31	Normal, unspecified	
401	Unauthorized	21	Call rejected	
402	Payment required	21	Call rejected	
403	Forbidden	21	Call rejected	
404	Not found	1	Unallocated number	
405	Method not allowed	63	Service/option unavailable	
406	Not acceptable	79 Service/option not impleme		
407	Proxy authentication required	ed 21 Call rejected		
408	Request timeout	102 Recovery on timer expiry		
409	Conflict	41 Temporary failure		

User's Manual 24. Manipulation

SIP Response	Description	ISDN Release Reason	Description	
410	Gone	22	Number changed w/o diagnostic	
411	Length required	127	Interworking	
413	Request entity too long	127	Interworking	
414	Request URI too long	127	Interworking	
415	Unsupported media type	79	Service/option not implemented	
420	Bad extension	127	Interworking	
480	Temporarily unavailable	18	No user responding	
481*	Call leg/transaction doesn't exist	127	Interworking	
482*	Loop detected	127	Interworking	
483	Too many hops	127	Interworking	
484	Address incomplete	28	Invalid number format	
485	Ambiguous	1 Unallocated number		
486	Busy here	17 User busy		
488	Not acceptable here	31 Normal, unspecified		
500	Server internal error	41 Temporary failure		
501	Not implemented	38	Network out of order	
502	Bad gateway	38	Network out of order	
503	Service unavailable	41	Temporary failure	
504	Server timeout	102 Recovery on timer expiry		
505*	Version not supported	127 Interworking		
600	Busy everywhere	17 User busy		
603	Decline	21 Call rejected		
604	Does not exist anywhere	1 Unallocated number		
606*	Not acceptable	38 Network out of order		

^{*} Messages and responses were created because the 'ISUP to SIP Mapping' draft does not specify their cause code mapping.

24.8.2 Fixed Mapping of ISDN Release Reason to SIP Response

The following table describes the mapping of ISDN release reason to SIP response.

Table 24-9: Mapping of ISDN Release Reason to SIP Response

ISDN Release Reason	Description	SIP Response	Description		
1	Unallocated number	404	Not found		
2	No route to network	404	Not found		
3	No route to destination	404	Not found		
6	Channel unacceptable	406 ⁻	Not acceptable		
7	Call awarded and being delivered in an established channel	500	Server internal error		
16	Normal call clearing	_*	BYE		
17	User busy	486	Busy here		
18	No user responding	408	Request timeout		
19	No answer from the user	480	Temporarily unavailable		
21	Call rejected	403	Forbidden		
22	Number changed w/o diagnostic	410	Gone		
26	Non-selected user clearing	404	Not found		
27	Destination out of order 502 Bad gateway				
28	Address incomplete 484 Address incomplete				
29	Facility rejected 501 Not implemented				
30	Response to status enquiry 501* Not implemented				
31	ormal unspecified 480 Temporarily unavailable				
34	No circuit available	circuit available 503 Service unavailable			
38	etwork out of order 503 Service unavailable				
41	Temporary failure 503 Service unavailable				
42	Switching equipment congestion	503	Service unavailable		
43	Access information discarded	502*	Bad gateway		
44	Requested channel not available	503*	Service unavailable		
47	Resource unavailable	503	Service unavailable		
49	QoS unavailable 503* Service unavailable				
50	Facility not subscribed 503* Service unavailable				
55	Incoming calls barred within CUG	403	Forbidden		
57	Bearer capability not authorized	403	Forbidden		
58	Bearer capability not presently available 503 Service unavailable				
63	Service/option not available 503* Service unavailable				
65	Bearer capability not implemented 501 Not implemented				

User's Manual 24. Manipulation

ISDN Release Reason	Description	SIP Response	Description		
66	Channel type not implemented	480*	Temporarily unavailable		
69	Requested facility not implemented	503*	Service unavailable		
70	Only restricted digital information bearer capability is available	503*	Service unavailable		
79	Service or option not implemented	501	Not implemented		
81	Invalid call reference value	502*	Bad gateway		
82	Identified channel does not exist	502*	Bad gateway		
83	Suspended call exists, but this call identity does not	503*	Service unavailable		
84	Call identity in use	503*	Service unavailable		
85	No call suspended	503*	Service unavailable		
86	Call having the requested call identity has been cleared	408* Request timeout			
87	User not member of CUG	503 Service unavailable			
88	Incompatible destination	compatible destination 503 Service unavailable			
91	Invalid transit network selection	502* Bad gateway			
95	Invalid message	503 Service unavailable			
96	Mandatory information element is missing	409* Conflict			
97	Message type non-existent or not implemented	480* Temporarily not available			
98	Message not compatible with call state or message type non-existent or not implemented	409* Conflict			
99	Information element non-existent or not implemented	480* Not found			
100	Invalid information elements contents	501*	Not implemented		
101	Message not compatible with call state	503*	Service unavailable		
102	Recovery of timer expiry	408	Request timeout		
111	Protocol error	500	Server internal error		
127	Interworking unspecified	500 Server internal error			

 $^{^{\}star}$ Messages and responses were created because the 'ISUP to SIP Mapping' draft doesn't specify their cause code mapping.

24.8.3 Reason Header

The device supports the SIP Reason header according to RFC 3326. The Reason header conveys information describing the disconnection cause of a call:

- Sending Reason header: If a call is disconnected from the Tel side (ISDN), the Reason header is set to the received Q.850 cause in the appropriate message (BYE/CANCEL/final failure response) and sent to the SIP side. If the call is disconnected because of a SIP reason, the Reason header is set to the appropriate SIP response.
- Receiving Reason header: If a call is disconnected from the IP side and the SIP message includes the Reason header, it is sent to the Tel side according to the following logic:
 - If the Reason header includes a Q.850 cause, it is sent as is.
 - If the Reason header includes a SIP response:
 - If the message is a final response, the response status code is translated to Q.850 format and passed to ISDN.
 - If the message isn't a final response, it is translated to a Q.850 cause.
 - When the Reason header is received twice (i.e., SIP Reason and Q.850), the Q.850 takes precedence over the SIP reason and is sent to the Tel side.

24.9 Numbering Plans and Type of Number

The IP-to-Tel destination or source number manipulation tables allow you to classify numbers by their Numbering Plan Indication (NPI) and Type of Number (TON). The device supports all NPI/TON classifications used in the ETSI ISDN variant, as shown in the table below:

Table 24-10: NPI/TON Values for ETSI ISDN Variant

NPI	TON	Description
Unknown [0]	Unknown [0]	A valid classification, but one that has no information about the numbering plan.
E.164 Public [1]	Unknown [0]	A public number in E.164 format, but no information on what kind of E.164 number.
	International [1]	A public number in complete international E.164 format, e.g., 16135551234.
	National [2]	A public number in complete national E.164 format, e.g., 6135551234.
	Network Specific [3]	The type of number "network specific number" is used to indicate administration / service number specific to the serving network, e.g., used to access an operator.
	Subscriber [4]	A public number in complete E.164 format representing a local subscriber, e.g., 5551234.
	Abbreviated [6]	The support of this code is network dependent. The number provided in this information element presents a shorthand representation of the complete number in the specified numbering plan as supported by the network.
Private [9]	Unknown [0]	A private number, but with no further information about the numbering plan.
	Level 2 Regional [1]	

User's Manual 404 Document #: LTRT-89725

User's Manual 24. Manipulation

NPI	TON	Description
	Level 1 Regional [2]	A private number with a location, e.g., 3932200.
	PISN Specific [3]	
	Level 0 Regional (local) [4]	A private local extension number, e.g., 2200.

For NI-2 and DMS-100 ISDN variants, the valid combinations of TON and NPI for calling and called numbers include (Plan/Type):

- 0/0 Unknown/Unknown
- 1/1 International number in ISDN/Telephony numbering plan
- 1/2 National number in ISDN/Telephony numbering plan
- 1/4 Subscriber (local) number in ISDN/Telephony numbering plan
- 9/4 Subscriber (local) number in Private numbering plan

This page is intentionally left blank.

25 Routing

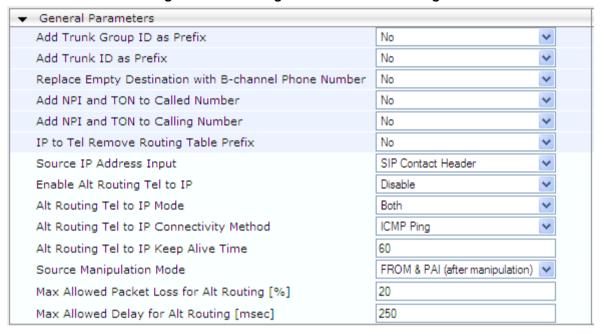

This section describes the configuration of call routing rules.

25.1 Configuring General Routing Parameters

The Routing General Parameters page allows you to configure general routing parameters. For a description of these parameters, see "Configuration Parameters Reference" on page 691.

- To configure general routing parameters:
- Open the Routing General Parameters page (Configuration tab > VolP menu > GW and IP to IP > Routing > General Parameters).

Figure 25-1: Routing General Parameters Page

- Configure the parameters as required.
- Click Submit.

25.2 Configuring Outbound IP Routing Table

The Outbound IP Routing table lets you configure up to 180 Tel-to-IP or outbound IP call routing rules. The device uses these rules to route calls from the Tel or IP to a user-defined IP destination. You can also configure the device to process the routing rule before or after it has performed number manipulation, if necessary.

The Outbound IP Routing table provides two configuration areas:

- Matching Characteristics: Characteristics of the incoming call. If the call characteristics match a table entry, the routing rule is used to route the call to the specified destination. One or more characteristics can be defined for the rule:
 - Source IP Group (to which the call belongs)
 - Source and destination Request-URI host name prefix
 - Source Trunk Group (from where the call is received)
 - Source (calling) and destination (called) telephone number prefix and suffix

- Source and destination Request-URI host name prefix
- **Destination:** If the call matches the configured characteristics, the device routes the call to an IP destination. If no characteristics match is found in the table, the call is rejected. The destination can be any of the following:
 - IP address in dotted-decimal notation.
 - Fully Qualified Domain Name (FQDN).
 - E.164 Telephone Number Mapping (ENUM service).
 - Lightweight Directory Access Protocol (LDAP). For a description, see Routing Based on LDAP Active Directory Queries on page 240.
 - IP Group, where the call is routed to the IP address configured for the Proxy Set or SRD associated with the IP Group (configured in "Configuring IP Groups" on page 273). If the device is configured with multiple SRDs, you can also indicate (in the table's 'Dest. SRD' field) the destination SRD for routing to one of the following destination types IP address, FQDN, ENUM, or LDAP. If the SRD is not specified, then the default SRD (0) is used. In scenarios where routing is to an IP Group, the destination SRD is obtained from the SRD associated with the IP Group (in the IP Group table). The specified destination SRD determines the:
 - Destination SIP interface (SIP port and control IP interface) important when using multiple SIP control VLANs
 - Media Realm (port and IP interface for media / RTP voice)
 - Other SRD-related interfaces and features on which the call is routed

Since each call must have a destination IP Group (even in cases where the destination type is not to an IP Group), in cases when the IP Group is not specified, the SRD's default IP Group is used, which is the first configured IP Group that belongs to the SRD.

Call from Tel Tel-to-IP Routing Table / Outbound IP Routing Table (Prefix Parameter) IP address, FQDN. IP Group **Destination Type?** ENUM, or LDAP SRD Obtained SRD # in 'SRD Default SRD IP Group IP Group IP Group Field in Tel-to-IP from 'SRD' SERVER USER Type? (#0) Used Field Routing Table? SRD Obtained from SRD SRD Obtained in Proxy Set (Associated from IP Group with IP Group)

Figure 25-2: Locating SRD

Note: When using a proxy server, you do not need to configure this table, unless you require one of the following:

- Fallback (alternative) routing if communication is lost with the proxy server.
- IP security, whereby the device routes only received calls whose source IP addresses are defined in this table. IP security is enabled using the SecureCallsFromIP parameter.

- Filter Calls to IP feature: the device checks this table before a call is routed to the
 proxy server. However, if the number is not allowed, i.e., the number does not
 exist in the table or a Call Restriction (see below) routing rule is applied, the call is
 released.
- Obtain different SIP URI host names (per called number).
- Assign IP Profiles to calls.
- For this table to take precedence over a proxy for routing calls, you need to set the
 parameter PreferRouteTable to 1. The device checks the 'Destination IP Address'
 field in this table for a match with the outgoing call; a proxy is used only if a match
 is not found.

In addition to basic outbound IP routing, this table supports the following features:

- Least Cost Routing (LCR): If the LCR feature is enabled, the device searches the routing table for matching routing rules and then selects the one with the lowest call cost. The call cost of the routing rule is done by assigning it a Cost Group. For configuring Cost Groups, see "Least Cost Routing" on page 240. If two routing rules have identical costs, then the rule appearing higher up in the table (i.e., first-matched rule) is used. If a selected route is unavailable, the device uses the next least-cost routing rule. However, even if a matched rule is not assigned a Cost Group, the device can select it as the preferred route over other matched routing rules with Cost Groups, according to the settings of the LCR parameter, LCRDefaultCost (see "Enabling LCR and Configuring Default LCR" on page 242).
- Call Forking: If the Tel-to-IP Call Forking feature is enabled, the device can send a Tel call to multiple IP destinations. An incoming Tel call with multiple matched routing rules (e.g., all with the same source prefix numbers) can be sent (forked) to multiple IP destinations if all these rules are configured with a Forking Group. The call is established with the first IP destination that answers the call.
- Call Restriction: Rejects calls whose matching routing rule is configured with the destination IP address of 0.0.0.0.
- Always Use Routing Table: Even if a proxy server is used, the SIP Request-URI host name in the outgoing INVITE message is obtained from this table. Using this feature, you can assign a different SIP URI host name for different called and/or calling numbers. This feature is enabled using the AlwaysUseRouteTable parameter.
- IP Profiles: IP Profiles can be assigned to destination addresses (also when a proxy is used).
- Alternative Routing (when a proxy isn't used): An alternative IP destination (alternative routing rule) can be configured for specific calls ("main" routing rule). When the "main" route fails (e.g., busy), the device can send the call to the alternative route. You must configure the alternative routing rules in table rows (indices) that are located anywhere below the "main" routing rule. For example, if you configure a "main" routing rule in Index 4, the alternative routing rule can be configured in Index 6. In addition, you must configure the alternative routing rules with identical matching characteristics (e.g., destination prefix number) to the "main" routing rule, but assigned with different destination IP addresses. Instead of an IP address, you can use an FQDN to resolve into two IP addresses. For more information on alternative routing, see "Alternative Routing for Tel-to-IP Calls" on page 422.
- Advice of Charge (AOC): AOC is a pre-billing feature that tasks the rating engine

with calculating the cost of using a service (Tel-to-IP call) and relaying that information to the customer. AOC, which is configured in the Charge Codes table, can be applied per Tel-to-IP routing rule.

Note: You can configure up to three alternative routing rules per "main" routing rule in the Inbound IP Routing table.

The following procedure describes how to configure Tel-to-IP or outbound IP routing rules in the Web interface. You can also configure these rules using the table ini file parameter, Prefix.

- > To configure Tel-to-IP or outbound IP routing rules:
- Open the Outbound IP Routing Table page (Configuration tab > VoIP menu > GW and IP to IP > Routing > Tel to IP Routing).

Routing Index Tel To IP Routing Mode Src. IP Src. Trunk Route Name Src. Host Prefix Dest Host Prefix Dest. Phone Prefix Group ID Group ID -1 1 2 -1 3 -1 4 -1 5 -1

Figure 25-3: Outbound IP Routing Page

- 2. From the 'Routing Index' drop-down list, select the range of entries that you want to add.
- 3. Configure a routing rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

The table below shows configuration examples of Tel-to-IP or outbound IP routing rules, where:

- Rule 1 and 2 (Least Cost Routing rule): For both rules, the called (destination) phone number prefix is 10, the caller's (source) phone number prefix is 100, and the call is assigned IP Profile ID 1. However, Rule 1 is assigned a cheaper Cost Group than Rule 2, and therefore, the call is sent to the destination IP address (10.33.45.63) associated with Rule 1.
- Rule 3 (IP Group destination rule): For all callers (*), if the called phone number prefix is 20, the call is sent to IP Group 1 (whose destination is the IP address configured for its associated Proxy Set ID).
- **Rule 4 (domain name destination rule):** If the called phone number prefix is 5, 7, 8, or 9 and the caller belongs to Trunk Group ID 1, the call is sent to domain.com.
- Rule 5 (block rule): For all callers (*), if the called phone number prefix is 00, the call is rejected (discarded).

Rule 6, 7, and 8 (Forking Group rule): For all callers (*), if the called phone number prefix is 100, the call is sent to Rule 7 and 9 (belonging to Forking Group "1"). If their destinations are unavailable and alternative routing is enabled, the call is sent to Rule 8 (Forking Group "2").

Rule 9 (IP-to-IP rule): If an incoming IP call from Source IP Group 2 with domain.com as source host prefix in its SIP Request-URI, the IP call is sent to IP address 10.33.45.65.

Table 25-1: Example of Tel-to-IP Source Phone Number Manipulation Rules

Parameter	Rule 1	Rule 2	Rul e 3	Rule 4	Rule 5	Rule 6	Rule 7	Rule 8	Rule 9
Src. Trunk Group ID	*	0	1	-	-	-	-	-	-
Src. Trunk Group ID	-	-	*	1	-	*	*	*	-
Dest. Phone Prefix	10	10	20	[5,7-9]	00	100	100	100	*
Source Phone Prefix	100	100	*	*	*	*	*	*	*
Dest. IP Address	10.33.45 .63	10.33.45.5 0	-	domain.co m	0.0.0.	10.33.45.6 8	10.33.45.6 7	domain.co m	10.33.45.6 5
Dest IP Group ID	-	-	1	-	-	-	-	-	-
IP Profile ID	1	1	-	-	-	-	-	-	-
Cost Group ID	Weeken d	Weekend_ B	-	-	-	-	-	-	-
Forking Group			-	-	-	1	2	1	-

Table 25-2: Outbound IP Routing Table Parameter Descriptions

Parameter	Description
Index [PREFIX_Index]	Defines an index number for the new table record.
Web/EMS: Tel to IP Routing Mode	Determines whether to route received calls to an IP destination before or after manipulation of the destination number.
[RouteModeTel2IP]	• [0] Route calls before manipulation = Calls are routed before the number manipulation rules are applied (default).
	• [1] Route calls after manipulation = Calls are routed after the number manipulation rules are applied.
	Notes:
	This parameter is not applicable if outbound proxy routing is used.
	• For number manipulation, see "Configuring Source/Destination Number Manipulation" on page 383.

Parameter	Description			
Route Name [PREFIX_RouteName]	Defines an arbitrary name to easily identify the routing rule. The valid value is a string of up to 20 characters. By default, no value is defined.			
Matching Call Characteristics				
Web: Src. IP Group ID EMS: Source IP Group ID [PREFIX_SrcIPGroupID]	Defines the IP Group from where the incoming IP call is received. Typically, the IP Group of an incoming INVITE is determined according to the Inbound IP Routing table. Notes: This parameter is applicable only to the Gateway's IP-to-IP routing application. To denote all IP Groups, leave this field empty. If this IP Group has a Serving IP Group (configured in the IP Group table), calls from the IP Group are sent to the Serving IP Group and therefore, this routing rule is ignored. However, if you want the call to be sent to a destination configured for this			
	routing rule instead, set the PreferRouteTable parameter to 1.			
Web: Src. Host Prefix EMS: Source Host Prefix [PREFIX_SrcHostPrefix]	Defines the prefix of the SIP Request-URI host name in the From header of the incoming SIP INVITE message. To denote any prefix, use the asterisk (*) symbol. Note: This parameter is applicable only to the Gateway's IP-to-IP routing application.			
Web: Dest. Host Prefix EMS: Destination Host Prefix [PREFIX_DestHostPrefix]	Defines the SIP Request-URI host name prefix of the incoming SIP INVITE message. To denote any prefix, use the asterisk (*) symbol. Note: This parameter is applicable only to the Gateway's IP-to-IP routing application.			
Web: Src. Trunk Group ID EMS: Source Trunk Group ID [PREFIX_SrcTrunkGroupID]	Defines the Trunk Group from where the call is received. To denote any Trunk Group, use the asterisk (*) symbol.			
Web: Dest. Phone Prefix EMS: Destination Phone Prefix [PREFIX_DestinationPrefix]	Defines the prefix and/or suffix of the called (destination) telephone number. The suffix is enclosed in parenthesis after the suffix value. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. To denote any prefix, use the asterisk (*) symbol or to denote calls without a called number, use the \$ sign. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689.			
	The number can include up to 50 digits. Notes:			
	 For LDAP-based routing, enter the LDAP query keyword as the prefix number to denote the IP domain: ✓ "PRIVATE" = Private number ✓ "OCS" = Lync / OCS client number ✓ "PBX" = PBX / IP PBX number ✓ "MOBILE" = Mobile number ✓ "LDAP_ERR" = LDAP query failure For more information, see Routing Based on LDAP Active Directory Queries on page 240. If you want to configure re-routing of ISDN Tel-to-IP calls to fax 			

Parameter	Description			
	destinations, you need to enter the value string "FAX" (case- sensitive) as the destination phone prefix. For more information regarding this feature, see the FaxReroutingMode parameter.			
Web/EMS: Source Phone Prefix [PREFIX_SourcePrefix]	Defines the prefix and/or suffix of the calling (source) telephone number. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. To denote any prefix, use the asterisk (*) symbol or to denote calls without a calling number, use the \$ sign. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689. The number can include up to 50 digits.			
Call Setup Rules Set ID [PREFIX_CallSetupRulesSetId]	Assigns a Call Setup Rule Set ID to the routing rule. The device performs the Call Setup rules of this Set ID if the incoming call matches the characteristics of this routing rule. The device routes the call to the destination according to the routing rule's configured action, only after it has performed the Call Setup rules. For configuring Call Setup rules, see "Configuring Call Setup			
	Rules" on page 247.			
Operation (IP Destination)				
Web: Dest. IP Address EMS: Address [PREFIX_DestAddress]	Defines the IP address (in dotted-decimal notation or FQDN) to where the call is sent. If an FQDN is used (e.g., domain.com), DNS resolution is done according to the DNSQueryType parameter. The IP address can include the following wildcards: "x": represents single digits. For example, 10.8.8.xx denotes all addresses between 10.8.8.10 and 10.8.8.99. "*": represents any number between 0 and 255. For example, 10.8.8.* denotes all addresses between 10.8.8.0 and 10.8.8.255. For ENUM-based routing, enter the string "ENUM". The device sends an ENUM query containing the destination phone number to an external DNS server, configured in the Interface table. The ENUM reply includes a SIP URI which is used as the Request-URI in the subsequent outgoing INVITE and for routing (if a proxy is not used). To configure the type of ENUM service (e.g., e164.arpa), use the EnumService parameter. For LDAP-based routing, enter the string value "LDAP" for			
	denoting the IP address of the LDAP server. For more information, see Routing Based on LDAP Active Directory Queries on page 240. Notes: This field and any value assigned to it is ignored if you have configured a destination IP Crown for this routing rule (in the			
	 configured a destination IP Group for this routing rule (in the 'Dest IP Group ID' field). To reject calls, enter the IP address 0.0.0.0. For example, if you want to prohibit international calls, then in the 'Dest Phone Prefix' field, enter 00 and in the 'Dest IP Address' field, enter 0.0.0.0. For routing calls between phones connected to the device (i.e., local routing), enter the device's IP address. 			

Parameter	Description				
	 When the device's IP address is unknown (e.g., when DHCP is used), enter IP address 127.0.0.1. When using domain names, enter the DNS server's IP address or alternatively, configure these names in the Internal DNS table (see "Configuring the Internal DNS Table" on page 140). 				
Web: Port EMS: Destination Port [PREFIX_DestPort]	Defines the destination port to where you want to route the call.				
Web/EMS: Transport Type [PREFIX_TransportType]	Defines the transport layer type for sending the IP call: • [-1] Not Configured • [0] UDP • [1] TCP • [2] TLS Note: When set to Not Configured (-1), the transport type defined by the SIPTransportType parameter is used.				
Web: Dest. IP Group ID EMS: Destination IP Group ID [PREFIX_DestIPGroupID]	Defines the IP Group to where you want to route the call. The SIP INVITE message is sent to the IP address defined for the Proxy Set ID associated with the IP Group. Notes: If you select an IP Group, you do not need to configure a destination IP address. However, if both parameters are configured in this table, the INVITE message is sent only to the IP Group (and not the defined IP address). If the source IP Group, configured in the 'Src. IP Group ID' parameter above, has a Serving IP Group (configured in the IP Group table), calls from the IP Group are sent to the Serving IP Group and therefore, this routing rule is ignored. However, if you want this routing rule to be used instead and sent to this destination IP Group, set the PreferRouteTable parameter to 1. If the destination is a User-type IP Group, the device searches for a match between the Request-URI (of the received INVITE) to an AOR registration record in the device's database. The INVITE is then sent to the IP address of the registered contact. If the parameter AlwaysUseRouteTable is set to 1 (see "Configuring IP Groups" on page 273), then the Request-URI host name in the INVITE message is set to the value defined for the parameter 'Dest. IP Address' (above); otherwise, if no IP address is defined, it is set to the value of the parameter 'SIP Group Name' (defined in the IP Group table). This parameter is used as the 'Serving IP Group' in the Account table for acquiring authentication user/password for this call (see "Configuring Registration Accounts" on page 291). For defining Proxy Set ID's, see "Configuring Proxy Sets" on page 284.				
Dest SRD [PREFIX_DestSRD]	Defines the SRD to where you want to route the call. The actual destination is defined by the Proxy Set associated with the SRD. This allows you to route the call to a specific SIP Media Realm and SIP Interface. To configure SRD's, see Configuring SRDs on page 267.				
IP Profile ID [PREFIX_ProfileId]	Assigns an IP Profile ID to this IP destination call. This allows you to assign numerous configuration attributes (e.g., voice codes) per routing rule. To configure IP Profiles, see "Configuring IP Profiles"				

Parameter	Description			
	on page 314.			
Status	(Read-only field) Displays the connectivity status of the routing rule's IP destination. If there is connectivity with the destination, this field displays "OK" and the device uses this routing rule if required.			
	 The routing rule is not used if any of the following is displayed: "n/a" = The destination IP Group is unavailable "No Connectivity" = No connection with the destination (no response to the ping or SIP OPTIONS). "QoS Low" = Poor Quality of Service (QoS) of the destination. "DNS Error" = No DNS resolution. This status is applicable only when a domain name is used (instead of an IP address). "Unavailable" = The destination is unreachable due to networking issues. 			
Web/EMS: Charge Code [PREFIX_MeteringCode]	Assigns a Charge Code to the routing rule. To configure Charge Codes, see "Configuring Charge Codes Table" on page 458. Note: This parameter is applicable only to E1 Euro ISDN trunks.			
Cost Group ID [PREFIX_CostGroup]	Assigns a Cost Group with the routing rule for determining the cost of the call. To configure Cost Groups, see "Configuring Cost Groups" on page 244.			
Forking Group [PREFIX_ForkingGroup]	Defines a forking group ID for the routing rule. This enables forking of incoming Tel calls to multiple IP destinations. The device sends simultaneous INVITE messages and handles multiple SIP dialogs until one of the calls is answered. When a call is answered, the other calls are dropped. If all matched routing rules belong to the same Forking Group number, the device sends an INVITE to all the destinations belonging to this group and according to the following logic: If matched routing rules belong to different Forking Groups, the device sends the call to the Forking Group of the first matched routing rule. If the call cannot be established with any of the destinations associated with this Forking Group and alternative routing is enabled, the device forks the call to the Forking Group is defined with a higher number than the previous Forking Group. For example: Table index entries 1 and 2 are defined with Forking Group "1", and index entries 3 and 4 with Forking Group "2": The device first sends the call according to index entries 1 and 2, and if unavailable and alternative routing is enabled, sends the call according to index entries 3 and 4. Table index entry 1 is defined with Forking Group "2", and index entries 2, 3, and 4 with Forking Group "1": The device sends the call according to index entry 1 only and ignores the other index entries even if the destination is unavailable and alternative routing is enabled. This is because the subsequent index entries are defined with a Forking Group "1", index entry 2 with Forking Group "2", and index entries 3 and 4 with Forking Group "1", index entry 2 with Forking Group "2", and index entries 3 and 4 with Forking Group "1", index entry 2 with Forking Group "2", and index entries 3 and 4 with Forking Group "1". The device first sends the call according to			

Parameter	Description			
	 index entries 1, 3, and 4 (all belonging to Forking Group "1"), and if the destination is unavailable and alternative routing is enabled, the device sends the call according to index entry 2. Table index entry 1 is defined with Forking Group "1", index entry 2 with Forking Group "3", index entry 3 with Forking Group "2", and index entry 4 with Forking Group "1": The device first sends the call according to index entries 1 and 4 (all belonging to Forking Group "1"), and if the destination is unavailable and alternative routing is enabled, the device sends the call according to index entry 2 (Forking Group "3"). Even if index entry 2 is unavailable and alternative routing is enabled, the device ignores index entry 3 because it belongs to a Forking Group that is lower than index entry 2. 			
	 Notes: To enable Tel-to-IP call forking, set the 'Tel2IP Call Forking Mode' (<i>Tel2IPCallForkingMode</i>) parameter to Enable. You can configure the device to immediately send the INVITE message to the first member of the Forking Group (as in normal operation) and then only after a user-defined interval, send (simultaneously) the INVITE messages to the other members. If the device receives a SIP 4xx or 5xx in response to the first INVITE, it immediately sends INVITEs to all the other members, regardless of the interval. To configure this feature, use the ForkingDelayTimeForInvite ini file parameter. You can implement Forking Groups when the destination is an LDAP server or a domain name using DNS. In such scenarios, the INVITE is sent to all the queried LDAP or resolved IP addresses, respectively. You can also use LDAP routing rules with standard routing rules for Forking Groups. When the UseDifferentRTPportAfterHold parameter is enabled, every forked call is sent with a different RTP port. Thus, ensure that the device has sufficient available RTP ports for these forked calls. 			

25.3 Configuring Inbound IP Routing Table

The Inbound IP Routing table lets you configure up to 120 inbound call routing rules:

- For IP-to-IP routing: The table is used to identify an incoming call as an IP-to-IP call and subsequently, to assign the call to an IP Group, referred to as a source IP Group. These IP-to-IP calls can later be routed to an outbound destination IP Group (see Configuring Outbound IP Routing Table on page 407).
- For IP-to-Tel routing: This table is used to route incoming IP calls to Trunk Groups. The specific channel pertaining to the Trunk Group to which the call is routed is determined according to the Trunk Group's channel selection mode. The channel selection mode can be defined per Trunk Group (see "Configuring Trunk Group Settings" on page 377) or for all Trunk Groups using the global parameter ChannelSelectMode.

The Inbound IP Routing table provides two configuration areas:

- Matching characteristics of incoming IP call, for example, prefix of destination number.
- Operation (destination), for example, sends to a specific Trunk Group.

If the incoming call matches the characteristics of a rule, the call is sent to the destination configured for that rule.

The device also supports alternative routing if the IP-to-Tel call cannot be routed to the Trunk Group:

- Routing to an Alternative Trunk Group: If a call release reason (cause) code (e.g., 17 for User Busy) is received from the Tel side for a specific IP-to-Tel call and you have configured this reason code in the Reasons for IP-to-Tel Alternative Routing table, the device re-routes the call to an alternative Trunk Group if an alternative routing rule has been configured. You must configure the alternative routing rules in table rows (indices) that are located anywhere below the "main" routing rule. For example, if you configure a "main" routing rule in Index 4, the alternative routing rules can be configured in Index 6. In addition, you must configure the alternative routing rules with identical matching characteristics (e.g., destination prefix number) to the "main" routing rule, but assigned with different destinations (i.e., Trunk Groups). For more information on IP-to-Tel alternative routing and for configuring call release reasons for alternative routing, see "Alternative Routing to Trunk upon Q.931 Call Release Cause Code" on page 426.
- Routing to an IP Destination (i.e., Call Redirection): The device can re-route the IP-to-Tel call to an alternative IP destination, using SIP 3xx responses. For more information, see "Alternative Routing to IP Destinations upon Busy Trunk" on page 428.
- Routing to an Alternative Physical Trunk Within the Same Trunk Group: The device can re-route an IP-to-Tel call to a different physical trunk if the destined trunk within the same Trunk Group is out of service (e.g., physically disconnected). When the physical trunk is disconnected, the device sends the SNMP trap, GWAPP_TRAP_BUSYOUT_LINK notifying of the out-of-service state for the specific trunk number. When the physical trunk is physically reconnected, this trap is sent notifying of the back-to-service state.

Notes:

 If your deployment includes calls of many different called (source) and/or calling (destination) numbers that need to be routed to the same destination, you can employ user-defined prefix tags to represent these numbers. Thus, instead of configuring many routing rules, you need to configure only one routing rule using the prefix tag as the source and destination number matching characteristics, and a destination for the calls. For more information on prefix tags, see "Dial Plan Prefix Tags for IP-to-Tel Routing" on page 563.

The following procedure describes how to configure Inbound IP Routing rules in the Web interface. You can also configure Inbound IP Routing rules using the table ini file parameter, PSTNPrefix.

- To configure IP-to-Tel or inbound IP routing rules:
- Open the Inbound IP Routing Table page (Configuration tab > VoIP menu > GW and IP to IP > Routing > IP to Trunk Group Routing).

Figure 25-4: Inbound IP Routing Table

The previous figure displays the following configured routing rules:

- Rule 1: If the incoming IP call destination phone prefix is between 10 and 19, the call is assigned settings configured for IP Profile ID 2 and routed to Trunk Group ID 1.
- Rule 2: If the incoming IP call destination phone prefix is between 501 and 502 and source phone prefix is 101, the call is assigned settings configured for IP Profile ID 1 and routed to Trunk Group ID 2.
- Rule 3: If the incoming IP call has a From URI host prefix as domain.com, the call is routed to Trunk Group ID 3.
- Rule 4: If the incoming IP call has IP address 10.13.64.5 in the INVITE's Contact header, the call is identified as an IP-to-IP call and assigned to Source IP Group 4. This call is routed according to the outbound IP routing rules for this Source IP Group configured in the Outbound IP Routing table.
- 2. Configure a routing rule according to the parameters described in the table below.
- Click Submit.

Table 25-3: IP-to-Tel or Inbound IP Routing Table Parameter Description

Parameter	Description			
IP to Tel Routing Mode [RouteModelP2Tel]	Determines whether to route the incoming IP call before or after manipulation of destination number, configured in "Configuring Source/Destination Number Manipulation" on page 383.			
	• [0] Route calls before manipulation = (Default) Incoming IP calls are routed before number manipulation.			
	 [1] Route calls after manipulation = Incoming IP calls are routed after number manipulation. 			
Index [PstnPrefix_Index]	Defines an index number for the new table record.			
Route Name	Defines an arbitrary name to easily identify the routing rule.			
[PstnPrefix_RouteName]	The valid value is a string of up to 20 characters. By default, no value is defined.			
Matching Characteristics				
Web: Dest. Host Prefix [PstnPrefix_DestPrefix]	Defines the Request-URI host name prefix of the incoming SIP INVITE message.			
	By default, no value is defined (i.e., not used in routing rule). To denote any prefix, use the asterisk (*) wildcard.			

Parameter	Description				
Web: Source Host Prefix [PstnPrefix_SrcHostPrefix]	Defines the From URI host name prefix of the incoming SIP INVITE message.				
	By default, no value is defined (i.e., not used in routing rule). To denote any prefix, use the asterisk (*) wildcard.				
	Note: If the P-Asserted-Identity header is present in the incoming INVITE message, the value of this parameter is compared to the P-Asserted-Identity URI host name (and not the From header).				
Web: Dest. Phone Prefix [PstnPrefix_DestHostPrefix]	Defines the prefix or suffix of the called (destined) telephone number. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. To denote any prefix, use the asterisk (*) symbol or to denote calls without a called number, use the \$ sign. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689. The prefix can include up to 49 digits.				
Web: Source Phone Prefix [PstnPrefix_SourcePrefix]	Defines the prefix or suffix of the calling (source) telephone number. You can use special notations for denoting the prefix. For example, [100-199](100,101,105) denotes a number that starts with 100 to 199 and ends with 100, 101 or 105. To denote any prefix, use the asterisk (*) symbol or to denote calls without a calling number, use the \$ sign. For a description of available notations, see "Dialing Plan Notation for Routing and Manipulation Tables" on page 689. The prefix can include up to 49 digits. Note: If the P-Asserted-Identity header is present in the incoming INVITE message, the value of this parameter is compared to the P-Asserted-Identity URI host name (and not the From header).				
Web: Source IP Address [PstnPrefix_SourceAddress]	Defines the source IP address of the incoming IP call that can be used for routing decisions. The IP address can be configured in dotted-decimal notation (e.g., 10.8.8.5) or as an FQDN. If the address is an FQDN, DNS resolution is done according to the DNSQueryType parameter. Notes: The source IP address is obtained from the Contact header in the INVITE message. You can configure from where the source IP address is obtained, using the SourceIPAddressInput parameter. The source IP address can include the following wildcards:				
	 ✓ "x": denotes single digits. For example, 10.8.8.xx represents all the addresses between 10.8.8.10 and 10.8.8.99. ✓ "*": denotes any number between 0 and 255. For example, 10.8.8.* represents all addresses between 10.8.8.0 and 10.8.8.255. 				
Web: Source SRD ID [PstnPrefix_SrcSRDID]	Defines the SRD from where the incoming packet is received. Note: When the incoming INVITE matches the SRD in the routing rule, if the 'Source IP Group ID' parameter (see below)				

Parameter	Description				
	is defined and it is associated with a different SRD, the incoming SIP call is rejected. If the 'Source IP Group ID' parameter is not defined, the SRD's default IP Group is used. If there is no valid source IP Group, the call is rejected.				
Call Setup Rules Set ID [PstnPrefix_CallSetupRulesSetId]	Assigns a Call Setup Rule Set ID to the routing rule. The device performs the Call Setup rules of this Set ID if the incoming call matches the characteristics of this routing rule. The device routes the call to the destination according to the routing rule's configured action, only after it has performed the Call Setup rules. For configuring Call Setup rules, see "Configuring Call Setup Rules" on page 247.				
Operation (Destination)					
Web: Trunk Group ID [PstnPrefix_TrunkGroupId]	For IP-to-Tel calls: Defines the Trunk Group to where the incoming SIP call is sent. For IP-to-IP calls: Identifies the call as an IP-to-IP call if this parameter is set to 1.				
Web: Trunk ID	parameter is set to -1. Defines the Trunk to where the incoming SIP call is sent.				
[PstnPrefix_TrunkId]	 Notes: If both 'Trunk Group ID' and 'Trunk ID' parameters are configured in the table, the routing is done according to the 'Trunk Group ID' parameter. The method for selecting the trunk's channel to which the IP call is sent is configured by the global parameter, ChannelSelectMode. Currently, this field can only be configured using the ini file. 				
Web: IP Profile ID [PstnPrefix_ProfileId]	Assigns an IP Profile (configured in "Configuring IP Profiles" on page 314) to the call.				
Web: Source IP Group ID [PstnPrefix_SrcIPGroupID]	For IP-to-Tel calls: Defines the IP Group associated with the incoming IP call. This is the IP Group that sent the INVITE message. This IP Group can later be used as the 'Serving IP Group' in the Account table for obtaining authentication user name/password for this call. For IP-to-IP calls: Assigns the IP Group to the incoming IP call. This IP Group can later be used for outbound IP routing and as the 'Serving IP Group' in the Account table for obtaining authentication user name/password for this call. For configuring registration accounts in the Account table, see "Configuring Account Table" on page 291.				

25.4 IP Destinations Connectivity Feature

The device can be configured to check the integrity of the connectivity to IP destinations of Tel-to-IP routing rules in the Outbound IP Routing table. The IP Connectivity feature can be used for the Alternative Routing feature, whereby the device attempts to re-route calls from unavailable Tel-to-IP routing destinations to available ones (see "Alternative Routing Based on IP Connectivity" on page 422).

The device supports the following methods for checking the connectivity of IP destinations:

Network Connectivity: The device checks the network connectivity of the IP

destination using one of the following methods configured by the 'Alt Routing Tel to IP Connectivity Method' parameter:

- Ping: The device periodically (every seven seconds) pings the IP destination.
- SIP OPTIONS: The device sends "keep-alive" SIP OPTIONS messages to the IP destination. If the device receives a SIP 200 OK in response, it considers the destination as available. If the destination does not respond to the OPTIONS message, then it is considered unavailable. You can configure the time interval for sending these OPTIONS messages, using the 'Alt Routing Tel to IP Keep Alive Time' parameter.

These parameters are configured in the Routing General Parameters page (Configuration tab > VoIP menu > GW and IP to IP > Routing > General Parameters), as shown below:

Figure 25-5: IP Connectivity Method in Routing General Parameters Page

Alt Routing Tel to IP Connectivity Method	SIP OPTIONS ▼
Alt Routing Tel to IP Keep Alive Time	60

- Quality of Service (QoS): You can enable the device to check the QoS of IP destinations. The device measures the QoS according to RTCP statistics of previously established calls with the IP destination. The RTCP includes packet delay (in milliseconds) and packet loss (in percentage). If these measured statistics exceed a user-defined threshold, the destination is considered unavailable. Note that if call statistics is not received within two minutes, the QoS data is reset. These thresholds are configured using the following parameters:
 - 'Max Allowed Packet Loss for Alt Routing' (IPConnQoSMaxAllowedPL): defines the threshold value for packet loss after which the IP destination is considered unavailable.
 - 'Max Allowed Delay for Alt Routing' (IPConnQoSMaxAllowedDelay): defines the threshold value for packet delay after which the IP destination is considered unavailable

These parameters are configured in the Routing General Parameters page, as shown below:

Figure 25-6: IP QoS Thresholds in Routing General Parameters Page

Max Allowed Packet Loss for Alt Routing [%]	20	
Max Allowed Delay for Alt Routing [msec]	250	

DNS Resolution: When a host name (FQDN) is used (instead of an IP address) for the IP destination, it is resolved into an IP address by a DNS server. The device checks network connectivity and QoS of the resolved IP address. If the DNS host name is unresolved, the device considers the connectivity of the IP destination as unavailable.

You can view the connectivity status of IP destinations in the following Web interface pages:

- Outbound IP Routing Table: The connectivity status of the IP destination per routing rule is displayed in the 'Status' column. For more information, see "Configuring Outbound IP Routing Table" on page 407.
- IP Connectivity: This page displays a more informative connectivity status of the IP destinations used in Tel-to-IP routing rules in the Outbound IP Routing table. For viewing this page, see "Viewing IP Connectivity" on page 630.

25.5 Alternative Routing for Tel-to-IP Calls

The device supports various alternative Tel-to-IP call routing methods, as described in this section.

25.5.1 Alternative Routing Based on IP Connectivity

You can configure the device to route Tel-to-IP calls to an alternative IP destination when the connectivity state of an IP destination is unavailable. The alternative routing rules are configured in the Outbound IP Routing table. These rules must be configured anywhere below the "main" routing rule and with identical matching characteristics (e.g., destination prefix number) to the "main" routing rule. The device uses the first alternative route that is available. For more information on configuring alternative Tel-to-IP routing rules in the Outbound IP Routing table, see "Configuring Outbound IP Routing Table" on page 407.

Note: Alternative routing based on IP connectivity is applicable only when a proxy server is not used.

The device searches for an alternative IP destination when any of the following connectivity states are detected with the IP destination of the initial Tel-to-IP routing rule:

- No response received from a ping or from SIP OPTIONS messages. This depends on the chosen method for checking IP connectivity.
- Poor QoS according to the configured thresholds for packet loss and delay.
- Unresolved DNS, if the configured IP destination is a domain name (or FQDN). If the domain name is resolved into two IP addresses, the timeout for INVITE retransmissions can be configured using the HotSwapRtx parameter. For example, if you set this parameter to 3, the device attempts up to three times to route the call to the first IP address and if unsuccessful, it attempts up to three times to re-route it to the second resolved IP address.

The connectivity status of the IP destination is displayed in the 'Status' column of the Outbound IP Routing table per routing rule. If it displays a status other than "ok", then the device considers the IP destination as unavailable and attempts to re-route the call to an alternative destination. For more information on the IP connectivity methods and on viewing IP connectivity status, see "IP Destinations Connectivity Feature" on page 420.

The table below shows an example of alternative routing where the device uses an available alternative routing rule in the Outbound IP Routing table to re-route the initial Telto-IP call.

	Destination Phone Prefix	IP Destination	IP Connectivity Status	Rule Used?
Main Route	40	10.33.45.68	"No Connectivity"	No
Alternative Route #1	40	10.33.45.70	"QoS Low"	No
Alternative Route #2	40	10.33.45.72	"ok"	Yes

Table 25-4: Alternative Routing based on IP Connectivity Example

The steps for configuring alternative Tel-to-IP routing based on IP connectivity are summarized below.

- To configure alternative Tel-to-IP routing based on IP connectivity:
- 1. In the Outbound IP Routing table, add alternative Tel-to-IP routing rules for specific

calls.

In the Routing General Parameters page (Configuration tab > VoIP menu > GW and IP to IP > Routing > General Parameters), do the following:

- **a.** Enable alternative routing based on IP connectivity, by setting the 'Enable Alt Routing Tel to IP AltRouting' (Tel2IPEnable) parameter to **Enable**.
- b. Configure the IP connectivity reason for triggering alternative routing, by setting the 'Alt Routing Tel to IP Mode' parameter (AltRoutingTel2IPMode) to one of the following:
 - Ping or SIP OPTIONS failure
 - Poor QoS
 - Ping or SIP OPTIONS failure, poor QoS, or unresolved DNS

25.5.2 Alternative Routing Based on SIP Responses

The device can perform alternative routing based on the received SIP response code (i.e., 4xx, 5xx, 6xx, or 8xx). If you have configured this response code in the Reasons for Tel-to-IP Alternative Routing table, the device attempts to re-route the call to an alternative destination, if configured. You can configure up to 10 SIP response codes in the Reasons for Tel-to-IP Alternative Routing table.

Typically, the device performs alternative routing when there is no response at all to an INVITE message. This is done after a user-defined number of INVITE re-transmissions, configured by the SIPMaxRtx parameter. In such a scenario, the device issues itself the SIP response code 408 (Request Timeout). You can also configure the device to perform alternative routing for the following proprietary response codes that are issued by the device itself:

- 805 IP Profile Call Limit: The device generates this response code when Call Admission Control (CAC) limits are exceeded for an IP Group. The CAC rules are configured in the IP Profile table (see "Configuring IP Profiles" on page 314). When this occurs, the device sends a SIP 480 (Temporarily Unavailable) response to the SIP entity.
- 806 Media Limits Exceeded: The device generates this response code when the call is terminated due to crossed thresholds of QoE metrics such as MOS, packet delay, and packet loss (configured in the Quality of Experience Profile table) and/or media bandwidth (configured in the Bandwidth profile table). When this occurs, the device sends a SIP 480 (Temporarily Unavailable) response to the SIP entity. This is configured by 1) assigning an IP Group a QoE and/or Bandwidth profile that rejects calls if the threshold is crossed, 2) configuring 806 in the Reasons for Tel-to-IP Alternative Routing table and 3) configuring an alternative routing rule.

Depending on configuration, the alternative routing is done using one of the following configuration entities:

Outbound IP Routing Rules: You configure alternative routing rules for a specific routing rule in the Outbound IP Routing table. If the destination of the "main" routing rule is unavailable, the device searches the table for the next matching rule (e.g., destination phone number), and if available attempts to re-route the call to the IP destination configured for this alternative routing rule. For more information on configuring alternative Tel-to-IP routing rules, see "Configuring Outbound IP Routing Table" on page 407. The table below shows an example of alternative routing where the device uses the first available alternative routing rule to re-route the initial, unsuccessful Tel-to-IP call destination:

Table 25-5: Alternative Routing based on SIP Response Code Example

Destination Phone Prefix	IP Destination	SIP Response	Rule Used?
-----------------------------	----------------	--------------	------------

	Destination Phone Prefix	IP Destination	SIP Response	Rule Used?
Main Route	40	10.33.45.68	408 Request Timeout	No
Alternative Route #1	40	10.33.45.70	486 Busy Here	No
Alternative Route #2	40	10.33.45.72	200 OK	Yes

Proxy Sets: Proxy Sets are used for Server-type IP Groups (e.g., an IP PBX or proxy), which define the address (IP address or FQDN) of the server (see "Configuring Proxy Sets" on page 284). As you can configure multiple IP destinations per Proxy Set, the device supports proxy redundancy, which works together with the alternative routing feature. If the destination of a routing rule in the Outbound IP Routing table is an IP Group, the device routes the call to the IP destination configured for the Proxy Set associated with the IP Group. If the first IP destination of the Proxy Set is unavailable, the device attempts to re-route the call to the next proxy destination, and so on until an available IP destination is located. To enable the Proxy Redundancy feature for a Proxy Set, set the IsProxyHotSwap parameter to 1 and the EnableProxyKeepAlive parameter to 1.

When the Proxy Redundancy feature is enabled, the device continually monitors the connection with the proxies by using keep-alive messages (SIP OPTIONS). The device sends these messages every user-defined interval (ProxyKeepAliveTime parameter). If the first (primary) proxy in the list replies with a SIP response code that you have also configured by the 'Keep-Alive Failure Responses' parameter, the device considers the Proxy as down; otherwise, the device considers the proxy as "alive". If the proxy is still considered down after a user-defined number of re-transmissions (configured by the HotSwapRtx parameter), the device attempts to communicate (using the same INVITE) with the next configured (redundant) proxy in the list, and so on until an available redundant proxy is located. Once an available proxy is located, the device can operate in one of the following modes (configured by the ProxyRedundancyMode parameter):

- Parking mode: The device continues operating with the redundant proxy (now active) until the next failure occurs, after which it switches to the next redundant proxy.
- **Homing mode:** The device always attempts to operate with the primary proxy. In other words, it switches back to the primary proxy whenever it's available again.

If none of the proxy servers respond, the device goes over the list again.

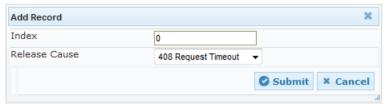

Note: The device assumes that all the proxy servers belonging to the Proxy Set are synchronized with regards to registered users. Thus, when the device locates an available proxy using the Hot Swap feature, it does not re-register the users; new registration (refresh) is done as normal.

The steps for configuring alternative Tel-to-IP routing based on SIP response codes are summarized below.

- To configure alternative Tel-to-IP routing based on SIP response codes:
- Configure SIP response codes (call failure reasons) that invoke alternative Tel-to-IP routing:
 - a. Open the Reasons for Tel-to-IP Alternative Routing page (Configuration tab > VoIP menu > GW and IP to IP > Routing > Alternative Reasons > Reasons for Tel-to-IP).

b. Click **Add**; the following dialog box appears:

Figure 25-7: Reasons for Tel-to-IP Alternative Routing Table - Add Record

- c. Configure a SIP response code for alternative routing according to the parameters described in the table below.
- d. Click Submit, and then save ("burn") your settings to flash memory.

Table 25-6: Reasons for Tel-to-IP Alternative Routing Table Parameter Descriptions

Parameter	Description
Index [AltRouteCauseTel2lp_Index]	Defines an index number for the new table record.
Release Cause [AltRouteCauseTel2lp_ReleaseCause]	Defines a SIP response code that if received, the device attempts to route the call to an alternative destination (if configured).

- 2. Enable alternative routing based on SIP responses, by setting the 'Redundant Routing Mode' parameter in the Proxy & Registration page to one of the following:
 - Routing Table: Outbound IP Routing table is used for alternative routing.
 - Proxy: Proxy Set redundancy feature is used for alternative routing.
- 3. If you are using the Outbound IP Routing table, configure alternative routing rules with identical call matching characteristics, but with different IP destinations.
- 4. If you are using the Proxy Set, configure redundant proxies.

25.5.3 Alternative Routing upon SIP 3xx with Multiple Contacts

You can configure how the device handles received SIP 3xx responses that contain multiple alternative contacts. The 3xx response indicates that the original destination is unavailable (e.g., 301 Moved Permanently – user cannot be found) and that the call can be redirected to alternative destinations specified in the SIP Contact headers.

Configured by the '3xx Use Alt Route Reasons' parameter, the device can handle the receipt of 3xx responses using one of the following methods:

- The device tries each contact sequentially, listed in the Contact headers, until a successful destination is found. If a contact responds with a SIP 486 or 600, the device does not try to redirect the call to the next contact and drops the call.
- The device tries each contact sequentially, listed in the Contact headers. If a SIP 6xx Global Failure response is received during this process (e.g., 600 Busy Everywhere), the device does not try to redirect the call to the next contact and drops the call.
- The device redirects the call to the first contact listed in the Contact header. If the contact responds with a SIP response that is configured in the Reasons for Tel-to-IP Alternative Routing table (see "Alternative Routing Based on SIP Responses" on page 423), the device tries to redirect the call to the next contact, and so on. If a contact responds with a response that is not configured in the table, the device does not try to redirect the call to the next contact and drops the call.

Note: If a SIP 401 or 407 response is received from a contact, the device does not try to redirect the call to the next contact. Instead, the device continues with the regular authentication process, as indicated by these response types.

25.5.4 PSTN Fallback

The PSTN Fallback feature enables the device to re-route a Tel-to-IP call to the legacy PSTN using one of its trunks if the IP destination is unavailable. For example, if poor voice quality is detected over the IP network, the device attempts to re-route the call to the PSTN.

The steps for configuring alternative Tel-to-IP routing to the legacy PSTN are summarized below.

➤ To configure alternative Tel-to-IP routing to the legacy PSTN:

- 1. Configure an alternative routing rule in the Outbound IP Routing table with the same call matching characteristics (e.g., phone number destination), but where the destination is the IP address of the device itself.
- 2. Configure an IP-to-Tel routing rule in the Inbound IP Routing table to route calls received from the device (i.e., its IP address) to a specific Trunk Group connected to the PSTN. This configuration is necessary as the re-routed call is now considered an IP-to-Tel call. For configuring IP-to-Tel routing rules, see "Configuring the Inbound IP Routing Table" on page 416.

25.6 Alternative Routing for IP-to-Tel Calls

The device supports alternative IP-to-Tel call routing, as described in this section.

25.6.1 Alternative Routing to Trunk upon Q.931 Call Release Cause Code

You can configure up to 10 ISDN Q.931 release cause codes, which if received from the Tel side, the device routes the IP-to-Tel call to an alternative Trunk Group, if configured. Alternative IP-to-Tel routing rules are configured in the Inbound IP Routing table. These rules must be configured anywhere below the "main" routing rule and with identical matching characteristics (e.g., destination prefix number) to the "main" routing rule. The device uses the first alternative route that is available. For more information on configuring alternative IP-to-Tel routing rules in the Inbound IP Routing table, see "Configuring Inbound IP Routing Table" on page 416.

A release cause code indicates that the IP-to-Tel call has been rejected or disconnected on the Tel side. The release cause codes are configured in the Reasons for IP-to-Tel Alternative Routing table. For example, you can configure alternative IP-to-Tel routing for scenarios where the initial Tel destination is busy and a Q.931 Cause Code No. 17 is received (or for other call releases that issue the default Cause Code No. 3).

You can configure a default release cause code that the device issues itself upon the following scenarios:

- The device initiates a call release whose cause is unknown.
- No free channels (i.e., busy) in the Trunk Group.
- No appropriate routing rule located in the Inbound IP Routing table.
- Phone number is not located in the Inbound IP Routing table.

This default release code is set to Cause Code No. 3 (No Route to Destination). You can change the code number using the 'Default Release Cause' parameter, located on the

Advanced Parameters page (Configuration tab > VoIP menu > SIP Definitions > Advanced Parameters).

Notes:

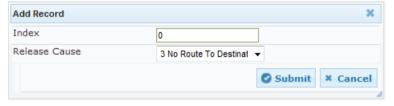

- If a Trunk is disconnected or not synchronized, the device issues itself the internal Cause Code No. 27. This cause code is mapped (by default) to SIP 502.
- The default release cause is described in the Q.931 notation and translated to corresponding SIP 40x or 50x values (e.g., Cause Code No. 3 to SIP 404, and Cause Code No. 34 to SIP 503).
- For mapping SIP-to-Q.931 and Q.931-to-SIP release causes, see Configuring Release Cause Mapping on page 399.

The following procedure describes how to configure alternative routing reasons for IP-to-Tel calls in the Web interface. You can also configure alternative routing reasons for IP-to-Tel calls using the table ini file parameter, AltRouteCauseIP2Tel.

To configure alternative Trunk Group routing based on Q.931 cause codes:

- In the Proxy & Registration page, set the 'Redundant Routing Mode' parameter to Routing Table so that the device uses the Inbound IP Routing table for alternative routing.
- 2. In the Inbound IP Routing table, configure alternative routing rules with the same call matching characteristics, but with different Trunk Group destinations.
- 3. Configure Q.931 cause codes that invoke alternative IP-to-Tel routing:
 - a. Open the Reasons for IP-to-Tel Alternative Routing page (Configuration tab > VoIP menu > GW and IP to IP > Routing > Alternative Routing Reasons > Reasons for IP-to-Tel).
 - **b.** Click **Add**; the following dialog box appears:

Figure 25-8: IP to Tel Reasons - Reasons for Alternative Routing Page

- **c.** Configure a Q.931 release cause code for alternative routing according to the parameters described in the table below.
- d. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 25-7: Reasons for IP-to-Tel Alternative Routing Table Parameter Descriptions

Parameter	Description
Index [AltRouteCauseIP2Tel_Index]	Defines an index number for the new table record.
Release Cause [AltRouteCauseIP2Tel_ReleaseCause]	Defines a Q.931 release code that if received, the device attempts to route the call to an alternative destination (if configured).

25.6.2 Alternative Routing to an IP Destination upon a Busy Trunk

The Forward on Busy Trunk Destination table lets you configure alternative routing rules for forwarding (i.e., call redirection) IP-to-Tel calls to an alternative IP destination using SIP 3xx responses. These rules are used upon the following:

Trunk Group has no free channels (i.e., "busy").

This feature is configured per Trunk Group. The alternative destination can be defined as a host name or as a SIP Request-URI user name and host part (i.e., user@host). For example, the below configuration forwards IP-to-Tel calls to destination user "112" at host IP address 10.13.4.12, port 5060, using transport protocol TCP, if Trunk Group ID 2 is unavailable:

ForwardOnBusyTrunkDest 1 = 2, 112@10.13.4.12:5060;transport=tcp;

When configured with user@host, the original destination number is replaced by the user part.

The device forwards calls using this table only if no alternative IP-to-Tel routing rule has been configured in the Inbound IP Routing table or alternative routing fails and the following reason(s) in the SIP Diversion header of 3xx messages exists:

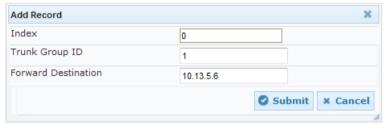

- "out-of-service" all trunks are unavailable/disconnected
- "unavailable":
 - All trunks are busy or unavailable

The following procedure describes how to configure Forward on Busy Trunks in the Web interface. You can also configure this using the table ini file parameter, ForwardOnBusyTrunkDest or CLI command, configure voip/gw routing fwd-on-bsy-trk-dst.

> To configure a Forward on Busy Trunk Destination rule:

- Open the Forward on Busy Trunk Destination page (Configuration tab > VolP menu > GW and IP to IP > Routing > Forward on Busy Trunk).
- 2. Click Add; the following dialog box appears:

Figure 25-9: Forward on Busy Trunk Destination Page - Add Record

The figure above displays a configuration that forwards IP-to-Tel calls destined for Trunk Group ID 1 to destination IP address 10.13.5.67 if the conditions mentioned earlier exist.

- 3. Configure a rule according to the parameters described in the table below.
- Click Submit, and then reset the device with a burn-to-flash for your settings to take effect.

Table 25-8: Forward on Busy Trunk Destination Parameter Descriptions

Parameter	Description
Trunk Group ID [ForwardOnBusyTrunkDest_TrunkGroupId]	Defines the Trunk Group ID to which the IP call is destined to.

Parameter	Description
Forward Destination [ForwardOnBusyTrunkDest_ForwardDestination]	Defines the alternative IP destination for the call used if the Trunk Group is busy or unavailable. The valid value can be an IP address in dotted-decimal notation, an FQDN, or a SIP Request-URI user name and host part (i.e., user@host). The following syntax can also be used: host:port;transport=xxx (i.e., IP address, port and transport type). Note: When configured with a user@host, the original destination number is replaced by the user part.

25.6.3 Alternative Routing upon ISDN Disconnect

You can configure when the device sends a call to an alternative route if it receives an ISDN Q.931 Disconnect message with a Progress Indicator (PI) IE from the Tel side for IP-to-Tel calls. The Disconnect message indicates that the call cannot be established due to, for example, a busy state on the Tel side. Using the DisconnectCallwithPlifAlt ini file parameter, you can configure the following modes of operation:

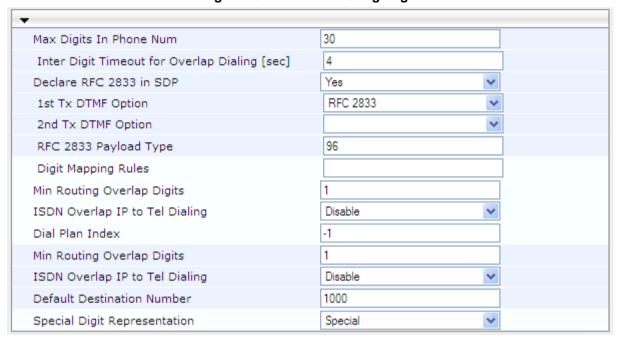

- The device does not immediately disconnect the call. Instead, it waits for any subsequent media from the Tel side (e.g., "this number is currently busy") and forwards it to the IP side (SIP 183 for early media). Only when it receives a Q.931 Release message, does the device disconnect the call (sends a SIP BYE message to the IP side). If you have configured an alternative route, the device sends the IP call to the alternative route.
- The device immediately sends the IP call to an alternative route, if you have configured one. If no alternative route has been configured and the Disconnect message is received with PI, the device forwards the subsequent early media to the IP side. The device disconnects the IP call only upon receipt of the subsequent Release message.

26 Configuring DTMF and Dialing

The DTMF & Dialing page is used to configure parameters associated with dual-tone multi-frequency (DTMF) and dialing. For a description of the parameters appearing on this page, see "Configuration Parameters Reference" on page 691.

- > To configure the DTMF and dialing parameters:
- Open the DTMF & Dialing page (Configuration tab > VolP menu > GW and IP to IP > DTMF & Supplementary > DTMF & Dialing).

Figure 26-1: DTMF & Dialing Page

- 2. Configure the parameters as required.
- Click Submit.
- 4. To save the changes to flash memory, see "Saving Configuration" on page 550.

26.1 Dialing Plan Features

This section describes various dialing plan features supported by the device.

26.1.1 Digit Mapping

Digit map pattern rules are used for Tel-to-IP ISDN overlap dialing (by setting the ISDNRxOverlap parameter to 1) to reduce the dialing period. For more information on digit maps for ISDN overlapping, see ISDN Overlap Dialing on page 365. The device collects digits until a match is found in the user-defined digit pattern (e.g., for closed numbering schemes). The device stops collecting digits and starts sending the digits (collected number) upon any of the following scenarios:

- Maximum number of digits is received. You can define (using the MaxDigits parameter) the maximum number of collected destination number digits that can be received from the Tel side by the device. When the number of collected digits reaches the maximum (or a digit map pattern is matched), the device uses these digits for the called destination number.
- Inter-digit timeout expires (e.g., for open numbering schemes). This is defined using the TimeBetweenDigits parameter. This is the time that the device waits between each received digit. When this inter-digit timeout expires, the device uses the collected digits to dial the called destination number.
- Digit string (i.e., dialed number) matches one of the patterns defined in the digit map.

Digit map (pattern) rules are defined using the DigitMapping parameter. The digit map pattern can contain up to 52 options (rules), each separated by a vertical bar ("|"). The maximum length of the entire digit pattern is 152 characters. The available notations are described in the table below:

Notation Description [n-m] Range of numbers (not letters). (single dot) Repeat digits until next notation (e.g., T). X Any single digit. **Note:** This notation does not apply to some scenarios when using the star (*) or hash (#) key. For example, the key sequence of ** must be presented in the dial plan as *x.s (instead of xx). T Dial timeout (configured by the TimeBetweenDigits parameter). S Short timer (configured by the TimeBetweenDigits parameter; default is two seconds) that can be used when a specific rule is defined after a more general rule. For example, if the digit map is 99|998, then the digit collection is terminated after the first two 9 digits are received. Therefore, the second rule of 998 can never be matched. But when the digit map is 99s|998, then after dialing the first two 9 digits, the device waits another two seconds within which the caller can enter the digit 8.

Table 26-1: Digit Map Pattern Notations

Below is an example of a digit map pattern containing eight rules:

```
DigitMapping = 11xS|00[1-7]xxx|8xxxxxxx|#xxxxxxx|*xx|91xxxxxxxxx|9011x|xx.T
```

In the example, the rule "00[1-7]xxx" denotes dialed numbers that begin with 00, and then any digit from 1 through 7, followed by three digits (of any number). Once the device receives these digits, it does not wait for additional digits, but starts sending the collected digits (dialed number) immediately.

Notes:

- If you want the device to accept/dial any number, ensure that the digit map contains the rule "xx.T"; otherwise, dialed numbers not defined in the digit map are rejected.
- If you are using an external Dial Plan file for dialing plans (see "Dialing Plans for Digit Collection" on page 561), the device first attempts to locate a matching digit pattern in the Dial Plan file, and if not found, then attempts to locate a matching digit pattern in the Digit Map (configured by the DigitMapping parameter).

• It may be useful to configure both Dial Plan file and Digit Maps. For example, the Digit Map can be used for complex digit patterns (which are not supported by the Dial Plan) and the Dial Plan can be used for long lists of relatively simple digit patterns. In addition, as timeout between digits is not supported by the Dial Plan, the Digit Map can be used to define digit patterns (MaxDigits parameter) that are shorter than those defined in the Dial Plan, or left at default. For example, "xx.T" Digit Map instructs the device to use the Dial Plan and if no matching digit pattern, it waits for two more digits and then after a timeout (TimeBetweenDigits parameter), it sends the collected digits. Therefore, this ensures that calls are not rejected as a result of their digit pattern not been completed in the Dial Plan.

26.1.2 External Dial Plan File

The device can be loaded with a Dial Plan file with user-defined dialing plans. For more information, see "Dial Plan File" on page 561.

This page is intentionally left blank.

27 Configuring Supplementary Services

This section describes SIP supplementary services that can enhance your telephone service.

Notes:

- All call participants must support the specific supplementary service that is used.
- When working with certain application servers (such as BroadSoft's BroadWorks) in client server mode (the application server controls all supplementary services and keypad features by itself), the device's supplementary services must be disabled.
- The device's SIP users are only required to enable the Hold and Transfer features.
 By default, the Call Forward (supporting 30x redirecting responses) and Call Waiting (receipt of 182 response) features are enabled.

The Supplementary Services page is used to configure many of the discussed supplementary services parameters. For a description of the parameters appearing on this page, see "Configuration Parameters Reference" on page 691.

- > To configure supplementary services parameters:
- Open the Supplementary Services page (Configuration tab > VoIP menu > GW and IP to IP > DTMF & Supplementary > Supplementary Services).

Figure 27-1: Supplementary Services Page

- Configure the parameters as required.
- 3. Click **Submit**, or click the **Subscribe to MWI** or **Unsubscribe to MWI** buttons to save your changes and to subscribe / unsubscribe to the MWI server.
- 4. To save the changes to flash memory, see "Saving Configuration" on page 550.

27.1 Call Hold and Retrieve

Call Hold and Retrieve:

- The party that initiates the hold is called the *holding* party; the other party is called the *held* party. The device can't initiate Call Hold, but it can respond to hold requests and as such, it's a held party.
- After a successful Hold, the holding party hears a dial tone (HELD_TONE defined in the device's Call Progress Tones file).
- After a successful retrieve, the voice is connected again.
- The hold and retrieve functionalities are implemented by re-INVITE messages. The IP address 0.0.0.0 as the connection IP address or the string 'a=inactive' in the received re-INVITE SDP cause the device to enter Hold state and to play the held tone (configured in the device) to the PBX/PSTN. If the string 'a=sendonly' is received in the SDP message, the device stops sending RTP packets, but continues to listen to the incoming RTP packets. Usually, the remote party plays, in this scenario, Music on Hold (MOH) and the device forwards the MOH to the held party.

You can also configure the device to keep a call on-hold for a user-defined time after which the call is disconnected, using the HeldTimeout parameter.

27.2 Call Transfer

This section describes the device's support for call transfer types.

27.2.1 Consultation Call Transfer

The device supports Consultation Call Transfer. The common method to perform a consultation transfer is described in the following example, which assumes three call parties:

- Party A = transferring
- Party B = transferred
- Party C = transferred to
- A Calls B.
- 2. B answers.
- 3. A presses the hook-flash button and places B on-hold (party B hears a hold tone).
- A dials C.
- 5. After A completes dialing C, A can perform the transfer by on-hooking the A phone.
- After the transfer is complete, B and C parties are engaged in a call.

The transfer can be initiated at any of the following stages of the call between A and C:

- Just after completing dialing C phone number transfer from setup
- While hearing ringback transfer from alert
- While speaking to C transfer from active

The Explicit Call Transfer (ECT, according to ETS-300-367, 368, 369) supplementary service is supported for PRI trunks. This service provides the served user who has two calls to ask the network to connect these two calls together and release its connection to both parties. The two calls can be incoming or outgoing calls. This service is similar to NI-2 Two B-Channel Transfer (TBCT) Supplementary Service. The main difference is that in ECT one of the calls must be in HELD state.

27.2.2 Consultation Transfer for QSIG Path Replacement

The device can interwork consultation call transfer requests for ISDN QSIG-to-IP calls. When the device receives a request for a consultation call transfer from the PBX, the device sends a SIP REFER message with a Replaces header to the SIP UA to transfer it to another SIP UA. Once the two SIP UA parties are successfully connected, the device requests the PBX to disconnect the ISDN call, thereby freeing resources on the PBX.

For example, assume legacy PBX user "A" has two established calls connected through the device – one with remote SIP UA "B" and the other with SIP UA "C". In this scenario, user "A" initiates a consultation call transfer to connect "B" with "C". The device receives the consultation call transfer request from the PBX and then connects "B" with "C", by sending "B" a REFER message with a Replaces header (i.e., replace caller "A" with "C"). Upon receipt of a SIP NOTIFY 200 message in response to the REFER, the device sends a Q.931 Disconnect messages to the PBX, notifying the PBX that it can disconnect the ISDN calls (of user "A").

This feature is enabled by the QSIGPathReplacementMode parameter.

27.2.3 Blind Call Transfer

Blind call transfer is done (using SIP REFER messages) after a call is established between call parties A and B, and party A decides to immediately transfer the call to C without first speaking to C. The result of the transfer is a call between B and C (similar to consultation transfer, but skipping the consultation stage).

You can also use the ManipulateIP2PSTNReferTo parameter to manipulate the destination number according to the number received in the SIP Refer-To header. This is applicable to all types of blind transfers to the PSTN (e.g., TBCT, ECT, RLT, QSIG, FXO, and CAS). During blind transfer, the device initiates a new call to the PSTN and the destination number of this call can be manipulated if this parameter is enabled. The following is an example of such a blind transfer:

- 1. IP phone "A" calls PSTN phone "B", and the call is established.
- 2. "A" performs a blind transfer to PSTN phone "C". It does this as follows:
 - a. "A" sends a SIP REFER message (with the phone number of "C" in the Refer-To header) to the device.
 - b. The device sends a Q.931 Setup message to "C". This feature enables manipulating the called party number in this outgoing Setup message.

The manipulation is done as follows:

- 1. If you configure a value for the xferPrefix parameter, then this value (string) is added as a prefix to the number in the Refer-To header.
- 2. This called party number is then manipulated using the IP-to-Tel Destination Phone Number Manipulation table.
- The source number of the transferred call is taken from the original call, according to its initial direction:
 - Tel-to-IP call: source number of the original call.
 - IP-to-Tel call: destination number of the original call.
 - If the UseReferredByForCallingNumber parameter is set to 1, the source number is taken from the SIP Referred-By header if included in the received SIP REFER message.

This source number can also be used as the value for the 'Source Prefix' field in the IP-to-Tel Destination Phone Number Manipulation table. The local IP address is used as the value for the 'Source IP Address' field.

Note: Manipulation using the ManipulateIP2PSTNReferTo parameter does not affect IP-to-Trunk Group routing rules.

27.3 Call Forward

The device supports Call Deflection (ETS-300-207-1) for Euro ISDN and QSIG (ETSI TS 102 393) for Network and User sides, which provides IP-ISDN interworking of call forwarding (call diversion) when the device receives a SIP 302 response.

Call forward performed by the SIP side: Upon receipt of a Facility message with Call Rerouting IE from the PSTN, the device initiates a SIP transfer process by sending a SIP 302 (including the Call Rerouting destination number) to the IP in response to the remote SIP entity's INVITE message. The device then responds with a Disconnect message to the PSTN side.

Call forward performed by the PSTN side: When the device sends the INVITE message to the remote SIP entity and receives a SIP 302 response, the device sends a Facility message with the same IE mentioned above to the PSTN, and waits for the PSTN side to disconnect the call. This is configured using the CallReroutingMode.

Notes:

- When call forward is initiated, the device sends a SIP 302 response with a contact
 that contains the phone number from the forward table and its corresponding IP
 address from the routing table (or when a proxy is used, the proxy's IP address).
- For receiving call forward, the device handles SIP 3xx responses for redirecting calls with a new contact.

27.4 Message Waiting Indication

The device supports Message Waiting Indication (MWI) according to IETF RFC 3842. The device also supports subscribing to an MWI server (using SIP SUBSCRIBE messages).

Note: For more information on IP voice mail configuration, refer to the *IP Voice Mail CPE Configuration Guide*.

To configure MWI, use the following parameters:

- EnableMWI
- MWIServerIP, or MWISubscribelPGroupID and ProxySet
- EnableMWISubscription
- MWIExpirationTime
- SubscribeRetryTime

- SubscriptionMode
- VoiceMailInterface
- EnableVMURI

The device supports the following digital PSTN-based MWI features:

- Euro-ISDN MWI: The device supports Euro-ISDN MWI for IP-to-Tel calls. The device interworks SIP MWI NOTIFY messages to Euro-ISDN Facility information element (IE) MWI messages. This is configured by setting the VoiceMailInterface parameter to 8.
- ISDN PRI NI-2: The device support the interworking of the SIP MWI NOTIFY messages to ISDN PRI NI-2 Message Waiting Notification (MWN), sent in the ISDN Facility IE message. This is applicable when the device is connected to a PBX through an ISDN PRI trunk configured to NI-2. This is configured by setting the VoiceMailInterface parameter to [9].
- QSIG MWI: The device supports the interworking of QSIG MWI to IP (in addition to interworking of SIP MWI NOTIFY to QSIG Facility MWI messages). This provides interworking between an ISDN PBX with voice mail capabilities and a softswitch, which requires information on the number of messages waiting for a specific user. This support is configured using the TrunkGroupSettings_MWIInterrogationType parameter (in the Trunk Group Settings table), which determines the device's handling of MWI Interrogation messages. The process for sending the MWI status upon request from a softswitch is as follows:
 - 1. The softswitch sends a SIP SUBSCRIBE message to the device.
 - The device responds by sending an empty SIP NOTIFY to the softswitch, and then sending an ISDN Setup message with Facility IE containing an MWI Interrogation request to the PBX.
 - The PBX responds by sending to the device an ISDN Connect message containing Facility IE with an MWI Interrogation result, which includes the number of voice messages waiting for the specific user.
 - The device sends another SIP NOTIFY to the softswitch, containing this MWI information.
 - The SIP NOTIFY messages are sent to the IP Group defined by the NotificationIPGroupID parameter.

When a change in the status occurs (e.g., a new voice message is waiting or the user has retrieved a message from the voice mail), the PBX initiates an ISDN Setup message with Facility IE containing an MWI Activate request, which includes the new number of voice messages waiting for the user. The device forwards this information to the softswitch by sending a SIP NOTIFY.

Depending on PBX support, the MWIInterrogationType parameter can be configured to handle these MWI Interrogation messages in different ways. For example, some PBXs support only the MWI Activate request (and not MWI Interrogation request). Some support both these requests. Therefore, the device can be configured to disable this feature or enable it with one of the following support:

- Responds to MWI Activate requests from the PBX by sending SIP NOTIFY MWI messages (i.e., does not send MWI Interrogation messages).
- Send MWI Interrogation message, but don't use its result. Instead, wait for MWI Activate requests from the PBX.
- Send MWI Interrogation message, use its result, and use the MWI Activate requests.

27.5 Emergency E911 Phone Number Services

This section describes the device's support for emergency phone number services.

27.5.1 Pre-empting Existing Calls for E911 IP-to-Tel Calls

If the device receives an E911 call from the IP network destined to the Tel, and there are unavailable channels (e.g., all busy), the device terminates one of the calls (arbitrary) and then sends the E911 call to that channel. The preemption is done only on a channel pertaining to the same Trunk Group for which the E911 call was initially destined and if the channel select mode (configured by the ChannelSelectMode parameter) is set to a value other than "By Dest Phone Number" (0).

The preemption is done only if the incoming IP-to-Tel call is identified as an emergency call. The device identifies emergency calls by one of the following:

- The destination number of the IP call matches one of the numbers defined by the EmergencyNumbers parameter. For E911, you must defined this parameter with the value "911".
- The Priority header of the incoming SIP INVITE message contains the "emergency" value

Emergency pre-emption of calls can be enabled for all calls, using the global parameter CallPriorityMode, or for specific calls using the Tel Profile parameter CallPriorityMode.

Notes:

- For Trunk Groups configured with call preemption, all must be configured to MLPP
 [1] or all configured to Emergency [2]. In other words, you cannot set some trunks
 to [1] and some to [2].
- The global parameter must be set to the same value as that of the Tel Profile parameter; otherwise, the Tel Profile parameter is not applied.
- If you configure call preemption using the global parameter and a new Tel Profile is subsequently added, the TelProfile_CallPriorityMode parameter automatically acquires the same setting as well.
- This feature is applicable to CAS and ISDN interfaces.

27.5.2 Enhanced 9-1-1 Support for Lync Server 2010

The Enhanced 9-1-1 (E9-1-1) service is becoming the mandatory emergency service required in many countries around the world. The E9-1-1 service, based on its predecessor 911, enables emergency operators to pinpoint the location (granular location) of callers who dial the 9-1-1 emergency telephone number.

Today, most enterprises implement an IP-based infrastructure providing a VoIP network with fixed and nomadic users, allowing connectivity anywhere with any device. This, together with an often deployed multi-line telephone system (MLTS) poses a challenge for E9-1-1 due to the difficulty in accurately locating the E9-1-1 caller.

This section describes the E9-1-1 solution provided by Microsoft Lync Server 2010 (hereafter referred to as *Lync Server 2010*), and the deployed AudioCodes ELIN Gateway which provides the ISDN (or CAMA) connectivity to the PSTN-based E9-1-1 emergency providers. This section also describes the configuration of AudioCodes ELIN Gateway for interoperating between the Lync Server 2010 environment and the E9-1-1 emergency provider.

27.5.2.1 About E9-1-1 Services

E9-1-1 is a national emergency service for many countries, enabling E9-1-1 operators to automatically identify the geographical location and phone number of a 911 caller. In E9-1-1, the 911 caller is routed to the nearest E9-1-1 operator, termed *public safety answering point* (PSAP) based on the location of the caller. Automatic identification of the caller's location and phone number reduces the time spent on requesting this information from the 911 caller. Therefore, the E9-1-1 service enables the PSAP to quickly dispatch the relevant emergency services (for example, fire department or police) to the caller's location. Even if the call prematurely disconnects, the operator has sufficient information to call back the 911 caller.

The figure below illustrates the routing of an E9-1-1 call to the PSAP:

Enterprise IP Network PSTN-Based Emergency Service Provider End Office Identifies 911 Call and Sends to E911 Selective Router VoIP User PSTN Gateway Sends Dials 9-1-1 IP Call to PSTN 2 **Automatic Location Master Street** Identification Address Guide (ALI) Database (MSAG) Database **E911 Selective Router** Sends Call to Nearest PSAP Based on Caller's ANI Sent to Phone Number (ANI) Retrieve ALI 5 503 972-4412 40 North East Going Street, Floor 3. **Nearest Public Safety** Portland, Oregon Answering Point (PSAP)

Figure 27-2: Call Flow of E9-1-1 to PSTN-Based Emergency Services Provider

- 1. The VoIP user dials 9-1-1.
- 2. The call is eventually sent to the PSTN through a PSTN Gateway.
- 3. The PSTN identifies the call is an emergency call and sends it to an E9-1-1 Selective Router in the Emergency Services provider's network.
- 4. The E9-1-1 Selective Router determines the geographical location of the caller by requesting this information from an Automatic Location Identification (ALI) database based on the phone number or Automatic Number Identifier (ANI) of the 911 caller. Exact location information is also supplied by the Master Street Address Guide (MSAG) database, which is a companion database to the ALI database. Phone companies and public safety agencies collaborate beforehand to create master maps that match phone numbers, addresses and cross streets to their corresponding PSAP. This MSAG is the official record of valid streets (with exact spelling), street number ranges, and other address elements with which the service providers are required to update their ALI databases.
- 5. The E9-1-1 Selective Router sends the call to the appropriate PSAP based on the retrieved location information from the ALI.
- 6. The PSAP operator dispatches the relevant emergency services to the E9-1-1 caller.

Version 6.8 441 Mediant 3000

27.5.2.2 Microsoft Lync Server 2010 and E9-1-1

Microsoft Lync Server 2010 enables Enterprise voice users to access its unified communications platform from virtually anywhere and through many different devices. This, together with a deployed MLTS, poses a challenge for E9-1-1 due to the difficulty in accurately locating the E9-1-1 caller. However, Lync Server 2010 offers an innovative solution to solving Enterprises E9-1-1 location problems.

27.5.2.2.1 Gathering Location Information of Lync 2010 Clients for 911 Calls

When a Microsoft® LyncTM 2010 client (hereafter referred to as *Lync 2010 client*) is enabled for E9-1-1, the location data that is stored on the client is sent during an emergency call. This stored location information is acquired automatically from the Microsoft Location Information Server (LIS). The LIS stores the location of each network element in the enterprise. Immediately after the Lync 2010 client registration process or when the operating system detects a network connection change, each Lync 2010 client submits a request to the LIS for a location. If the LIS is able to resolve a location address for the client request, it returns the address in a location response. Each client then caches this information. When the Lync 2010 client dials 9-1-1, this location information is then included as part of the emergency call and used by the Emergency Services provider to route the call to the correct PSAP.

The gathering of location information in the Lync Server 2010 network is illustrated in the figure below:

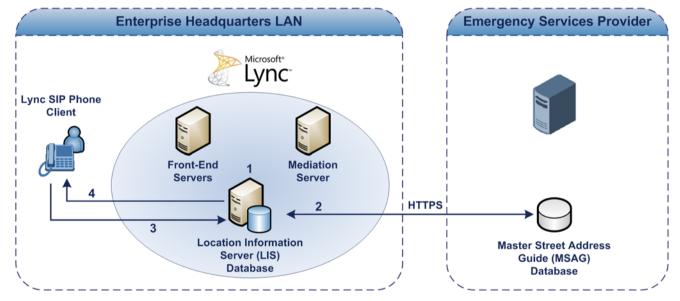

Figure 27-3: Microsoft Lync Server 2010 Client Acquiring Location Information

- 1. The Administrator provisions the LIS database with the location of each network element in the Enterprise. The location is a civic address, which can include contextual in-building and company information. In other words, it associates a specific network entity (for example, a WAP) with a physical location in the Enterprise (for example, Floor 2, Wing A, and the Enterprise's street address). For more information on populating the LIS database, see "Adding ELINs to the Location Information Server" on page 443.
- 2. The Administrator validates addresses with the Emergency Services provider's MSAG –a companion database to the ALI database. This ensures that the civic address is valid as an official address (e.g., correct address spelling).

- 3. The Lync 2010 client initiates a location request to the LIS under the following circumstances:
 - Immediately after startup and registering the user with Lync Server 2010
 - Approximately every four hours after initial registration
 - Whenever a network connection change is detected (such as roaming to a new WAP)

The Lync 2010 client includes in its location request the following known network connectivity information:

- Always included:
 - IPv4 subnet
 - Media Access Control (MAC) address
- Depends on network connectivity:
 - Wireless access point (WAP) Basic Service Set Identifier (BSSID)
 - Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) chassis ID and port ID

For a Lync 2010 client that moves inside the corporate network such as a soft phone on a laptop that connects wirelessly to the corporate network, Lync Server 2010 can determine which subnet the phone belongs to or which WAP / SSID is currently serving the soft-client.

- **4.** The LIS queries the published locations for a location and if a match is found, returns the location information to the client. The matching order is as follows:
 - WAP BSSID
 - LLDP switch / port
 - LLDP switch
 - Subnet
 - MAC address

This logic ensures that for any client that is connected by a wireless connection, a match is first attempted based on the hardware address of its connected access point. The logic is for the match to be based on the most detailed location. The subnet generally provides the least detail. If no match is found in the LIS for WAP BSSID, LLDP switch / port, LLDP switch, or subnet, the LIS proxies the MAC address to an integrated Simple Network Management Protocol (SNMP) scanning application. Using SNMP may benefit some organizations for the following reasons:

- LLDP is not supported by Lync Server 2010 so this provides a mechanism for soft phones to acquire detailed location information.
- Installed Layer-2 switches may not support LLDP.

If there is no match and the LIS cannot determine the location, the user may be prompted to manually enter the location. For example, the client may be located in an undefined subnet, at home, in a coffee shop or anywhere else outside the network. When a user manually provides a location, the location is mapped based on the MAC address of the default gateway of the client's network and stored on the client. When the client returns to any previously stored location, the client is automatically set to that location. A user can also manually select any location stored in the local users table and manage existing entries.

27.5.2.2.2Adding ELINs to the Location Information Server

As mentioned in the previous section, the Administrator needs to populate the Location Information Server (LIS) database with a network wire map, which maps the Enterprise's network elements to civic addresses. Once done, it can automatically locate clients within

a network. You can add addresses individually to the LIS or in a batch using a commaseparated value (CSV) file containing the column formats listed in the table below.

Table 27-1: Columns in the LIS Database

Network Element	Columns
Wireless access point	<pre><bssid>,<description>,<location>,<companyname>,<housenumber>,<housenumbersuffix>,<predirectional>,<streetname>,<streetsuffix>,<postdirectional>,<city>,<state>,<postalcode>,<country></country></postalcode></state></city></postdirectional></streetsuffix></streetname></predirectional></housenumbersuffix></housenumber></companyname></location></description></bssid></pre>
Subnet	<subnet>,<description>,<location>,<companyname>,<housenumbersuffix>,<predirectional>,<streetname>,<streetsuffix>,<postdirectional>,<city>,<state>,<postalcode>,<country></country></postalcode></state></city></postdirectional></streetsuffix></streetname></predirectional></housenumbersuffix></companyname></location></description></subnet>
Port	<chassisid>,<portidsubtype>,<portid>,<description>,<location>,<companyname>,<housenumber>,<housenumbersuffix>,<predirectional>,<streetname>,<streetsuffix>,<postdirectional>,<city>,<state>,<postalcode>,<country></country></postalcode></state></city></postdirectional></streetsuffix></streetname></predirectional></housenumbersuffix></housenumber></companyname></location></description></portid></portidsubtype></chassisid>
Switch	<pre><chassisid>,<description>,<location>,<companyname>,<housenumber>,<housen umberSuffix>,<predirectional>,<streetname>,<streetsuffix>,<postdirectional>,<cit y>,<state>,<postalcode>,<country></country></postalcode></state></cit </postdirectional></streetsuffix></streetname></predirectional></housen </housenumber></companyname></location></description></chassisid></pre>

For the ELIN number to be included in the SIP INVITE (XML-based PIDF-LO message) sent by the Mediation Server to the ELIN Gateway, the Administrator must add the ELIN number to the <CompanyName> column (shown in the table above in **bold** typeface). As the ELIN Gateway supports up to five ELINs per PIDF-LO, the <CompanyName> column can be populated with up to this number of ELINs, each separated by a semicolon. The digits of each ELIN can be separated by hyphens (xxx-xxx-xxx) or they can be adjacent (xxxxxxxxxx).

When the ELIN Gateway receives the SIP INVITE, it extracts the ELINs from the NAM field in the PIDF-LO (e.g., <ca:NAM>1111-222-333; 1234567890 </ca:NAM>), which corresponds to the <CompanyName> column of the LIS.

If you do not populate the location database, and the Lync Server 2010 location policy, Location Required is set to **Yes** or **Disclaimer**, the user will be prompted to enter a location manually.

27.5.2.2.3 Passing Location Information to the PSTN Emergency Provider

When a Lync 2010 client, enabled for E9-1-1 emergency services, dials 9-1-1, the location data and callback information stored on the client is sent with the call through the Mediation Server to a PSTN-based Emergency Services provider. The Emergency Services provider then routes the call to the nearest and most appropriate PSAP based on the location information contained within the call.

Lync Server 2010 passes the location information of the Lync 2010 client in an IETF-standard format - Presence Information Data Format - Location Object (PIDF-LO)—in a SIP INVITE message. However, this content cannot be sent on the PSTN network using ISDN PRI due to protocol limitations. To overcome this, Enterprises using PSTN Gateways can divide their office space into Emergency Response Locations (ERLs) and assign a dedicated Emergency Location Identification Number (ELIN) to each ERL (or zone). When Lync Server 2010 sends a SIP INVITE message with the PIDF-LO to the PSTN Gateway, it can parse the content and translate the calling number to an appropriate ELIN. The PSTN Gateway then sends the call to the PSTN with the ELIN number as the calling number. This ELIN number is sent to the Emergency Services provider, which sends it on to the appropriate PSAP according to the ELIN address match in the ALI database lookup.

The ERL defines a specific location at a street address, for example, the floor number of the building at that address. The geographical size of an ERL is according to local or national regulations (for example, less than 7000 square feet per ERL). Typically, you

would have an ERL for each floor of the building. The ELIN is used as the phone number for 911 callers within this ERL.

The figure below illustrates the use of ERLs and ELINs, with an E9-1-1 call from floor 2 at the branch office:

Enterprise Headquarters Building Lync Clients Floor 3 ERL 3: ELIN 503 972-4412 Floor 2 Public Safety ERL 2: ELIN 503 972-4411 Answering Point (PSAP) Floor 1 ERL 1: ELIN 503 972-4410 **PSTN** CAMA / ISDN PRI CAMA / ISDN PRI ELIN Sent to PSTN as Calling Number E911 Call from Branch Office **Public Safety** Answering Point (PSAP) **Branch Office Building PSTN** Lync Clients 503 972-4414 Floor 2 ERL 5: ELIN 503 972-4414 40 North East Going Street. Floor 2. Floor 1 Portland, Oregon ERL 4: ELIN 503 972-4413

Figure 27-4: Implementing ERLs and ELINs for E9-1-1 in Lync Server 2010

The table below shows an example of designating ERLs to physical areas (floors) in a building and associating each ERL with a unique ELIN.

ERL Number Physical Area IP Address ELIN 1 Floor 1 503 972-4410 10.13.124.xxx 2 Floor 2 10.15.xxx.xxx 503 972-4411 3 Floor 3 503 972-4412 10.18.xxx.xxx

Table 27-2: Designating ERLs and Assigning to ELINs

In the table above, a unique IP subnet is associated per ERL. This is useful if you implement different subnets between floors. Therefore, IP phones, for example, on a specific floor are in the same subnet and therefore, use the same ELIN when dialing 9-1-1.

27.5.2.3 AudioCodes ELIN Gateway for Lync Server 2010 E9-1-1 Calls to PSTN

The Microsoft Mediation Server sends the location information of the E9-1-1 caller in the XML-based PIDF-LO body contained in the SIP INVITE message. However, this content cannot be sent on the PSTN network using ISDN PRI due to protocol limitations. To solve this issue, Lync Server 2010 requires a PSTN Gateway (*ELIN Gateway*) to send the E9-1-1

Point (PSAP)

call to the PSTN. When Lync Server 2010 sends the PIDF-LO to the PSTN Gateway, it parses the content and translates the calling number to an appropriate ELIN. This ensures that the call is routed to an appropriate PSAP, based on ELIN-address match lookup in the Emergency Services provider's ALI database.

The figure below illustrates an AudioCodes ELIN Gateway deployed in the Lync Server 2010 environment for handling E9-1-1 calls between the Enterprise and the PSTN.

Enterprise Headquarters LAN Aicrosoft* ITSP Lync Lync PC (WAN) Clients AudioCodes ELIN Microsoft **Mediation Server** Gateway Microsoft LIS Database CAMA ISDN PRI **PSTN** Lync SIP Phone Clients **Public Safety Answering**

Figure 27-5: AudioCodes ELIN Gateway for E9-1-1 in Lync Server 2010 Environment

27.5.2.3.1 Detecting and Handling E9-1-1 Calls

The ELIN Gateway identifies E9-1-1 calls and translates their incoming E9-1-1 calling numbers into ELIN numbers, sent toward the PSAP. The ELIN Gateway handles the received E9-1-1 calls as follows:

1. The ELIN Gateway identifies E9-1-1 calls if the incoming SIP INVITE message contains a PIDF-LO XML message body. This is indicated in the SIP *Content-Type* header, as shown below:

Content-Type: application/pidf+xml

The ELIN Gateway extracts the ELIN number(s) from the "NAM" field in the XML message. The "NAM" field corresponds to the <CompanyName> column in the Location Information Server (LIS). The ELIN Gateway supports up to five ELIN numbers per XML message. The ELINs are separated by a semicolon. The digits of the ELIN number can be separated by hyphens (xxx-xxx-xxx) or they can be adjacent (xxxxxxxxxx), as shown below:

<ca:NAM>1111-222-333; 1234567890 </ca:NAM>

- 3. The ELIN Gateway saves the From header value of the SIP INVITE message in its ELIN database table (Call From column). The ELIN table is used for PSAP callback, as discussed later in "PSAP Callback to Lync 2010 Clients for Dropped E9-1-1 Calls" on page 448. The ELIN table also stores the following information:
 - ELIN: ELIN number
 - Time: Time at which the original E9-1-1 call was terminated with the PSAP
 - Count: Number of E9-1-1 calls currently using this ELIN

ELIN	Time	Count	Index	Call From
4257275678	22:11:52	0	2	4258359333
4257275999	22:11:57	0	3	4258359444
4257275615	22:12:03	0	0	4258359555
4257275616	22:11:45	0	1	4258359777

An example of the ELIN database table is shown below:

The ELIN table stores this information for a user-defined period (see "Configuring the E9-1-1 Callback Timeout" on page 450), starting from when the E9-1-1 call, established with the PSAP, terminates. After this time expires, the table entry with its ELIN is disregarded and no longer used (for PSAP callback). Therefore, table entries of only the most recently terminated

E9-1-1 callers are considered in the ELIN table.

The maximum entries in the ELIN table depend on the AudioCodes ELIN Gateway deployed in the Lync Server 2010 environment:

- Mediant 1000 Series and Mediant 2000: 100 entries
- Mediant 3000: 300 entries
- 4. The ELIN Gateway uses the ELIN number as the E9-1-1 calling number and sends it in the ISDN Setup message (as an ANI / Calling Party Number) to the PSTN.

An example of a SIP INVITE message received from an E9-1-1 caller is shown below. The SIP *Content-Type* header indicating the PIDF-LO, and the NAM field listing the ELINs are shown in **bold** typeface.

27.5.2.3.2 Pre-empting Existing Calls for E9-1-1 Calls

If the ELIN Gateway receives an E9-1-1 call from the IP network and there are unavailable channels (for example, all busy), the ELIN Gateway immediately terminates one of the non-E9-1-1 calls (arbitrary) and accepts the E9-1-1 call on the freed channel.

The preemption is done only on a channel pertaining to the same Trunk Group for which the E9-1-1 call was initially destined. For example, if an E9-1-1 call is destined for Trunk Group #2 and all the channels belonging to this group are busy, the ELIN Gateway terminates one of the calls in this group to free a channel for accepting the E9-1-1 call.

This feature is initiated only if the received SIP INVITE message contains a *Priority* header set to "emergency", as shown below:

PRIORITY: emergency

27.5.2.3.3PSAP Callback to Lync 2010 Clients for Dropped E9-1-1 Calls

As the E9-1-1 service automatically provides all the contact information of the E9-1-1 caller to the PSAP, the PSAP operator can call back the E9-1-1 caller. This is especially useful in cases where the caller disconnects prematurely. However, as the Enterprise sends ELINs to the PSAP for E9-1-1 calls, a callback can only reach the original E9-1-1 caller using the ELIN Gateway to translate the ELIN number back into the E9-1-1 caller's extension number.

In the ELIN table of the ELIN Gateway, the temporarily stored *From* header value of the SIP INVITE message originally received from the E9-1-1 caller is used for PSAP callback. When the PSAP makes a callback to the E9-1-1 caller, the ELIN Gateway translates the called number (i.e., ELIN) received from the PSAP to the corresponding E9-1-1 caller's extension number as matched in the ELIN table.

The handling of PSAP callbacks by the ELIN Gateway is as follows:

- When the ELIN Gateway receives any call from the PSTN, it searches the ELIN table for an ELIN that corresponds to the received Called Party Number in the incoming PSTN call.
- 2. If a match is found in the ELIN table, it routes the call to the Mediation Sever by sending a SIP INVITE, where the values of the *To* and *Request-URI* are taken from the value of the original *From* header that is stored in the ELIN table (in the Call From column).
- 3. The ELIN Gateway updates the Time in the ELIN table. (The Count is not affected).

The PSAP callback can be done only within a user-defined timeout (see "Configuring the E9-1-1 Callback Timeout" on page 450) started from after the original E9-1-1 call established with the PSAP is terminated. After this time expires, the table entry with its ELIN is disregarded and no longer used (for PSAP callback). Therefore, table entries of only the most recently terminated

E9-1-1 callers are considered in the ELIN table. If the PSAP callback is done after this timeout expires, the ELIN Gateway is unable to route the call to the E9-1-1 caller and instead, either sends it as a regular call or most likely, rejects it if there are no matching routing rules. However, if another E9-1-1 caller has subsequently been processed with the same ELIN number, then the PSAP callback is routed to this new E9-1-1 caller.

In scenarios where the same ELIN number is being used by multiple E9-1-1 callers, upon receipt of a PSAP callback, the ELIN Gateway sends the call to the most recent E9-1-1 caller. For example, if the ELIN number "4257275678" is being used by three E9-1-1 callers, as shown in the table below, then when a PSAP callback is received, the ELIN Gateway sends it to the E9-1-1 caller with phone number "4258359555".

ELIN	Time	Call From
4257275678	11:00	4258359333
4257275678	11:01	4258359444
4257275678	11:03	4258359555

Table 27-3: Choosing Caller of ELIN

27.5.2.3.4 Selecting ELIN for Multiple Calls within Same ERL

The ELIN Gateway supports the receipt of up to five ELIN numbers in the XML message of each incoming SIP INVITE message. As discussed in the preceding sections, the ELIN Gateway sends the ELIN number as the E9-1-1 calling number to the PSTN-based emergency provider. If the XML message contains more than one ELIN number, the ELIN Gateway chooses the ELIN according to the following logic:

- If the first ELIN in the list is not being used by other active calls, it chooses this ELIN.
- If the first ELIN in the list is being used by another active call, the ELIN Gateway skips to the next ELIN in the list, and so on until it finds an ELIN that is not being used and sends this ELIN.
- If all the ELINs in the list are in use by active calls, the ELIN Gateway selects the ELIN number as follows:
 - The ELIN with the lowest count (i.e., lowest number of active calls currently using this ELIN).

2. If the count between ELINs is identical, the ELIN Gateway selects the ELIN with the greatest amount of time passed since the original E9-1-1 call using this ELIN was terminated with the PSAP. For example, if E9-1-1 caller using ELIN 4257275678 was terminated at 11:01 and E9-1-1 caller using ELIN 4257275670 was terminated at 11:03, then the ELIN Gateway selects ELIN 4257275678.

In this scenario, multiple E9-1-1 calls will be sent with the same ELIN.

27.5.2.3.5 Location Based Emergency Routing

The device supports location-based emergency routing (E-911) in Lync Server 2010. This ensures that E-911 calls from remote branches are routed to emergency providers that are relevant to the geographical area in which the remote branch callers are physically located.

To support this, the device enables routing and SIP header / number manipulation of such emergency calls based on the geographical location of the caller. The device manipulates the received destination number (i.e., 911) from the remote branch callers, into a destination number of an emergency provider that is relevant to the geographical area in which the remote branch office is located.

27.5.2.4 Configuring AudioCodes ELIN Gateway

This section describes E9-1-1 configuration of the AudioCodes ELIN Gateway deployed in the Lync Server 2010 environment.

27.5.2.4.1 Enabling the E9-1-1 Feature

By default, the E9-1-1 feature in the ELIN Gateway for Lync Server 2010 is disabled. To enable it, the following *ini* file parameter setting must be done:

E911Gateway = 1

27.5.2.4.2Configuring the E9-1-1 Callback Timeout

The PSAP can use the ELIN to call back the E9-1-1 caller within a user-defined time interval (in minutes) from when the initial call established with the PSAP has been terminated. By default, an ELIN can be used for PSAP callback within 30 minutes after the call is terminated. You can change this interval, by using the following *ini* file parameter:

E911CallbackTimeout = <time value> ; where <time value > can be any value from 0 through 60

27.5.2.4.3 Configuring the SIP Release Cause Code for Failed E9-1-1 Calls

When a Lync 2010 client makes an emergency call, the call is routed through the Microsoft Mediation Server to the ELIN Gateway, which sends it on to the PSTN. In some scenarios, the call may not be established due to either the PSTN (for example, the destination is busy or not found) or ELIN Gateway (for example, lack of resources or an internal error). In such a scenario, the Mediation Server requires that the ELIN Gateway "reject" the call with the SIP release cause code 503 "Service Unavailable" instead of the designated release call. Such a release cause code enables the Mediation Server to issue a failover to another entity (for example, another ELIN Gateway), instead of retrying the call or returning the release call to the user.

To support this requirement, the ELIN Gateway can be configured to send the 503 "Service Unavailable" release cause code instead of SIP 4xx if an emergency call cannot be established. To enable this support, the following *ini* file parameter setting must be done:

Note: This can also be configured using the *ini* file parameter, EmergencySpecialReleaseCause.

To enable SIP response 503 upon failed E911:

- Open the Advanced Parameters page (Configuration tab > VolP menu > SIP Definitions > Advanced Parameters).
- 2. From the 'Emergency Special Release Cause' drop-down list, select **Enable**.

27.5.2.4.4 Configuring Location-Based Emergency Routing

The device identifies the geographical location of emergency callers by their ELIN numbers, which is present in the PIDF-LO XML body of received SIP INVITE messages. Therefore, you need to configure the device to route emergency calls to a destination (i.e., emergency center such as police) that is appropriate to the caller's ELIN number. As the destination of incoming calls is the emergency number (e.g., 999), the device needs to manipulate the destination number to a number that represents the caller's local emergency center (e.g., +4420999 for London police).

To add manipulation rules for location-based emergency routing, you need to use the Destination Phone Number Manipulation Table for IP-to-Tel Calls table. In this table, you need to use the ELIN number (e.g., 5000) as the source prefix, with the "ELIN" string value added in front of it (e.g., ELIN5000) which is used internally by the device to identify the number as an ELIN number (and **not** used for any other routing processes etc.). For each corresponding ELIN source number prefix entry, you need to configure the manipulation action required on the destination number so that the call is routed to the appropriate destination.

Following is an example of how to configure location-based emergency routing:

Assumptions:

- Company with offices in different cities -- London and Manchester.
- Each city has its local police department.
- In an emergency, users need to dial 999.
- Company employs Microsoft Lync for communication between employers, and between employers and the external telephone network (PSTN). In other words, all employers are seemingly (virtual) in the same location in respect to the IP network.
- ELIN numbers are used to identify the geographical location of emergency calls dialed by users:
 - London ELIN is 5000.
 - Manchester ELIN is 3000.

Configuration Objectives:

- Emergency calls received from London office users are routed by the device to the London police department, which is +4420999.
- Emergency calls received from Manchester office users are routed by the device to the Manchester police department, which is +44161999.

The international code, +44 for England is used for IP routing considerations, but can be omitted depending on your specific network environment.

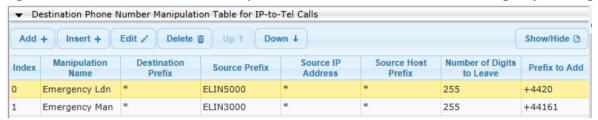

The above example scenario is configured as follows:

1. Enable location-based emergency routing, by loading an ini file to the device with the following parameter setting:

```
E911Gateway = 2
```

2. In the Destination Phone Number Manipulation Table for IP-to-Tel Calls (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > Dest Number IP->Tel), add the following two rules for manipulating the destination number of incoming emergency calls, based on ELIN numbers:

Figure 27-6: Destination Number Manipulation Rules for Location-Based Emergency Routing

Index 0 manipulates the destination number for London emergency callers; Index 1 manipulates the destination number for Manchester emergency callers.

27.5.2.4.5 Viewing the ELIN Table

You can view the ELIN table of the ELIN Gateway:

Using Syslog, by invoking the following Web command shell:

SIP / GateWay / E911Dump

27.6 Multilevel Precedence and Preemption

The device supports Multilevel Precedence and Preemption (MLPP) service. MLPP is a call priority scheme, which does the following:

- Assigns a precedence level (priority level) to specific phone calls or messages.
- Allows higher priority calls (*precedence call*) and messages to preempt lower priority calls and messages (i.e., terminates existing lower priority calls) that are recognized within a user-defined domain (*MLPP domain ID*). The domain specifies the collection of devices and resources that are associated with an MLPP subscriber. When an MLPP subscriber that belongs to a particular domain places a precedence call to another MLPP subscriber that belongs to the same domain, MLPP service can preempt the existing call that the called MLPP subscriber is on for a higher-precedence call. MLPP service availability does not apply across different domains.

MLPP is typically used in the military where, for example, high-ranking personnel can preempt active calls during network stress scenarios such as a national emergency or degraded network situations.

MLPP can be enabled for all calls, using the global parameter, CallPriorityMode, or for specific calls using the Tel Profile parameter, CallPriorityMode.

Notes:

- MLPP is supported on ISDN PRI interfaces.
- The device provides MLPP interworking between SIP and ISDN (both directions).

- For Trunk Groups configured with call preemption, all must be configured to MLPP [1] or all configured to Emergency [2]. In other words, you cannot set some trunks to [1] and some to [2].
- The global parameter must be set to the same value as that of the Tel Profile parameter; otherwise, the Tel Profile parameter is not applied.
- If you configure call preemption using the global parameter and a new Tel Profile is subsequently added, the TelProfile_CallPriorityMode parameter automatically acquires the same setting as well.

The Resource Priority value in the Resource-Priority SIP header can be any one of those listed in the table below. A default MLPP call Precedence Level (configured by the SIPDefaultCallPriority parameter) is used if the incoming SIP INVITE or PRI Setup message contains an invalid priority or Precedence Level value respectively. For each MLPP call priority level, the Multiple Differentiated Services Code Points (DSCP) can be set to a value from 0 to 63.

Table 27-4: MLPP Call Priority Levels (Precedence) and DSCP Configuration Parameters

MLPP Precedence Level	Precedence Level in Resource- Priority SIP Header	DSCP Configuration Parameter
0 (lowest)	routine	MLPPRoutineRTPDSCP
2	priority	MLPPPriorityRTPDSCP
4	immediate	MLPPImmediateRTPDSCP
6	flash	MLPPFlashRTPDSCP
8	flash-override	MLPPFlashOverRTPDSCP
9 (highest)	flash-override-override	MLPPFlashOverOverRTPDSCP

The device automatically interworks the network identity digits (NI) in the ISDN Q.931 Precedence Information Element (IE) to the network domain subfield of the INVITE's Resource-Priority header, and vice versa. The SIP Resource-Priority header contains two fields, namespace and priority. The namespace is subdivided into two subfields, network-domain and precedence-domain. Below is an example of a Resource-Priority header whose network-domain subfield is "uc", r-priority field is "priority" (2), and precedence-domain subfield is "000000":

Resource-Priority: uc-000000.2

The MLPP Q.931 Setup message contains the Precedence IE. The NI digits are presented by four nibbles found in octets 5 and 6. The device checks the NI digits according to the translation table of the Department of Defense (DoD) Unified Capabilities (UC) Requirements (UCR 2008, Changes 3) document, as shown below:

Table 27-5: NI Digits in ISDN Precedence

Level IE	Network Domain in SIP Resource-Priority Header
0000	uc
0001	cuc
0002	dod
0003	nato

Notes:

 If the received ISDN message contains NI digits that are not listed in the translation table, the device sets the network-domain to "uc" in the outgoing SIP message.

- If the received SIP message contains a network-domain value that is not listed in the translation table, the device sets the NI digits to "0000" in the outgoing ISDN message.
- If the received ISDN message does not contain a Precedence IE, you can
 configure the namespace value dsn (default), dod, drsn, uc, or cuc in the SIP
 Resource-Priority header of the outgoing INVITE message. This is done using the
 MLPPDefaultNamespace parameter. You can also configure up to 32 user-defined
 namespaces, using the table ini file parameter, ResourcePriorityNetworkDomains.
 Once defined, you need to set the MLPPDefaultNamespace parameter value to
 the desired table row index.

By default, the device maps the received Resource-Priority field of the SIP Resource-Priority header to the outgoing ISDN PRI Precedence Level (priority level) field as follows:

If the network-domain field in the Resource-Priority header is "uc", then the device sets the Precedence Level field in the ISDN PRI Precedence Level IE according to Table 5.3.2.12-4 (Mapping of RPH r-priority Field to PRI Precedence Level Value):

Table 27-6: Mapping of SIP Resource-Priority Header to PRI Precedence Level for MLPP

MLPP Precedence Level	PRI Precedence Level	SIP Resource-Priority Header Field
Routine	4	0
Priority	3	2
Immediate	2	4
Flash	1	6
Flash Override	0	8

If the network-domain field in the Resource-Priority header is any value other than "uc", then the device sets the Precedence Level field to "0 1 0 0" (i.e., "routine").

This can be modified using the Enablelp2TelInterworkingtable field of the ini file parameter, ResourcePriorityNetworkDomains.

Notes:

- If required, you can exclude the "resource-priority" tag from the SIP Require header in INVITE messages for Tel-to-IP calls when MLPP priority call handling is used. This is configured using the RPRequired parameter.
- For a complete list of the MLPP parameters, see "MLPP and Emergency Call Parameters" on page 811.

27.6.1 MLPP Preemption Events in SIP Reason Header

The device sends the SIP Reason header (as defined in RFC 4411) to indicate the reason and type of a preemption event. The device sends a SIP BYE or CANCEL request, or SIP 480, 486 response (as appropriate) with a Reason header whose Reason-params can includes one of the following preemption cause classes:

- Reason: preemption ;cause=1 ;text="UA Preemption"
- Reason: preemption ;cause=2 ;text="Reserved Resources Preempted"
- Reason: preemption :cause=3 :text="Generic Preemption"
- Reason: preemption ;cause=4 ;text="Non-IP Preemption"

This Reason cause code indicates that the session preemption has occurred in a non-IP portion of the infrastructure. The device sends this code in the following scenarios:

- The device performs a network preemption of a busy call (when a high priority call is received), the device sends a SIP BYE or CANCEL request with this Reason cause code.
- The device performs a preemption of a B-channel for a Tel-to-IP outbound call request from the softswitch for which it has not received an answer response (e.g., Connect), and the following sequence of events occurs:
 - **a.** The device sends a Q.931 DISCONNECT over the ISDN MLPP PRI to the partner switch to preempt the remote end instrument.
 - b. The device sends a 488 (Not Acceptable Here) response with this Reason cause code.
- Reason: preemption; cause=5; text="Network Preemption"

This Reason cause code indicates preempted events in the network. Within the Defense Switched Network (DSN) network, the following SIP request messages and response codes for specific call scenarios have been identified for signaling this preemption cause:

- SIP:BYE If an active call is being preempted by another call
- CANCEL If an outgoing call is being preempted by another call
- 480 (Temporarily Unavailable), 486 (User Busy), 488 (Not Acceptable Here) -Due to incoming calls being preempted by another call.

The device receives SIP requests with preemption reason cause=5 in the following cases:

- The softswitch performs a network preemption of an active call the following sequence of events occurs:
 - **a.** The softswitch sends the device a SIP BYE request with this Reason cause code.

- b. The device initiates the release procedures for the B-channel associated with the call request and maps the preemption cause to PRI Cause = #8 'Preemption'. This value indicates that the call is being preempted. For PRI, it also indicates that the B-channel is not reserved for reuse.
- **c.** The device sends a SIP 200 OK in response to the received BYE, before the SIP end instrument can proceed with the higher precedence call.
- The softswitch performs a network preemption of an outbound call request for the device that has not received a SIP 2xx response - the following sequence of events occur:
 - **a.** The softswitch sends the device a SIP 488 (Not Acceptable Here) response code with this Reason cause code. The device initiates the release procedures for the B-channel associated with the call request and maps the preemption cause to PRI Cause = #8 'Preemption'.
 - b. The device deactivates any user signaling (e.g., ringback tone) and when the call is terminated, it sends a SIP ACK message to the softswitch.

27.6.2 Precedence Ring Tone

You can configure the duration for which the device plays a preemption tone to the Tel and IP sides if a call is preempted, using the PreemptionToneDuration parameter.

27.7 Detecting Collect Calls

The device detects collect calls (reverse charge calls) using any of the following information elements (IE) in the received Q.931 ISDN Setup message for Tel-to-IP calls:

- Reverse Charging Indication IE
- Facility IE

When the device detects a collect call, it adds a proprietary header (X-Siemens-Call-Type: collect call) to the outgoing SIP INVITE message.

This support does not require any configuration and is applicable to the Euro ISDN protocol variant.

27.8 Advice of Charge Services for Euro ISDN

Advice of charge (AOC) is a pre-billing function that tasks the rating engine with calculating the cost of using a service and relaying that information back to the customer (caller). This allows users to obtain call charging information periodically - during the call (AOC-D) and at the end of the call (AOC-E).

The AOC messages are sent in the EURO ISDN Facility Information Element (IE) message. The device interworks these ISDN messages with SIP by converting the AOC messages into SIP INFO (during call) and BYE messages (end of call), using AudioCodes proprietary SIP AOC header, and vice versa. The device supports both currency (monetary units) and pulse (non-monetary units) AOC messages.

This feature can typically be implemented in the hotel industry, where external calls made by guests can be billed accurately. In such a setup, the device is connected on one side to a PBX through an ISDN line (Euro ISDN), and on the other side to a SIP trunk provided by an ITSP. When a call is made by a guest, the device first sends an AOC-D Facility message to the PBX indicating the connection charge unit, and then sends subsequent AOC-D messages every user-defined interval to indicate the charge unit during the call. When the call ends, the device sends an AOC-E Facility message to the PBX indicating the total number of charged units.

The device supports various methods for AOC:

Tel-to-IP direction: The device converts the AOC messages received in the EURO ISDN Facility IE messages into SIP INFO and BYE messages using AudioCodes

proprietary SIP AOC header.

- IP-to-Tel direction provides optional methods:
 - The device generates the metering tones according to user-defined pulses and intervals, configured in the Charge Code table (see "Configuring Charge Codes" on page 458). These include:
 - 'Pulses On Answer' number of charging units in the first generated AOC-D Facility message.
 - 'Pulse Interval' time between every sent AOC-D Facility message.
 - 'End Time' time at which the charge code ends.
 - TELES proprietary method. For more information, see the PayPhoneMeteringMode parameter in Metering Tone Parameters on page 865.
 - Cirpack proprietary methods. For more information, see the PayPhoneMeteringMode parameter.

To configure AOC:

- Make sure that the PSTN protocol for the trunk line is Euro ISDN and set to network side.
- 2. Make sure that the date and time of the device is correct. For accuracy, it is recommended to use an NTP server to obtain the date and time.
- For AOC in the Tel-to-IP direction:
 - a. Enable the AOC service for sending AOC to IP: on the Supplementary Services page (Configuration tab > VoIP menu > GW and IP to IP > DTMF and Supplementary > Supplementary Services), set 'AoC Support' to Enable.
- 4. For AOC in the IP-to-Tel direction:
 - Configure the AOC method: on the Supplementary Services page
 (Configuration tab > VoIP menu > GW and IP to IP > DTMF and
 Supplementary > Supplementary Services), configure the 'Generate Metering
 Tones' parameter (PayPhoneMeteringMode).
 - b. If the AOC feature uses the Charge Codes table, configure Charge Codes (see Configuring Charge Codes), and then assign the Charge Code index to the relevant Tel-to-IP routing rule in the Outbound IP Routing table (see "Configuring Outbound IP Routing" on page 407).

Note: This feature is applicable to Euro ISDN (PRI).

27.9 Configuring Charge Codes

The Charge Codes table lets you configure metering tones Advice of Charge (AOC) services for Euro ISDN trunks (see Advice of Charge Services for Euro ISDN on page 456).

You can configure up to 25 different Charge Codes, where each table row represents a Charge Code. Each Charge Code can include up to four different time periods in a day (24 hours). The device selects the time period by comparing the device's current time to the end time of each time period of the selected Charge Code. The device generates the number of pulses on answer once the call is connected, and from that point on, it generates a pulse for each pulse interval. If a call starts at a certain time period and crosses to the next, the information of the next time period is used.

To assign a Charge Code to an outgoing Tel-to-IP call, use the Outbound IP Routing table.

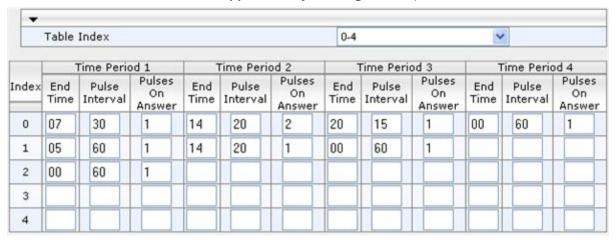

Note: The Charge Codes table is applicable only to Euro ISDN PRI interfaces.

The following procedure describes how to configure Charge Codes in the Web interface. You can also configure Charge Codes using the table ini file parameter, ChargeCode.

To configure a Charge Code:

1. Open the Charge Codes Table page (Configuration tab > VoIP menu > GW and IP to IP > DTMF and Supplementary > Charge Codes).

- Configure a Charge Code according to the parameters described in the table below.
- 3. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 27-7: Charge Codes Table Parameter Descriptions

Parameter	Description
End Time [ChargeCode_EndTime<1-4>]	Defines the end of the time period in a 24 hour format, <i>hh</i> . For example, "04" denotes 4 A.M.
	Notes:
	The first time period always starts at midnight (00).
	 It is mandatory that the last time period of each rule end at midnight (00). This prevents undefined time frames in a day.

Parameter	Description
Pulse Interval [ChargeCode_PulseInterval<1-4>]	Defines the time interval between pulses (in tenths of a second).
Pulses On Answer [ChargeCode_PulsesOnAnswer<1- 4>]	Defines the number of pulses sent on answer.

27.10 Configuring Voice Mail

The Voice Mail Settings page allows you to configure the voice mail parameters. For a description of these parameters, see "Configuration Parameters Reference" on page 691.

Notes:

- The Voice Mail Settings page is available only for CAS interfaces.
- For more information on configuring voice mail, refer to the CPE Configuration Guide for Voice Mail User's Manual.

> To configure the Voice Mail parameters:

1. Open the Voice Mail Settings page (Configuration tab > VoIP menu > GW and IP to IP > Advanced Applications > Voice Mail Settings).

Figure 27-7: Voice Mail Settings Page

- Configure the parameters as required.
- 3. Click Submit.
- 4. To save the changes to flash memory, see "Saving Configuration" on page 550.

Part VI

Session Border Controller Application

User's Manual 28. SBC Overview

28 SBC Overview

This section provides a detailed description of the device's SBC application.

Notes:

 For guidelines on how to deploy your E-SBC device, refer to the E-SBC Design Guide document.

- The SBC feature is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see "Software License Key" on page 575.
- For the maximum number of supported SBC sessions, and SBC users than can be registered in the device's registration database, see "Technical Specifications" on page 925.

The SBC application supports the following main features:

- NAT traversal: The device supports NAT traversal, allowing, for example, communication with ITSPs with globally unique IP addresses, for LAN-to-WAN VoIP signaling (and bearer), using two independent legs. This also enables communication for "far-end" users located behind a NAT on the WAN. The device supports this by:
 - Continually registering far-end users in its dynamic database.
 - Maintaining remote NAT binding state by frequent registrations, thereby, offloading far-end registrations from the LAN IP PBX.
 - Using Symmetric RTP (RFC 4961) to overcome bearer NAT traversal.
- VoIP firewall and security for signaling and media:
 - SIP signaling:
 - Deep and stateful inspection of all SIP signaling packets.
 - SIP dialog initiations may be rejected based on values of incoming SIP INVITE message and other Layer-3 characteristics.
 - Packets not belonging to an authorized SIP dialog are discarded.
 - RTP:
 - Opening pinholes (ports) in the device's firewall based on Offer-Answer SDP negotiations.
 - Deep packet inspection of all RTP packets.
 - Late rogue detection if a SIP session was gracefully terminated and someone tries to "ride on it" with rogue traffic from the already terminated RTP and SIP context, the VoIP Firewall prevents this from occurring.
 - Disconnects call (after user-defined time) if RTP connection is broken.
 - Black/White lists for both Layer-3 firewall and SIP classification.
- Topology hiding: The device intrinsically supports topology hiding, limiting the amount of topology information displayed to external parties. For example, IP addresses of ITSPs' equipment (e.g. proxies, gateways, and application servers) can be hidden from outside parties. The device's topology hiding is provided by implementing backto-back user agent (B2BUA) leg routing:
 - Strips all incoming SIP Via header fields and creates a new Via value for the outgoing message.
 - Each leg has its own Route/Record Route set.
 - Modifies SIP To, From, and Request-URI host names (must be configured using the Message Manipulations table).
 - Generates a new SIP Call-ID header value (different between legs).

- Changes the SIP Contact header to the device's own address.
- Layer-3 topology hiding by modifying source IP address in the SIP IP header.
- SIP normalization: The device supports SIP normalization, whereby the SBC application can overcome interoperability problems between SIP user agents. This is achieved by the following:
 - Manipulation of SIP URI user and host parts.
 - Connection to ITSP SIP trunks on behalf of an IP-PBX the device can register and utilize user and password to authenticate for the IP-PBX.

Survivability:

- Routing calls to alternative routes such as the PSTN.
- Routing calls between user agents in the local network using a dynamic database (built according to registrations of SIP user agents).

Routing:

- IP-to-IP routing translations of SIP, UDP, TCP, TLS (when extensive transcoding is not required).
- Load balancing and redundancy of SIP servers.
- Routing according to Request-URI\Specific IP address\Proxy\FQDN.
- Alternative routing.
- Routing between different Layer-3 networks (e.g., LAN and WAN).
- Load balancing\redundancy of SIP servers.
- ITSP accounts.
- SIP URI user and host name manipulations.
- Coder transcoding.

28.1 SIP Network Definitions

The device's SBC application can implement multiple SIP signaling and RTP (media) interfaces.

28.2 SIP Dialog Initiation Process

The device's SIP dialog initiation process concerns all incoming SIP dialog initiation requests. This includes SIP methods such as INVITE, SUBSCRIBE, OPTIONS, REFER, INFO, UNSOLICITED NOTIFY, MESSAGE, and REGISTER.

The SIP dialog initiation process consists of the following stages:

- 1. Determining source and destination URL: The SIP protocol has more than one URL in a dialog-establishing request that may represent the source and destination URLs. When handling an incoming request, the device uses specific SIP headers for obtaining the source and destination URLs. Once these URLs are determined, their user and host parts are used as input for the classification process, message manipulation, and call routing.
 - All SIP requests (e.g., INVITE) except REGISTER dialogs:
 - Source URL: The source URL is obtained from the SIP header according to the following logic:
 - ✓ The source URL is obtained from the From header.
 - ✓ If the From header contains the value 'Anonymous', the source URL is obtained from the P-Preferred-Identity header.
 - ✓ If the P-Preferred-Identity header does not exist, the source URL is obtained from the P-Asserted-Identity header.

User's Manual 28. SBC Overview

Destination URL: The destination URL is obtained from the Request-URI.

- REGISTER dialogs:
 - Source URL: The source URL is obtained from the To header.
 - Destination URL: The destination URL is obtained from the Request-URI.

Note: You can determine the SIP header from where the device obtains the source URL in the incoming SIP request. This is done in the IP Group table using the 'Source URI Input' parameter.

- 2. Classifying incoming SIP dialog-initiating requests to a source IP Group: The classification identifies the incoming SIP dialog request as belonging to a specific IP Group (from where the SIP dialog request originated). For more information, see "Configuring Classification Rules" on page 502.
- 3. SBC IP-to-IP routing: The device routes the call to a destination that can be configured to one of the following:
 - Registered user Contact listed in the device's database (only for User-type IP Groups).
 - IP Group the destination is the address configured for the Proxy Set associated with the IP Group (allows redundancy/load balancing).
 - Specified destination address (can be based on IP address, host name, port, transport type, and/or SRD). Routing to a host name can be resolved using NAPTR/SRV/A-Record.
 - Request-URI of incoming SIP dialog initiating requests.
 - ENUM query.
 - Hunt Group used for call survivability.
 - IP address (in dotted-decimal notation or FQDN NAPTR/SRV/A-Record resolutions) according to a specified Dial Plan index listed in the loaded Dial Plan file.
 - LDAP server or LDAP query result.

For more information, see "Configuring SBC IP-to-IP Routing Rules" on page 510.

- 4. Manipulating SIP URI user part (source and destination) of inbound and/or outbound SIP dialog requests: You can configure rules for manipulating the SIP URI user part (source and destination) on the inbound and/or outbound leg. For more information, see "SBC Manipulations" on page 520.
- 5. SIP message manipulations: You can configure SIP message manipulation rules that can add, remove, and/or modify SIP headers and parameters. For more information, see "Configuring SIP Message Manipulation" on page 298.

The flowchart below illustrates the SBC process:

Incoming SIP Dialog Request (e.g. INVITE) from Specific SIP Interface belonging to Specific SRD Determining Source/ Destination URL Failed Call Rejected Source SRD, Source/ Output Input Classification Dest. IP Group, Manipulated Output Input Outbound Source SRD, Source/Dest Source/Dest Host Manipulation URL, Dest IP Address Names

Figure 28-1: Routing Process

28.3 User Registration

To allow registrations to traverse the SBC, the device must be configured with at least one User-type IP Group. These IP Groups represent a group of user agents that share the following characteristics:

- Perform registrations and share the same serving proxy\registrar
- Possess identical SIP and media behavior
- Reside on the same Layer-3 network and are associated with the same SRD

User's Manual 28. SBC Overview

Typically, the device is configured as the user agent's outbound proxy and the device is configured (using the IP-to-IP Routing table) to route requests received from this IP Group to the serving proxy and vice versa. Survivability can be achieved using the alternative routing feature.

28.3.1 Initial Registration Request Processing

The device's handling of registration requests (REGISTER messages) are as follows:

- The device obtains the source URL from the SIP To header and the destination URL from the Request-URI.
- The device's classification process for REGISTER requests is the same as for other SIP messages. However, the REGISTER request must be received from **User-type** IP Groups only. If classification fails or the IP Group is not a User-type, the device rejects the registration request.
- The device's routing of REGISTER requests is done using the IP-to-IP Routing table. If the destination is a User-type IP Group, the device does not forward the registration; instead, it accepts (replies with a SIP 200 OK response) or rejects (SIP 4xx) the request, according to the user's IP Group configuration.
- If registration succeeds (replied with 200 OK by the IP PBX), the device adds a record to its Users Registration database that identifies the specific contact of the specific user (AOR). This record is used by the device to route subsequent requests to the specific user (in normal or in survivability modes).
- Alternative routing can be configured for REGISTER requests, in the IP-to-IP Routing table.
- The record in the device's database includes the SIP Contact header. Every REGISTER request is added to the database before manipulation, allowing correct user identification in the Classification process for the next received request.
- Call Admission Control (CAC) can be configured for incoming and outgoing REGISTER requests. For example, limiting REGISTER requests from a certain IP Group/SRD. Note that this is only for concurrent register dialogs and not concurrent registrations in the device's Users Registration database.
- The device can retain the original value of the SIP Expires header received from the user or proxy, in the outgoing REGISTER message. This feature also applies when the device is in survivability mode (i.e., REGISTER requests cannot be forwarded to the proxy and is terminated by the device). This is configured by the SBCUserRegistrationTime, SBCProxyRegistrationTime, SBCRandomizeExpires, and SBCSurvivabilityRegistrationTime parameters.
- By default, the Contact header in the outgoing REGISTER is populated with a unique contact generated by the device and associated with the specific registration. Alternatively, the original user can be retained in the Contact header and used in the outgoing REGISTER request (using the SBCKeepContactUserinRegister parameter).

28.3.2 SBC Users Registration Database

The device manages a dynamic Users Registration database that is updated according to registration requests that traverse it. Each database entry for a user represents a binding between an AOR (obtained from the SIP To header) and one or more contact (obtained from the SIP Contact headers). Database bindings are added upon successful registration responses.

Database bindings are removed in the following cases:

- Successful de-registration responses (REGISTER with Expires header that equals zero).
- Registration failure responses.

Timeout of the Expires header value (in scenarios where the user agent did not send a refresh registration request).

Note: The device's Users Registration database poses the following restrictions:

- The same contact cannot belong to more than one AOR.
- Contacts with identical URIs and different ports and transport types are not supported (same key is created).
- Multiple contacts in a single REGISTER is not supported.
- One database is shared between all User-type IP Groups.

28.3.3 Routing using Users Registration Database

The device uses the Users Registration database when routing calls of registered users. The device tries to locate a match for the IP-to-IP Routing rule between the incoming Request-URI and the following, listed in chronological order:

- 1. Unique Contact: the contact generated by the device and sent in the initial registration request to the serving proxy.
- Registered AOR in the Users Registration database: the AOR of the incoming REGISTER request.
- **3.** Registered Contact in the Users Registration database: the Contact of the incoming REGISTER request.

If registrations are destined to the database (using the above rules), the device does not attempt to find a database match, but instead replies with a SIP 200 OK (used for Survivability). Once a match is found, the request is routed either to the contact received in the initial registration or (if the device identifies that the user agent is behind a NAT) to the source IP address of the initial registration.

28.3.4 Registration Refreshes

Registration refreshes are incoming REGISTER requests that are associated with a registered user in the Users Registration database. These refreshes are routed to the serving proxy only if the serving proxy Expires time is about to expire; otherwise, the device responds with a 200 OK without routing the REGISTER. Each such refreshes also refresh the internal timer set on the device for this specific registration.

The device automatically notifies SIP Proxy / Registrar servers of users that are registered in the device's Users Registration database whose registration timeout has expired. When a user's registration timer expires, the device removes the user record from the database and sends an un-register notification (REGISTER message with the Expires header set to 0) to the Proxy/Registrar. This occurs only if a REGISTER message is sent to an IP Group destination type (in the IP-to-IP Routing table).

The device can be configured to add extra time (grace period) to the expiration timer of registered users in the database. If you configure this grace period, the device keeps the user in the database (and does not send an un-register to the Registrar server), allowing the user to send a "late" re-registration to the device. The device removes the user from the database only when this additional time expires. This featured is configured using the 'User Registration Grace Time' parameter (SBCUserRegistrationGraceTime).

The device keeps registered users in its Users Registration database even if connectivity with the SIP proxy server is lost (i.e., proxy does not respond to users' registration refresh requests). The device removes users from the database only when their registration expiry time is reached (with the additional grace period, if configured).

28.3.5 Registration Restriction Control

The device provides flexibility in controlling user registration:

Limiting Number of Registrations: You can limit the number of users that can register with the device per IP Group and/or SRD. By default, no limitation exists for registered users. This is configured in the SRD and IP Group tables.

Blocking Incoming Calls from Unregistered Users: You can block incoming calls (INVITE requests) from unregistered users (pertaining to User-type IP Groups). By default, calls from unregistered users are not blocked. This is configured in the SRD table. The flowchart below depicts the process for blocking unregistered users. When the call is rejected, the device sends a SIP 500 (Server Internal Error) response to the remote end.

Classification Complete: Obtain Source IP Group SERVER USER Source IP Group Type? Continue to Regular Yes User SBC Routing Registered? Process No Source No SRD Blocked for Unregistered Users? Yes Reject Call

Figure 28-2: Blocking Incoming Calls from Unregistered Users

28.4 SBC Media Handling

Media behavior includes anything related to the establishment, management and termination of media sessions within the SIP protocol. Media sessions are created using the SIP "offer"/"answer" mechanism. If successful, the result is a bi-directional media (RTP) flow (e.g. audio, fax, modem, DTMF). Each offer/answer may create more than one media session of different types (e.g. audio and fax). In a SIP dialog, multiple offer/answer transactions may occur, each may change the media sessions characteristics (e.g. IP address, port, coders, media types, and RTP mode). The media capabilities exchanged in an offer/answer transaction include the following:

Media types (Audio, Secure Audio, Video, Fax, Text...)

- IP addresses and ports of the media flow
- Media flow mode (send receive, receive only, send only, inactive)
- Media coders (coders and their characteristics used in each media flow)
- Other (standard or proprietary) media and session characteristics

Even though the device usually does not change the negotiated media capabilities (mainly performed by the remote user agents), it does examine the media exchange to control negotiated media types (if necessary) and to know how to open the RTP media channels (IP addresses, coder type, payload type etc.). The device forwards multiple video streams and text, as is.

The device interworks (normalization) the media (RTP-to-RTP, SRTP-to-RTP, and SRTP-to-SRTP) between its SBC legs. It "re-builds" specific fields in the RTP header when forwarding media packets. The main fields include the sequence number, SSRC, and timestamp.

The device is aware and sometimes active in the offer\answer process due to the following:

- NAT traversal: the device changes the SDP address to be its own address, thereby, resolving NAT problems.
- Firewall and security:
 - RTP pin holes only RTP packets related to a successful offer\answer negotiation traverse the device: When the device initializes, there are no RTP pin holes opened, this means that each RTP\RTCP packets destined to the device are discarded. Once an offer\answer transaction ends successfully, an RTP pin hole is opened and RTP\RTCP flows between the two remote user agents. Once a pin hole is opened, the payload type and RTP header version is validated for each packet. RTP pin holes close if one of the associated SIP dialogs is closed (may also be due to broken connection).
 - Late rogue detection once a dialog is disconnected, the related pin holes also disconnect.
 - Deep Packet inspection of the RTP that flows through the opened pin holes.
- Adding of media functionality to SIP user agents:
 - Transcoding (for a description on the transcoding modes, see "Transcoding Modes" on page 474)
 - Broken connection

According to the above functionalities, the call can be configured to operate in one of the following modes:

- Media Anchoring without Transcoding (Transparent): RTP traverses the device with minimal RTP packet changes (no DSP resources needed). This is typically used to solve NAT, firewall, and security issues. In this mode, all the "audio" coders in the received offer are included in the SBC outgoing offer. The Coder Table configuration has no effect on the coders in the outgoing offer. For more information, see "Media Anchoring without Transcoding (Transparent)" on page 470.
- Media Anchoring with Transcoding: RTP traverses the device and each leg uses a different coder or coder parameters (DSP resources are required). For more information, see "Media Anchoring with Transcoding" on page 471.
- No Media Anchoring: The RTP packet flow does not traverse the device. Instead, the two SIP UA's establish a direct RTP/SRTP flow between one another (see "No Media Anchoring" on page 473).

28.4.1 Media Anchoring without Transcoding (Transparent)

To direct the RTP to flow through the device (for NAT traversal, firewall and security), all IP address fields in the SDP are modified:

Origin: IP address, session and version id

- Session connection attribute ('c=' field)
- Media connection attribute ('c=' field)
- Media port number
- RTCP media attribute IP address and port

Each SBC leg allocates and uses the device's local ports (e.g., for RTP\RTCP\fax). The local ports are allocated from a Media Realm associated with each leg. The legs are associated with a Media Realm as follows: If the leg's IP Group is configured with a Media Realm, then this is the associated Media Realm; otherwise, the leg's SRD Media Realm is the associated one. The figure below illustrates an example of SDP handling for a call between a LAN IP Phone 10.2.2.6 and a remote IP Phone 212.179.1.13 on the WAN.

WAN Media Address: LAN Media Address: 10.2.2.2:5000-6000 212.179.1.11:7000-8000 Incoming SDP Offer - from LAN Outgoing SDP Offer - to WAN v=0 o=SMG 791285 795617 IN IP4 10.2.2.6 o=SMG 5 9 IN IP4 212,179,1.11 s=Astra Phone-Call s=Astra Phone-Call c=IN IP4 10.2.2.6 c=IN IP4 212.179.1.11 t=00 t=00 a=xxxxxx a=xxxxxx m=audio 6000 RTP/AVP 8 18 96 m=audio 8000 RTP/AVP 8 18 96 a=rtpmap:8 pcma/8000 a=rtpmap:8 pcma/8000 INVITE INVITE a=rtpmap:96 telephone-event/8000 a=rtpmap:96 telephone-event/8000 WAN a=fmtp:96 0-15 Enterprise a=fmtp:96 0-15 a=rtpmap:18 G729/8000 a=rtpmap:18 G729/8000 LAN a=sendrecy a=sendrecy a=ptime:20 a=ptime:20 IP Phone **IP Phone** IP Address: IP Address: Incoming Answer - from WAN Outgoing SDP Answer - to LAN 10226 212,179,1,13 o=SMG 777777 888888 IN IP4 o=SMG 866455 789789 IN IP4 10.2.2. 212,179,1,13 s=Astra Phone-Call s=Astra Phone-Call c=IN IP4 10,2,2,2 c=IN IP4 212.179.1.13 200 OK t=00 t=00 200 OK a=xxxxxx a=xxxxxx m=audio 4500 RTP/AVP 8 96 m=audio 5010 RTP/AVP 8 96 a=rtpmap:8 pcma/8000 a=rtpmap:8 pcma/8000 a=rtpmap:96 telephone-event/8000 a=rtpmap:96 telephone-event/8000 a=fmtp:96 0-15 a=fmtp:96 0-15 a=sendrecv a=sendrecv a=ptime:20 a=ptime:20

Figure 28-3: SDP Offer/Answer Example

28.4.2 Media Anchoring with Transcoding

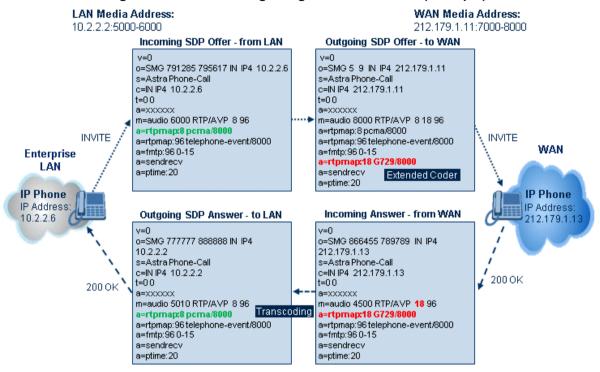

The device performs transcoding when there are no common coders between the two user agents (i.e., the SDP answer from one user agent doesn't include any coder included in the offer previously sent by the other user agent). For transcoding, the device can be configured to add media capabilities to user agents pertaining to a specific IP Group, and then perform transcoding in cases where the selected coder in the answer SDP is not one that appears in the original offer. The capabilities that can be added are one or more of the configured by device's supported coders and are using the SBCExtensionCodersGroupID (points to a coders list) in the IP Profile table (which is assigned to the IP Group). Therefore, to allow user agents of different IP Groups to communicate with each other (regardless of their capabilities), an extended coders table with at least one coder that is supported by each IP Groups' user agents needs to be assigned to each IP Group. Therefore, each offer destined to specific IP Groups include this coder.

In the scenario depicted in the figure below, the IP phone on the LAN side initiates a call to the IP phone on the WAN. The initial SDP offer (from the LAN leg) includes codec G.711 as its supported codec. Since this is sent to a Destination IP Group that is configured with an extended coder list, on the WAN leg the device adds another supported codec G.729 to

the SDP, which is now offered to the WAN IP phone. The WAN IP phone chooses the extended codec (G.729) in its SDP answer to the device's WAN leg. Since this codec was not included in the original incoming offer, the device performs transcoding (between G.729 and G.711) between its two legs, allowing the streaming of media to occur.

Figure 28-4: Transcoding using Extended Coders (Example)

For an SDP offer to provide an extended coder list to a remote user agent, the following prerequisites must be fulfilled:

- An extended coders list has been configured for the user agent's IP Group (i.e., Destination IP Group)
- The incoming offer contains at least one supported coder (otherwise, transcoding can't be performed)
- Both legs have available DSP's
- T.38 doesn't appear in the offer

If the above prerequisites are not met, the SDP offer is sent without the extended coders list. The coders from the extended list are added after the ones from the original offer (decreases transcoding probability). Coders common between the extended coders list and those in the original SDP offer are not added. Transcoding may be performed even in scenarios when the same coder has been chosen - this occurs if the coders use different coder parameters (e.g. rate and packetization time).

The device also supports early media, whereby the first offer\answer transaction is finalized and the media flow starts before the SIP call is connected (before the INVITE 200 OK response). The offer and answer options can be included in the following SIP messages:

- Offer in first INVITE, answer on 180, and no or same answer in the 200 OK
- Offer in first INVITE, answer on 180, and a different answer in the 200 OK (not standard)
- INVITE without SDP, offer in 180, and answer in PRACK
- PRACK and UPDATE transactions can also be used for initiating subsequent offer\answer transactions before the INVITE 200 OK response.
- In a SIP dialog life time, media characteristics after originally determined by the first offer\answer transaction can be changed by using subsequent offer\answer transactions. These transactions may be carried either in UPDATE or ReINVITE SIP

transactions. The media handling is similar to the original offer/answer handling. If the offer is rejected by the remote party, then no media changes occur (e.g. INVITE without SDP, then 200 OK and ACK, offer\answer within an offer/answer, and Hold ReINVITE with IP address of 0.0.0.0 - IP address is unchanged).

28.4.3 No Media Anchoring

The No Media Anchoring (commonly referred to as Anti-Tromboning) feature enables the use of SBC signaling capabilities without handling the media (RTP/SRTP) flow between remote SIP user agents (UA). The media flow does not traverse the device. Instead, the two SIP UAs establish a direct media flow (i.e., direct call) between one another. Signaling continues to traverse the device with minimal intermediation and involvement to enable certain SBC abilities such as routing.

By default, media packets traverse the device to solve NAT problems, enforce media security policy, perform media transcoding between the two legs, and media monitoring. In certain deployments, specific calls do not require media anchoring, for example, when there is no need for NAT, security, or transcoding. This is typical for calls between users in the LAN:

- Internal LAN calls: When the SBC routes a call between two UAs within the same LAN, the SBC can forward the SDP directly between caller and callee, and direct the media to flow between the UAs without traversing the SBC.
- Internal LAN calls via WAN: In this setup, the SBC dynamically identifies the call as between UAs located in the same network (i.e., LAN) and thereby, directs the media to flow between these UAs without traversing the SBC.

The No Media Anchoring feature is typically implemented in the following scenarios:

- The device is located within the LAN.
- Calls between two SIP UAs in the same LAN and signaling is sent to a SIP proxy server (or hosted IP PBX) located in the WAN.
- The device does not need to perform NAT traversal (for media) and all the users are in the same domain.

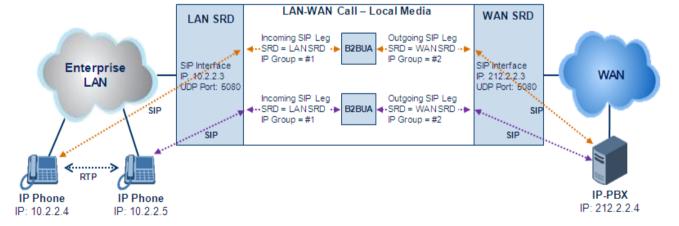

Figure 28-5: SBC SIP Signaling without RTP Media Flow

The benefits of implementing the No Media Anchoring feature include the following:

- Saves network bandwidth
- Reduces CPU usage (no media handling)
- Avoids interference in SDP negotiation and header manipulation on RTP/SRTP

The device handles the No Media Anchoring process as follows:

1. Identifies a No Media Anchoring call according to configuration and the call's properties (such as source, destination, IP Group, and SRD).

Handles the identified No Media Anchoring call.

The No Media Anchoring feature is enabled for all calls (regardless of SRD), using the global parameter, SBCDirectMedia. You can also enable No Media Anchoring per SRD (in the SRD table), whereby calls belonging to this same SRD (source and destination) are handled as No Media Anchoring (direct media) calls. This occurs even if the global parameter is disabled.

Notes:

- No Media Anchoring can be used when the SBC does not do NAT traversal (for media) where all the users are in the same domain.
- No Media Anchoring calls cannot operate with the following features:
 - Manipulation of SDP data (offer/answer transaction) such as ports, IP address, coders
 - √ Force transcoding
 - √ Extension Coders
 - √ Extension of RFC 2833 / out-of-band DTMF / in-band DTMF
 - √ Extension of SRTP/RTP

- All restriction features (Allowed Coders, restrict SRTP/RTP, restrict RFC 2833)
 can operate with No Media Anchoring calls. Restricted coders are removed from
 the SDP offer message.
- For No Media Anchoring, opening of voice channels and allocation of IP media ports are not required.
- When two UAs belong to the same SRD which is enabled for No Media Anchoring, and one of the UAs is defined as a foreign user (example, "follow me service") located in the WAN while the other UA is located in the LAN: calls between these two UAs cannot be established until the No Media Anchoring for the SRD is disabled, as the device does not interfere in the SIP signaling. In other words, parameters such as IP addresses are not manipulated for calls between LAN and WAN (although required).
- When the global parameter SBCDirectMedia is disabled, No Media Anchoring can only occur for calls between UAs belonging to the same SRD that is configured for No Media Anchoring in the SRD table.

28.4.4 Transcoding Modes

The device supports the configuration of the voice transcoding mode (media negotiation) between the two SBC legs. The device can be configured to perform transcoding only when necessary. Typically, the SBC passes RTP packets transparently (RTP-to-RTP) between the two user agents. If the device is configured to always perform transcoding, then transcoding is performed on the outgoing SBC leg and the device's SBC application interworks the media by implementing PSTN transcoding (since both legs have different media capabilities).

In the SBC application, forced transcoding of voice in an SBC session allows the device to receive capabilities that are not negotiated between the SBC legs. For example, if on the SBC session you want to force Gain Control to use voice transcoding even though both sides of the session have negotiated without SBC intervention (for example, coder extension).

The transcoding mode can be configured globally, using the TranscodingMode parameter or for specific calls, using the IP Profile table.

Note: To implement transcoding, you must configure the number of required DSP channels for transcoding (for example, MediaChannels = 120). Each transcoding session uses two DSP resources.

28.4.5 Restricting Coders

The SBC Allowed Coders (coders restriction) feature determines the coders that can be used for a specific SBC leg. This provides greater control over bandwidth by enforcing the use of specific coders (*allowed coders groups*) while preventing the use of other coders. This is done by defining a group of allowed coders for the SBC leg, as described below:

- 1. Configure a Coders Group for allowed coders, using the AllowedCodersGroup parameter.
- 2. Select this Coders Group using the SBCAllowedCodersGroupID parameter of the IP Profile table.
- Enable this feature by setting the SBCAllowedCodersMode parameter of the IP Profile table to Restriction.

Coders that are not listed (including unknown coders) in the Allowed Coders Group are removed from the SDP offer. Therefore, only coders common between the SDP offer and Allowed Coders Group are used. If the SDP offer does not list any of the Allowed Coders, the call is rejected, unless transcoding is configured using Extension coders (see Coder Transcoding on page 475).

Notes:

- For a list of supported coders, see "Configuring Default Coders" on page 307.
- Allowed Coder Groups are applicable only to audio media.

The Allowed Coders process is as follows:

- The device receives an incoming SIP message with SDP (offer) and checks the offered coders.
- b. The source (first) leg may have Allowed Coders (i.e. list of coders that can be used enforced).
- c. The device checks for common coders between the SDP offered coders and the Allowed Coders Group list.

For example, assume the following:

- The SDP coder offer includes the following coders: G.729, G.711, and G.723.
- The source (first) leg includes the following Allowed Coders: G.711 and G.729.

The device selects the common coders, i.e., G.711 and G.729 (with changed preferred coder priority - highest for G.711). In other words, it removes the coders that are not in the Allowed Coders list and the order of priority is first according to the Allowed Coders list.

28.4.6 Coder Transcoding

The device can add coders, referred to as *Extension coders* to the SDP offer in the outgoing leg.

For example, assume the following:

- The SDP coder offer includes the following coders: G.729, G.711, and G.723.
- The incoming leg includes the following Allowed coders: G.711 and G.729.
- 1. The device selects the common coders, i.e., G.711 and G.729 (with changed

preferred coder priority - highest for G.711). In other words, it removes the coders that are not in the Allowed coders list and the order of priority is first according to the Allowed coders list.

- 2. Assuming that the outgoing leg also includes Allowed coders and/or Extension coders: The device performs the Allowed coders procedure (common coders) between the updated coder list and the outgoing leg's Allowed coders. The Extension coders procedure is performed before Allowed coders.
- Adding to the example, assume the following:
 - For the outgoing leg, the device selects the common coders G.711 and G.729 (explained in the example above).
 - Outgoing leg includes the Extended coder G.726.
 - Outgoing leg includes the following Allowed coders: G.723, G.726, and G.729.

As a result, the device selects the common coders, i.e., G.729 and G.726 (coder priority did not change Extension coder order).

If the Allowed coders policy on the SDP incoming leg returns an empty coders list, the device rejects the call (SIP 488 or ACK and BYE). If both Extension coders and Allowed coders policies on SDP (in this order) returns an empty coders list, the outgoing leg rejects the call (SIP 488, or ACK and BYE).

Below is an example, assuming that Allowed Coders list (ordered) includes G711A-law (PCMA), G729, and G711U-law (PCMU), and Extension Coder is G729.

1. SDP offer - original offer:

```
m=audio 6050 RTP/AVP 0 8 4 96
a=rtpmap:0 PCMU/8000
a=rtpmap:8 PCMA/8000
a=rtpmap:4 G723/8000
a=fmtp:4 annexa=no
a=rtpmap:96 telephone-event/8000
a=fmtp:96 0-15
a=ptime:20
a=sendrecv
```

2. SDP offer - after manipulation:

```
m=audio 6010 RTP/AVP 8 0 96 18
a=rtpmap:0 PCMU/8000
a=rtpmap:8 PCMA/8000
a=rtpmap:96 telephone-event/8000
a=fmtp:96 0-15
a=ptime:20
a=sendrecv
a=rtpmap:18 G729/8000
a=fmtp:18 annexb=no
```

In the SDP, the "m=audio 6010 RTP/AVP 8 0 96 18" line shows that the coder priority has changed - G.711A-law ("8") and then G.711U-law ("0") - and that the Extension coder G.729 ("18") has been added. The G.723 coder ("4) in the original offer was removed as it was not defined in the Allowed Coders list (i.e., a restricted coder).

To configure Extension coders:

- In the Coders Group table (see "Configuring Coder Groups" on page 310), configure a Coders Group for extension coders.
- In the IP Profile table, select this Coders Group in the 'Extension Coders Group ID' parameter.
- 3. In the IP Profile table, enable this feature by setting the 'Allowed Coders Mode' parameter to **Restriction** or **Restriction and Preference**.

28.4.7 Prioritizing Coder List in SDP Offer

In addition to restricting the use of coders with Allowed coders, you can prioritize the coders listed in the SDP offer. This feature is referred to as *Coder Preference*. This is done on both SBC legs:

- Incoming SDP offer: The device arranges the coder list according to the order in the Allowed Coders Group table. The coders listed higher up in the table take preference over ones listed lower down in the table. This feature is enabled by setting the 'Allowed Coders Mode' parameter in the IP Profile table to Preference or Restriction and Preference. If set to Preference, in addition to the Allowed coders that are listed first in the SDP offer, the original coders received in the SDP are retained and listed after the Allowed coders. Thus, this mode does not necessarily restrict coder use to Allowed coders, but uses (prefers) the Allowed coders whenever possible.
- Outgoing SDP offer: If only Allowed coders are used, the coders are arranged in the SDP offer as described above. However, if Extension coders are also used, the coder list is arranged according to the 'SBC Preferences Mode' parameter in the IP Profile table. This parameter can be configured to add the Extension coders after the Allowed coders (i.e., at the end of the list default) according to their order in the Coders Group table, or arrange Allowed and Extension coders according to their position in the Coders Group table.

28.4.8 SRTP-RTP and SRTP-SRTP Transcoding

The device supports transcoding between SRTP and RTP. The device can also enforce specific SBC legs to use SRTP and/or RTP. The device's handling of SRTP/RTP is configured using the IP Profile parameter, SBCMediaSecurityBehaviour, which provides the following options:

- SBC passes the media as is, regardless of whether it's RTP or SRTP (default).
- SBC legs negotiate only SRTP media lines (m=); RTP media lines are removed from the incoming SDP offer\answer.
- SBC legs negotiate only RTP media lines; SRTP media lines are removed from the incoming offer\answer.
- Each SDP offer\answer is extended (if not already) to two media lines for RTP and SRTP.

If after SDP offer\answer negotiation, one SBC leg uses RTP while the other uses SRTP, then the device performs RTP-SRTP transcoding. To translate between RTP and SRTP, the following prerequisites must be met:

- At least one supported SDP "crypto" attribute.
- The EnableMediaSecurity parameter must be set to 1.

Transcoding where both legs are configured for SRTP is typically required to trans-encrypt and trans-decrypt. This is relevant when the MKI and Symmetric MKI parameters are enabled. In other words, both sides need to both encrypt and decrypt the outgoing and incoming SRTP packets, respectively.

Channel (DSP) resources are not required for RTP and SRTP transcoding.

28.4.9 Multiple RTP Media Streams per Call Session

The device's SBC application supports multiple RTP media streams per SBC call session. Up to five different media types can be included in a session:

- Audio (m=audio)
- Video (m=video)

- Text (m=text)
- Fax (m=image)

Therefore, the device can provide transcoding of various attributes in the SDP offer/answer (e.g., codec, port, and packetization time) per media type. If the device is unable to perform transcoding (for example, does not support the codec), it relays the SBC dialog transparently.

28.4.10 Interworking DTMF Methods

The device supports interworking between various DTMF methods such as RFC 2833, In-Band DTMF's, and SIP INFO (Cisco\Nortel\Korea). By default, the device allows the remote user agents to negotiate (in case of RFC 2833) and passes DTMF without intervention. However, if two user agents (UA) support different DTMF methods, the device can interwork these different DTMF methods at each leg.

This DTMF interworking feature is enabled using IP Profiles (ini file parameter IPProfile):

- SBCRFC2833Behavior affects the RFC 2833 SDP offer\answer negotiation:
 - [0] (default): the device does not intervene in the RFC 2833 negotiation.
 - [1]: each outgoing offer\answer includes RFC 2833 in the offered SDP (the device adds RFC 2833 only if the incoming offer does not include RFC 2833).
 - [2]: the device removes RFC 2833 from the incoming offer.
- SBCAlternativeDTMFMethod the device's first priority for DTMF method at each leg is RFC 2833. Therefore, if a specific leg negotiates RFC 2833 successfully, then the chosen DTMF method for this leg is RFC 2833. For legs where RFC 2833 is not negotiated successfully, the device uses this parameter to determine the DTMF method for the leg.

The chosen DTMF method determines (for each leg) which DTMF method is used for sending DTMF's. If the device interworks between different DTMF methods and one of the methods is In-band\RFC 2833, detection and generation of DTMF methods requires DSP allocation.

28.5 Fax Negotiation and Transcoding

The device can allow fax transmissions to traverse transparently without transcoding or it can handle the fax as follows:

- Allow interoperability between different fax machines, supporting fax transcoding if required.
- Restrict usage of specific fax coders to save bandwidth, enhance performance, or comply with supported coders. These coders include G.711 (A-Law or Mu-Law), VBD (G.711 A-Law or G.711 Mu-Law), and T38.

Fax configuration is done in the IP Profile and Coder Group Settings tables. The IP Profile table determines the supported fax coders and the negotiation method used between the incoming and outgoing fax legs, using the following fax-related parameters:

- SBCFaxBehavior: defines the offer negotiation method pass fax transparently, negotiate fax according to fax settings in IP Profile, or enforce remote UA to first establish a voice channel before fax negotiation.
- SBCFaxCodersGroupID: defines the supported fax coders (from the Coders Group Settings table).
- SBCFaxOfferMode: determines the fax coders sent in the outgoing SDP offer.
- SBCFaxAnswerMode: determines the fax coders sent in the outgoing SDP answer.
- IPProfile_SBCRemoteRenegotiateOnFaxDetection: You can also configure the device to detect for faxes (CNG tone) immediately after the establishment of a voice channel (i.e., after 200 OK) and within a user-defined interval. If detected, it can then handle

the subsequent fax renegotiation by sending re-INVITE messages to both SIP entities (originating and terminating faxes). For more information, see the parameter in Configuring IP Profiles on page 314.

Note: The voice-related coder configuration (Allowed and Extended coders) is independent of the fax-related coder configuration, with the exception of the G.711 coder. If the G.711 coder is restricted by the Allowed Coders Group table, it is not used for fax processing even if it is listed in the Coders Group Settings table for faxes. However, support for G.711 coders for voice is not dependent upon which fax coders are listed in the Coders Group Settings table.

28.6 Limiting SBC Call Duration

You can define a maximum allowed duration (in minutes) for SBC calls. If an established call reaches this user-defined limit, the device terminates the call. This feature ensures calls are properly terminated, allowing available resources for new calls. This feature is configured using the MaxCallDuration parameter.

28.7 SBC Authentication

The device can authenticate SIP servers and SBC users (clients). The different methods of support for this functionality is described in the following subsections.

28.7.1 SIP Authentication Server Functionality

The device can function as an Authentication server for authenticating received SIP message requests, based on HTTP authentication Digest with MD5. Alternatively, such requests can be authenticated by an external, third-party server.

When functioning as an Authentication server, the device can authenticate the following SIP entities:

- SIP servers: This is applicable to Server-type IP Groups. This provides protection from rogue SIP servers, preventing unauthorized usage of device resources and functionality. To authenticate remote servers, the device challenges the server with a user-defined username and password that is shared with the remote server. When the device receives an INVITE request from the remote server, it challenges the server by replying with a SIP 401 Unauthorized response containing the WWW-Authenticate header. The remote server then re-sends the INVITE containing an Authorization header with authentication information based on this username-password combination to confirm its identity. The device uses the username and password to authenticate the message prior to processing it.
- SIP clients: These are clients belonging to a User-type IP Group. This support prevents unauthorized usage of the device's resources by rogue SIP clients. When the device receives an INVITE or REGISTER request from a client (e.g., SIP phone) for SIP message authorization, the device processes the authorization as follows:
 - 1. The device challenges the received SIP message only if it is configured as a SIP method (e.g., INVITE) for authorization. This is configured in the IP Group table, using the 'Authentication Method List' parameter.
 - If the message is received without a SIP Authorization header, the device "challenges" the client by sending a SIP 401 or 407 response. The client then resends the request with an Authorization header (containing the user name and password).

- **3.** The device validates the SIP message according to the AuthNonceDuration, AuthChallengeMethod and AuthQOP parameters.
 - If validation fails, the device rejects the message and sends a 403 (Forbidden) response to the client.
 - If validation succeeds, the device verifies client identification. It checks that the username and password received from the client is the same username and password in the device's User Information table / database (see "SBC User Information for SBC User Database" on page 572). If the client is not successfully authenticated after three attempts, the device sends a SIP 403 (Forbidden) response to the client. If the user is successfully identified, the device accepts the SIP message request.

The device's Authentication server functionality is configured per IP Group, using the 'Authentication Mode' parameter in the IP Group table (see "Configuring IP Groups" on page 273).

Note: This feature is applicable only to Mediant 3000 in Simplex mode.

28.7.2 User Authentication based on RADIUS

The device can authenticate SIP clients (users) using a remote RADIUS server. The device supports the RADIUS extension for digest authentication of SIP clients, according to draft-sterman-aaa-sip-01. Based on this standard, the device generates the nonce (in contrast to RFC 5090, where it is done by the RADIUS server).

RADIUS based on draft-sterman-aaa-sip-01 operates as follows:

- The device receives a SIP request without an Authorization header from the SIP client.
- 2. The device generates the nonce and sends it to the client in a SIP 407 (Proxy Authentication Required) response.
- 3. The SIP client sends the SIP request with the Authorization header to the device.
- 4. The device sends an Access-Request message to the RADIUS server.
- The RADIUS server verifies the client's credentials and sends an Access-Accept (or Access-Reject) response to the device.
- 6. The device accepts the SIP client's request (sends a SIP 200 OK or forwards the authenticated request) or rejects it (sends another SIP 407 to the SIP client).

To configure this feature, set the SBCServerAuthMode ini file parameter to 2.

28.8 Interworking SIP Signaling

The device supports interworking of SIP signaling messages to ensure interoperability between communicating SIP UAs or entities. This is critical in network environments where the UAs on opposing SBC legs have different SIP signaling support. For example, some UAs may support different versions of a SIP method while others may not event support a specific SIP method. The configuration method for assigning specific SIP message handling modes to UAs, includes configuring an IP Profile with the required interworking mode, and then assigning the IP Profile to the relevant IP Group.

This section describes some of the device's support for handling SIP methods to ensure interoperability.

28.8.1 Interworking SIP 3xx Redirect Responses

The device supports interworking of SIP 3xx redirect responses. By default, the device's handling of SIP 3xx responses is to send the Contact header unchanged. However, some SIP UAs may support different versions of the SIP 3xx standard while others may not even support SIP 3xx.

The handling of SIP 3xx can be configured for all calls, using the global parameter SBC3xxBehavior. For configuring different SIP 3xx handling options for different UAs (i.e., per IP Group), use the IP Profile table parameter, 'SBC Remote 3xx Behavior'.

28.8.1.1 Resultant INVITE Traversing Device

The device can handle SIP 3xx responses so that the new INVITE message sent as a result of the 3xx traverses the device. The reasons for enforcing resultant INVITEs to traverse the device may vary:

- The user that receives the 3xx is unable to route to the 3xx contact (i.e., the user is on the LAN and the new contact is on the WAN). In such a scenario, the device enables the user to reach the WAN contact and overcome NAT problems.
- Enforce certain SBC policies (e.g., call admission control, header manipulation, and transcoding) on the resultant INVITE.

The device enforces this by modifying each Contact in the 3xx response as follows:

- Changes the host part to the device's IP address this change causes the remote user agent to send the INVITE to the device.
- Adds a special prefix ("T~&R_") to the Contact user part to identify the new INVITE as a 3xx resultant INVITE.

The SBC handling for the 3xx resultant INVITE is as follows:

- 1. The incoming INVITE is identified as a 3xx resultant INVITE according to the special prefix.
- 2. The device automatically replaces the SBC host part (in the Request-URI) with the host from the 3xx Contact.
- **3.** The prefix ("T~&R_") remains in the user part for the classification, manipulation, and routing mechanisms.
- 4. The classification, manipulation, and routing processes are done exactly like any other INVITE handling. The special prefix can be used for specific routing rules for 3xx resultant INVITEs.
- **5.** The prefix is removed before the resultant INVITE is sent to the destination.

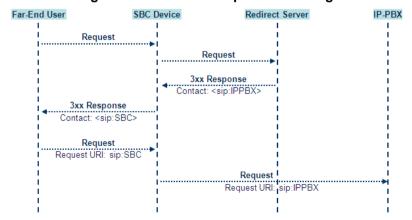

Figure 28-6: SIP 3xx Response Handling

The process of this feature is described using an example:

- **1.** The device receives the Redirect server's SIP 3xx response (e.g., Contact: <sip:User@IPPBX:5060;transport=tcp;param=a>;q=0.5).
- 2. The device replaces the Contact header value with the special prefix and database key value as user part, and with the device's URL as host part (e.g., Contact: <sip:Prefix_Key_User@SBC:5070;transport=udp>;q=0.5).
- 3. The device sends this manipulated SIP 3xx response to the Far-End User (FEU).
- 4. The FEU sends a new request with the Request-URI set to the value of the received 3xx response's Contact header (e.g., RequestURI: sip:Prefix_Key_User@SBC:5070;transport=udp).
- 5. Upon receipt of the new request from the FEU, the device replaces the Request-URI with the new destination address (e.g., RequestURI: sip:Prefix User@IPPBX:5070;transport=tcp;param=a).
- 6. The device removes the user prefix from the Request-URI, and then sends this Request-URI to the new destination (e.g., RequestURI: sip:User@IPPBX:5070;transport=tcp;param=a).

28.8.1.2 Local Handling of SIP 3xx

The device can handle SIP 3xx responses on behalf of the dialog-initiating UA and retry the request (e.g., INVITE) using one or more alternative URIs included in the 3xx response. The new request includes SIP headers from the initial request such as Diversion, History-Info, P-Asserted-Id, and Priority. The source and destination URIs can be manipulated using the regular manipulation mechanism.

The device sends the new request to the alternative destination according to the IP-to-IP Routing table rules. (where the 'Call Trigger' field is set to 3xx). It is also possible to specify the IP Group that sent the 3xx request as matching criteria for the re-routing rule in this table ('ReRoute IP Group ID' field).

28.8.2 Interworking SIP Diversion and History-Info Headers

This device can be configured to interwork between the SIP Diversion and History-Info headers. This is important, for example, to networks that support the Diversion header but not the History-Info header, or vice versa. Therefore, mapping between these headers is crucial for preserving the information in the SIP dialog regarding how and why (e.g., call redirection) the call arrived at a certain SIP UA. If the Diversion header is used, you can specify the URI type (e.g., "tel:") to use in the header, using the SBCDiversionUriType parameter.

This feature is configured in the IP Profile table (IPProfile parameter) using the following parameters:

- SBCDiversionMode defines the device's handling of the Diversion header
- SBCHistoryInfoMode defines the device's handling of the History-Info header

The handling of the SIP Diversion and History-Info headers is described in the table below:

Table 28-1: Handling of SIP Diversion and History-Info Headers

Parameter Value	SIP Header Present in Received SIP Message		
	Diversion	History-Info	Diversion and History-Info
HistoryInfoMode = Add DiversionMode = Remove	Diversion converted to History-Info. Diversion removed.	Not present	Diversion removed.

Parameter Value	SIP Header Present in Received SIP Message		
HistoryInfoMode = Remove DiversionMode = Add	Not present.	History-Info converted to Diversion. History-Info removed.	History-Info added to Diversion. History-Info removed.
HistoryInfoMode = Disable DiversionMode = Add	Diversion converted to History-Info.	Not present.	Diversion added to History-Info.
HistoryInfoMode = Disable DiversionMode = Add	Not present.	History-Info converted to Diversion.	History-Info added to Diversion.
HistoryInfoMode = Add DiversionMode = Add	Diversion converted to History-Info.	History-Info converted to Diversion.	Headers are synced and sent.
HistoryInfoMode = Remove DiversionMode = Remove	Diversion removed.	History-Info removed.	Both removed.

28.8.3 Interworking SIP REFER Messages

The device supports interworking of SIP REFER messages. SIP UAs may support different versions of the REFER standard while others may not even support REFER.

This feature supports the following:

- Attended, unattended, and semi-attended call transfers
- Sending INVITE, REFER-notifications, BYE, PRACK and Session Timer on behalf of peer PBXs
- Advanced routing rules for the new, initiated INVITE
- Forwarding early media after REFER while attempting to avoid transcoding (by sending session update)
- Interoperate with environments were different SIP UAs lack basic SIP functionality such as re-INVITE, UPDATE, PRACK, Delayed Offer, re-INVITE without SDP
- Session updates after connect to avoid transcoding

The handling of REFER can be configured for all calls, using the global parameter SBCReferBehavior. For configuring different REFER handling options for different UAs (i.e., IP Groups), use the IP Profile table parameter, 'SBC Remote Refer Behavior'.

- Local handling of REFER: This option is used for UAs that do not support REFER. Upon receipt of a REFER request, instead of forwarding it to the IP Group, the device handles it locally. It generates a new INVITE to the alternative destination according to the rules in the IP-to-IP Routing table (where the 'Call Trigger' field is set to **REFER**). It is also possible to specify the IP Group that sent the REFER request, as matching criteria for the re-routing rule in this table ('ReRoute IP Group ID' field).
- Transparent handling: The device forwards the REFER with the Refer-To header unchanged.
- Re-routing through SBC: The device changes the Refer-To header so that the re-routed INVITE is sent through the SBC application.
- IP Group Name: The device sets the host part in the REFER message to the name configured for the IP Group in the IP Group table.

28.8.4 Interworking SIP PRACK Messages

The device supports interworking of SIP Provisional Response ACKnowledgement (PRACK) messages (18x). While some UAs may not support PRACK (RFC 3262) others may require it. The device can be configured to resolve this interoperable issue and enable sessions between such endpoints. SIP PRACK handling is configured using the IP Profile parameter, 'SBC Prack Mode':

- Optional: PRACK is optional for these UAs. If required, the device performs the PRACK process on behalf of the destination UA.
- Mandatory: PRACK is required for these UAs. Calls from UAs that do not support PRACK are rejected. Calls destined to these UAs are also required to support PRACK.
- Transparent (default): The device does not intervene with the PRACK process and forwards the request as is.

28.8.5 Interworking SIP Session Timer

The device supports interworking of the SIP signaling keep-alive mechanism. The SIP standard provides a signaling keep-alive mechanism using re-INVITE and UPDATE messages. In certain setups, keep-alive may be required by some SIP UAs while for others it may not be supported. The device can resolve this mismatch by performing the keep-alive process on behalf of SIP UAs that do not support it.

For configuring the handling of session expires, use the IP Profile parameter, 'SBC Session Expires Mode'.

28.8.6 Interworking SIP Early Media

The device supports various interworking modes for SIP early media between SIP UAs (i.e., IP Groups):

- Early Media Enabling: The device supports the interworking of early media between SIP UAs that support early media and those that do not support receipt of early media. Early media can arrive in provisional responses to an INVITE request. The device forwards the request of early media for IP Groups that support this capability; otherwise, the device terminates it. Provisional responses whose SDP are suppressed are changed to a SIP 180 response. This feature is also supported for delayed offers. This is configured using the IP Profile parameter, 'SBC Remote Early Media Support'. The device refers to this parameter also for features that require early media such as playing ringback tone.
- Early Media Response Type: The device supports the interworking of different SIP provisional response types between UAs for forwarding the early media to the caller. This can support all early media response types (default), SIP 180 only, or SIP 183 only, and is configured by the IP Profile parameter, 'SBC Remote Early Media Response Type'.
- Multiple 18x: The device supports the interworking of different support for multiple 18x responses (including 180 Ringing, 181 Call is Being Forwarded, 182 Call Queued, and 183 Session Progress) that are forwarded to the caller. The UA can be configured as supporting only receipt of the first 18x response (i.e., the device forwards only this response to the caller), or receipt of multiple 18x responses (default). This is configured by the IP Profile parameter, 'SBC Remote Multiple 18x Support'.
- Early Media RTP: The device supports the interworking with remote clients that send 18x responses with early media and whose subsequent RTP is delayed, and with remote clients that do not support this and require RTP to immediately follow the 18x response. Some clients do not support 18x with early media, while others require 18x with early media (i.e., they cannot play ringback tone locally). These various

User's Manual 484 Document #: LTRT-89725

interworking capabilities are configured by the IP Profile parameters, 'SBC Remote Early Media RTP', 'SBC Remote Supports RFC 3960', and 'SBC Remote Can Play Ringback'. See the flowcharts below for the device's handling of such scenarios:

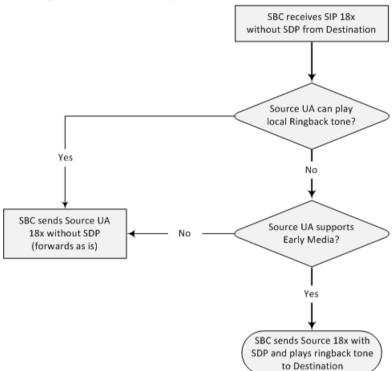

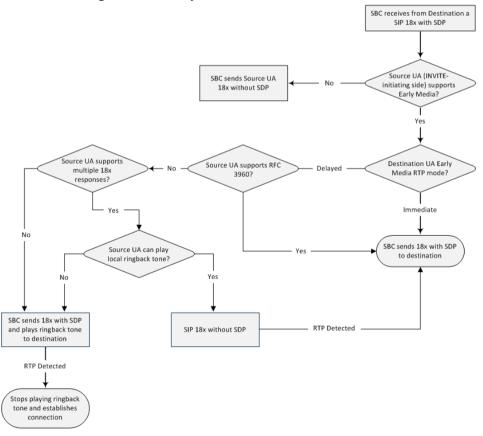

Figure 28-7: SBC Early Media RTP 18x without SDP

Figure 28-8: Early Media RTP - SIP 18x with SDP

Version 6.8 485 Mediant 3000

28.8.7 Interworking SIP re-INVITE Messages

The device supports interworking of SIP re-INVITE messages. This enables communication between endpoints that generate re-INVITE requests and those that do not support the receipt of re-INVITEs. The device does not forward re-INVITE requests to IP Groups that do not support it. Instead, it sends a SIP response to the re-INVITE request, which can either be a success or a failure, depending on whether the device can bridge the media between the endpoints. The device can also handle re-INVITEs with or without an SDP body, enabling communication between endpoints that do not support re-INVITE requests without SDP, and those that require SDP. The device generates an SDP offer and adds it to the incoming re-INVITE request if it does not contain an SDP and only then forwards it to the destination endpoint. This interworking support is configured by the IP Profile parameter, 'SBC Remote Reinvite Support'.

28.8.8 Interworking SIP UPDATE Messages

The device supports interworking of the SIP UPDATED message. This enables communication between UAs that generate UPDATE requests and those that do not support the receipt of UPDATE requests. The device does not forward UPDATE requests to IP Groups that do not support it. Instead, it sends a SIP response to the UPDATE request which can either be a success or a failure, depending on whether the device can bridge the media between the endpoints. The handling of UPDATE messages is configured by the IP Profile parameter 'SBC Remote Update Support'.

28.8.9 Interworking SIP re-INVITE to UPDATE

The device enables communication between endpoints (IP Groups) that do not support re-INVITE requests but support the UPDATE method, and vice versa. The device translates the re-INVITE request to the UPDATE request, and vice versa. Note that if a re-INVITE request arrives without SDP, the device generates the SDP and adds it to the outgoing UPDATE request. To enable this feature, each IP Group needs to be configured with its unique capabilities by associating it with a relevant IP Profile. For example, an IP Group that supports UPDATE requests but not re-INVITEs would be configured as follows:

- SBCRemoteUpdateSupport = 2 (Supported)
- SBCRemoteReinviteSupport = 0 (Not Supported)

If a re-INVITE request needs to be forwarded to this IP Group, it is translated to an UPDATE request.

28.8.10 Interworking Delayed Offer

The device enables sessions between endpoints (IP Groups) that send INVITEs without SDP (i.e., delayed media) and those that do not support the receipt of INVITEs without SDP. The device creates an SDP and adds it to INVITEs that arrive without SDP. This intervention in the SDP offer/answer process may require transcoding. Delayed offer is also supported when early media is present.

The interworking of delayed offer is configured using the IP Profile parameter 'SBC Remote Delayed Offer Support'.

Note: For this feature to function properly, a valid Extension Coders Group ID needs to be configured for IP Profiles that do not support delayed offer.

28.8.11 Interworking Call Hold

The device supports the interworking of call hold / retrieve requests between IP entities supporting different call hold capabilities:

- Interworking SDP call hold formats. This is configured by the IP Profile parameter, 'SBC Remote Hold Format'.
- Interworking the play of the held tone for IP entities that cannot play held tones locally. This is configured by the IP Profile parameter, 'SBC Play Held Tone'.
- Interworking generation of held tone where the device generates the tone to the held party instead of the call hold initiator. This is configured by the IP Profile parameter, 'SBC Reliable Held Tone Source'.

For configuring IP Profiles, see "Configuring IP Profiles" on page 314.

28.9 Call Survivability

This section describes various call survivability features supported by the SBC device.

28.9.1 Auto-Provisioning of Subscriber-Specific Information for BroadWorks Server for Survivability

This feature enables SBC user registration for interoperability with BroadSoft BroadWorks server to provide call survivability in case of connectivity failure with the BroadWorks server, for example, due to a WAN failure. This feature enables local users to dial a local extension (or any other configured alias) that identifies another local user, in survivability mode. This feature is enabled using the SBCExtensionsProvisioningMode parameter.

In normal operation, when subscribers (such as IP phones) register to the BroadWorks server through the device, the device includes the SIP Allow-Events header in the sent REGISTER message. In response, the BroadWorks server sends the device a SIP 200 OK containing an XML body with subscriber information such as extension number, phone number, and URIs (aliases). The device forwards the 200 OK to the subscriber (without the XML body).

Figure 28-9: Interoperability with BroadWorks Registration Process

The device saves the users in its registration database with their phone numbers and extensions, enabling future routing to these destinations during survivability mode. When in survivability mode, the device routes the call to the Contact associated with the dialed phone number or extension number in the registration database.

Below is an example of an XML body received from the BroadWorks server:

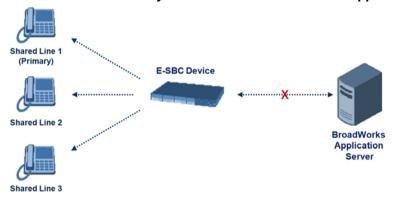

```
<aliases>
    <alias>sip:bob@broadsoft.com</alias>
    <alias>sip:rhughes@broadsoft.com</alias>
    </aliases>
    <extensions>
        <extension>5317</extension>
        <extension>1321</extension>
        </extensions>
        </extensions>
        </extensions>
```

28.9.2 BroadSoft's Shared Phone Line Call Appearance for SBC Survivability

The device can provide redundancy for BroadSoft's Shared Call Appearance feature. When the BroadSoft application server switch (AS) fails or does not respond, or when the network connection between the device and the BroadSoft AS is down, the device manages the Shared Call Appearance feature for the SIP clients.

This feature is supported by configuring a primary extension and associating it with secondary extensions (i.e., *shared lines*) so that incoming calls to the primary extension also ring at the secondary extensions. The call is established with the first extension to answer the call and consequently, the ringing at the other extensions stop. For example, assume primary extension number 600 is shared with secondary extensions 601 and 602. In the case of an incoming call to 600, all three phone extensions ring simultaneously, using the device's call forking feature as described in "SIP Forking Initiated by SIP Proxy Server" on page 493. Note that incoming calls specific to extensions 601 or 602 ring only at these specific extensions.

Figure 28-10: Call Survivability for BroadSoft's Shared Line Appearance

To configure this capability, you need to configure a shared-line, inbound manipulation rule for registration requests to change the destination number of the secondary extension numbers (e.g. 601 and 602) to the primary extension (e.g., 600). Call forking must also be enabled. The following procedure describes the main configuration required.

Notes:

- The device enables outgoing calls from all equipment that share the same line simultaneously (usually only one simultaneous call is allowed per a specific shared line).
- You can configure whether REGISTER messages from secondary lines are terminated on the device or forwarded transparently (as is), using the SBCSharedLineRegMode parameter.
- The LED indicator of a shared line may display the wrong current state.

To configure the Shared Line feature:

1. In the IP Group table (see "Configuring IP Groups" on page 273), add a Server-type IP Group for the BroadWorks server.

- 2. In the IP Group table, add a User-type IP Group for the IP phone users and set the 'SBC Client Forking Mode' parameter to **Parallel** so that the device forks incoming calls to all contacts under the same AOR registered in the device's registration database.
- 3. In the IP-to-IP Routing table (see "Configuring SBC IP-to-IP Routing Rules" on page 510), add a rule for routing calls between the above configured IP Groups.
- 4. In the IP to IP Inbound Manipulation table (see "Configuring IP-to-IP Inbound Manipulations" on page 522), add a manipulation rule for the secondary extensions (e.g., 601 and 602) so that they also register to the device's database under the primary extension contact (e.g., 600):
 - Set the 'Manipulation Purpose' field to Shared Line.
 - Set the 'Source IP Group' field to the IP Group ID that you created for the users (e.g., 2).
 - Set the 'Source Username Prefix' field to represent the secondary extensions (e.g., 601 and 602).
 - Set the 'Manipulated URI' field to Source to manipulate the source URI.
 - Set the 'Remove From Right' field to "1" to remove the last digit of the extensions (e.g., 601 is changed to 60).
 - Set the 'Suffix to Add' field to "0" to add 0 to the end of the manipulated number (e.g., 60 is changed to 600).

28.9.3 Call Survivability for Call Centers

The device supports call survivability for call centers. When a communication failure (e.g., in the network) occurs with the remote voice application server responsible for handling the call center application (such as IVR), the device routes the incoming calls received from the customer (i.e., from the TDM gateway) to the call center agents.

In normal operation, the device registers the agents in its users registration database. Calls received from the TDM gateway are forwarded by the device to the application server, which processes the calls and sends them to specific call center agents, through the device. Upon a failure with the application server, the device routes the calls from the TDM Gateway to the agents. The device routes the call to the first available user it founds. If the call is not answered by the user, the device routes it to the next available user. The SBC can handle a sequence of up to five users, after which the session is timed out and the call is dropped.

Remote Site

Call Center Agents

Figure 28-11: Normal Operation in Call Center Application

Figure 28-12: Call Survivability for Call Center

> To configure call survivability for a call center application:

- 1. In the IP Group table (see "Configuring IP Groups" on page 273), add IP Groups for the following entities:
 - TDM Gateway (Server-type IP Group). This entity forwards the customer calls through the device to the Application server.
 - Application server (Server-type IP Group). This entity processes the call and sends the call through the device to the specific call center agent located on a different network (remote).
 - Call center agents (User-type IP Group). You can configure multiple IP Groups to represent different groups of call center agents, for example, agents and managers.
- In the Classification table (see "Configuring Classification Rules" on page 502), add rules to classify incoming calls that are received from the entities listed in Step 1, to IP Groups.

3. In the SBC IP-to-IP Routing table (see "Configuring SBC IP-to-IP Routing Rules" on page 510), add the following IP-to-IP routing rules:

- For normal operation:
 - Routing from TDM Gateway to Application server.
 - Routing from Application server to call center agents.
- For call survivability mode: Routing from TDM Gateway to call center agents. This
 configuration is unique due to the following settings:
 - The 'Source IP Group ID' field is set to the IP Group of the TDM Gateway.
 - The 'Destination Type' field is set to **Hunt Group**, which is specifically used for call center survivability.
 - The 'Destination IP Group ID' field is set to the IP Group of the call center agents.

The figure below displays a routing rule example, assuming IP Group "1" represents the TDM Gateway and IP Group "3" represents the call center agents:

Add Record Index 3 Source IPGroup ID 1 Source Username Prefix ± Source Host ± Destination Username Prefix * Destination Host ± Request Type ΑII Message Condition None ▼ Destination Type **Hunt Group** Destination IPGroup ID 3 Destination SRD ID None Destination Address Destination Port 0 Destination Transport Type Alternative Route Options Route Row Cost Group None ▼ ■ Submit x Cancel

Figure 28-13: Routing Rule Example for Call Center Survivability

28.9.4 Survivability Mode Display on Aastra IP Phones

If the SBC device is deployed in an Enterprise network with Aastra IP phones and connectivity with the WAN fails, the device provides call survivability by enabling communication between IP phone users within the LAN enterprise. In such a scenario, the device can be configured to notify the IP phones that it is currently operating in Survivability mode. When this occurs, the Aastra IP phones display the message, "StandAlone Mode" on their LCD screens. This feature is enabled by setting the SBCEnableAASTRASurvivabilityNotice parameter to 1.

When this feature is enabled and the SBC device is in Survivability mode, it responds to SIP REGISTER messages from the IP phones with a SIP 200 OK containing the following XML body:

28.10 Call Forking

This section describes various Call Forking features supported by the device.

28.10.1 Initiating SIP Call Forking

The SBC device supports call forking of an incoming call to multiple SBC users (destinations). Call forking is supported by the device's capability of registering multiple SIP client user phone contacts (mobile and fixed-line extensions) under the same Address of Record (AOR) in its registration database. This feature can be implemented in the following example scenarios:

- An enterprise Help Desk, where incoming customer calls are simultaneously sent to multiple customer service agent extensions.
- An employee's phone devices, where the incoming call is simultaneously sent to multiple devices (e.g., to the employee's office phone and mobile SIP phone).
- An enterprise reception desk, where an incoming call is simultaneously sent to multiple receptionists.

The device supports various modes of call forking. For example, in Parallel call forking mode, the device sends the INVITE message simultaneously to all the users registered under the same AOR, resulting in the ringing of all extensions; the first extension to pick up the call receives the call, and all other extensions stop ringing. The Call Forking feature is configured by creating a User-type IP Group and configuring the IP Group table's parameter, 'SBC Client Forking Mode' (see "Configuring IP Groups" on page 273).

The device can also fork INVITE messages received for a Request-URI of a specific contact (user), belonging to the destination IP Group User-type, registered in the database to all other users located under the same AOR as the specific contact. This is configured using the SBCSendInviteToAllContacts parameter.

28.10.2 SIP Forking Initiated by SIP Proxy Server

The device can handle SIP forking responses received from a proxy server in response to an INVITE forwarded by the device from a UA. In other words, received responses with a different SIP To header 'tag' parameter for the request forwarded by the device. This occurs in scenarios, for example, where a proxy server forks the INVITE request to several UAs, and therefore, the SBC device may receive several replies for a single request. Forked SIP responses may result in a single SDP offer with two or more SDP answers during call setup. The SBC handles this scenario by "hiding" the forked responses from the INVITE-initiating UA. This is achieved by marking the UA that responded first to the INVITE as the active UA, and only requests/responses from that UA are subsequently forwarded. All other requests/responses from other UAs are handled by the SBC (SDP offers from these users are answered with an 'inactive' media).

The SBC supports two forking modes, configured by the SBCForkingHandlingMode parameter:

- Latch On First only the first received 18x response is forwarded to the INVITE initiating UA, and disregards any subsequently received 18x forking responses (with or without SDP).
- Sequential all 18x responses are forwarded to the INVITE initiating UA, one at a time in a sequential manner. If 18x arrives with an offer only, only the first offer is forwarded to the INVITE initiating UA.

The SBC also supports media synchronization for call forking. If the active UA is the first one to send the final response (e.g., 200 OK) the call is established and all other final responses are acknowledged and a BYE is sent if needed. If another UA sends the first final response, then it is possible that the SDP answer that was forwarded to the INVITE-initiating UA is not relevant, and media synchronization is needed between the two UAs. Media synchronization is done by sending a re-INVITE request immediately after the call is established. The re-INVITE is sent without an offer to the INVITE-initiating UA. This causes the UA to send an offer which is forwarded to the UA that confirmed the call. The media synchronization process is enabled by the EnableSBCMediaSync parameter.

28.10.3 Call Forking-based IP-to-IP Routing Rules

You can configure call forking routing rules in the IP-to-IP Routing table. This is done by configuring multiple routing rules under a forking group. These rules send an incoming IP call to multiple destinations of any type (e.g., IP Group or IP address). The device forks the call by sending simultaneous INVITE messages to all the specified destinations. It handles the multiple SIP dialogs until one of the calls is answered and then terminates the other SIP dialogs. For more information, see "Configuring SBC IP-to-IP Routing Rules" on page 510.

28.11 Alternative Routing on Detection of Failed SIP Response

The device can detect failure of a sent SIP response (e.g., TCP timeout, and UDP ICMP). In such a scenario, the device re-sends the response to an alternative destination. This support is in addition to alternative routing if the device detects failed SIP requests.

For example, assume the device sends a SIP 200 OK in response to a received INVITE request. If the device does not receive a SIP ACK in response to this, it sends a new 200 OK to the next alternative destination. This new destination can be the next given IP address resolved from a DNS from the Contact or Record-Route header in the request related to the response.

28.12 Active SBC Call Continuity during HA Blade Switchover

The device maintains active SBC call sessions during a blade switchover when in High Availability mode. Upon active blade failure, the standby blade takes over and current SBC calls are maintained and not disconnected.

29 SBC Configuration

This chapter describes the configuration of the SBC application.

29.1 Configuring General Settings

The General Settings page allows you to configure general SBC parameters. For a description of these parameters, see "SBC Parameters" on page 887.

- > To configure general parameters:
- 1. Open the General Settings page (Configuration tab > VolP menu > SBC > General Settings).

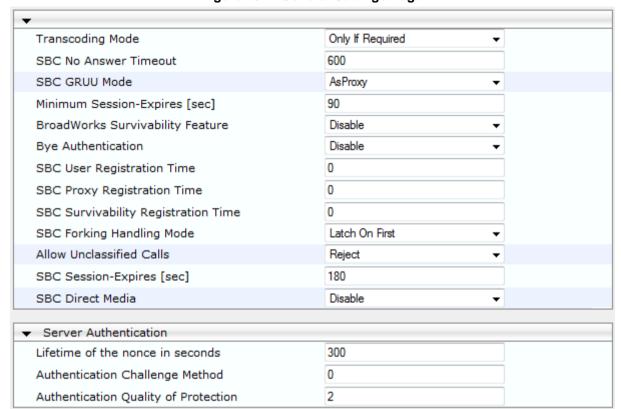

Figure 29-1: General Settings Page

- Configure the parameters as required.
- 3. Click Submit.
- **4.** To save the changes to flash memory, see "Saving Configuration" on page 550.

29.1.1 Interworking Dialog Information in SIP NOTIFY Messages

You can enable the device to interwork dialog information (XML body) received in SIP NOTIFY messages from a remote (WAN) application server. The NOTIFY message is sent by application servers to notify a SIP client, subscribed to a service and located behind the device (LAN), of the status of another SIP client in the LAN. For example, user B can subscribe to an application server for call pick-up service, whereby if user A's phone rings, the application server notifies user B. User B can then press a pre-configured key sequence to answer the call.

User B

The NOTIFY message contains the XML body with call identifiers (call-id and tags). However, as the application server is located in the external network WAN and the SIP clients behind the device, the call dialog information sent by the application server reflects only the dialog between the device and itself; not that of the involved SIP clients. This is due to, for example, the device's topology hiding (e.g., IP address) of its LAN elements. The device resolves this by replacing the call identifiers received from the application server with the correct call identifiers (e.g., user A and user B). Thus, users subscribed to the service can receive relevant NOTIFY messages from the device and use the service.

User A (Ringing State) and User B

Application Server

WAN

NOTIFY
XML Body with Call Identifiers of
Device and Application Server

Figure 29-2: Interworking NOTIFY XML Body for Application Server

To enable this feature, set the 'SBC Dialog-Info Interworking' (EnableSBCDialogInfoInterworking) parameter to **Enable**. When this feature is disabled, the device forwards the NOTIFY message as is, without modifying its XML body.

Below is an example of an XML body where the call-id, tags, and URIs have been replaced by the device:

```

```

29.2 Configuring Admission Control

The Admission Control table lets you configure up to 100 Call Admission Control rules (CAC). CAC rules define the maximum number of concurrent calls (SIP dialogs) permitted per IP Group or SRD, and per user (identified by its registered contact) belonging to these entities. CAC rules also define a guaranteed (*reserved*) number of concurrent calls. Thus, CAC rules can be useful for implementing Service Level Agreements (SLA) policies.

CAC rules can be applied per SIP request type and SIP dialog direction (inbound and/or outbound). These relate to requests that initiate SIP dialogs and not the subsequent requests that can be of different type and direction. The SIP dialog-initiating request types can include INVITE, REGISTER, and/or SUBSCRIBE messages, or it can be configured to include the total number of all dialogs.

This feature also provides support for SIP-dialog rate control, using the "token bucket" mechanism. The token bucket is a control mechanism that dictates the rate of SIP-dialog setups based on the presence of tokens in the bucket – a logical container that holds aggregate SIP dialogs to be accepted or transmitted. Tokens in the bucket are removed ("cashed in") for the ability to setup a dialog. Thus, a flow can setup dialogs up to its peak burst rate if there are adequate tokens in the bucket and if the burst threshold is configured appropriately:

- Every SIP dialog setup request must attempt to take a token from the bucket.
- If there are no tokens, the request is dropped.
- New tokens are added to the bucket at a user-defined rate (token rate).
- If the bucket contains the maximum number of tokens, tokens to be added at that moment are dropped.

Reserved capacity is especially useful when the device operates with multiple SIP entities such as in a contact center environment handling multiple customers. For example, if the total call capacity of the device is 200 call sessions, a scenario may arise where one SIP entity may reach the maximum configured call capacity of 200 and thereby, leaving no available call resources for the other SIP entities. Thus, reserved capacity guarantees a minimum capacity for each SIP entity. If the reserved call capacity of a SIP entity is threatened by a new call for a different SIP entity, the device rejects the call to safeguard the reserved capacity.

Reserved call capacity can be configured for both an SRD and each of its associated IP Groups. In such a setup, the SRD's reserved call capacity must be greater or equal to the summation of the reserved call capacity of all these IP Groups. In other words, the SRD serves as the "parent" reserved call capacity. If the SRD's reserved call capacity is greater, the extra call capacity can be used as a shared pool between the IP Groups for unreserved calls when they exceed their reserved capacity. For example, assume that the reserved capacities for an SRD and its associated IP Groups are as follows:

- SRD reserved call capacity: 40
- IP Group ID 1 reserved call capacity: 10
- IP Group ID 2 reserved call capacity: 20

In this setup, the SRD offers a shared pool for unreserved call capacity of 10 [i.e., 40 - (10 + 20)]. If IP Group ID 1 needs to handle 15 calls, it is guaranteed 10 calls and the remaining 5 is provided from the SRD's shared pool. If the SDR's shared pool is currently empty and resources for new calls are required, the quota is taken from the device's total capacity, if available. For example, if IP Group ID 1 needs to handle 21 calls, it's guaranteed 10, the SRD's shared pool provides another 10, and the last call is provided from the device's total call capacity support (e.g., of 200).

Requests that reach the user-defined call limit (maximum concurrent calls and/or call rate) are sent to an alternative route, if configured in the IP-to-IP Routing table. If no alternative routing rule is located, the device rejects the SIP request with a SIP 480 "Temporarily Unavailable" response.

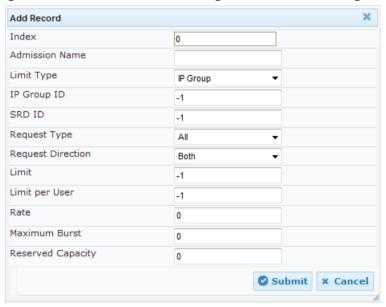

Note: The device applies the CAC rule for the incoming leg immediately after the Classification process. If the call/request is rejected at this stage, no routing is performed. The enforcement for the outgoing leg is performed within each alternative route iteration. This is accessed from two places: one during initial classification/routing, and another during alternative routing process.

The following procedure describes how to configure CAC rules in the Web interface. You can also configure CAC rules using the table ini file parameter, SBCAdmissionControl.

- To configure a CAC rule:
- Open the Admission Control page (Configuration tab > VolP menu > SBC > Admission Control).
- 2. Click **Add**; the following dialog box appears:

Figure 29-3: Admission Control Page - Add Record Dialog Box

- 3. Configure an Admission Control rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 29-1: Admission Control Table Parameter Description

Parameter	Description
Index [SBCAdmissionControl_Index]	Defines an index number for the new table record.

Parameter	Description
Admission Name [SBCAdmissionControl_AdmissionControlName]	Defines an arbitrary name to easily identify the Admission Control rule. The valid value is a string of up to 20 characters. By default, no value is defined.
Limit Type [SBCAdmissionControl_LimitType]	Defines the entity to which the rule applies. • [0] IP Group (default) • [1] SRD
IP Group ID [SBCAdmissionControl_IPGroupI D]	Defines the IP Group to which you want to apply the rule. The default value is -1 (i.e., all IP Groups). Note: This parameter is applicable only if 'Limit Type' is set to IP Group.
SRD ID [SBCAdmissionControl_SRDID]	Defines the SRD to which you want to apply the rule. The default value is -1 (i.e., all SRDs). Note: This parameter is applicable only if 'Limit Type' is set to SRD.
Request Type [SBCAdmissionControl_RequestType]	Defines the SIP dialog-initiating request type to which you want to apply the rule (not the subsequent requests that can be of different type and direction). • [0] All = (Default) Includes the total number of all dialogs. • [1] INVITE • [2] SUBSCRIBE • [3] Other
Request Direction [SBCAdmissionControl_RequestDirection]	 Defines the direction of the SIP request to which the rule applies. [0] Both = (Default) Rule applies to inbound and outbound SIP dialogs. [1] Inbound = Rule applies only to inbound SIP dialogs. [2] Outbound = Rule applies only to outbound SIP dialogs.
Limit [SBCAdmissionControl_Limit]	Defines the maximum number of concurrent SIP dialogs per IP Group or SRD. You can also use the following special values: • [0] 0 = Block all these dialogs. • [-1] -1 = (Default) Unlimited.
Limit Per User [SBCAdmissionControl_LimitPerUser]	Defines the maximum number of concurrent SIP dialogs per user belonging to the specified IP Group or SRD. You can also use the following special values: [0] 0 = Block all these dialogs. [-1] -1 = (Default) Unlimited.
Rate [SBCAdmissionControl_Rate]	Defines the rate at which tokens are added to the token bucket per second (i.e., token rate). One token is added to the bucket every 1000 divided by the value of this parameter (in milliseconds). The default is 0 (i.e., unlimited rate). Note: The token bucket feature is per IP Group, SRD, SIP request type, and SIP request direction.

Parameter	Description
Maximum Burst [SBCAdmissionControl_MaxBurst]	Defines the maximum number of tokens (SIP dialogs) that the bucket can hold. The device only accepts a SIP dialog if a token exists in the bucket. Once the SIP dialog is accepted, a token is removed from the bucket. If a SIP dialog is received by the device and the token bucket is empty, then the device rejects the SIP dialog. Alternatively, if the bucket is full, for example, 100 tokens, and 101 SIP dialogs arrive (before another token is added to the bucket, i.e., faster than that defined in the Rate field), then the device accepts the first 100 SIP dialogs and rejects the last one. Dropped requests are replied with the SIP 480 "Temporarily Unavailable" response. Dropped requests are not counted in the bucket. The default is 0 (i.e., unlimited SIP dialogs). Note: The token bucket feature is per IP Group, SRD, SIP
Reservation [SBCAdmissionControl_Reservati	request type, and SIP request direction. Defines the guaranteed (minimum) call capacity. Notes:
on]	 An IP Group ID or SRD ID must be specified when this parameter is configured and the IP Group or SRD cannot be set to all (-1).
	 Reserved call capacity is applicable only to INVITE and SUBSCRIBE messages.
	 Reserved call capacity must be less than the maximum capacity (limit) configured for the CAC rule.
	The total reserved call capacity configured for all the CAC rules must be within the device's total call capacity support.

29.3 Configuring Allowed Audio Coder Groups

The Allowed Audio Coders Group table lets you configure up to five Allowed Audio Coders Groups. An Allowed Audio Coders Group defines a list of audio media coders that can be used for a specific SIP entity. Each Allowed Audio Coders Group can be configured with up to 10 coders. The coders can include pre-defined audio coders (according to the installed Software License Key) and user-defined (string) coders for non-standard or unknown coders.

Allowed Audio Coders Groups are assigned to SIP entities, using IP Profiles (see "Configuring IP Profiles" on page 314). Coders that are not listed in the Allowed Audio Coders Group are removed from the SDP offer ('a=rtpmap' field) that is sent to the SIP entity. Only coders that are common between the coders in the SDP offer and the coders listed in the Allowed Audio Coders Group are used. Thus, Allowed Audio Coders Groups enable you to enforce the use of only specified coders. For more information, see "Restricting Coders" on page 475.

You can also use Allowed Audio Coders Groups to configure Extension coders. Extension coders are coders (listed in the Allowed Audio Coders Group) which the device adds to the SDP offer. For more information on Extension coders, see Coder Transcoding on page 475.

The order of appearance of the coders listed in the Allowed Audio Coders Group determines the priority (preference) of the coders in the SDP offer. The device arranges the SDP offer's coder list according to their order in the Allowed Audio Coders Group. The priority is in descending order, whereby the first coder in the list is given the highest priority and the last coder, the lowest priority. If Extension coders are also used, these coders can

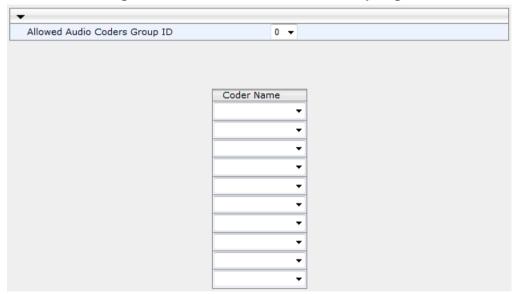

be added after the Allowed coders or arranged with the Allowed coders according to their appearance in the Allowed Coders Group. For more information, see "Prioritizing Coder List in SDP Offer" on page 477.

The following procedure describes how to configure Allowed Audio Coder Groups in the Web interface. You can also configure Allowed Audio Coder Groups using the table ini file parameter, AllowedCodersGroup.

To configure an Allowed Coders Group:

Open the Allowed Audio Coders Group page (Configuration tab > VolP menu > SBC > Allowed Audio Coders Group).

Figure 29-4: Allowed Audio Coders Group Page

- 2. Configure an Allowed Audio Coders Group according to the parameters described in the table below.
- 3. Click Submit, and then reset the device with a save ("burn") to flash memory.

Table 29-2: Allowed Audio Coders Group Table Parameter Descriptions

Parameter	Description
Allowed Coders Group ID [AllowedCodersGroupX]	Defines an index number for the new table record.
Coder Name [AllowedCodersGroupX_Name]	Defines the audio coder. This can be a pre-defined coder or a user-defined coder. The valid value for user-defined coders is a string of up to 25 characters (case-insensitive). For example, "HD.123" (without quotes).
	Note: Each coder type (e.g., G.729) can be configured only once per Allowed Coders Group.

29.4 Configuring Allowed Video Coder Groups

The Allowed Video Coders Group table lets you configure up to four Allowed Video Coders Groups. An Allowed Video Coders Group defines a list of video coders that can be used when forwarding video streams to a specific SIP entity. Each Allowed Video Coders Group can be configured with up to 20 coders. The coders can include pre-defined video coders

(according to the installed Software License Key) and user-defined (string) video coders for non-standard or unknown coders. Allowed Video Coders Groups are assigned to SIP entities, using IP Profiles (see "Configuring IP Profiles" on page 314). The video coders appear in the SDP media type "video" ('m=video' line). Coders that are not listed in the Allowed Video Coders Group are removed from the SDP offer that is sent to the SIP entity. Only coders that are common between the coders in the SDP offer and the coders listed in the Allowed Video Coders Group are used. Thus, Allowed Video Coders Groups enable you to enforce the use of only specified coders. For more information, see "Restricting Coders" on page 475.

The order of appearance of the coders listed in the Allowed Video Coders Group determines the priority (preference) of the coders in the SDP offer. The device arranges the SDP offer's coder list according to their order in the Allowed Video Coders Group. The priority is in descending order, whereby the first coder in the list is given the highest priority and the last coder, the lowest priority. For more information, see "Prioritizing Coder List in SDP Offer" on page 477.

Currently, the Allowed Video Coder Groups table can only be configured using the ini file parameter, Allowed Video Coders Group. The table below describes this parameter.

Table 29-3: Allowed Video Coders Group Table Parameter Descriptions

Parameter	Description
Allowed Coders Group ID [AllowedVideoCodersGroupX]	Defines an index number for the new table record.
Coder Name [AllowedVideoCodersGroupX_Name]	Defines the video coder. This can be a pre-configured coder or a user-defined coder. The valid value for user-defined coders is a string of up to 25 characters (case-insensitive). For example, "WOW.789" (but without quotes).
	Note: Each coder type can be configured only once per Allowed Video Coders Group.

29.5 Routing SBC

This section describes the configuration of the routing entities for the SBC application. These include the following:

- Classification rules see "Configuring Classification Rules" on page 502
- Message Condition rules see "Configuring Message Condition Rules" on page 508
- IP-to-IP routing rules see "Configuring SBC IP-to-IP Routing Rules" on page 510
- Alternative routing reasons see "Configuring SIP Response Codes for Alternative Routing Reasons" on page 518

29.5.1 Configuring Classification Rules

The Classification table lets you configure up to 100 Classification rules. A Classification rule classifies incoming SIP dialog-initiating requests (e.g., INVITE messages) to an IP Group from where the SIP dialog request was received. The identified IP Group is then used in the manipulation and routing processes. Classification rules also enhance security by allowing you to create a SIP access list, whereby classified calls can be denied (i.e., blacklist) or allowed (i.e., whitelist).

A Classification rule includes two areas:

- Matching characteristics (Rule) characteristics of incoming IP call such as source IP address.
- Operation (**Action**) if the incoming call matches the characteristics of the rule, the device classifies the call as belonging to an IP Group.

The Classification table is used to classify incoming SIP dialog requests only if the following classification stages fail:

- Classification Stage 1 Registered Users Database: The device searches its registration database to check if the incoming SIP dialog arrived from a registered user:
 - Compares the SIP Contact header of the received SIP dialog to the Contact of the registered user.
 - Compares the URL in the SIP P-Asserted-Identity/From header to the registered address-of-record (AOR).

If this stage fails, the device proceeds to classification based on Proxy Set.

Classification Stage 2 - Proxy Set: If the database search fails, the device performs classification based on Proxy Set. This is done only if the 'Classify By Proxy Set' parameter is enabled for the IP Group (see "Configuring IP Groups" on page 273). The device checks whether the INVITE's IP address (if host name, then according to the dynamically resolved IP address list) is defined for a Proxy Set ID (in the Proxy Set table). If a Proxy Set ID has such an IP address, the device classifies the INVITE to the IP Group that is associated with this Proxy Set. (The Proxy Set ID is assigned to the IP Group using the IP Group table's 'Proxy Set ID' parameter.)

Note: For security, it is highly recommended to disable the Classify by Proxy Set feature so that the device can use the Classification table instead. This enables "strict" classification of incoming calls to IP Groups. In addition, in cases where multiple IP Groups are associated with the same Proxy Set ID, do **not** use the Classify by Proxy Set feature.

If this stage fails (or Classify by Proxy Set is disabled), the device proceeds to classification based on the Classification table.

3. Classification Stage 3 - Classification Table: If classification based on Proxy Set fails (or disabled), the device uses the Classification table to classify the SIP dialog to an IP Group. If it locates a Classification rule whose characteristics (such as source IP address) match the incoming SIP dialog, the SIP dialog is assigned to the associated IP Group. In addition, if the Classification rule is defined as a whitelist, the SIP dialog is allowed and proceeds with the manipulation, routing and other SBC processes. If the Classification rule is defined as a blacklist, the SIP dialog is denied.

If the classification process fails, the device rejects or allows the call, depending on the setting of the 'Unclassified Calls' parameter (on the General Settings page - **Configuration** tab > **VoIP** menu > **SBC** > **General Settings**). If this parameter is set to **Allow**, the incoming SIP dialog is assigned to an IP Group as follows:

- 1. The device checks on which SIP listening port (e.g., 5061) the incoming SIP dialog request arrived and the SIP Interface which is configured with this port (in the SIP Interface table).
- 2. The device checks the SRD that is associated with this SIP Interface (in the SIP Interface table) and then classifies the SIP dialog with the first IP Group that is associated with this SRD. For example, if IP Groups 3 and 4 use the same SRD, the device classifies the call to IP Group 3.

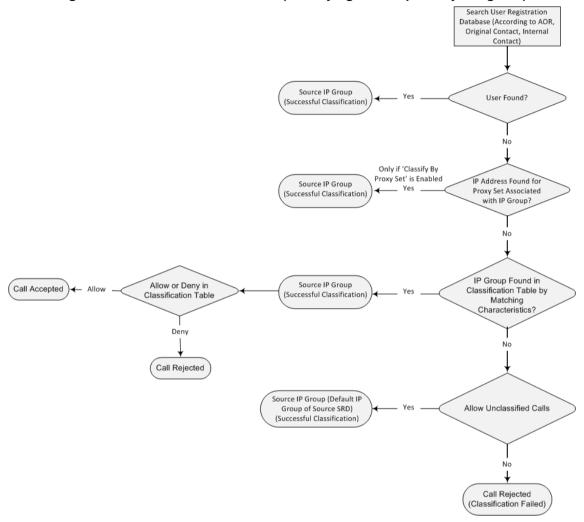

Note: If classification for a SIP request fails and the device is configured to reject unclassified calls, the device can send a specific SIP response code per SIP interface. This is configured by the 'Classification Failure Response Type' parameter in the SIP Interface table (see "Configuring SIP Interfaces" on page 270).

The flowchart below illustrates the classification process:

Figure 29-5: Classification Process (Identifying IP Group or Rejecting Call)

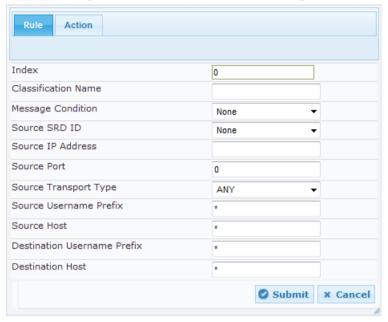

Note: The device saves incoming SIP REGISTER messages in its registration database. If the REGISTER message is received from a User-type IP Group, the device sends the message to the configured destination.

The following procedure describes how to configure Classification rules in the Web interface. You can also configure Classification rules using the table ini file parameter, Classification.

- To configure a Classification rule:
- 1. Open the Classification Table page (Configuration tab > VoIP menu > SBC > Routing SBC > Classification Table).
- 2. Click **Add**; the following dialog box appears:

Figure 29-6: Classification Table Page

- **3.** Configure the Classification rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 29-4: Classification Table Parameter Descriptions

December December		
Parameter	Description	
Index [Classification_Index]	Defines an index number for the new table record.	
Classification Name [Classification_ClassificationName]	Defines an arbitrary name to easily identify the Classification rule.	
	The valid value is a string of up to 20 characters. By default, no name is defined.	
Matching Characteristics - Rule		
Message Condition [Classification_MessageCondition]	Assigns a Message Condition rule, which can be used to classify the incoming SIP dialog. To configure Condition rules, see "Configuring Message Condition Rules" on page 508.	
Source SRD ID [Classification_SrcSRDID]	Defines an SRD ID of the incoming SIP dialog. To configure SRDs, see "Configuring SRDs" on page 267.	
	By default, no SRD is defined.	
	Note: The SRDs are also associated with a port number as defined by the SIP Interface used by the SRD (see "Configuring SIP Interfaces" on page 270).	
Source IP Address	Defines the source IP address (in dotted-decimal notation)	

Parameter	Description
[Classification_SrcAddress]	of the incoming SIP dialog. The IP address can be configured using the following wildcards:
	 "x" wildcard: represents single digits. For example, 10.8.8.xx represents all the addresses between 10.8.8.10 to 10.8.8.99.
	 asterisk (*) wildcard: represents any number between 0 and 255. For example, 10.8.8.* represents all addresses between 10.8.8.0 and 10.8.8.255.
	If this parameter is not configured or is configured as an asterisk (*), any source IP address is accepted.
Source Port [Classification_SrcPort]	Defines the source port number of the incoming SIP dialog.
Source Transport Type [Classification_SrcTransportType]	Defines the source transport type (UDP, TCP, or TLS) of the incoming SIP dialog.
	[-1] ANY (Default) = All transport types[0] UDP[1] TCP[2] TLS
Source Username Prefix [Classification_SrcUsernamePrefix]	Defines the prefix of the source URI user part of the incoming SIP dialog. The URI is typically located in the SIP From header. However, you can configure the SIP header from where the device obtains the source URI. This is done in the IP Group table, using the 'Source URI Input' parameter. For more information on how the device obtains this URI, see "SIP Dialog Initiation Process" on page 464.
	The default is the asterisk (*) symbol, which represents any source username prefix. The prefix can be a single digit or a range of digits. For available notations, see "Dialing Plan Notation for Routing and Manipulation" on page 689. Note: For REGISTER requests, the source URL is obtained from the To header.
Source Host [Classification_SrcHost]	Defines the prefix of the source URI host name. The URI is typically located in the SIP From header. However, you can configure the SIP header from where the device obtains the source URI. This is done in the IP Group table, using the 'Source URI Input' parameter. For more information on how the device obtains this URI, see "SIP Dialog Initiation Process" on page 464. The default is the asterisk (*) symbol, which represents any source host prefix. Note: For REGISTER requests, the source URL is obtained
	from the To header.
Destination Username Prefix	Defines the prefix of the destination Request-URI user part of the incoming SIP dialog.
[Classification_DestUsernamePrefix]	The default is the asterisk (*) symbol, which represents any destination username. The prefix can be a single digit or a range of digits. For available notations, see "Dialing Plan Notation for Routing and Manipulation" on page 689.

Parameter	Description
Destination Host [Classification_DestHost]	Defines the prefix of the destination Request-URI host name of the incoming SIP dialog request.
	The default is the asterisk (*) symbol, which represents any destination host prefix.
Operation Rule - Action	
Action Type [Classification_ActionType]	Defines a whitelist or blacklist for incoming SIP dialog requests that match the characteristics of the classification rule.
	 [0] Deny = Blocks incoming SIP dialogs that match the characteristics of the Classification rule (blacklist).
	 [1] Allow = (Default) Allows incoming SIP dialogs that match the characteristics of the Classification rule (whitelist) and assigns it to the associated IP Group. (default)
Source IP Group ID [Classification_SrcIPGroupID]	Defines an IP Group to which the incoming SIP dialog request must be assigned if this SIP dialog matches the matching characteristics. The IP Group is used for SBC routing and manipulations. To configure IP Groups, see "Configuring IP Groups" on page 273.
	By default, no IP Group is defined.
	Note: The IP Group must be associated with the assigned SRD.

29.5.1.1 Classification Based on URI of Selected Header Example

The following example describes how to configure classification of incoming calls to IP Groups, based on source URI in a specific SIP header.

This example assumes the following incoming INVITE message:

```
INVITE sip:8000@10.33.4.226 SIP/2.0
```

Via: SIP/2.0/UDP 10.33.4.226; branch=z9hG4bKVEBTDAHSUYRTEXEDEGJY

From: <sip:100@10.33.4.226>;tag=YSQQKXXREVDPYPTNFMWG

To: <sip:8000@10.33.4.226>

Call-ID: FKPNOYRNKROIMEGBSSKS@10.33.4.226

CSeq: 1 INVITE

Contact: <sip:100@10.33.4.226>

Route: <sip:2000@10.10.10.10.10>, <sip:300@10.10.10.30>

Supported: em,100rel,timer,replaces
P-Called-Party-ID: <sip:1111@10.33.38.1>
User-Agent: Sip Message Generator V1.0.0.5

Content-Length: 0

1. In the Classification table, add the following classification rules:

Index	Source Username Prefix	Destination Username Prefix	Destination Host	Source IP Group ID
0	333	-	-	1
1	1111	2000	10.10.10.10	2

2. In the IP Group table, add the following IP Groups:

Index	Source URI Input	Destination URI Input
1	-	-
2	P-Called-Party-ID	Route

In this example, a match exists only for Classification Rule #1. This is because the source (1111) and destination (2000) username prefixes match those in the INVITE's P-Called-Party-ID header (i.e., "<sip:1111@10.33.38.1>") and Route header (i.e., "<sip:2000@10.10.10.10.10.10)", respectively. These SIP headers were determined in IP Group ID 2.

29.5.2 Configuring Message Condition Rules

The Message Condition table lets you configure up to 20 Message Condition rules. A Message Condition defines special conditions (requisites) for incoming SIP messages. These rules can be used as additional matching criteria for the following:

- Classification rules in the Classification table (see "Configuring Classification Rules" on page 502)
- IP-to-IP routing rules in the IP-to-IP Routing table (see "Configuring SBC IP-to-IP Routing Rules" on page 510)
- IP-to-IP outbound manipulation rules in the IP to IP Outbound Manipulation table (see "Configuring IP-to-IP Outbound Manipulations" on page 525)

Message Condition rules are configured using the same syntax as that used for Conditions when configuring Message Manipulation rules in the Message Manipulations table (see "Configuring SIP Message Manipulation" on page 298). You can configure simple Message Condition rules, for example, "header.to.host contains company", meaning SIP messages whose To header has a host part containing the string "company". You can configure complex rules using the "AND" or "OR" Boolean operands and also use regular expressions (regex), for example:

- "body.sdp regex pcmu" can be used to enable routing based on the offered codec (G.711 Mu) in the incoming SDP message.
- "body.sdp regex (AVP[0-9||\s]*\s8[\s||\n])" can be used to enable routing based on payload type 8 in the incoming SDP message.

Note: For a description on SIP message manipulation syntax, refer to the SIP Message Manipulations Quick Reference Guide.

The following procedure describes how to configure Message Condition rules in the Web interface. You can also configure Message Condition rules using the table ini file parameter, ConditionTable.

- > To configure a Message Condition rule:
- 1. Open the Message Condition Table page (Configuration tab > VoIP menu > SBC > Routing SBC > Message Condition Table).
- 2. Click **Add**; the following dialog box appears:

Figure 29-7: Condition Table Page - Add Record Dialog Box

- **3.** Configure a Message Condition rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

An example of configured Message Condition rules is shown in the figure below:

Figure 29-8: Condition Table Page

Index	Condition	Description
0	param.ipg.src.type==user	IP Group USER
1	header.via.exists	Includes SIP Via header
2	header.from.url.user=='101'	101 user part of From header

- Index 0: Incoming SIP dialog that is classified as belonging to a User-type IP Group.
- Index 1: Incoming SIP dialog that contains a SIP Via header.
- Index 2: Incoming SIP dialog with 101 as the user part in the SIP From header.

Table 29-5: Message Condition Table Parameter Descriptions

Parameter	Description
Index [ConditionTable_Index]	Defines an index number for the new table record.
Condition [ConditionTable_Condition]	Defines the Condition rule of the SIP message. The valid value is a string. Note: User and host parts must be enclosed in single quotes.
Description [ConditionTable_Description]	Defines a brief description of the Condition rule.

29.5.3 Configuring SBC IP-to-IP Routing

The IP-to-IP Routing table lets you configure up to 500 SBC IP-to-IP routing rules. An IP-to-IP routing rule routes received SIP dialog messages (e.g., INVITE) to an IP destination. An IP-to-IP routing rule includes two areas:

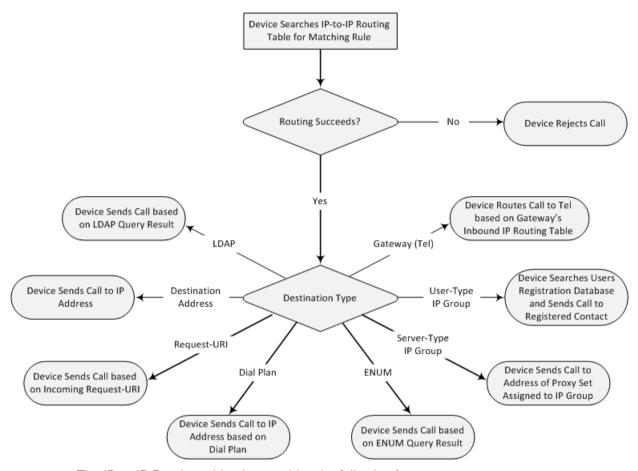

- Matching characteristics (Rule) characteristics of incoming SIP message such as the IP Group from where the message was received.
- Operation (Action) if the incoming SIP message matches the characteristics of the rule, the device routes the message to the configured destination

If the characteristics of an incoming call do not match the first rule in the table, the call characteristics are compared to those of the second rule, and so on until a matching rule is located. If no rule is matched, the call is rejected.

You can configure the IP-to-IP routing rule to send the call to any of the following IP destinations:

- According to registered user Contact listed in the device's database (only for Usertype IP Groups).
- IP Group the destination is the address configured for the Proxy Set associated with the IP Group (allows redundancy/load balancing).
- IP address in dotted-decimal notation or FQDN. Routing to a host name can be resolved using NAPTR/SRV/A-Record.
- Request-URI of incoming SIP dialog initiating requests.
- According to result of an ENUM guery.
- Hunt Group used for call survivability of call centers (see "Call Survivability for Call Centers" on page 489).
- IP address according to a specified Dial Plan index listed in the loaded Dial Plan file.
- According to result of LDAP query (for more information on LDAP-based routing, see "Routing Based on LDAP Active Directory Queries" on page 240).

The IP-to-IP routing rule can also send the IP call to the Tel side (i.e., Gateway call). The rule redirects the call to the Inbound IP Routing table where the device searches for a matching IP-to-Tel routing rule. This feature can also be done for alternative routing. If an IP-to-IP routing rule fails and it is configured with a "Gateway" routing rule as an alternative route, the device uses the Inbound IP Routing table to send the call to the Tel. The device identifies (internally) calls re-directed for alternative Gateway routing, by appending a user-defined string to the prefix destination Request-URI user part (by default, "acgateway-prefix destination>", for example, acgateway-200). The device removes this prefix before sending it to the Tel side. To configure this prefix string, use the GWDirectRoutePrefix ini file parameter.

The IP-to-IP Routing table also provides the following features:

- Alternative routing or load balancing: In addition to the alternative routing/load balancing provided by the Proxy Set associated with the destination IP Group, the table allows the configuration of alternative routes whereby if a route fails, the next adjacent (below) rule in the table that is configured as 'Alt Route Ignore/Consider Inputs' are used. The alternative routes rules can be set to enforce the input matching criteria or to ignore any matching criteria. Alternative routing occurs upon one of the following conditions:
 - A request sent by the device is responded with one of the following:
 - SIP response code (i.e., 4xx, 5xx, and 6xx SIP responses) configured in the SBC Alternative Routing Reasons table (see "Configuring SIP Response Codes for Alternative Routing Reasons" on page 518).
 - SIP 408 Timeout or no response (after timeout).
 - The DNS resolution includes IP addresses that the device has yet to try (for the current call).

Messages are re-routed with the same SIP Call-ID and CSeq header fields (increased by 1).

- Re-routing of SIP requests: This table enables you to configure "re-routing" rules of requests (e.g., INVITEs) that the device sends upon receipt of SIP 3xx responses or REFER messages. These rules are configured for destinations that do not support receipt of 3xx or REFER and where the device handles the requests locally (instead of forwarding the 3xx or REFER to the destination).
- Least cost routing (LCR): If the LCR feature is enabled, the device searches the routing table for matching routing rules and then selects the one with the lowest call cost. The call cost of the routing rule is done by assigning it a Cost Group. For configuring Cost Groups, see "Least Cost Routing" on page 240. If two routing rules

have identical costs, then the rule appearing higher up in the table (i.e., first-matched rule) is used. If a selected route is unavailable, the device uses the next least-cost routing rule. However, even if a matched rule is not assigned a Cost Group, the device can select it as the preferred route over other matched routing rules with Cost Groups, according to the settings of the LCR parameter, LCRDefaultCost (see "Enabling LCR and Configuring Default LCR" on page 242).

Call Forking: The IP-to-IP Routing table can be configured to route an incoming IP call to multiple destinations (call forking). The incoming call can be routed to multiple destinations of any type such as an IP Group or IP address. The device forks the call by sending simultaneous INVITE messages to all the specified destinations. It handles the multiple SIP dialogs until one of the calls is answered and then terminates the other SIP dialogs.

Call forking is configured by creating a Forking group. A Forking group consists of a main routing rule ('Alternative Route Options' set to **Route Row**) whose 'Group Policy' is set to **Forking**, and one or more associated routing rules ('Alternative Route Options' set to **Group Member Ignore Inputs** or **Group Member Consider Inputs**). The group members must be configured in contiguous table rows to the main routing rule. If an incoming call matches the input characteristics of the main routing rule, the device routes the call to its destination and all those of the group members.

An alternative routing rule can also be configured for the Forking group. The alternative route is used if the call fails for the Forking group (i.e., main route and all its group members). The alternative routing rule must be configured in the table row immediately below the last member of the Forking group. The 'Alternative Route Options' of this alternative route must be set to **Alt Route Ignore Inputs** or **Alt Route Consider Inputs**. The alternative route can also be configured with its own forking group members, where if the device uses the alternative route, the call is also sent to its group members. In this case, instead of setting the alternative route's 'Group Policy' to **None**, you must set it to **Forking**. The group members of the alternative route must be configured in the rows immediately below it.

The LCR feature can also be employed with call forking. The device calculates a maximum call cost for each Forking group and routes the call to the Forking group with the lowest cost. Thus, even if the call can successfully be routed to the main routing rule, a different routing rule can be chosen (even an alternative route, if configured) based on LCR. If routing to one Forking group fails, the device tries to route the call to the Forking group with the next lowest cost (main or alternative route), and so on. The prerequisite for this functionality is that the incoming call must successfully match the input characteristics of the main routing rule.

Dial Plan Prefix Tags for Representing Source / Destination Numbers: If your deployment includes calls of many different called (source URI user name) and/or calling (destination URI user name) numbers that need to be routed to the same destination, you can employ user-defined prefix tags to represent these numbers. Thus, instead of configuring many routing rules, you need to configure only one routing rule using the prefix tag as the source and destination number matching characteristics, and a destination for the calls. For more information on prefix tags, see "Dial Plan Prefix Tags for SBC IP-to-IP Routing" on page 565.

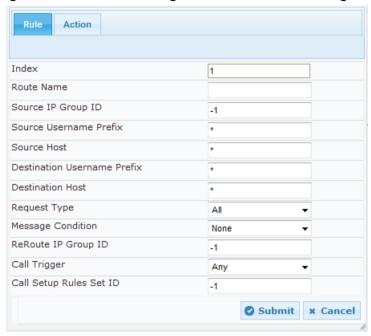

Note: Call forking is not applicable to LDAP-based IP-to-IP routing rules.

The following procedure describes how to configure IP-to-IP routing rules in the Web interface. You can also configure IP-to-IP routing rules using the table ini file parameter, IP2IPRouting.

- To configure an IP-to-IP routing rule:
- 1. Open the IP-to-IP Routing Table page (Configuration tab > VoIP menu > SBC > Routing SBC > IP-to-IP Routing Table).
- 2. Click **Add**; the following dialog box appears:

Figure 29-9: IP-to-IP Routing Table - Add Record Dialog Box

- 3. Configure an IP-to-IP routing rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 29-6: IP-to-IP Routing Table Parameter Descriptions

Parameter	Description
Index [IP2IPRouting_Index]	Defines an index number for the new table record.
Route Name [IP2IPRouting_RouteName]	Defines an arbitrary name to easily identify the IP-to-IP routing rule.
	The valid value is a string of up to 20 characters. By default, no value is defined.
Matching Characteristics - Rule	
Source IP Group ID [IP2IPRouting_SrcIPGroupID]	Defines the IP Group from where the IP call was received. Typically, the IP Group of an incoming SIP dialog is determined (or classified) using the Classification table (see Configuring Classification Rules on page 502).
	The default is -1. To denote any IP Group, leave this field empty.
Source Username Prefix [IP2IPRouting_SrcUsernamePrefix]	Defines the prefix of the user part of the incoming SIP dialog's source URI (usually the From URI). You can use special notations for denoting the prefix. To denote calls without a user part in the URI, use the \$ sign. For available notations, see "Dialing Plan Notation for Routing and

Parameter	Description
	Manipulation" on page 689. The default is the asterisk (*) symbol (i.e., any prefix). If this rule is not required, leave this field empty.
Source Host [IP2IPRouting_SrcHost]	Defines the host part of the incoming SIP dialog's source URI (usually the From URI). The default is the asterisk (*) symbol (i.e., any host name). If this rule is not required, leave this field empty.
Destination Username Prefix [IP2IPRouting_DestUsernamePrefix]	Defines the prefix of the incoming SIP dialog's destination URI (usually the Request URI) user part. You can use special notations for denoting the prefix. To denote calls without a user part in the URI, use the \$ sign. For available notations, see "Dialing Plan Notation for Routing and Manipulation" on page 689. The default is the asterisk (*) symbol (i.e., any prefix). If this rule is not required, leave this field empty.
Destination Host [IP2IPRouting_DestHost]	Defines the host part of the incoming SIP dialog's destination URI (usually the Request-URI). The default is the asterisk (*) symbol (i.e., any destination host). If this rule is not required, leave this field empty.
Request Type [IP2IPRouting_RequestType]	Defines the SIP dialog request type of the incoming SIP dialog. • [0] All (default) • [1] INVITE • [2] REGISTER • [3] SUBSCRIBE • [4] INVITE and REGISTER • [5] INVITE and SUBSCRIBE • [6] OPTIONS
Message Condition [IP2IPRouting_MessageCondition]	Assigns a SIP message Condition rule. To configure Condition rules, see "Configuring Message Condition Rules" on page 508.
ReRoute IP Group ID [IP2IPRouting_ReRouteIPGroupID]	Defines the IP Group that initiated (sent) the SIP redirect response (e.g., 3xx) or REFER message. This field is typically used for re-routing requests (e.g., INVITEs) when interworking is required for SIP 3xx redirect responses or REFER messages. For more information, see "Interworking SIP 3xx Redirect Responses" on page 481 and "Interworking SIP REFER Messages" on page 483, respectively. This parameter functions together with the 'Call Trigger' field (see below). The default is -1 (i.e., not configured).
Call Trigger [IP2IPRouting_Trigger]	 Defines the reason (i.e, trigger) for re-routing the SIP request: [0] Any = (Default) This routing rule is used for all scenarios (re-routes and non-re-routes). [1] 3xx = Re-routes the request if it was triggered as a result of a SIP 3xx response. [2] REFER = Re-routes the INVITE if it was triggered as a result of a REFER request. [3] 3xx or REFER = Applies to options [1] and [2].

Parameter	Description
	• [4] Initial only = This routing rule is used for regular requests that the device forwards to the destination. This rule is not used for re-routing of requests triggered by the receipt of REFER or 3xx.
Call Setup Rules Set Id [IP2IPRouting_CallSetupRulesSetId]	Assigns a Call Setup Rule Set ID to the routing rule. The device performs the Call Setup rules of this Set ID if the incoming call matches the characteristics of this routing rule. The device routes the call to the destination according to the routing rule's configured action, only after it has performed the Call Setup rules.
	For configuring Call Setup rules, see "Configuring Call Setup Rules" on page 247.
Operation Routing Rule - Action	
Destination Type [IP2IPRouting_DestType]	Determines the destination type to which the outgoing SIP dialog is sent. • [0] IP Group = (Default) The SIP dialog is sent to the IP Group's Proxy Set (SERVER-type IP Group) or registered contact from the database (if USER-type IP
	registered contact from the database (if USER-type IP Group). I] Dest Address = The SIP dialog is sent to the address configured in the following fields: 'Destination SRD ID', 'Destination Address', 'Destination Port', and 'Destination Transport Type'. I[2] Request URI = The SIP dialog is sent to the address indicated in the incoming Request-URI. If the fields 'Destination Port' and 'Destination Transport Type' are configured, the incoming Request-URI parameters are overridden and these fields take precedence. I[3] ENUM = An ENUM query is sent to include the destination address. If the fields 'Destination Port' and 'Destination Transport Type' are configured, the incoming Request-URI parameters are overridden and these fields take precedence. I[4] Hunt Group = Used for call center survivability. For more information, see "Call Survivability for Call Centers" on page 489. I[5] Dial Plan = The IP destination is determined by a Dial Plan index of the loaded Dial Plan file. The syntax of the Dial Plan index in the Dial Plan file is as follows: <destination called="" number="" prefix="">,0,<ip destination=""> Note that the second parameter "0" is ignored. An example of a configured Dial Plan (# 6) in the Dial Plan</ip></destination>
	file is shown below: [PLAN6] 200,0,10.33.8.52 ; called prefix 200 is routed to destination 10.33.8.52 201,0,10.33.8.52 300,0,itsp.com ; called prefix 300 is routed to destination itsp.com
	Once the Dial Plan is defined, you need to assign it (0 to 7) to the routing rule as the destination in the 'Destination Address' parameter, where "0" denotes [PLAN1], "1"

Parameter	Description
	 denotes [PLAN2], and so on. [7] LDAP = LDAP-based routing. [8] Gateway = The device routes the SBC call to the Tel side (Gateway call) using an IP-to-Tel routing rule in the Inbound IP Routing table (see Configuring Inbound IP Routing Table on page 416). The IP-to-Tel routing rule must be configured with the same call matching characteristics as this SBC IP-to-IP routing rule. This option is also used for alternative routing of an IP-to-IP route to the PSTN. In such a case, the IP-to-Tel routing rule must also be configured with the same call matching characteristics as this SBC IP-to-IP routing rule.
Destination IP Group ID [IP2IPRouting_DestIPGroupID]	Defines the IP Group ID to where you want to route the call. The SIP dialog messages are sent to the IP address defined for the Proxy Set associated with this IP Group. If you select an IP Group, it is unnecessary to configure a destination IP address (in the 'Destination Address' field). However, if both parameters are configured, then the IP Group takes precedence. If the destination IP Group is of USER type, the device searches for a match between the Request-URI (of the received SIP dialog) to an AOR registration record in the device's database. The SIP dialog is then sent to the IP address of the registered contact.
	The default is -1. Notes: This parameter is only relevant if the parameter
	'Destination Type' is set to IP Group . However, regardless of the settings of the parameter 'Destination Type', the IP Group is still used - only for determining the IP Profile or outgoing SRD. If neither IP Group nor SRD are defined in this table, the destination SRD is determined according to the source SRD associated with the Source IP Group (configured in the IP Group table, see "Configuring IP Groups" on page 273). If this table does not define an IP Group but only an SRD, the first IP Group associated with this SRD (in the IP Group table) is used.
	 If the destination IP Group ID is of SERVER type, the request is routed according to the IP Group addresses. If the destination IP Group ID is of USER type, the request is routed according to the IP Group specific database (i.e., only to registered users of the selected database). If the destination IP Group ID is ANY USER ([-2]), the request is routed according to the general database (i.e.,
	any matching registered user).
Destination SRD ID [IP2IPRouting_DestSRDID]	Defines the SRD ID. The default is None. Note: The destination IP Group must belong to the destination SRD if both are configured in this table.
Destination Address [IP2IPRouting_DestAddress]	Defines the destination to where the call is sent. This can be an IP address or a domain name (e.g., domain.com). If ENUM-based routing is used (i.e., the 'Destination Type'

Parameter	Description
	parameter is set to ENUM) this parameter defines the IP address or domain name (FQDN) of the ENUM service, for example, e164.arpa, e164.customer.net or NRENum.net. The device sends the ENUM query containing the destination phone number to an external DNS server, configured in the Interface table. The ENUM reply includes a SIP URI (user@host) which is used as the destination Request-URI in this routing table. The valid value is a string of up to 50 characters.
	Notes:
	 This parameter is applicable only if the 'Destination Type' parameter is set to Dest Address [1] or ENUM [3]. When using domain names, enter a DNS server IP address or alternatively, define these names in the Internal DNS table (see "Configuring the Internal SRV Table" on page 142). To terminate SIP OPTIONS messages at the device (i.e., to handle them locally), set this parameter to "internal".
Destination Port [IP2IPRouting_DestPort]	Defines the destination port to where the call is sent.
Destination Transport Type [IP2IPRouting_DestTransportType]	Defines the transport layer type for sending the call:
Alternative Route Options [IP2IPRouting_AltRouteOptions]	 Determines whether this routing rule is the main routing rule or an alternative routing rule (to the rule defined directly above it in the table). [0] Route Row (default) = Main routing rule - the device first attempts to route the call to this route if the incoming SIP dialog's input characteristics matches this rule. [1] Alt Route Ignore Inputs = If the call cannot be routed to the main route (Route Row), the call is routed to this alternative route regardless of the incoming SIP dialog's input characteristics. [2] Alt Route Consider Inputs = If the call cannot be routed to the main route (Route Row), the call is routed to this alternative route only if the incoming SIP dialog matches this routing rule's input characteristics. [3] Group Member Ignore Inputs = This routing rule is a member of the Forking routing rule. The incoming call is also forked to the destination of this routing rule are ignored. [4] Group Member Consider Inputs = This routing rule is a member of the Forking routing rule. The incoming call is also forked to the destination of this routing rule only if the incoming call matches this rule's input characteristics.

Parameter	Description
	Notes:
	• The alternative routing entry ([1] or [2]) must be defined in the next consecutive table entry index to the Route Row entry (i.e., directly below it). For example, if Index 4 is configured as a Route Row, Index 5 must be configured as the alternative route.
	 The Forking Group members must be configured in a table row that is immediately below the main Forking routing rule, or below an alternative routing rule for the main rule, if configured.
	 For IP-to-IP alternative routing, configure alternative routing reasons upon receipt of 4xx, 5xx, and 6xx SIP responses (see Configuring SIP Response Codes for Alternative Routing Reasons on page 518). However, if no response, ICMP, or a SIP 408 response is received, the device attempts to use the alternative route even if no entries are configured in the 'SBC Alternative Routing Reasons' table.
	 Multiple alternative route entries can be configured (e.g., Index 1 is the main route - Route Row - and indices 2 through 4 are configured as alternative routes).
Group Policy	Defines whether the routing rule includes call forking.
[IP2IPRouting_GroupPolicy]	 [0] None (default) = Call uses only this route (even if Forking Group members are configured in the rows below it). [1] Forking = Call uses this route and the routes of Forking Group members, if configured (in the rows below it).
Cost Group [IP2IPRouting_CostGroup]	Assigns a Cost Group to the routing rule for determining the cost of the call. To configure Cost Groups, see "Configuring Cost Groups" on page 244.
	By default, no Cost Group is defined.

29.5.4 Configuring SIP Response Codes for Alternative Routing Reasons

The SBC Alternative Routing Reasons table lets you configure up to 20 SIP response codes for call release (termination) reasons. If a call (outgoing SIP dialog-initiating methods, e.g., INVITE, OPTIONS, and SUBSCRIBE messages) is released as a result of a configured SIP code (provided in SIP 4xx, 5xx, and 6xx), the device attempts to locate an alternative route for the call in the IP-to-IP Routing table. Alternative routing rules are configured with the 'Alternative Route Options' parameter set to **Alt Route Ignore Inputs** or **Alt Route Consider Inputs** (see "Configuring SBC IP-to-IP Routing Rules" on page 510).

Typically, the device performs alternative routing when there is no response at all to an INVITE message. This is done after a user-defined number of INVITE re-transmissions, configured by the SIPMaxRtx parameter. In such a scenario, the device issues itself the SIP response code 408 (Request Timeout). Alternative routing is only done if you have configured this response code in the SBC Alternative Routing Reasons table.

You can also configure alternative routing for the following proprietary response codes, if configured in the table, which are issued by the device itself:

805 IP Profile Call Limit: The device generates this response code when Call

Admission Control (CAC) limits (such as maximum concurrent calls) are exceeded for an IP Group (or SRD). The CAC rules are configured in the Admission Control table (see "Configuring Admission Control" on page 497). When this occurs, the device sends a SIP 480 (Temporarily Unavailable) response to the SIP entity. In such a scenario, an alternative route configured in the IP-to-IP Routing table can be used.

806 Media Limits Exceeded: The device generates this response code when the call is terminated due to crossed thresholds of QoE metrics such as MOS, packet delay, and packet loss (configured in the Quality of Experience Profile table) and/or media bandwidth (configured in the Bandwidth profile table). When this occurs, the device sends a SIP 480 (Temporarily Unavailable) response to the SIP entity. This is configured by 1) assigning an IP Group a QoE and/or Bandwidth profile that rejects calls if the threshold is crossed, 2) configuring 806 in the SBC Alternative Routing Reasons table and 3) configuring an alternative routing rule.

Notes:

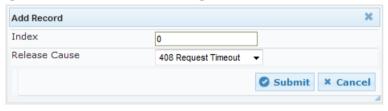

- If the device receives a SIP 408 response, an ICMP message, or no response, alternative routing is still performed even if the SBC Alternative Routing Reasons table is not configured.
- SIP requests belonging to an SRD or IP Group that have reached the call limit (maximum concurrent calls and/or call rate) as configured in the Call Admission table are sent to an alternative route if configured in the IP-to-IP Routing table for the SRD or IP Group. If no alternative routing rule is located, the device automatically rejects the SIP request with a SIP 480 "Temporarily Unavailable" response.

The following procedure describes how to configure the SBC Alternative Routing Reasons table in the Web interface. You can also configure this table using the table ini file parameter, SBCAlternativeRoutingReasons.

- To configure SIP reason codes for alternative IP routing:
- Open the SBC Alternative Routing Reasons page (Configuration tab > VolP menu > SBC > Routing SBC > Alternative Routing Reasons).
- 2. Click Add; the following dialog box appears:

Figure 29-10: Alternative Routing Reasons Table - Add Record

- 3. Configure a SIP response code for alternative routing according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 29-7: SBC Alternative Routing Reasons Table Parameter Descriptions

Parameter	Description
Index [SBCAlternativeRoutingReasons_Index]	Defines an index number for the new table record.

Parameter	Description
Release Cause [SBCAlternativeRoutingReasons_ReleaseCause]	Defines a SIP response code for triggering the device's alternative routing mechanism.

29.6 SBC Manipulations

This section describes the configuration of the manipulation rules for the SBC application.

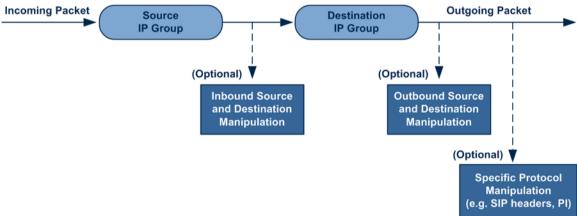

Note: For additional manipulation features, see the following:

- "Configuring SIP Message Policy Rules".
- "Configuring SIP Message Manipulation" on page 298.

The device supports SIP URI user part (source and destination) manipulations for inbound and outbound routing. These manipulations can be applied to a source IP group, source and destination host and user prefixes, and/or user-defined SIP request (e.g., INVITE, OPTIONS, SUBSCRIBE, and/or REGISTER). Since outbound manipulations are performed after routing, the outbound manipulation rule matching can also be done by destination IP Group. Manipulated destination user and host are performed on the following SIP headers: Request-URI, To, and Remote-Party-ID (if exists). Manipulated source user and host are performed on the following SIP headers: From, P-Asserted (if exists), P-Preferred (if exists), and Remote-Party-ID (if exists).

Figure 29-11: SIP URI Manipulation in IP-to-IP Routing

You can also restrict source user identity in outgoing SIP dialogs in the Outbound Manipulation table (using the column PrivacyRestrictionMode). The device identifies an incoming user as restricted if one of the following exists:

- From header user is 'anonymous'.
- P-Asserted-Identity and Privacy headers contain the value 'id'.

All restriction logic is done after the user number has been manipulated.

Host name (source and destination) manipulations are simply host name substitutions with the names defined for the source and destination IP Groups respectively (if any, in the IP Group table).

Below is an example of a call flow and consequent SIP URI manipulations:

Incoming INVITE from LAN:

```
INVITE sip:1000@10.2.2.3;user=phone;x=y;z=a SIP/2.0
Via: SIP/2.0/UDP 10.2.2.6;branch=z9hGLLLLLan
From: <sip:7000@10.2.2.6; user=phone; x=y; z=a>; tag=01LAN; paramer1
=abe
To: <sip:1000@10.2.2.3;user=phone>
Call-ID: USELLLAN@10.2.2.3
CSeq: 1 INVITE
Contact: <sip:7000@10.2.2.3>
Supported: em,100rel,timer,replaces
Allow: REGISTER, OPTIONS, INVITE, ACK, CANCEL, BYE, NOTIFY, PRACK
User-Agent: Sip Message Generator V1.0.0.5
Content-Type: application/sdp
Content-Length: 155
v=0
o=SMG 791285 795617 IN IP4 10.2.2.6
s=Phone-Call
c=IN IP4 10.2.2.6
t = 0 0
m=audio 6000 RTP/AVP 8
a=rtpmap:8 pcma/8000
a=sendrecv
a=ptime:20
```

Outgoing INVITE to WAN:

```
INVITE sip: 9721000@ITSP;user=phone;x=y;z=a SIP/2.0
Via: SIP/2.0/UDP 212.179.1.12;branch=z9hGWwan
From:
<sip:97000@IP_PBX;user=phone;x=y;z=a>;tag=OWan;paramer1=abe
To: <sip: 9721000@ ITSP;user=phone>
Call-ID: USEVWWAN@212.179.1.12
CSeq: 38 INVITE
Contact: <sip:7000@212.179.1.12>
Supported: em, 100rel, timer, replaces
Allow:
REGISTER, OPTIONS, INVITE, ACK, CANCEL, BYE, NOTIFY, PRACK, REFER
User-Agent: Sip Message Generator V1.0.0.5
Content-Type: application/sdp
Content-Length: 155
0 = v
o=SMG 5 9 IN IP4 212.179.1.11
s=Phone-Call
c=IN IP4 212.179.1.11
t = 0 0
m=audio 8000 RTP/AVP 8
a=rtpmap:8 pcma/8000
a=sendrecv
a=ptime:20
```

The SIP message manipulations in the example above (contributing to typical topology hiding) are as follows:

Inbound source SIP URI user name from "7000" to "97000":

```
From: <sip:7000@10.2.2.6;user=phone;x=y;z=a>;tag=OlLAN;paramer1
=abe
to
From:
<sip:97000@IP_PBX;user=phone;x=y;z=a>;tag=OWan;paramer1=abe
```

Source IP Group name (i.e., SIP URI host name) from "10.2.2.6" to "IP_PBX":

```
From: <sip:7000@10.2.2.6; user=phone; x=y; z=a>; tag=OlLAN; paramer1
=abe
```

to

From:

<sip:97000@IP_PBX;user=phone;x=y;z=a>;tag=OWan;paramer1=abe

Inbound destination SIP URI user name from "1000" to 9721000":

```
INVITE sip:1000@10.2.2.3;user=phone;x=y;z=a SIP/2.0
To: <sip:1000@10.2.2.3;user=phone>
to
INVITE sip:9721000@ITSP;user=phone;x=y;z=a SIP/2.0
To: <sip:9721000@ITSP;user=phone>
```

Destination IP Group name (SIP URI host name) from "10.2.2.3" to "ITSP":

```
INVITE sip:1000@10.2.2.3;user=phone;x=y;z=a SIP/2.0
To: <sip:1000@10.2.2.3;user=phone>
to
INVITE sip:9721000@ITSP;user=phone;x=y;z=a SIP/2.0
To: <sip:9721000@ITSP;user=phone>
```

29.6.1 Configuring IP-to-IP Inbound Manipulations

The IP to IP Inbound Manipulation table lets you configure up to 100 IP-to-IP Inbound Manipulation rules. An IP-to-IP Inbound Manipulation rule defines a manipulation sequence for the source or destination SIP URI user part of inbound SIP dialog requests. You can apply these manipulations to different SIP dialog message types (e.g., INVITE or REGISTER) and SIP headers as follows:

- Manipulated destination URI user part are done on the following SIP headers: Request-URI, To, and Remote-Party-ID (if exists)
- Manipulated source URI user part are done on the following SIP headers: From, P-Asserted-Identity (if exists), P-Preferred-Identity (if exists), and Remote-Party-ID (if exists)

An IP-to-IP Inbound Manipulation rule includes two areas:

- Matching characteristics (Rule) characteristics of incoming SIP dialog such as source host name.
- Operation (Action) if the incoming call matches the characteristics of the rule, the device manipulates the source or destination SIP URI user part of the SIP dialog (e.g., removes user-defined number of characters from the left of the SIP URI user part).

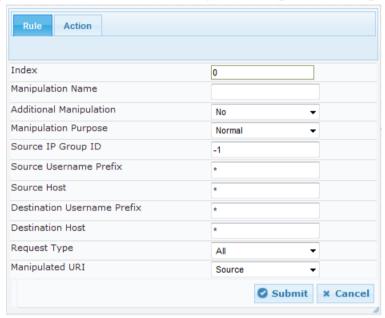

Note: The IP Group table can be used to configure a host name that overwrites the received host name. This manipulation can be done for source and destination IP Groups (see "Configuring IP Groups" on page 273).

The following procedure describes how to configure IP-to-IP Inbound Manipulation rules in the Web interface. You can also configure these rules using the table ini file parameter, IPInboundManipulation.

- To configure an IP-to-IP Inbound Manipulation rule:
- 1. Open the IP to IP Inbound Manipulation page (Configuration tab > VoIP menu > SBC > Manipulations SBC > IP to IP Inbound).
- 2. Click **Add**; the following dialog box appears:

Figure 29-12: IP to IP Inbound Manipulation Page - Add Dialog Box

- 3. Configure the IP-to-IP inbound manipulation rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 29-8: IP to IP Inbound Manipulation Parameter Descriptions

Parameter	Description	
Index [IPInboundManipulation_Index]	Defines an index number for the new table record.	
Manipulation Name [IPInboundManipulati	Defines an arbitrary name to easily identify the manipulation rule.	
onName]	The valid value is a string of up to 20 characters. By default, no value is defined.	
Matching Characteristics - Rule		
Additional Manipulation [IPInboundManipulation_IsAddition alManipulation]	Determines whether additional SIP URI user part manipulation is done for the table entry rule listed directly above it.	
	 [0] No = (Default) Regular manipulation rule (not done in addition to the rule above it). 	
	 [1] Yes = If the above row entry rule matched the call, consider this row entry as a match as well and perform the manipulation specified by this rule. 	
	Note: Additional manipulation can only be done on a different SIP URI, source or destination, to the rule configured in the row above as configured by the 'Manipulated URI' parameter (see below).	

Parameter	Description
Manipulation Purpose [IPInboundManipulation_ManipulationPurpose]	 Defines the purpose of the manipulation: [0] Normal = (Default) Inbound manipulations affect the routing input and source and/or destination number. [1] Routing input only = Inbound manipulations affect the routing input only, retaining the original source and destination number. [2] Shared Line = Used for the Shared-Line Appearance feature. This manipulation is for registration requests to change the destination number of the secondary extension numbers to the primary extension. For more information, see "BroadSoft's Shared Phone Line Call Appearance for SBC Survivability" on page 488.
Source IP Group ID [IPInboundManipulation_SrclpGroup]	Defines the IP Group from where the incoming INVITE is received. The default is -1 (i.e., any IP Group).
Source Username Prefix [IPInboundManipulation_SrcUsernamePrefix]	Defines the prefix of the source SIP URI user name (usually in the From header). The default is the asterisk (*) symbol (i.e., any source username prefix). Note: The prefix can be a single digit or a range of digits. For available notations, see "Dialing Plan Notation for Routing and Manipulation" on page 689.
Source Host [IPInboundManipulation_SrcHost]	Defines the source SIP URI host name - full name (usually in the From header). The default is the asterisk (*) symbol (i.e., any host name).
Destination Username Prefix [IPInboundManipulation_DestUsern amePrefix]	Defines the prefix of the destination SIP URI user name, typically located in the Request-URI and To headers. The default is the asterisk (*) symbol (i.e., any destination username prefix). Note: The prefix can be a single digit or a range of digits. For available notations, see "Dialing Plan Notation for Routing and Manipulation" on page 689.
Destination Host [IPInboundManipulation_DestHost]	Defines the destination SIP URI host name - full name, typically located in the Request-URI and To headers. The default is the asterisk (*) symbol (i.e., any destination host name).
Request Type [IPInboundManipulation_RequestTy pe]	 Defines the SIP request type to which the manipulation rule is applied. [0] All = (Default) All SIP messages. [1] INVITE = All SIP messages except REGISTER and SUBSCRIBE. [2] REGISTER = Only REGISTER messages. [3] SUBSCRIBE = Only SUBSCRIBE messages. [4] INVITE and REGISTER = All SIP messages except SUBSCRIBE. [5] INVITE and SUBSCRIBE = All SIP messages except REGISTER.
Manipulated URI [IPInboundManipulation_Manipulat	Determines whether the source or destination SIP URI user part is manipulated.

Parameter	Description
edURI]	 [0] Source = (Default) Manipulation is done on the source SIP URI user part. [1] Destination = Manipulation is done on the destination SIP URI user part.
Operation Rule - Action	
Remove From Left [IPInboundManipulation_RemoveFromLeft]	Defines the number of digits to remove from the left of the user name prefix. For example, if you enter 3 and the user name is "john", the new user name is "n".
Remove From Right [IPInboundManipulation_RemoveFromRight]	Defines the number of digits to remove from the right of the user name prefix. For example, if you enter 3 and the user name is "john", the new user name is "j". Note: If both 'Remove From Right' and 'Leave From Right' parameters are configured, the 'Remove From Right' setting is applied first.
Leave From Right [IPInboundManipulation_LeaveFromRight]	Defines the number of characters that you want retained from the right of the user name. Note: If both 'Remove From Right' and 'Leave From Right' parameters are configured, the 'Remove From Right' setting is applied first.
Prefix to Add [IPInboundManipulation_Prefix2Ad d]	Defines the number or string that you want added to the front of the user name. For example, if you enter 'user' and the user name is "john", the new user name is "userjohn".
Suffix to Add [IPInboundManipulation_Suffix2Ad d]	Defines the number or string that you want added to the end of the user name. For example, if you enter '01' and the user name is "john", the new user name is "john01".

29.6.2 Configuring IP-to-IP Outbound Manipulations

The IP to IP Outbound Manipulation table lets you configure up to 100 IP-to-IP Outbound Manipulation rules. An IP-to-IP Outbound Manipulation rule defines a manipulation action for the SIP Request-URI user part (source or destination) or calling name of outbound SIP dialog requests. The IP-to-IP Outbound Manipulation rules can be applied to any SIP request type (e.g., INVITE). Manipulated destination URI user part are done on the SIP headers - Request URI, To, and Remote-Party-ID (if exists). Manipulated source URI user part are done on the SIP headers - From, P-Asserted (if exists), P-Preferred (if exists), and Remote-Party-ID (if exists).

An IP-to-IP Outbound Manipulation rule includes two areas:

- Matching characteristics (Rule) characteristics of incoming SIP dialog such as source host name. As the device performs outbound manipulations only after the routing process, the IP-to-IP Outbound Manipulation rule can also use destination IP Groups as matching characteristics.
- Operation (Action) if the incoming call matches the characteristics of the rule, the device manipulates the source or destination SIP URI user part or calling name of the SIP dialog (e.g., removes user-defined number of characters from the left of the SIP URI user part).

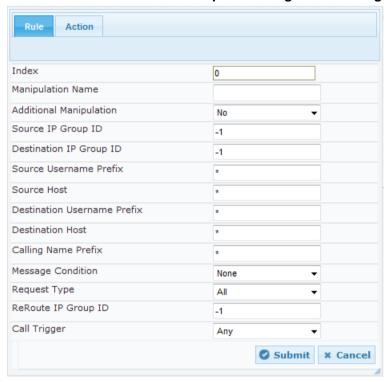

Note: SIP URI host name (source and destination) manipulations can also be configured in the IP Group table. These manipulations are simply host name substitutions with the names configured for the source and destination IP Groups, respectively.

The following procedure describes how to configure IP-to-IP Outbound Manipulation rules in the Web interface. You can also configure these rules using the table ini file parameter, IPOutboundManipulation.

- To configure IP-to-IP outbound manipulation rules:
- Open the IP to IP Outbound Manipulation page (Configuration tab > VoIP menu > SBC > Manipulations SBC > IP to IP Outbound).
- Click Add; the following dialog box appears:

Figure 29-13: IP to IP Outbound Manipulation Page - Add Dialog Box

- **3.** Configure an IP-to-IP outbound manipulation rule according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 29-9: IP to IP Outbound Manipulation Table Parameter Description

Parameter	Description
Index [IPOutboundManipulation_Index]	Defines an index number for the new table record.
Manipulation Name [IPOutboundManipulation_Manipulati	Defines an arbitrary name to easily identify the manipulation name.
onName]	The valid value is a string of up to 20 characters. By default, no value is defined.
Matching Characteristics - Rule	
Additional Manipulation	Determines whether additional manipulation is done for the

Parameter	Description
[IPOutboundManipulation_IsAddition alManipulation]	 table entry rule listed directly above it. [0] No = (Default) Regular manipulation rule - not done in addition to the rule above it. [1] Yes = If the previous table row entry rule matched the call, consider this row entry as a match as well and perform the manipulation specified by this rule. Note: Additional manipulation can only be done on a different item (source URI, destination URI, or calling name) to the rule configured in the row above (configured)
Source IP Group ID [IPOutboundManipulation_SrcIPGroupID]	by the 'Manipulated URI' parameter). Defines the IP Group from where the INVITE is received. The default values is -1 (i.e., any IP Group).
Destination IP Group ID [IPOutboundManipulation_DestIPGroupID]	Defines the IP Group to where the INVITE is to be sent. The default values is -1 (i.e., any IP Group).
Source Username Prefix [IPOutboundManipulation_SrcUsernamePrefix]	Defines the prefix of the source SIP URI user name, typically used in the SIP From header. The default value is the asterisk (*) symbol (i.e., any source username prefix). The prefix can be a single digit or a range of digits. For available notations, see "Dialing Plan Notation for Routing and Manipulation" on page 689.
Source Host [IPOutboundManipulation_SrcHost]	Defines the source SIP URI host name - full name, typically in the From header. The default value is the asterisk (*) symbol (i.e., any source host name).
Destination Username Prefix [IPOutboundManipulation_DestUsern amePrefix]	Defines the prefix of the destination SIP URI user name, typically located in the Request-URI and To headers. The default value is the asterisk (*) symbol (i.e., any destination username prefix). The prefix can be a single digit or a range of digits. For available notations, see "Dialing Plan Notation for Routing and Manipulation" on page 689.
Destination Host [IPOutboundManipulation_DestHost]	Defines the destination SIP URI host name - full name, typically located in the Request-URI and To headers. The default value is the asterisk (*) symbol (i.e., any destination host name).
Calling Name Prefix [IPOutboundManipulation_CallingNamePrefix]	Defines the prefix of the calling name (caller ID). The calling name appears in the SIP From header. The valid value is a string of up to 37 characters. By default, no prefix is defined.
Message Condition [IPOutboundManipulation_MessageCondition]	Assigns a Message Condition rule as a matching characteristic. Message Condition rules define required SIP message formats. For configuring Message Condition rules, see "Configuring Message Condition Rules" on page 508.
Request Type [IPOutboundManipulation_RequestType]	Defines the SIP request type to which the manipulation rule is applied. • [0] All = (Default) all SIP messages.

Parameter	Description
	 [1] INVITE = All SIP messages except REGISTER and SUBSCRIBE. [2] REGISTER = Only SIP REGISTER messages. [3] SUBSCRIBE = Only SIP SUBSCRIBE messages. [4] INVITE and REGISTER = All SIP messages except SUBSCRIBE. [5] INVITE and SUBSCRIBE = All SIP messages except REGISTER.
ReRoute IP Group ID [IPOutboundManipulation_ReRouteIP GroupID]	Defines the IP Group that initiated (sent) the SIP redirect response (e.g., 3xx) or REFER message. This parameter is typically used for re-routing requests (e.g., INVITEs) when interworking is required for SIP 3xx redirect responses or REFER messages. The default is -1 (i.e., not configured).
	 Notes: This parameter functions together with the 'Call Trigger' parameter (see below). For more information on interworking of SIP 3xx redirect
	responses or REFER messages, see "Interworking SIP 3xx Redirect Responses" on page 481 and "Interworking SIP REFER Messages" on page 483, respectively.
Call Trigger [IPOutboundManipulation_Trigger]	 Defines the reason (i.e, trigger) for the re-routing of the SIP request: [0] Any = (Default) Re-routed for all scenarios (re-routes and non-re-routes). [1] 3xx = Re-routed if it triggered as a result of a SIP 3xx response.
	 [2] REFER = Re-routed if it triggered as a result of a REFER request. [3] 3xx or REFER = Applies to options [1] and [2]. [4] Initial only = Regular requests that the device forwards to a destination. In other words, re-routing of requests triggered by the receipt of REFER or 3xx does not apply.
Operation Manipulation Rule - Action	ποι αρριγ.
Manipulated Item [IPOutboundManipulation_IsAddition alManipulation]	Defines the element in the SIP message that you want manipulated. • [0] Source URI = (Default) Manipulates the source SIP Request-URI user part. • [1] Destination URI = Manipulates the destination SIP Request-URI user part. • [2] Calling Name = Manipulates the calling name in the SIP message.
Remove From Left [IPOutboundManipulation_RemoveFromLeft]	Defines the number of digits to remove from the left of the manipulated item prefix. For example, if you enter 3 and the user name is "john", the new user name is "n".
Remove From Right [IPOutboundManipulation_RemoveFromRight]	Defines the number of digits to remove from the right of the manipulated item prefix. For example, if you enter 3 and the user name is "john", the new user name is "j".

Parameter	Description
Leave From Right [IPOutboundManipulation_LeaveFromRight]	Defines the number of digits to keep from the right of the manipulated item.
Prefix to Add [IPOutboundManipulation_Prefix2Ad d]	Defines the number or string to add in the front of the manipulated item. For example, if you enter 'user' and the user name is "john", the new user name is "userjohn".
	If you set the 'Manipulated Item' parameter to Source URI or Destination URI , you can configure this parameter to a string of up 49 characters. If you set the 'Manipulated Item' parameter to Calling Name , you can configure this parameter to a string of up 36 characters.
Suffix to Add [IPOutboundManipulation_Suffix2Ad d]	Defines the number or string to add at the end of the manipulated item. For example, if you enter '01' and the user name is "john", the new user name is "john01". If you set the 'Manipulated Item' parameter to Source URI
	or Destination URI , you can configure this parameter to a string of up 49 characters. If you set the 'Manipulated Item' parameter to Calling Name , you can configure this parameter to a string of up 36 characters.
Privacy Restriction Mode [IPOutboundManipulation_PrivacyRestrictionMode]	Determines user privacy handling (i.e., restricting source user identity in outgoing SIP dialogs). • [0] Transparent = (Default) No intervention in SIP privacy. • [1] Don't change privacy = The user identity remains the same as in the incoming SIP dialog. If a restricted number exists, the restricted presentation is normalized as follows: • From URL header: anonymous@anonymous.invalid. • If a P-Asserted-Identity header exists (either in the incoming SIP dialog or added by the device), a Privacy header is added with the value "id". • [2] Restrict = The user identity is restricted (the restricted presentation is as mentioned above). • [3] Remove Restriction = The device attempts to reveal the user identity by setting user values in the From header and removing the privacy "id" value if the Privacy header exists. If the From header user is anonymous, the value is taken from the P-Preferred-Identity, P-Asserted-Identity, or Remote-Party-ID header (if exists). The device identifies an incoming user as restricted if one of the following exists: • From header user is anonymous. • P-Asserted-Identity and Privacy headers contain the value "id". Note: All restriction logic is performed after the user number has been manipulated.

This page is intentionally left blank.

Part VII

High-Availability System

User's Manual 30. HA Overview

30 HA Overview

The High Availability architecture of the Mediant 3000 provides the following main functionality:

- Redundant Active/Standby configuration
- Support for both TP-6310 and TP-8410 blades
- One or many global device IP addresses
- Private IP address for each blade for maintenance and fallback.
- Upgrading software without disrupting current calls (Hitless Software Upgrade)

The device supports a 1+1 redundancy scheme termed High Availability (HA). In HA mode, the device includes two VoP blades (TP-8410 or TP-6310) and two SA/M3K blades in the front panel, where one of each blade pair is either in active or redundant mode). The general architecture of the HA system with TP-8410 and TP-6310 are shown respectively in the figures below:

Figure 30-1: High Availability System 1+1 of Mediant 3000 with TP-8410

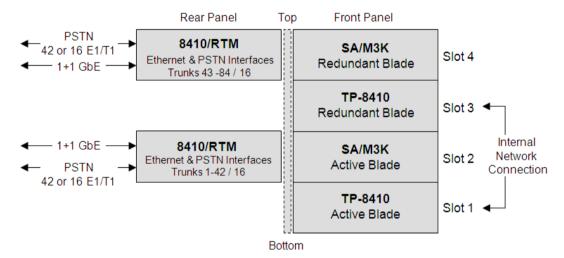

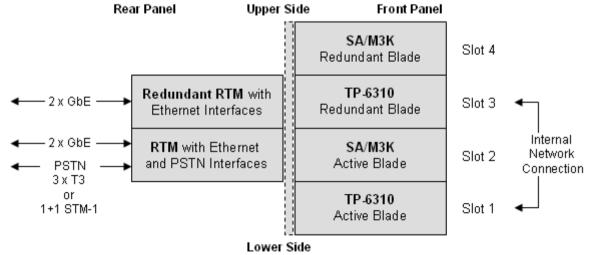

Figure 30-2: High Availability System 1+1 of Mediant 3000 with TP-6310

On the front panel, the active blade occupies Slot 1 while the redundant blade occupies Slot 3. The SA/M3K blades occupy the front panel's slots 2 (active blade) and 4 (redundant blade).

The RTMs on the rear of the chassis is according to implemented blade:

- TP-8410: the RTM-8410 is located in Slot 2. The RTM-8410 connects to Trunks 1 through 42 (or 1 through 16). Its PSTN and Gigabit Ethernet (GbE) interfaces are connected to the active VoP blade in Slot 1 of the front panel. The second RTM-8410 is located in Slot 4 and connects to Trunks 43 through 84. Trunks connected to this RTM are connected to the active VoP blade. Ethernet interfaces are connected to the VoP blade in Slot 3 of the front panel.
- TP-6310: the RTM-6310 occupies Slot 2. Its PSTN and GbE interfaces are always connected to the active VoP blade in Slot 1 of the front panel. The redundant RTM (RTM-6310 Redundant) is located in Slot 3 of the rear panel and provides the GbE interfaces to the redundant 6310 blade in the front panel's Slot 3. The redundant blade is not connected to the external network. It only has an internal link with the active blade. In other words, the user doesn't interact directly with the redundant blade. This link controls the HA feature and is automatically and internally configured.

Two GbE links can be connected to each VoP blade through their corresponding RTMs (i.e., for TP-6310: RTM-6310 for the active TP-6310; RTM-6310 Redundant for the redundant TP-6310). At least one link per VoP blade must be connected, but two links are recommended for Ethernet redundancy. After system initialization is complete, network access is available only to the active blade. The redundant GbE links have no network access.

Each blade (Active and Redundant) has its own private, local IP address (acquired from BootP/DHCP), which is used only for maintenance. This private address is also used as a fallback in case of major system problem which prevents the system from working in HA mode. Typically, this IP address is configured only once (on first time installation of the system). Afterwards, it can be changed only through BootP/DHCP.

For normal operation, the HA device uses "global" IP address(es). These are the IP addresses that are used by the Active blade for Media, OAMP and Control interfaces. These IP addresses are configured in the Interface table.

30.1 Initialization Process

If both VoP blades are already installed when the device powers up, the VoP blade in Slot 1 always initially serves as the active blade, while the VoP blade in Slot 3 serves as the redundant blade. The active blade is identified by its **ACT** LED being lit green. If only one blade is installed, (no matter which slot it occupies), it always assumes the active blade. If at a later time, a second VoP blade is added, this second blade serves as the redundant blade.

Synchronization between active and redundant VoP blades may take several minutes in which the active blade forwards to the redundant blade all its current configuration data. This data includes files such as voice prompt, call progress tone, and even its software (cmp file). If necessary, a second boot of the redundant blade is issued to apply the new configuration.

After the synchronization is complete, the redundant blade is identified by a blinking yellow light in the **ACT** LED.

Note: When the active blade synchronizes with the redundant blade, all configuration changes (e.g., parameter modifications and uploading of files) are blocked until this process completes and the system is in High Availability mode.

User's Manual 30. HA Overview

30.2 Configuration Stages

For the device to be configured for HA, the following installation stages must be performed:

- Hardware configuration setup (refer to Mediant 3000 and IPmedia 3000 Installation Manual). The system can be set up initially with only one VoP blade and one SA/M3K blade. However, HA mode is only functional when a second VoP blade and a second SA/M3K blade are added.
- Software License Key includes the HA feature and is installed on both VoP blades (see "Software License Key" on page 575). (If the HA feature is specified at the time the system was purchased, then it's already included on both blades).
- The device's global IP addresses (i.e., Control, Media, and OAMP) are defined (using the Interface table) for the active blade to a valid IP address that is different to that of the local IP addresses of the blades. In the HA system, when the blades are initially configured using BootP, the BootP communicates with the two blades using two different local IP addresses: one for the active and one for the redundant blade. However, the device's global (system) IP addresses are later used for communicating with the IP network.
 - Private (local) IP address: A single IP address (and subnet) per blade that is
 acquired through BootP/DHCP and used for maintenance only. It should be
 configured once (on initial installation of the system). It can later be changed
 through BootP/DHCP or CLI. This local address is also used as a fallback in case
 of major system problems which prevents the system from operating in HA mode.
 - **System (global) IP address:** IP addresses (i.e., Control, Media, and OAMP) of the HA system configured using the Interface table.
 - Note that in HA, the private IP addresses are used only when major failure occurs, whereby the blades can report to a Syslog server.

Note: It is recommended to define the local private IP addresses of the blades in the same subnet as that of the device's OAMP interface. This allows the device's blade to send reports to a Syslog server in case of major device failure.

The Mediant 3000 HA is loaded from flash (when loading from BootP/TFTP on first configuration setup, HA is disabled).

30.3 Blade Failure Detection

Upon detection of a blade failure, the following occurs:

- Active blade failure: the redundant (standby) blade issues a switch-over operation. As part of this switch-over operation, the failed blade is reset and the previously redundant blade becomes the active blade in Simplex mode until a redundant blade is detected. The previously active VoP blade only reboots from its flash (and not from the BootP/DHCP) to ensure that it's operating with the same software version and configuration it received from the active VoP blade. If the failure in the active blade is repaired after reset, it is initialized as the redundant blade and the device returns to HA mode.
- Redundant blade failure: the active blade resets the redundant blade and moves itself into Simplex mode until the redundant blade is returned to functional operation. If the failure in the redundant blade is repaired after reset, it's initialized as the redundant blade once again and the device returns to HA mode.

31 Network Interfaces and Mediant 3000 High Availability

In High Availability (HA) mode, the device features two blades which are redundant to each other. Both blades share the same configuration, while only one of them is active. (The default state is the Active module in Slot 1 and the Redundant module in Slot 3).

Each blade in the Mediant 3000 system boots as standalone. The blade is also assigned its own private address (which may have been acquired via BootP/DHCP or configured manually) which is used for maintenance only (prior to entering HA mode).

The active blade uses the address configured by the Interface table. The redundant blade disconnects from the network once the device enters HA mode.

When the system loads from BootP/TFTP (first configuration setup), HA is disabled. After resetting the Active blade from the Web interface/EMS, it loads from flash and HA becomes activated.

31.1 Mediant 3000 Internal Link

The device's two blades keep an active communication channel between them. Through this channel, the redundant blade is constantly updated by the active blade and monitors the state of the active blade, ready to take over in the case of a failure. This internal link is used solely for internal communication and is un-reachable from an external network.

The device uses pre-configured IP addresses based on the chassis slot in which each resides:

Table 31-1: Blades' Default Private IP Addresses

Blade	IP Address Subnet	
Active (Slot 1)	11.3.9.1 255.255.252 (prefix length of 30 bits)	
Redundant (Slot 3)	11.3.9.2 255.255.255.252 prefix length of 30 bits)	

Note: The internal link addresses must not be configured as one of the device's IP addresses. Communication with any external peer carrying this address is also forbidden.

31.2 Example of Multiple Interface Configuration

The following example shows a configuration of multiple network interfaces, including IPv6 and VLANs.

- 1. The Interface table is configured with three IP network interfaces, one for each application type:
 - OAMP
 - Call Control
 - RTP Media

Table 31-2: Example of VLANS and Multiple IPs for Mediant 3000 HA

IP Address	Description	
Device's Global IP Addresses		
IP Address	Application	VLAN ID
192.168.85.14	Management (OAMP) address	1
200.200.85.14	Call Control address	200
211.211.85.14	RTP Media address and with default gateway 211.211.85.1	211
Private IP Addresses	of the Blades	-
192.168.85.15	Blade in Slot 1 (received from BootP)	
192.168.85.16	Blade in Slot 3 (received from BootP)	

Table 31-3: Example of Multiple Interfaces for Mediant 3000 HA in Interface Table

Inde x	Applicatio n Type	Interfac e Mode	IP Address	Prefix Lengt h	Gateway	VLA N ID	Interface Name	Primary / Secondar y DNS Server IP Address
0	OAMP	IPv6 Manual	192.168.85.1 4	16	192.168.0.1	1	Managementl F	-
1	Control	IPv6 Manual	200.200.85.1 4	24	200.200.85. 1	200	myControllF	-
2	Media	IPv6 Manual	211.211.85.1 4	24	211.211.85. 1	211	myMedialF	-

- 2. VLANs are required and the Native VLAN ID is the same VLAN ID as the Management interface (configured for Index 0):
 - 'VLAN Mode' is set to Enable.
 - 'Native VLAN ID' field is set to "1".
- **3. IP Routing table:** One routing rule is required to allow remote management from a host in 176.85.49.0 / 24:

Table 31-4: Example of IP Routing Table

Destination IP Address		Prefix Length	Gateway IP Address	Metric	Interface Name
	176.85.49.0	24	192.168.0.10	1	0

4. All other parameters are set to their respective default values.

Notes:

- Ensure that the private addresses of the blades are not configured in the Interface table.
- The same configuration must be done for both blades.

32 Physical Network Separation Mode

When the device operates in the multiple IP interfaces scheme, it uses a **single** physical Ethernet port (located on its RTM) to connect to these networks. Using VLAN tags and an external VLAN-aware switch, the traffic can be directed to separate physical networks. In contrast, in the Physical Network Separation mode, supported only when the device houses a TP-8410 blade, each application type (OAMP, Call Control and RTP Media) has its own **dedicated** physical Ethernet port. The device splits the traffic between these different application types into different physical ports. This Physical Network Separation feature eliminates the need for a VLAN-aware switch using VLAN tags to separate the different traffic of each network. In this mode, the device actually implements the same scheme internally. This means that VLAN tags are used internally, but traffic is not sent or received with VLAN tags.

Physical Network Separation can be configured in the Web (or by using the *ini* file parameter EnableNetworkPhysicalSeparation).

Notes:

- Physical Network Separation supports three interfaces (OAMP, Control, and Media) and all three must be configured when operating in Physical Network Separation mode.
- When the Physical Network Separation mode is enabled, user VLANs are not supported.
- When operating in this mode, OAMP traffic is sent and received from/to the designated physical port (i.e., on the PEM); when operating with a single physical interface, the GbE port on the RTM-8410 is used.

Each of the TP-8410 blades (Active and Redundant) has its own dedicated and redundant physical GBE port for Media traffic. This interface is directly available through the RTM. The other four Ethernet ports are available through the PEM module, but are shared by both blades. The active blade is the one connected to these ports.

The physical interfaces are summarized as follows:

- Media network interface: provided by the Gigabit Ethernet port on the RTM-8410.
- The Control and OAMP network interfaces are provided by the 10/100BaseT Ethernet ports located on the two Power Entry Modules (PEM), as follows:
 - Control network interface: Ethernet ports labeled 1A (bottom PEM module) and 1B (top PEM module)
 - OAMP network interface: Ethernet ports labeled 2A (bottom PEM module) and
 2B (top PEM module)

For more information on cabling these interfaces, refer to the *Hardware Installation Manual*. The figure below illustrates the connectivity of the device when operating in network physical interfaces separation mode.

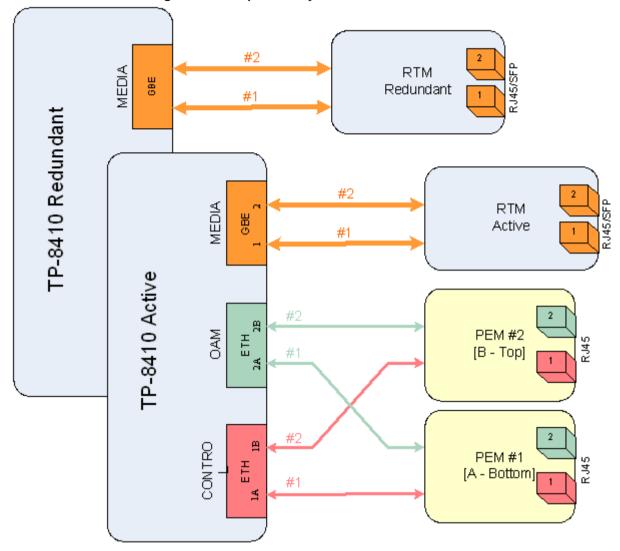

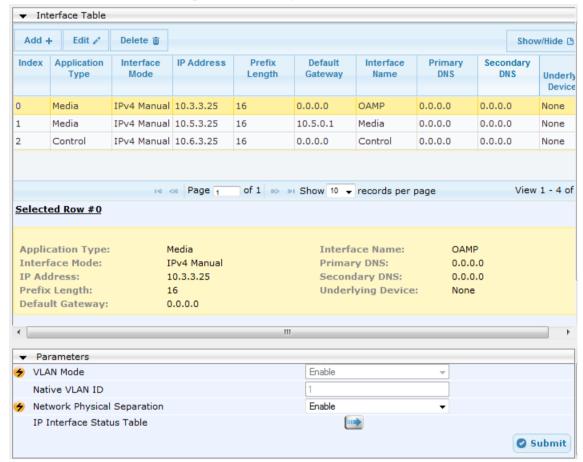

Figure 32-1: Separate Physical Network Interfaces

32.1 Configuring Physical Network Separation

You can configure the device for Physical Network Separation using either the Web interface or *ini* file, as described below.

- To configure the device for Physical Network Separation using the Web interface:
- 1. Open the Interface Table page (see "Configuring IP Network Interfaces" on page 126).
- 2. Configure three interfaces, one for each application type (OAMP, Media, and Control).

Figure 32-2: Multiple Interface Table

- From the 'Network Physical Separation' drop-down list, select Enable; a message box appears notifying you that OAMP and Control traffic is now allocated to the PEM module.
- 4. Click **OK** to close the message box.
- 5. Click **Submit**, and then reset the device (see "Basic Maintenance" on page 547).
- **6.** Change the cabling so that the OAMP and Control networks are cabled to the PEM's relevant Ethernet ports (refer to the *Installation Manual*).
- To configure the device for Multiple Interfaces and Physical Network Separation using the ini file:
- 1. Prepare an *ini* file with the parameter EnableNetworkPhysicalSeparation set to 1 to enable Physical Network Separation mode, and parameters configuring the Interface table, as described in Using the ini File.
- 2. Insert a single RTM-8410 in the Mediant 3000 chassis (each blade is configured separately).
- 3. Ensure that the Ethernet cable is connected to the RTM-8410 (i.e., to the RJ-45 port).
- 4. Load the ini file prepared in Step 1, using the Web interface (see "Backing Up and Loading Configuration File" on page 585). Alternatively, you can use BootP/DHCP to

load the ini file.

- 5. Save and reset the device, using the Web interface (see see "Basic Maintenance" on page 547).
- **6.** Verify that the Syslog displays the following message: "Updating Flash to work in Network Separation Mode in the next Boot".
- 7. If the Mediant 3000 is in High Availability (HA) mode, remove the blade that you configured above, and then repeat steps 1 through 5 for the second blade (using the identical ini file). Otherwise, skip to Step 8.
- 8. Insert the blade (or both blades if in HA mode) in the chassis, and then connect the Ethernet cables accordingly for separate networks, as described in "Physical Network Separation Mode" on page 539. Note that the OAMP interface is now through the Ethernet port on the PEM module.
- **9.** Verify that the Syslog displays the following message: "Board Is Working in Network Separation Mode".

32.2 Disabling Physical Network Separation

The following procedure describes how to disable a previously configured Physical Network Separation mode and configure the device for multiple interfaces.

- > To disable Physical Network Separation using the Web interface:
- 1. Open the Interface Table page.
- 2. From the 'Network Physical Separation' drop-down list, select **Disable**.
- 3. Configure your new multiple interfaces.
- 4. Click Submit, and then reset the device.
- **5.** Change the cabling so that the OAMP, Control, and Media networks are cabled to the RTM's GbE Ethernet port (refer to the *Installation Manual*).
- > To disable Physical Network Separation and configure the device for multiple interfaces using the ini file:
- Prepare an *ini* file with the parameter EnableNetworkPhysicalSeparation set to 0 to disable Physical Network Separation mode, and parameters configuring the OAMP, Control, and Media interfaces using the table ini file parameter InterfaceTable (as described in Using the ini File).
- 2. Insert a single RTM-8410 blade in the Mediant 3000 chassis (each blade is configured separately).
- 3. Ensure that the Ethernet cable is connected to the Ethernet port for the OAMP interface on the PEM (i.e., not to the RTM-8410 blade).
- **4.** Load the *ini* file prepared in Step 1, using the Web interface (see "Backing Up and Loading Configuration File" on page 585). Alternatively, you can use BootP/DHCP to load the *ini* file.
- **5.** Save and reset the device, using the Web interface (see "Resetting the Device" on page 547).
- **6.** Verify that the Syslog displays the following message: "Updating Flash to work in Non Network Separation Mode in the next Boot".
- 7. If the Mediant 3000 is in High Availability (HA) mode, remove the blade that you configured above, insert the second blade, and then repeat steps 1 through 6 for the second blade (using the identical ini file).
- 8. Insert the blade (or both blades if in HA mode) in the chassis, and then connect an Ethernet cable to each RTM-8410. The OAMP, Media, and Control network interfaces are all now through the Ethernet port on the RTM-8410.

33 Viewing HA Status on Home Page

When the device is configured for HA mode, the Home page displays the chassis with two VoIP blades (TP-6310 or TP-8410) and two SA/M3K Alarms, Status and Synchronization ("SAT") blades, as shown in the figure below:

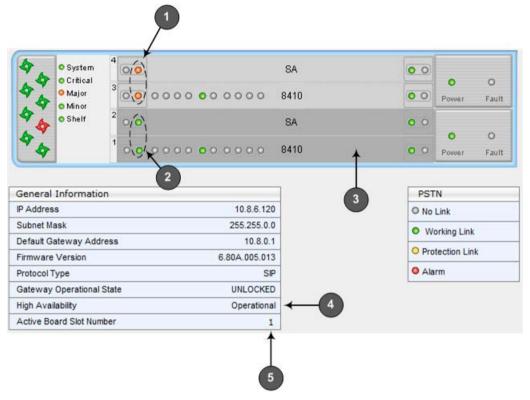

Figure 33-1: Home Page for Mediant 3000 HA Device

Table 33-1: Indications of HA on Home Page

Parameter	Description	
1	ACT icons displayed in orange, indicating Redundant blades	
2	ACT icons displayed in green, indicating Active blades	
3	Active blades displayed with dark-colored background	
4	Device is in HA mode	
5	Chassis slot number of Active blade	

The status of the HA mode is indicated in the General Information pane's 'High Availability' field:

- "Operational": device is in HA mode
- Synchronizing: device is synchronizing (temporary state, after which it changes to Operational if successful)
- "Stand Alone": device is in Simplex mode
- "Not Available": HA is not configured
- "Not Operational": HA is not supported
- "Not Operational: Load from Boot": device is loading from BootP
- "Not Operational: Global IP Not Defined": Global IP address is not configured

- "Operational: Internal Error": Internal error in HA mode
- "Operational: SA Card Error": Malfunction in SAT blade
- "Operational: RTM Card Error": Malfunction in RTM blade

The Active blade is indicated by the following:

- The darker-shaded blade in the graphical display of the device's chassis.
- The color of the ACT icon:
 - (gray): Single blade (i.e., Simplex mode)

 - **(orange):** Redundant blade (HA mode)
- The General Information pane's 'Active Board Slot Number' field indicates the Slot number in which the Active blade is currently located.

Notes:

- To perform a switch-over between Active and Redundant blades, or to reset the Redundant blade, see "High Availability Blade Switch-Over" on page 551.
- You can view real-time status of the device's hardware components (including chassis slots with Active and Redundant blades, fans, power supplies, and PEMs), by clicking any area (except the alarms, Ethernet and PSTN icons) on the graphical display of the chassis. For more information, see "Viewing Hardware Components Status" on page 612.

Part VIII

Maintenance

User's Manual 34. Basic Maintenance

34 Basic Maintenance

The Maintenance Actions page allows you to perform the following:

- Reset the device see "Resetting the Device" on page 547
- Lock and unlock the device see "Locking and Unlocking the Device" on page 549
- Save configuration to the device's flash memory see "Saving Configuration" on page 550
- To access the Maintenance Actions page, do one of the following:
- On the toolbar, click the **Device Actions** button, and then from the drop-down menu, choose **Reset**.
- On the Navigation bar, click the **Maintenance** tab, and then in the Navigation tree, select the **Maintenance** menu and choose **Maintenance Actions**.

Figure 34-1: Maintenance Actions Page

34.1 Resetting the Device

The Maintenance Actions page allows you to remotely reset the device. In addition, before resetting the device, you can choose the following options:

- Save the device's current configuration to the device's flash memory (non-volatile).
- Perform a graceful shutdown, whereby device reset starts only after a user-defined time (i.e., timeout) or after no more active traffic exists (the earliest thereof).

Notes:

- Throughout the Web interface, parameters displayed with a lightning
 symbol are not applied on-the-fly and require that you reset the device for them to take effect
- When you modify parameters that require a device reset, once you click the Submit button in the relevant page, the toolbar displays "Reset" (see "Toolbar Description" on page 54) to indicate that a device reset is required.
- After you reset the device, the Web GUI is displayed in Basic view (see "Displaying Navigation Tree in Basic and Full View" on page 55).

To reset the device:

- 1. Open the Maintenance Actions page (see "Basic Maintenance" on page 547).
- 2. Under the 'Reset Configuration' group, from the 'Burn To FLASH' drop-down list, select one of the following options:
 - **Yes:** The device's current configuration is saved (*burned*) to the flash memory prior to reset (default).
 - No: Resets the device without saving the current configuration to flash (discards all unsaved modifications).
- **3.** Under the 'Reset Configuration' group, from the 'Graceful Option' drop-down list, select one of the following options:
 - Yes: Reset starts only after the user-defined time in the 'Shutdown Timeout' field (see Step 4) expires or after no more active traffic exists (the earliest thereof). In addition, no new traffic is accepted.
 - No: Reset starts regardless of traffic, and any existing traffic is terminated at once.
- 4. In the 'Shutdown Timeout' field (relevant only if the 'Graceful Option' in the previous step is set to **Yes**), enter the time after which the device resets. Note that if no traffic exists and the time has not vet expired, the device resets.
- 5. Click the **Reset** button; a confirmation message box appears, requesting you to confirm.

Figure 34-2: Reset Confirmation Message Box

6. Click **OK** to confirm device reset; if the parameter 'Graceful Option' is set to **Yes** (in Step 3), the reset is delayed and a screen displaying the number of remaining calls and time is displayed. When the device begins to reset, a message appears notifying you of this.

34.2 Remotely Resetting Device using SIP NOTIFY

The device can be remotely reset upon the receipt of a SIP NOTIFY that includes an Event header set to 'check-sync;reboot=true', as shown in the example below:

NOTIFY sip:<user>@<dsthost> SIP/2.0

To: sip:<user>@<dsthost> From: sip:sipsak@<srchost>

CSeq: 10 NOTIFY

Call-ID: 1234@<srchost>

Event: check-sync;reboot=true

User's Manual 34. Basic Maintenance

- To enable remote reset upon receipt of SIP NOTIFY:
- 1. Open the Advanced Parameters page (Configuration tab > VolP menu > SIP Definitions > Advanced Parameters).
- Under the Misc Parameters group, set the 'SIP Remote Rest' parameter to Enable.
- Click Submit.

Note: This SIP Event header value is proprietary to AudioCodes.

34.3 Locking and Unlocking the Device

The Lock and Unlock option allows you to lock the device so that it doesn't accept any new calls and maintains only the current calls. This is useful when, for example, you are uploading new software files to the device and you don't want any traffic to interfere with the process.

- To lock the device:
- 1. Open the Maintenance Actions page (see "Basic Maintenance" on page 547).
- 2. Scroll down to the 'LOCK / UNLOCK' group:

Figure 34-3: Locking the Device

- 3. From the 'Graceful Option' drop-down list, select one of the following options:
 - Yes: The device is locked only after the user-defined time in the 'Lock Timeout' field (see Step 3) expires or no more active traffic exists (the earliest thereof). In addition, no new traffic is accepted.
 - No: The device is locked regardless of traffic. Any existing traffic is terminated immediately.

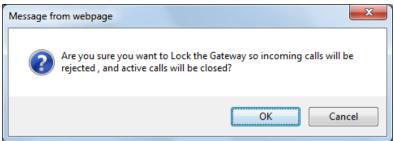

Note: These options are only available if the current status of the device is in UNLOCKED state.

4. If you set 'Graceful Option' to **Yes** (in the previous step), then in the 'Lock Timeout' field, enter the time (in seconds) after which the device locks. If no traffic exists and the time has not yet expired, the device locks immediately.

5. Click the **LOCK** button; a confirmation message box appears requesting you to confirm device lock.

Figure 34-4: Device Lock Confirmation Message Box

- 6. Click OK to confirm device lock; if you set 'Graceful Option' to Yes, a lock icon is delayed and a window appears displaying the number of remaining calls and time. If you set 'Graceful Option' to No, the lock process begins immediately. The 'Gateway Operational State' field displays "LOCKED".
- > To unlock the device:
- Under the 'LOCK / UNLOCK' group, click the UNLOCK button. Unlock starts immediately and the device accepts new incoming calls. The 'Gateway Operational State' field displays "UNLOCKED".

Note: The Home page's General Information pane displays whether the device is locked or unlocked (see "Viewing the Home Page" on page 66).

34.4 Saving Configuration

The Maintenance Actions page allows you to save (*burn*) the current parameter configuration (including loaded auxiliary files) to the device's *non-volatile* memory (i.e., flash). The parameter modifications that you make throughout the Web interface's pages are temporarily saved (to the *volatile* memory - RAM) when you click the **Submit** button on these pages. Parameter settings that are saved only to the device's RAM revert to their previous settings after a hardware/software reset (or power failure). Therefore, to ensure that your configuration changes are retained, you must save them to the device's flash memory using the burn option described below.

- > To save the changes to the non-volatile flash memory:
- 1. Open the Maintenance Actions page (see "Basic Maintenance" on page 547).
- 2. Under the 'Save Configuration' group, click the **BURN** button; a confirmation message appears when the configuration successfully saves.

Notes:

- Saving configuration to the non-volatile memory may disrupt current traffic on the device. To avoid this, disable all new traffic before saving, by performing a graceful lock (see "Locking and Unlocking the Device" on page 549).
- Throughout the Web interface, parameters displayed with the lightning ** symbol are not applied on-the-fly and require that you reset the device for them to take effect (see "Resetting the Device" on page 547).
- The Home page's General Information pane displays whether the device is currently "burning" the configuration (see "Viewing the Home Page" on page 66).

35 High Availability Maintenance

The High Availability Maintenance page allows you to perform a switch-over between the Active and Redundant blades. It also allows you to reset the Redundant blade.

Notes:

- When performing a switchover or a reset on a Redundant blade, the HA mode becomes temporarily unavailable.
- This page can also be accessed from the toolbar's Device Actions drop-down menu options - Switch Over and Reset Redundant (see "Toolbar Description" on page 54).

To perform a switch-over:

1. Open the High Availability Maintenance page (Maintenance tab > Maintenance menu > High Availability Maintenance).

Figure 35-1: High Availability Maintenance Page

- 2. Under the 'Switch Over' group, click **Switch Over**; a confirmation box appears requesting you to confirm.
- 3. Click OK.
- > To reset the Redundant blade:
- 1. Under the 'Redundant Options' group, click **Reset**; a confirmation box appears requesting you to confirm.
- Click OK.

This page is intentionally left blank.

36 Resetting Channels

You can restart a specific B-channel belonging to an ISDN or CAS trunk, using the SNMP MIB variable, acTrunkISDNCommonRestartBChannel or the EMS management tool (refer to the EMS User's Manual). This may be useful, for example, for troubleshooting specific voice channels.

Notes:

- If a voice call is currently in progress on the B-channel, it is disconnected when the B-channel is restarted.
- B-channel restart can only be done if the D-channel of the trunk to which it belongs is synchronized (Layer 2).
- B-channel restart does not affect the B-channel's configuration.

This page is intentionally left blank.

37 Software Upgrade

The Software Update menu allows you to do the following:

- Load Auxiliary files (see "Loading Auxiliary Files" on page 555)
- Load a Software License Key (see "Software License Key" on page 575)
- Upgrade the device using the Software Upgrade Wizard (see "Software Upgrade Wizard" on page 579)
- Saving and loading a Configuration file (see "Backing Up and Loading Configuration File" on page 585)

37.1 Loading Auxiliary Files

Various Auxiliary files can be installed on the device. These Auxiliary files provide the device with additional configuration settings. The table below lists the different types of Auxiliary files:

File Description Configures the device. The Web interface enables practically full device INI provisioning. However, some features may only be configured by ini file or you may wish to configure your device using the ini file. For more information on the ini file, see "INI File-Based Management" on page 99. CAS CAS auxiliary files containing the CAS Protocol definitions for CAS-terminated trunks (for various types of CAS signaling). You can use the supplied files or construct your own files. Up to eight different CAS files can be installed on the device. For more information, see CAS Files on page 560. Call Progress Region-specific, telephone exchange-dependent file that contains the Call **Tones** Progress Tones (CPT) levels and frequencies for the device. The default CPT file is U.S.A. For more information, see "Call Progress Tones File" on page 557. Prerecorded The Prerecorded Tones (PRT) file enhances the device's capabilities of playing a wide range of telephone exchange tones that cannot be defined in the CPT Tones file. For more information, see "Prerecorded Tones File" on page 560. Dial Plan Provides dialing plans, for example, to know when to stop collecting dialed digits and start forwarding them or for obtaining the destination IP address for outbound IP routing. For more information, see "Dial Plan File" on page 561. The User Information file maps PBX extensions to IP numbers. This file can be User Info used to represent PBX extensions as IP phones in the global 'IP world'. For more information, see "User Information File" on page 569. Answer Machine Detector (AMD) Sensitivity file containing the AMD Sensitivity **AMD Sensitivity** suites. For more information, see AMD Sensitivity File on page 574.

Table 37-1: Auxiliary Files

The Auxiliary files can be loaded to the device using one of the following methods:

- Web interface.
- TFTP: This is done by specifying the name of the Auxiliary file in an *ini* file (see Auxiliary and Configuration Files Parameters) and then loading the *ini* file to the device. The Auxiliary files listed in the *ini* file are then automatically loaded through TFTP during device startup. If the *ini* file does not contain a specific auxiliary file type, the device uses the last auxiliary file of that type that was stored on its non-volatile memory.

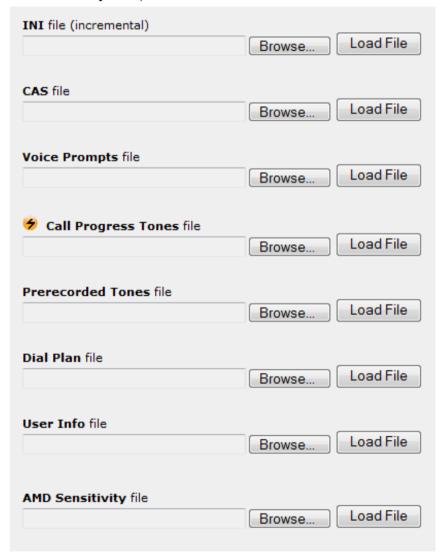

Notes:

- You can schedule automatic loading of updated auxiliary files using HTTP/HTTPS, FTP, or NFS. For more information on automatic updates, see Automatic Update Mechanism.
- Auxiliary file upload through TFTP is not supported by HA mode.
- When loading an *ini* file using this Web page, parameters that are excluded from the loaded *ini* file retain their current settings (*incremental*).
- Saving an auxiliary file to flash memory may disrupt traffic on the device. To avoid this, disable all traffic on the device by performing a graceful lock as described in "Locking and Unlocking the Device" on page 549.
- For deleting auxiliary files, see "Viewing Device Information" on page 609.

The following procedure describes how to load Auxiliary files using the Web interface.

- To load auxiliary files to the device using the Web interface:
- Open the Load Auxiliary Files page (Maintenance tab > Software Update menu > Load Auxiliary Files).

Note: The appearance of certain file load fields depends on the installed Software License Key.

- 2. Click the **Browse** button corresponding to the file type that you want to load, navigate to the folder in which the file is located, and then click **Open**; the name and path of the file appear in the field next to the **Browse** button.
- 3. Click the Load File button corresponding to the file you want to load.
- 4. Repeat steps 2 through 3 for each file you want to load.
- **5.** Save the loaded auxiliary files to flash memory, see "Saving Configuration" on page 550 and reset the device (if you have loaded a Call Progress Tones file), see "Resetting the Device" on page 547.

You can also load auxiliary files using an ini file that is loaded to the device with BootP. Each auxiliary file has a specific ini file parameter that specifies the name of the auxiliary file that you want to load to the device with the ini file. For a description of these ini file parameters, see Auxiliary and Configuration Files Parameters.

To load auxiliary files using an ini file:

- 1. In the ini file, define the auxiliary files to be loaded to the device. You can also define in the ini file whether the loaded files must be stored in the non-volatile memory so that the TFTP process is not required every time the device boots up.
- 2. Save the auxiliary files and the ini file in the same directory on your local PC.
- Invoke a BootP/TFTP session; the ini and associated auxiliary files are loaded to the device.

37.1.1 Call Progress Tones File

The Call Progress Tones (CPT) auxiliary file includes the definitions of the Call Progress Tones (levels and frequencies) that are detected / generated by the device.

You can use one of the supplied auxiliary files (.dat file format) or create your own file. To create your own file, it's recommended to modify the supplied *usa_tone.ini* file (in any standard text editor) to suit your specific requirements and then convert the modified *ini* file into binary format, using AudioCodes DConvert utility. For a description on converting a CPT *ini* file into a binary *dat* file, refer to the *DConvert Utility User's Guide*.

Note: Only the dat file format can be loaded to the device.

You can create up to 32 different Call Progress Tones, each with frequency and format attributes. The frequency attribute can be single or dual-frequency (in the range of 300 to 1980 Hz) or an Amplitude Modulated (AM). Up to 64 different frequencies are supported. Only eight AM tones, in the range of 1 to 128 kHz, can be configured (the detection range is limited to 1 to 50 kHz). Note that when a tone is composed of a single frequency, the second frequency field must be set to zero.

The format attribute can be one of the following:

Continuous: A steady non-interrupted sound (e.g., a dial tone). Only the 'First Signal On time' should be specified. All other on and off periods must be set to zero. In this case, the parameter specifies the detection period. For example, if it equals 300, the tone is detected after 3 seconds (300 x 10 msec). The minimum detection time is 100 msec.

- Cadence: A repeating sequence of on and off sounds. Up to four different sets of on/off periods can be specified.
- **Burst:** A single sound followed by silence. Only the 'First Signal On time' and 'First Signal Off time' should be specified. All other on and off periods must be set to zero. The burst tone is detected after the off time is completed.

You can specify several tones of the same type. These additional tones are used only for tone detection. Generation of a specific tone conforms to the first definition of the specific tone. For example, you can define an additional dial tone by appending the second dial tone's definition lines to the first tone definition in the *ini* file. The device reports dial tone detection if either of the two tones is detected.

The Call Progress Tones section of the *ini* file comprises the following segments:

- [NUMBER OF CALL PROGRESS TONES]: Contains the following key:
 'Number of Call Progress Tones' defining the number of Call Progress Tones that are defined in the file.
- [CALL PROGRESS TONE #X]: containing the Xth tone definition, starting from 0 and not exceeding the number of Call Progress Tones less 1 defined in the first section (e.g., if 10 tones, then it is 0 to 9), using the following keys:
 - Tone Type: Call Progress Tone types:
 - [1] Dial Tone
 - [2] Ringback Tone
 - [3] Busy Tone
 - [4] Congestion Tone
 - [6] Warning Tone
 - [7] Reorder Tone
 - [17] Call Waiting Ringback Tone heard by the calling party
 - [18] Comfort Tone
 - [23] Hold Tone
 - [46] Beep Tone
 - Tone Modulation Type: Amplitude Modulated (1) or regular (0)
 - Tone Form: The tone's format can be one of the following:
 - Continuous (1)
 - Cadence (2)
 - Burst (3)
 - Low Freq [Hz]: Frequency (in Hz) of the lower tone component in case of dual frequency tone, or the frequency of the tone in case of single tone. This is not relevant to AM tones.
 - **High Freq [Hz:** Frequency (in Hz) of the higher tone component in case of dual frequency tone, or zero (0) in case of single tone (not relevant to AM tones).
 - Low Freq Level [-dBm]: Generation level 0 dBm to -31 dBm in dBm (not relevant to AM tones).
 - **High Freq Level:** Generation level of 0 to -31 dBm. The value should be set to 32 in the case of a single tone (not relevant to AM tones).
 - **First Signal On Time [10 msec]:** 'Signal On' period (in 10 msec units) for the first cadence on-off cycle. For continuous tones, this parameter defines the detection period. For burst tones, it defines the tone's duration.
 - **First Signal Off Time [10 msec]:** 'Signal Off' period (in 10 msec units) for the first cadence on-off cycle (for cadence tones). For burst tones, this parameter defines the off time required after the burst tone ends and the tone detection is reported. For continuous tones, this parameter is ignored.
 - **Second Signal On Time [10 msec]:** 'Signal On' period (in 10 msec units) for the second cadence on-off cycle. Can be omitted if there isn't a second cadence.

- **Second Signal Off Time [10 msec]:** 'Signal Off' period (in 10 msec units) for the second cadence on-off cycle. Can be omitted if there isn't a second cadence.
- Third Signal On Time [10 msec]: 'Signal On' period (in 10 msec units) for the third cadence on-off cycle. Can be omitted if there isn't a third cadence.
- Third Signal Off Time [10 msec]: 'Signal Off' period (in 10 msec units) for the third cadence on-off cycle. Can be omitted if there isn't a third cadence.
- **Fourth Signal On Time [10 msec]:** 'Signal On' period (in 10 msec units) for the fourth cadence on-off cycle. Can be omitted if there isn't a fourth cadence.
- **Fourth Signal Off Time [10 msec]:** 'Signal Off' period (in 10 msec units) for the fourth cadence on-off cycle. Can be omitted if there isn't a fourth cadence.
- Carrier Freq [Hz]: Frequency of the carrier signal for AM tones.
- **Modulation Freq [Hz]:** Frequency of the modulated signal for AM tones (valid range from 1 to 128 Hz).
- Signal Level [-dBm]: Level of the tone for AM tones.
- **AM Factor [steps of 0.02]:** Amplitude modulation factor (valid range from 1 to 50). Recommended values from 10 to 25.

Notes:

- When the same frequency is used for a continuous tone and a cadence tone, the 'Signal On Time' parameter of the continuous tone must have a value that is greater than the 'Signal On Time' parameter of the cadence tone. Otherwise, the continuous tone is detected instead of the cadence tone.
- The tones frequency must differ by at least 40 Hz between defined tones.

For example, to configure the dial tone to 440 Hz only, enter the following text:

```
[NUMBER OF CALL PROGRESS TONES]
Number of Call Progress Tones=1
#Dial Tone
[CALL PROGRESS TONE #0]
Tone Type=1
Tone Form =1 (continuous)
Low Freq [Hz]=440
High Freq [Hz]=0
Low Freq Level [-dBm]=10 (-10 dBm)
High Freq Level [-dBm]=32 (use 32 only if a single tone is
required)
First Signal On Time [10msec]=300; the dial tone is detected after
3 sec
First Signal Off Time [10msec]=0
Second Signal On Time [10msec]=0
Second Signal Off Time [10msec]=0
```

37.1.2 Prerecorded Tones File

The CPT file mechanism has several limitations such as a limited number of predefined tones and a limited number of frequency integrations in one tone. To overcome these limitations and provide tone generation capability that is more flexible, the Prerecorded Tones (PRT) file can be used. If a specific prerecorded tone exists in the PRT file, it takes precedence over the same tone that exists in the CPT file and is played instead of it.

Notes:

- The PRT file is used only for generation of tones; detection of tones is performed according to the CPT file.
- Playing tones from the PRT file requires DSP resources. For local generation of tones, the device also requires DSP resources.
- For SBC calls, the PRT file supports only calls that use the G.711 coder.
- For SBC calls, the PRT file supports only the ringback tone and hold tone.

The PRT is a .dat file containing a set of prerecorded tones that can be played by the device. Up to 40 tones (totaling approximately 10 minutes) can be stored in a single PRT file on the device's flash memory. The prerecorded tones are prepared offline using standard third-party recording utilities and combined into a single file, using AudioCodes DConvert utility (refer to the document, *DConvert Utility User's Guide* for more information).

The raw data files must be recorded with the following characteristics:

Coders: G.711 A-law or G.711 μ-law

Rate: 8 kHz
Resolution: 8-bit
Channels: mono

Once created, the PRT file must then be loaded to the device, using AudioCodes' AcBootP utility or the Web interface (see "Loading Auxiliary Files" on page 555).

The prerecorded tones are played repeatedly. This allows you to record only part of the tone and then play the tone for the full duration. For example, if a tone has a cadence of 2 seconds on and 4 seconds off, the recorded file should contain only these 6 seconds. The device repeatedly plays this cadence for the configured duration. Similarly, a continuous tone can be played by repeating only part of it.

37.1.3 CAS Files

The CAS auxiliary files contain the CAS Protocol definitions that are used for CAS-terminated trunks. You can use the supplied files or construct your own files. Up to eight files can be loaded to the device. Different files can be assigned to different trunks (CASTableIndex_x) and different CAS tables can be assigned to different B-channels (CASChannelIndex).

The CAS files can be loaded to the device using the Web interface or *ini* file (see "Loading Auxiliary Files" on page 555).

Note: All CAS files loaded together must belong to the same Trunk Type (i.e., either E1 or T1).

37.1.4 Dial Plan File

The Dial Plan file can be used for various digit mapping features, as described in this section.

37.1.4.1 Creating a Dial Plan File

The Dial Plan file is a text-based file that can contain up to 8 Dial Plans (Dial Plan indices) and up to 8,000 rules (lines). The general syntax rules for the Dial Plan file are as follows (syntax specific to the feature is described in the respective section):

- Each Dial Plan index must begin with a Dial Plan name enclosed in square brackets "[...]" on a new line.
- Each line under the Dial Plan index defines a rule.
- Empty lines are ignored.
- Lines beginning with a semicolon ";" are ignored. The semicolon can be used for comments.

Creating a Dial Plan file is similar for all Dial Plan features. The main difference is the syntax used in the Dial Plan file and the method for selecting the Dial Plan index.

To create a Dial Plan file:

- 1. Create a new file using a text-based editor (such as Notepad) and configure your Dial Plans, as required.
- 2. Save the file with the *ini* file extension name (e.g., mydialplanfile.ini).
- **3.** Convert the *ini* file to a *dat* binary file, using AudioCodes DConvert utility. For more information, refer to *DConvert Utility User's Guide*.
- **4.** Load the converted file to the device, as described in "Loading Auxiliary Files" on page 555.
- 5. Select the Dial Plan index that you want to use. This depends on the feature and is described in the respective section.

37.1.4.2 External Dial Plan File

The device enables you to configure multiple dialing plans in an external Dial Plan file, which can be installed on the device. If a Dial Plan file is implemented, the device first attempts to locate a matching digit pattern in a specified Dial Plan index listed in the file and if not found, attempts to locate a matching digit pattern in the Digit Map. The Digit Map is configured by the 'Digit Mapping Rules' parameter, located in the DTMF & Dialing page (Configuration tab > VolP menu > GW and IP to IP > DTMF and Supplementary > DTMF & Dialing).

The Dial Plan is used for the following:

- ISDN Overlap Dialing (Tel-to-IP calls): The file allows the device to know when digit collection ends, after which it starts sending all the collected (or dialed) digits in the outgoing INVITE message. This also provides enhanced digit mapping.
- CAS E1 MF-CR2 (Tel-to-IP calls): Useful for E1 MF-CR2 variants that do not support I-15 terminating digits (e.g., in Brazil and Mexico). The Dial Plan file allows the device to detect end-of-dialing in such cases. The CasTrunkDialPlanName_x ini file parameter determines which dial plan (in the Dial Plan file) to use for a specific trunk.

Notes:

- To use the Dial Plan file, you must also use a special CAS .dat file that supports this feature. For more information, contact your AudioCodes sales representative.
- For E1 CAS MFC-R2 variants, which don't support terminating digit for the called party number, usually I-15, the Dial Plan file and the DigitMapping parameter are ignored. Instead, you can define a Dial Plan template per trunk using the parameter CasTrunkDialPlanName x.

The Dial Plan file can contain up to 8 Dial Plans (Dial Plan indices), with a total of up to 8,000 dialing rules (lines) of distinct prefixes (e.g. area codes, international telephone number patterns) for the PSTN to which the device is connected.

The Dial Plan file is created in a textual *ini* file with the following syntax:

<called number prefix>,<total digits to wait before sending>

- Each new Dial Plan index begins with a Dial Plan name enclosed in square brackets "[...]" on a new line.
- Each line under the Dial Plan index defines a dialing prefix and the number of digits expected to follow that prefix. The prefix is separated by a comma "," from the number of additional digits.
- The prefix can include numerical ranges in the format [x-y], as well as multiple numerical ranges [n-m][x-y] (no comma between them).
- The prefix can include the asterisk "*" and number "#" signs.
- The number of additional digits can include a numerical range in the format x-y.
- Empty lines are ignored.
- Lines beginning with a semicolon ";" are ignored. The semicolon can be used for comments.

Below shows an example of a Dial Plan file (in ini-file format), containing two dial plans:

```
; Example of dial-plan configuration.
; This file contains two dial plans:
; Destination cellular area codes 052, 054, and 050 with 8 digits.
052,8
054,8
050,8
; Defines International prefixes 00, 012, 014.
; The number following these prefixes may
; be 7 to 14 digits in length.
00,7-14
012,7-14
014,7-14
; Defines emergency number 911. No additional digits are expected.
911,0
[ PLAN2 ]
; Defines area codes 02, 03, 04.
; In these area codes, phone numbers have 7 digits.
; Operator services starting with a star: *41, *42, *43.
; No additional digits are expected.
*4[1-3],0
```

The following procedure provides a summary on how to create a Dial Plan file and select the required Dial Plan index.

To create a Dial Plan file:

- 1. Create a new file using a text-based editor (such as Notepad) and configure your Dial Plans, as required.
- 2. Save the file with the *ini* file extension name (e.g., mydialplans.ini).
- **3.** Convert the *ini* file to a *dat* binary file, using AudioCodes DConvert utility. For more information, refer to *DConvert Utility User's Guide*.
- **4.** Install the converted file on the device, as described in "Loading Auxiliary Files" on page 555.
- The required Dial Plan is selected using the 'Dial Plan Index' parameter. This
 parameter can be set to 0 through 7, where 0 denotes PLAN1, 1 denotes PLAN2, and
 so on.

Notes:

- The Dial Plan file must not contain overlapping prefixes. Attempting to process an overlapping configuration by the DConvert utility results in an error message specifying the problematic line.
- The Dial Plan index can be selected globally for all calls (as described in the previous procedure), or per specific calls using Tel Profiles.
- It may be useful to configure both Dial Plan file and Digit Maps. For example, the Digit Map can be used for complex digit patterns (which are not supported by the Dial Plan file) and the Dial Plan can be used for long lists of relatively simple digit patterns. In addition, as timeout between digits is not supported by the Dial Plan, the Digit Map can be used to configure digit patterns that are shorter than those defined in the Dial Plan or left at default (MaxDigits parameter). For example, the "xx.T" digit map instructs the device to use the Dial Plan and if no matching digit pattern is found, it waits for two more digits and then after a timeout (TimeBetweenDigits parameter), it sends the collected digits. Therefore, this ensures that calls are not rejected as a result of their digit pattern not been completed in the Dial Plan.
- By default, if no matching digit pattern is found in both the Dial Plan and Digit Map, the device rejects the call. However, if you set the DisableStrictDialPlan parameter to 1, the device attempts to complete the call using the MaxDigits and TimeBetweenDigits parameters. In such a setup, it collects the number of digits configured by the MaxDigits parameters. If more digits are received, it ignores the settings of this parameter and collects the digits until the inter-digit timeout configured by the TimeBetweenDigits parameter is exceeded.

37.1.4.3 Dial Plan Prefix Tags for Routing

37.1.4.3.1 Dial Plan Prefix Tags for IP-to-Tel Routing

For deployments requiring many IP-to-Tel routing rules that exceed the maximum number of rules that can be configured in the Inbound IP Routing table, you can employ user-defined string labels (tags) to represent the many different prefix calling (source) and called (destination) numbers. The prefix tags are used in the Inbound IP Routing table (see "Configuring Inbound IP Routing Table" on page 416) as source and destination number matching characteristics for the routing rule. Prefix tags are typically implemented when you have calls of many different called or calling numbers that need to be routed to the same destination. Thus, instead of configuring a routing rule for each prefix number, you need to configure only one routing rule using the prefix tag.

For example, this feature is useful in deployments that need to handle hundreds of call routing scenarios such as for a large geographical area (a state in the US). Such an area could consist of hundreds of local area codes as well as codes for international calls. The local calls and international calls would need to be routed to different SIP trunks. Thus, instead of configuring many routing rules for each call destination type, you can simply configure two routing rules, one with a unique prefix tag representing the different local area codes and the other with a prefix tag representing international calls.

Note: When using prefix tags, you need to configure manipulation rules to remove the tags before the device sends the calls to their destinations.

You configure prefix tags in the Dial Plan file, using the following syntax:

```
[ PLAN<index> ]
cprefix number>,0,<prefix tag>
```

where:

- Index is the Dial Plan index
- prefix number is the called or calling number prefix (ranges can be defined in brackets)
- prefix tag is the user-defined prefix tag of up to nine characters, representing the prefix number

Each prefix tag type - called or calling - must be configured in a dedicated Dial Plan index number. For example, Dial Plan 1 can be for called prefix tags and Dial Plan 2 for calling prefix tags.

The example Dial Plan file below defines the prefix tags "LOCL" and "LONG" to represent different called number prefixes for local and long distance calls:

```
[ PLAN1 ]
42520[3-5],0,LOCL
425207,0,LOCL
42529,0,LOCL
425200,0,LONG
425100,0,LONG
```

Notes:

- Called and calling prefix tags can be used in the same routing rule.
- •

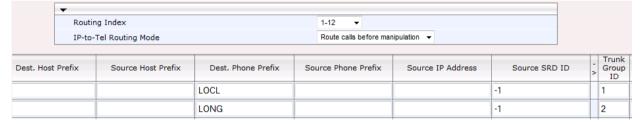

The following procedure describes how to configure IP-to-Tel routing using prefix tags.

- To configure IP-to-Tel routing using prefix tags:
- 1. Configure a Dial Plan file with prefix tags, and then load the file to the device.
- 2. On the Routing General Parameters page (Configuration tab > VolP menu > SIP Definitions > General Parameters), specify the Dial Plan indices (e.g., 1) where you configured the prefix tags:
 - Prefix tags for called number prefixes: 'IP-to-Tel Tagging Destination Dial Plan Index' parameter
 - Prefix tags for calling number prefixes: 'IP-to-Tel Tagging Source Dial Plan Index' parameter

User's Manual 564 Document #: LTRT-89725

- 3. Open the Inbound IP Routing table (Configuration tab > VoIP menu > GW and IP to IP > Routing > IP to Trunk Group Routing).
 - a. From the 'IP-to-Tel Routing Mode' drop-down list, select Route calls before manipulation so that the device performs the routing processing before manipulation.
 - **b.** Configure routing rules using the prefix tags as matching characteristics for destination or source number prefixes:
 - Prefix tags for called number prefixes: 'Dest. Phone Prefix'. For example, configure two routing rules:
 - Set this field to "LOCL" and the 'Trunk Group ID' field to 1 (local Trunk Group).
 - Set this field to "LONG" and the 'Trunk Group ID' field to 2 (long distance Trunk Group).
 - Prefix tags for calling number prefixes: 'Source Phone Prefix'.

Figure 37-1: Configuring Dial Plan File Label for IP-to-Tel Routing

- 4. Configure manipulation rules to remove the prefix called tags:
 - a. Open the Destination Phone Number Manipulation Table for IP-to-Tel Calls table (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > Dest Number IP->Tel).
 - b. In the 'Destination Prefix' field, enter the prefix called tag (e.g., "LOCL").
 - c. In the 'Stripped Digits From Left' field, enter the number of characters in the prefix called tag (e.g., "4").
- 5. Configure manipulation rules to remove the prefix calling tags:
 - a. Open the Source Phone Number Manipulation Table for IP-to-Tel Calls table (Configuration tab > VoIP menu > GW and IP to IP > Manipulations > Source Number IP->Tel).
 - b. In the 'Source Prefix' field, enter the prefix calling tag.
 - **c.** In the 'Stripped Digits From Left' field, enter the number of characters in the prefix calling tag.

37.1.4.3.2Dial Plan Prefix Tags for SBC IP-to-IP Routing

For deployments requiring many SBC IP-to-IP routing rules that exceed the maximum number of rules that can be configured in the IP-to-IP Routing table, you can employ user-defined string labels (tags) to represent the many different prefix calling (source) and called (destination) numbers. The prefix tags are used in the IP-to-IP Routing table (see "Configuring SBC IP-to-IP Routing Rules" on page 510) as source and destination URI user parts matching characteristics for the routing rule. Prefix tags are typically implemented when you have calls of many different called or calling numbers that need to be routed to the same destination. Thus, instead of configuring a routing rule for each prefix number, you need to configure only one routing rule using the prefix tag.

For example, this feature is useful in deployments that need to handle hundreds of call routing scenarios such as for a large geographical area (a state in the US). Such an area could consist of hundreds of local area codes as well as codes for international calls. The local calls and international calls would need to be routed to different SIP trunks. Thus,

instead of configuring many routing rules for each call destination type, you can simply configure two routing rules, one with a unique prefix tag representing the different local area codes and the other with a prefix tag representing international calls.

Note: When using prefix tags, you need to configure manipulation rules to remove the tags before the device sends the calls to their destinations.

You configure prefix tags in the Dial Plan file, using the following syntax:

```
[ PLAN<index> ]
cprefix number>,0,<prefix tag>
```

where:

- Index is the Dial Plan index
- prefix number is the called or calling number prefix (ranges can be defined in brackets)
- prefix tag is the user-defined prefix tag of up to nine characters, representing the prefix number

Each prefix tag type - called or calling - must be configured in a dedicated Dial Plan index number. For example, Dial Plan 1 can be for called prefix tags and Dial Plan 2 for calling prefix tags.

The example Dial Plan file below defines the prefix tags "LOCL"and "INTL" to represent different called number prefixes for local and long distance calls:

```
[ PLAN1 ]
42520[3-5],0,LOCL
425207,0,LOCL
42529,0,LOCL
425200,0,INTL
425100,0,INTL
```

Note: Called and calling prefix tags can be used in the same routing rule.

The following procedure describes how to configure IP-to-IP routing using prefix tags.

- > To configure IP-to-IP routing using prefix tags:
- 1. Configure a Dial Plan file with prefix tags, and then load the file to the device.
- Add the prefix tags to the numbers of specific incoming calls using Inbound IP-to-IP Manipulation rules:
 - Open the IP to IP Inbound Manipulation table (Configuration tab > VoIP menu > SBC > Manipulations SBC > IP-to-IP Inbound), and then click Add.
 - b. Click the Rule tab, and then configure matching characteristics for the incoming call (e.g., set 'Source IP Group ID' to "1").
 - **c.** From the 'Manipulated URI' drop-down list, select **Source** to add the tag to the calling URI user part, or **Destination** to add the tag to the called URI user part.
 - d. Click the **Action** tab, and then enter the Dial Plan index for which you configured your prefix tag, in the 'Prefix to Add' or 'Suffix to Add' fields, using the following syntax: \$DialPlan<x>, where x is the Dial Plan index (0 to 7). For example, if the called number is 4252000555, the device manipulates it to LOCL4252000555.

- 3. Add an SBC IP-to-IP routing rule using the prefix tag to represent the different source or destination URI user parts:
 - Open the IP-to-IP Routing table (Configuration tab > VoIP menu > SBC > Routing SBC > IP-to-IP Routing Table), and then click Add.
 - b. Click the Rule tab, and then enter the prefix tag in the 'Source Username Prefix' or 'Destination Username Prefix' fields (e.g., "LOCL", without the quotes).
 - c. Continue configuring the rule as required.
- **4.** Configure a manipulation rule to remove the prefix tags before the device sends the message to the destination:
 - Open the IP to IP Outbound Manipulation table (Configuration tab > VoIP menu
 > SBC > Manipulations SBC > IP-to-IP Outbound), and then click Add.
 - b. Click the **Rule** tab, and then configure matching characteristics for the incoming call (e.g., set 'Source IP Group ID' to "1"), including calls with the prefix tag (in the 'Source Username Prefix' or 'Destination Username Prefix' fields, enter the prefix tag to remove).
 - c. Click the **Action** tab, and then in the 'Remove from Left' or 'Remove from Right' fields (depending on whether you added the tag at the beginning or end of the URI user part, respectively), enter the number of characters making up the tag.

37.1.4.4 Obtaining IP Destination from Dial Plan File

You can use a Dial Plan index listed in a loaded Dial Plan file for determining the IP destination of Tel-to-IP /IP-to-IP and SBC calls. This enables the mapping of called numbers to IP addresses (in dotted-decimal notation) or FQDNs (up to 15 characters).

- To configure routing to an IP destination based on Dial Plan:
- Create the Dial Plan file. The syntax of the Dial Plan index for this feature is as follows:

```
<destination / called prefix number>,0,<IP destination>
```

Note: The second parameter "0" is not used and ignored.

An example of a configured Dial Plan (# 6) in the Dial Plan file is shown below:

```
[ PLAN6 ]
200,0,10.33.8.52 ; called prefix 200 is routed to
10.33.8.52
201,0,10.33.8.52
300,0,itsp.com ; called prefix 300 is routed to itsp.com
```

- 2. Convert the file to a loadable file and then load it to the device (see "Creating a Dial Plan File" on page 561).
- 3. Assign the Dial Plan index to the required routing rule:
 - SBC Calls: In the SBC IP-to-IP Routing table, do the following:
 - Set the 'Destination Type' field to Dial Plan.
 - **b.** In the 'Destination Address' field, enter the required Dial Plan index, where "0" denotes [PLAN1] in the Dial Plan file, "1" denotes [PLAN2], and so on.
 - Tel-to-IP/IP-to-IP Calls (Gateway application): In the Outbound IP Routing table, do the following:
 - **a.** In the 'Destination Address' field, enter the required Dial Plan index using the following syntax:

DialPlan<index>

Where "DialPlan0" denotes [PLAN1] in the Dial Plan file, "DialPlan1" denotes [PLAN2], and so on.

Note: The "DialPlan" string is case-sensitive.

37.1.4.5 Modifying ISDN-to-IP Calling Party Number

The device can use the Dial Plan file to change the Calling Party Number value (source number) of the incoming ISDN call when sending to IP. For this feature, the Dial Plan file supports the following syntax:

<ISDN Calling Party Number>,0,<new calling number>

- The first number contains the calling party number (or its prefix) received in the ISDN call SETUP message. The source number can also be a range, using the syntax [x-y] in the Dial Plan file. This number is used as the display name in the From header of the outgoing INVITE.
- The second number must always be set to "0".
- The third number is a string of up to 12 characters containing the mapped number that is used as the URI user part in the From and Contact headers of the outgoing INVITE.

The Dial Plan index used in the Dial Plan file for this feature is defined by the Tel2IPSourceNumberMappingDialPlanIndex parameter.

An example of such a configuration in the Dial Plan file is shown below:

```
[ PLAN1 ]
; specific received number changed to 04343434181.
0567811181,0,04343434181
; number range that changes to 04343434181.
056788118[2-4],0,04343434181
```

If we take the first Dial Plan rule in the example above (i.e., "0567811181,0,04343434181"), the received Calling Number Party of 0567811181 is changed to 04343434181 and sent to the IP with a SIP INVITE as follows:

```
Via: SIP/2.0/UDP 211.192.160.214:5060; branch=z9hG4bK3157667347
From: <sip:0434343434181@kt.co.kr:5060>; tag=de0004b1
To: sip:01066557573@kt.co.kr:5060
Call-ID: 585e60ec@211.192.160.214
CSeq: 1 INVITE
Contact:<sip:04343434181@211.192.160.214:5060; transport=udp>
```

The initial Dial Plan text file must be converted to *.dat file format using the DConvert utility. This is done by clicking the DConvert's **Process Dial Plan File** button. For more information, refer to *DConvert Utility User's Guide*.

You can load this *.dat file to the device using the Web interface (see "Loading Auxiliary Files" on page 555), AcBootP utility, or using the Auto-update mechanism from an external HTTP server.

Notes:

- Tel-to-IP routing is performed on the original source number if the parameter 'Tel
 to IP Routing Mode' is set to 'Route calls before manipulation'.
- Tel-to-IP routing is performed on the modified source number as defined in the Dial Plan file, if the parameter 'Tel To IP Routing Mode' is set to 'Route calls after manipulation'.
- Source number Tel-to-IP manipulation is performed on the modified source number as defined in the Dial Plan file.

37.1.5 User Information File

This section describes the User Info table and how to configure the table.

37.1.5.1 Enabling the User Info Table

Before you can use the User Info table, you need to enable the User Info functionality as described in the procedure below.

- > To enable the User Info table:
- Open the Advanced Parameters page (Configuration tab > VolP menu > SIP Definitions > Advanced Parameters).
- 2. Set the 'Enable User-Information Usage' parameter to **Enable**.
- 3. Save this setting to the device with a reset for the setting to take effect.

37.1.5.2 Gateway User Information for PBX Extensions and "Global" Numbers

The GW User Info table contains user information that can be used for the following Gateway-related features:

- Mapping (Manipulating) PBX Extension Numbers with Global Phone Numbers: maps PBX extension number, connected to the device, with any "global" phone number (alphanumerical) for the IP side. In this context, the "global" phone number serves as a routing identifier for calls in the "IP world" and the PBX extension uses this mapping to emulate the behavior of an IP phone. This feature is especially useful in scenarios where unique or non-consecutive number translation per PBX is needed. This number manipulation feature supports the following call directions:
 - IP-to-Tel Calls: Maps the called "global" number (in the Request-URI user part) to the PBX extension number. For example, if the device receives an IP call destined for "global" number 638002, it changes this called number to the PBX extension number 402, and then sends the call to the PBX extension on the Tel side.

Note: If you have configured regular IP-to-Tel manipulation rules (see "Configuring Source/Destination Number Manipulation" on page 383), the device applies these rules before applying the mapping rules of the User Info table.

Tel-to-IP Calls: Maps the calling (source) PBX extension to the "global" number.
 For example, if the device receives a Tel call from PBX extension 402, it changes
 this calling number to 638002, and then sends call to the IP side with this calling
 number. In addition to the "global" phone number, the display name (caller ID)
 configured for the PBX user in the User Info table is used in the SIP From header.

Note: If you have configured regular Tel-to-IP manipulation rules (see "Configuring Source/Destination Number Manipulation" on page 383), the device applies these rules before applying the mapping rules of the User Info table.

- IP-to-IP Calls: Maps SIP From (calling number) and To (called number) of IP PBX extension numbers with "global" numbers. For example, if the device receives a call from IP PBX extension number 402 (calling / SIP From) that is destined to IP PBX extension number 403 (called / SIP To), the device changes both these numbers into their "global" numbers 638002 and 638003, respectively.
- Registering Users: The device can register each PBX user configured in the User Info table. For each user, the device sends a SIP REGISTER to an external IP-based Registrar server, using the "global" number in the From/To headers. If authentication is necessary for registration, the device sends the user's username and password, configured in the User Info table, in the SIP MD5 Authorization header.

You can configure up to 5,000 mapping rules in the GW User Info table. These rules can be configured using any of the following methods:

- Web interface see "Configuring GW User Info Table in Web Interface" on page 570
- Loadable User Info file see "Configuring GW User Info Table in Loadable Text File" on page 571

Notes:

- To enable user registration, set the following parameters on the Proxy & Registration page (Configuration tab > VoIP menu > SIP Definitions > Proxy & Registration) as shown:
 - ✓ 'Enable Registration': **Enable** (IsRegisterNeeded is set to 1).
 - √ Registration Mode': Per Endpoint (AuthenticationMode is set to 0).

37.1.5.2.1 Configuring GW User Info Table in Web Interface

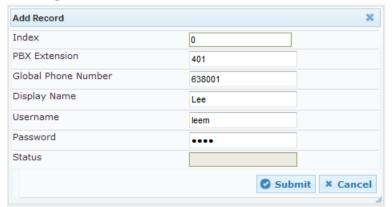

The following procedure describes how to configure and register users in the GW User Info table in the Web interface.

Note: If a User Info file is loaded to the device (as described in "Configuring GW User Info Table in Loadable Text File" on page 571), all previously configured entries are removed from the table in the Web interface and replaced with the entries from the loaded User Info file.

- > To configure the GW User Info table in the Web interface:
- 1. Open the GW User Info Table page (Configuration tab > VolP menu > SIP Definitions > User Information > GW User Info Table).
- 2. Click **Add**: the following dialog box appears:

Figure 37-2: GW User Info Table in Web Interface

- 3. Configure the GW User Info table parameters according to the table below.
- 4. Click Submit.
- 5. To save the changes to flash memory, see "Saving Configuration" on page 550.

To register a user, select the user's table entry, and then from the **Action** button's drop-down list , choose **Register**. To un-register a user, select the user, and then from the **Action** button's drop-down list , choose **Un-Register**.

Table 37-2: GW User Info Table Parameter Descriptions

Parameter	Description
Index [GWUserInfoTable_Index]	Defines an index for the new table record.
PBX Extension [GWUserInfoTable_PBXExtension]	Defines the PBX extension number. The valid value is a string of up to 10 characters.
Global Phone Number [GWUserInfoTable_GlobalPhoneNumber]	Defines the "global" phone number for the IP side. The valid value is a string of up to 20 characters.
Display Name [GWUserInfoTable_DisplayName]	Defines the Caller ID of the PBX extension. The valid value is a string of up to 30 characters.
Username [GWUserInfoTable_Username]	Defines the username for registering the user when authentication is necessary. The valid value is a string of up to 40 characters.
Password [GWUserInfoTable_Password]	Defines the password for registering the user when authentication is necessary. The valid value is a string of up to 20 characters.
Status	(Read-only field) Displays the status of the user - "Registered" or "Not Registered".

37.1.5.2.2 Configuring GW User Info Table in Loadable Text File

The GW User Info table can be configured as a User Info file using a text-based file (*.txt). This file can be created using any text-based program such as Notepad. You can load the User Info file using any of the following methods:

- Web interface see "Loading Auxiliary Files" on page 555
- ini file, using the UserInfoFileName parameter see "Auxiliary and Configuration File Name Parameters" on page 699
- Automatic Update mechanism, using the UserInfoFileURL parameter see Automatic Update Mechanism

To add mapping rules to the User Info file, use the following syntax:

[GW] FORMAT

PBXExtensionNum, GlobalPhoneNum, DisplayName, UserName, Password

Where:

- [GW] indicates that this part of the file is the GW User Info table
- PBXExtensionNum is the PBX extension number (up to 10 characters)
- GlobalPhoneNum is the "global" phone number (up to 20 characters) for the IP side
- DisplayName is the Caller ID (string of up to 30 characters) of the PBX extension

- UserName is the username (string of up to 40 characters) for registering the user when authentication is necessary
- Password is the password (string of up to 20 characters) for registering the user when authentication is necessary

Each line in the file represents a mapping rule of a single PBX extension user.

Notes:

- Make sure that the last line in the User Info file ends with a carriage return (i.e., by pressing the <Enter> key).
- To modify the GW User Info table using a User Info file, you need to load to the device a new User Info file containing your modifications.

Below is an example of a configured User Info file:

```
[ GW ]
FORMAT
PBXExtensionNum,GlobalPhoneNum,DisplayName,UserName,Password
401 , 638001 , Mike , miked , 1234
402 , 638002 , Lee , leem, 4321
403 , 638003 , Sue , suer, 8790
404 , 638004 , John , johnd, 7694
405 , 638005 , Pam , pame, 3928
406 , 638006 , Steve , steveg, 1119
407 , 638007 , Fred , frede, 8142
408 , 638008 , Maggie , maggiea , 9807
```

37.1.5.3 User Information File for SBC User Database

You can use the SBC User Info table for the following:

- Registering each user to an external registrar server.
- Authenticating (for any SIP request and as a client) each user if challenged by an external server.
- Authenticating as a server incoming user requests (for SBC security).

If the device registers on behalf of users and the users do not perform registration, any SIP request destined to the user is routed to the Proxy Set associated with the user's IP Group.

You can configure up to 5,000 users (table rows) in the SBC User Info table. The SBC User Info table can be configured using any of the following methods:

- Web interface see "Configuring SBC User Info Table in Web Interface" on page 572
- Loadable User Info file see "Configuring SBC User Info Table in Loadable Text File" on page 574

37.1.5.3.1 Configuring SBC User Info Table in Web Interface

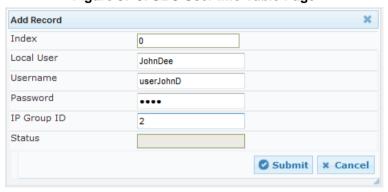

The following procedure describes how to configure the SBC User Info table in the Web interface.

Note: If any User Info file is loaded to the device, all previously configured entries are removed from the table in the Web interface and replaced with the entries from the loaded User Info file.

- To configure the SBC User Info table in the Web interface:
- Open the SBC User Info Table page (Configuration tab > VolP menu > SIP Definitions > User Information > SBC User Info Table).
- 2. Click **Add**; the following dialog box appears:

Figure 37-3: SBC User Info Table Page

- 3. Configure the SBC User Info table parameters according to the table below.
- 4. Click Submit.
- 5. To save the changes to flash memory, see "Saving Configuration" on page 550.

To register a user, select the user's table entry, and then from the **Action** button's drop-down list , choose **Register**. To un-register a user, select the user, and then from the **Action** button's drop-down list , choose **Un-Register**.

Table 37-3: SBC User Info Table Parameter Descriptions

Parameter	Description
Index [SBCUserInfoTable_Index]	Defines an index for the new table record.
Local User [SBCUserInfoTable_LocalUser]	Defines the user and is used as the Request-URI user part for the AOR in the database.
	The valid value is a string of up to 10 characters.
Username [SBCUserInfoTable_Username]	Defines the username for registering the user when authentication is necessary.
	The valid value is a string of up to 40 characters.
Password [SBCUserInfoTable_Password]	Defines the password for registering the user when authentication is necessary.
	The valid value is a string of up to 20 characters.
IP Group ID [SBCUserInfoTable_IPGroupID]	Defines the IP Group ID to which the user belongs and is used as the Request-URI source host part for the AOR in the database.
Status [SBCUserInfoTable_Status]	(Read-only field) Displays the status of the user - "Registered" or "Not Registered".

37.1.5.3.2Configuring SBC User Info Table in Loadable Text File

The SBC User Info table can be configured as a User Info file using a text-based file (*.txt). This file can be created using any text-based program such as Notepad. This User Info file is the same file used for the GW User Info table. Thus, this file can include both Gateway and SBC user information.

You can load the User Info file using any of the following methods:

- Web interface see "Loading Auxiliary Files" on page 555
- ini file, using the UserInfoFileName parameter see "Auxiliary and Configuration File Name Parameters" on page 699
- Automatic Update mechanism, using the UserInfoFileURL parameter see Automatic Update Mechanism

To add SBC users to the SBC User Info file, use the following syntax:

```
[ SBC ]
FORMAT LocalUser, UserName, Password, IPGroupID
john, john_user, john_pass, 2
sue, sue_user, sue_pass, 1
```

where:

- [SBC] indicates that this part of the file is the SBC User Info table
- LocalUser is the user and is used as the Request-URI user part for the AOR in the database
- UserName is the user's authentication username
- Password is the user's authentication password
- IPGroupID is the IP Group ID to which the user belongs and is used as the Request-URI source host part for the AOR in the database

Note: To modify the SBC User Info table using a User Info file, you need to load to the device a new User Info file containing your modifications.

37.1.6 AMD Sensitivity File

The device is shipped with a default, pre-installed AMD Sensitivity file for its Answering Machine Detection (AMD) feature. This file includes the detection algorithms for detecting whether a human or answering machine has answered the call, and is based on North American English. In most cases, the detection algorithms in this file suffice even when your deployment is in a region where a language other than English is spoken. However, if you wish to replace the default file with a different AMD Sensitivity file containing customized detection algorithms, please contact your AudioCodes sales representative for more information.

The AMD Sensitivity file is created in .xml format and then converted to a binary .dat file that can be installed on the device. The XML-to-binary format conversion can be done using AudioCodes DConvert utility. For more information on using this utility, refer to the *DConvert Utility User's Guide*. Only one AMD Sensitivity file can be installed on the device. To install a new AMD Sensitivity file, use any of the following methods:

- Web interface: On the Load Auxiliary Files page see Loading Auxiliary Files page 555.
- TFTP during initialization: You need to configure the ini file parameter, AMDSensitivityFileName, and then copy the AMD Sensitivity file to the TFTP directory.

Automatic Update feature: For more information, see Automatic Update Mechanism on page 587. For this method, the AMDSensitivityFileUrl parameter must be set through SNMP or ini file.

For more information on the AMD feature, see 'Answering Machine Detection (AMD)' on page **Error! Bookmark not defined.**.

37.2 Software License Key

The device is shipped with a pre-installed Software License Key for each of its TrunkPack Modules (TPM), which determines the device's supported features, capabilities, and available resources. You can upgrade or change your device's supported features by purchasing and installing a new Software License Key to match your requirements.

Notes:

- Each TPM utilizes a unique key.
- For the High Availability (HA) system, the Software License Key includes the HA
 feature and is installed on both blades active and redundant. If the redundant
 blade's Software License Key is missing or invalid, the system is moved to
 mismatch configuration mode (alerted by SNMP).
- The availability of certain Web pages depends on the installed Software License Key.

37.2.1 Obtaining the Software License Key File

Before you can install a new Software License Key, you need to obtain a Software License Key file for your device with the required features from your AudioCodes representative. The Software License Key is an encrypted key in string format that is associated with the device's serial number ("S/N") and supplied in a text-based file. If you need a Software License Key for more than one device, the Software License Key file can include multiple Software License Keys (see figure below). In such cases, each Software License Key in the file is associated with a unique serial number identifying the specific device. When loading such a Software License Key file, the device installs only the Software License Key that is associated with its serial number.

Figure 37-4: Software License Key File with Multiple S/N Lines

To obtain a Software License Key:

- Open the Device Information page (Status & Diagnostics tab > System Status menu > Device Information) and make a note of the device's MAC address and/or serial number:
 - 'MAC Address' field displays the MAC address.
 - 'Serial Number' field displays the serial number.

- If you need a Software License Key for more than one device, repeat Step 1 for each device.
- 3. Send the MAC address and/or serial number to your AudioCodes representative when requesting the required Software License Key.
- 4. When you receive the new Software License Key file, check the file as follows:
 - a. Open the file with any text-based program such as Notepad.
 - **b.** Verify that the first line displays "[LicenseKeys]".
 - c. Verify that the file contains one or more lines in the following format:
 "S/N<serial number> = <Software License Key string>"
 - For example: "S/N370604 = jCx6r5tovCIKaBBbhPtT53Yj..."
 - **d.** Verify that the "S/N" value reflects the serial number of your device. If you have multiple Software License Keys, ensure that each "S/N" value corresponds to a device.

Warning: Do not modify the contents of the Software License Key file.

5. Install the Software License Key on the device, as described in "Installing the Software License Key" on page 576.

37.2.2 Installing the Software License Key

Once you have received your Software License Key file from your AudioCodes representative, you can install it on the device using one of the following management tools:

- Web interface see "Installing Software License Key using Web Interface" on page 576
- AudioCodes AcBootP utility see Installing Software License Key using AcBootP on page 579
- AudioCodes EMS refer to the EMS User's Manual or EMS Product Description

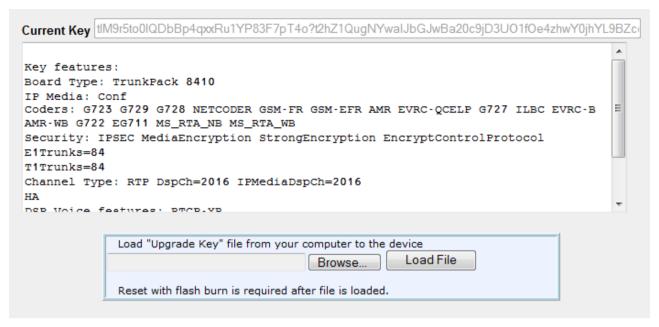

Note: When you install a new Software License Key, it is loaded to the device's non-volatile flash memory and overwrites the previously installed Software License Key.

37.2.2.1 Installing Software License Key using Web Interface

The following procedure describes how to install the Software License Key in the Web interface.

- > To install the Software License Key in the Web interface:
- Open the Software Upgrade Key Status page (Maintenance tab > Software Update menu > Software Upgrade Key).

User's Manual 37. Software Upgrade

- Back up the Software License Key currently installed on the device, as a precaution. If the new Software License Key does not comply with your requirements, you can reload this backup to restore the device's original capabilities.
 - a. In the 'Current Key' field, select the entire text string and copy it to any standard text file (e.g., Notepad).
 - **b.** Save the text file with any file name and file extension (e.g., key.txt) to a folder on your computer.

- 3. Depending on whether you are loading a Software License Key file with a single Software License Key (i.e., one "S/N") or with multiple Software License Keys (i.e., more than one "S/N"), do one of the following:
 - Loading a File with a Single Software License Key:
 - Open the Software License Key file using a text-based program such as Notepad.
 - Copy-and-paste the string from the file to the 'Add a Software Upgrade Key' field.
 - c. Click the Add Key button.
 - Loading a File with Multiple Software License Keys:
 - a. In the 'Load Upgrade Key file ...' field, click the Browse button and navigate to the folder in which the Software License Key file is located on your computer.
 - b. Click **Load File**; the new key is installed on the device.

If the Software License Key is valid, it is burned to the device's flash memory and displayed in the 'Current Key' field.

- **4.** Verify that the Software License Key was successfully installed, by doing one of the following:
 - In the Software Upgrade Key Status page, check that the listed features and capabilities activated by the installed Software License Key match those that were ordered.
 - Access the Syslog server and ensure that the following message appears in the Syslog server:
 - "S/N___ Key Was Updated. The Board Needs to be Reloaded with ini file\n"
- 5. Reset the device; the new capabilities and resources enabled by the Software License Key are active.

Note: If the Syslog server indicates that the Software License Key was unsuccessfully loaded (i.e., the "SN_" line is blank), do the following preliminary troubleshooting procedures:

- 1. Open the Software License Key file and check that the "S/N" line appears. If it does not appear, contact AudioCodes.
- 2. Verify that you have loaded the correct file. Open the file and ensure that the first line displays "[LicenseKeys]".
- 3. Verify that the content of the file has not been altered.

37.2.2.2 Installing Software License Key using AcBootP

The following procedure describes how to install a Software License Key using AudioCodes AcBootP utility.

Notes:

- When loading the Software License Key file, a cmp file must also be loaded during this BootP process.
- For more information on using the AcBootP utility, refer to the document AcBootP Utility User's Guide.

To install a Software License Key using the AcBootP utility:

- 1. Change the file extension name of the Software License Key file from .txt to .ini.
- 2. Place the Software License Key file in the same folder in which the device's *cmp* file is located.
- 3. Start the AcBootP utility.
- **4.** Click the **Client Configuration** tab, and then from the 'INI File' drop-down list, select the Software License Key file.
- 5. From the 'BootP File' drop-down list, select the device's *cmp* file.
- 6. Configure the initial BootP/TFTP parameters as required, and then click Apply.
- 7. Reset the device; the *cmp* and Software License Key files are loaded to the device.

37.3 Software Upgrade Wizard

The Web interface's Software Upgrade Wizard lets you easily upgrade the device's software version (.cmp file). The wizard also provides you the option to load other files such as an ini file and auxiliary files (e.g., Call Progress Tone / CPT file). However, loading a .cmp file is mandatory through the wizard and before you can load any other type of file, the .cmp file must be loaded.

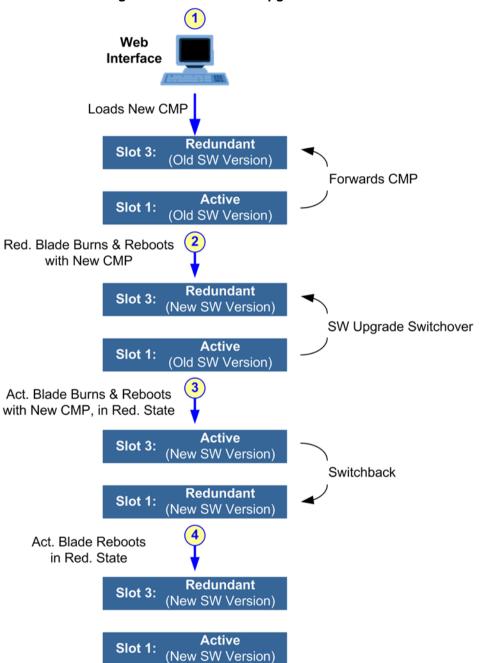

The wizard can also upgrade devices set up in High Availability (HA) mode. You can choose between two optional HA upgrade methods:

- System Reset Upgrade (non-Hitless): Both the active and redundant blades are upgraded simultaneously. Therefore, this method is traffic-affecting and terminates current calls during the upgrade process. The process is as follows:
 - 1. The active (current) blade loads the .cmp file.
 - 2. The active blade sends the .cmp file to the redundant blade.
 - 3. Both active and redundant blades install and burn the file to flash memory with a reset. In other words, no HA switchover occurs.
- Hitless Upgrade: The blades are upgraded without disrupting traffic (i.e., current calls are maintained). The process is as follows:
 - 1. The active (current) blade loads the .cmp file.
 - 2. The active blade sends the .cmp file to the redundant blade.
 - **3.** The redundant blade installs and burns the file to its flash memory with a reset. The redundant blade now runs the new software version.
 - 4. An HA switchover occurs from the active to redundant blade. Therefore, current calls are maintained and now processed by the previously redundant blade, which is now the active blade.

- The previously active blade (now in redundant mode) installs and burns the file to its flash memory with a reset. Therefore, both blades now run the new software version.
- 6. An HA switchover occurs from the active blade (i.e., the initial redundant blade) to the redundant blade (i.e., the initial active device) to return the blades to their original HA state. Only the initial redundant blade undergoes a reset to return to redundant state.

Figure 37-5: Hitless SW Upgrade Process

Notes:

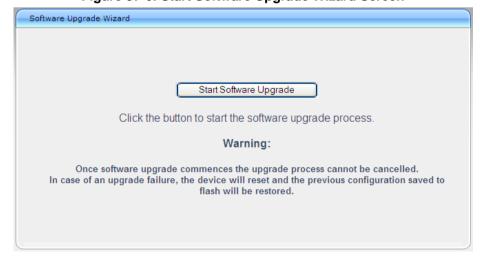

- If you upgraded your firmware (.cmp file) and the "SW version mismatch" message appears in the Syslog or Web interface, your Software License Key does not support the new .cmp file version. If this occurs, contact AudioCodes support for assistance.
- Instead of manually upgrading the device, you can use the device's Automatic Update feature for automatic provisioning (see Automatic Provisioning on page 587).

The following procedure describes how to load files using the Web interface's Software Upgrade Wizard.

To load files using the Software Upgrade Wizard:

- 1. Make sure that you have installed a new Software License Key (see Software License Key on page 575) that is compatible with the software version to be installed.
- 2. It is recommended to enable the Graceful Lock feature (see Locking and Unlocking the Device on page 549). The wizard resets the device at the end of the upgrade process, thereby causing current calls to be untimely terminated. To minimize this traffic disruption, the Graceful Lock feature prevents the establishment of new calls.
- 3. It is recommended to save a copy of the device's configuration to your computer. If an upgrade failure occurs, you can restore your configuration settings by uploading the backup file to the device. For saving and restoring configuration, see Backing Up and Loading Configuration File on page 585).
- 4. Open the Software Upgrade wizard, by performing one of the following:
 - Select the Maintenance tab, click the Software Update menu, and then click Software Upgrade Wizard.
 - On the toolbar, click Device Actions, and then choose Software Upgrade Wizard

Figure 37-6: Start Software Upgrade Wizard Screen

5. Click **Start Software Upgrade**; the wizard starts, prompting you to load a .cmp file:

Figure 37-7: Software Upgrade Wizard - Load CMP File

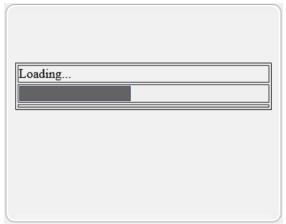

Note: At this stage, you can quit the Software Upgrade Wizard without having to reset the device, by clicking **Cancel**. However, if you continue with the wizard and start loading the cmp file, the upgrade process must be completed with a device reset.

- **6.** Click **Browse**, and then navigate to where the .cmp file is located on your computer. Select the file, and then click **Open**.
- Click Load File; the device begins to install the .cmp file. A progress bar displays the status of the loading process and a message informs you when file load successfully completes.

Figure 37-8: Software Upgrade Wizard – CMP File Loading Progress Bar

- **8.** If your device is in HA mode, select one of the following upgrade options:
 - Hitless Upgrade (default)
 - System Reset Upgrade

See the description of these methods in the beginning of this section.

Note: If you select the **Hitless Upgrade** option, the wizard can only be used to upload a .cmp file; Auxiliary and ini files cannot be uploaded.

9. If you want to load additional files, skip this step and continue with the next step. If you

only want to load a .cmp file, click **Reset** ; the device burns the .cmp file to its flash memory and then resets. The device uses the existing configuration (ini) and auxiliary files.

Note: Device reset may take a few minutes (even up to 30 minutes) depending on cmp file version.

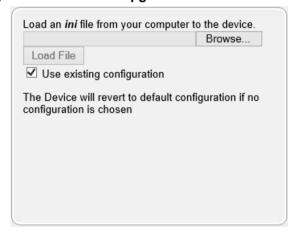

- 10. To load additional files, use the **Next** and **Back** buttons to navigate through the wizard to the desired file-load wizard page. Alternatively, you can navigate to the relevant file-load wizard page by clicking the respective file-name buttons listed in the left pane of the wizard pages.
- 11. The wizard page for loading an ini file provides you with the following options:
 - Load a new ini file: In the 'Load an ini file...' field, click **Browse**, and then navigate to where the ini file is located on your computer. Select the file, and then click **Load File**; the device loads the ini file.

Note: If you use the wizard to load an ini file, parameters excluded from the ini file are assigned default values (according to the .cmp file running on the device) and thereby, overwrite values previously configured for these parameters.

- Retain the existing configuration (default): Select the 'Use existing configuration' check box to use the current configuration (and do not select an inifile).
- Restore configuration to factory defaults: Clear the 'Use existing configuration' check box (and do not select an ini file).

Figure 37-9: Software Upgrade Wizard - Load INI File

12. When you have completed loading all the desired files, click Next until the last wizard page appears (the **FINISH** button is highlighted in the left pane):

Figure 37-10: Software Upgrade Wizard - Files Loaded

You have finished the upgrade process. Click the "Reset" button to burn the configuration to the device flash memory and restart the device.

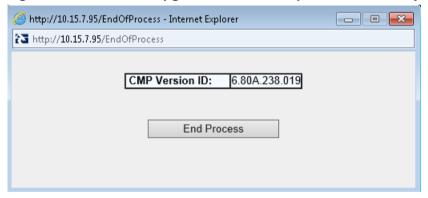

13. Click **Reset** to burn the files to the device's flash memory; the "Burn and reset in progress" message is displayed and the device 'burns' the newly loaded files to flash memory and then resets.

Note: Device reset may take a few minutes (even up to 30 minutes), depending on .cmp file version.

When the device finishes the installation process and resets, the following wizard page is displayed, showing the installed software version and other files (ini file and auxiliary files) that you may also have installed:

Figure 37-11: Software Upgrade Process Completed Successfully

- 14. Click **End Process** to close the wizard; the Web Login dialog box appears.
- **15.** Enter your login username and password, and then click **Login**; a message box appears informing you of the new .cmp file version.
- **16.** Click **OK**; the Web interface becomes active, reflecting the upgraded device.

37.4 Backing Up and Loading Configuration File

You can save a copy/backup of the device's current configuration settings as an *ini* file to a folder on your computer, using the Configuration File page. The saved file includes only parameters that were modified and parameters with other than default values. The Configuration File page also allows you to load an *ini* file to the device. If the device has "lost" its configuration, you can restore the device's configuration by loading the previously saved *ini* file or by simply loading a newly created *ini* file.

copy cli-script to <URL of TFTP/HTTP/HTTPS server>

For example:

Remote server:

copy cli-script to tftp://192.168.0.3/config-device1.txt

User's Manual

Note: When loading an *ini* file using the Configuration File page, parameters not included in the *ini* file are reset to default settings.

To save or load an ini file:

- 1. Open the Configuration File page by doing one of the following:
 - From the Navigation tree, click the Maintenance tab, click the Software Update menu, and then click Configuration File.
 - On the toolbar, click **Device Actions**, and then from the drop-down menu, choose **Load Configuration File** or **Save Configuration File**.

Figure 37-12: Configuration File Page

- 2. To save the *ini* file to a folder on your computer:
 - a. Click the Save INI File button; the File Download dialog box appears.
 - **b.** Click the **Save** button, navigate to the folder where you want to save the file, and then click **Save**.
- 3. To load the *ini* file to the device:
 - a. Click the **Browse** button, navigate to the folder where the file is located, select the file, and then click **Open**; the name and path of the file appear in the field beside the **Browse** button.
 - b. Click the **Load INI File** button, and then at the prompt, click **OK**; the device uploads the file and then resets. Once complete, the Web Login screen appears, requesting you to enter your user name and password.

38 Automatic Update Mechanism

This chapter describes the device's Automatic Updated mechanism.

38.1 Automatic Configuration Methods

The table below summarizes the automatic provisioning methods supported by the device:

Automatic Provisioning Methods

BootP / TFTP	DHCP		Automatic Update Methods			SNMP (EMS)	
	67	66	HTTP/S	TFTP	FTP	NFS	(LIVIO)
Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

38.2 BootP Request and DHCP Discovery upon Device Initialization

After the device powers up or is physically reset, it broadcasts a BootP request to the network. If it receives a reply from a BootP server, it changes its network parameters (IP address, subnet mask and default gateway address) according to the values provided by the BootP server. If there is no reply from a BootP server and if DHCP is enabled (see "DHCP-based Configuration Server" on page 604), the device initiates a standard DHCP procedure to configure its network parameters.

After changing the network parameters, the device attempts to load the firmware file (cmp) and various configuration files from the TFTP server's IP address received from the BootP/DHCP server. If a TFTP server's IP address is not obtained, the device attempts to load the cmp file and/or configuration files from a preconfigured TFTP server. Thus, the device can obtain its network parameters from BootP or DHCP servers, and its software and configuration files from a different TFTP server (preconfigured in the ini configuration file).

If BootP/DHCP servers are not found or when the device is reset using the Web interface or SNMP, it retains its network parameters and attempts to load the cmp file and/or configuration files from a preconfigured TFTP server. If a preconfigured TFTP server does not exist, the device operates using the existing software and configuration files on its flash memory.

Reset from the **Physical** Web Interface Reset or SNMP **BootP** DHCP No x times x times Response Response Update network BootP Response parameters from **DHCP** Response BootP/DHCP reply BootP/DHCP reply contains firmware file name? No Yes Download firmware via TFTP BootP/DHCP BootP/DHCP No reply contains ini file reply contains ini name? file name? Νo Download configuration files via TFTF Run operational software

Figure 38-1: BootP Request and DHCP Discovery upon Startup

Note: By default, the duration between BootP/DHCP requests sent by the device is one second (configured by the BootPDelay ini file parameter). By default, the number of requests is three (configured by the BootPRetries ini file parameter).

38.2.1 Local Configuration Server with BootP/TFTP

Local configuration server with BootP/TFTP provides an easy and efficient method for automatic configuration, where configuration occurs at a staging warehouse, as described below:

- Install AudioCodes AcBootP/TFTP utility program on a computer located in a staging warehouse.
- 2. Prepare a standard configuration *ini* file and place it in the TFTP directory.
- 3. Enter the MAC address of each device in the AcBootP utility.
- **4.** For each device added in the BootP utility, select the cmp and *ini* file in the 'BootP File' field.
- 5. Connect each device to the network and then power up the device.
- 6. The BootP reply contains the cmp and *ini* file names entered in the 'BootP File' field. Each device retrieves these files using BootP and stores them in its flash memory. If auxiliary files are required (e.g., call progress tones), they may also be specified in the *ini* file and downloaded from the same TFTP server.
- 7. When the devices' LEDs turn green indicating that the files were successfully loaded, disconnect the devices and ship to the customer.

Notes:

- Typically, IP addressing at the customer site is done by DHCP.
- For more information on the AcBootP utility, refer to the AcBootP Utility User's Guide.

38.2.2 DHCP-based Provisioning

This method is similar to the setup described in Local Configuration Server with BootP/TFTP on page 589, except that DHCP is used instead of BootP. A DHCP server can be configured to automatically provide each device with a temporary IP address so that individual MAC addresses are not required. The DHCP server can provide additional networking parameters such as subnet mask, default gateway, primary and secondary DNS server, and two SIP server addresses. These network parameters have a time limit, after which the device must 'renew' its lease from the DHCP server.

The device can use a host name in the DHCP request. The host name is set to acl_nnnnn, where *nnnnn* denotes the device's serial number. The serial number is the last six digits of the MAC address converted to decimal representation. In networks that support this feature and if the DHCP server registers this host name to a DNS server, you can access the device (through a Web browser) using the URL, http://acl_<serial number> (instead of using the device's IP address). For example, if the device's MAC address is 00908f010280, the DNS name is acl 66176.

Notes:

- Throughout the DHCP procedure, ensure that the BootP/TFTP program (AcBootP utility) is deactivated; otherwise the device receives a response from the BootP server instead of the DHCP server. Typically, after the device powers up, it attempts to communicate with a BootP server. If a BootP server does not respond and DHCP is enabled, the device attempts to obtain its networking parameters from the DHCP server.
- When using DHCP to acquire an IP address, the Interface table, VLANs and other advanced configuration options are disabled.
- For more information on DHCP, see BootP Request and DHCP Discovery upon Device Initialization on page 604.
- For additional DHCP parameters, see "DHCP Parameters" on page 711.

To enable DHCP:

 Open the Application Settings page (Configuration tab > System menu > Application Settings).

Figure 2: Enabling DHCP - Application Settings Page

- 2. From the 'Enable DHCP" drop-down list, select Enable.
- 3. Click Submit.
- **4.** To activate the DHCP process, perform a cold reset by pressing the device's hardware reset button. A soft reset using the Web interface doesn't trigger the DHCP process and if done, this parameter reverts to **Disable**.

The following shows an example of a configuration file for a Linux DHCP server (dhcpd.conf). The devices are allocated temporary IP addresses in the range 10.31.4.53 to 10.31.4.75. TFTP is assumed to be on the same computer as the DHCP server (alternatively, the "next-server" directive may be used).

Notes:

- If, during operation, the device's IP address is changed as a result of a DHCP renewal, the device automatically resets.
- If the DHCP server denies the use of the device's current IP address and specifies
 a different IP address (according to RFC 1541), the device must change its
 networking parameters. If this occurs while calls are in progress, they are not
 automatically rerouted to the new network address. Therefore, administrators are
 advised to configure DHCP servers to allow renewal of IP addresses.

- If the device's network cable is disconnected and then reconnected, a DHCP renewal is performed (to verify that the device is still connected to the same network). The device also includes its product name in the DHCP Option 60 Vendor Class Identifier. The DHCP server can use this product name to assign an IP address accordingly.
- After power-up, the device performs two distinct DHCP sequences. Only in the second sequence is DHCP Option 60 included. If the device is software reset (e.g., from the Web interface or SNMP), only a single DHCP sequence containing Option 60 is sent.

38.2.3 Provisioning from HTTP Server using DHCP Option 67

Most DHCP servers support the configuration of individual DHCP option values for different devices on the network. The DHCP configuration should be modified so that the device receives a URL to the configuration file in Option 67, along with IP addressing and DNS server information. The DHCP response is processed by the device upon startup and the device automatically downloads the configuration file from the HTTP server specified in the DHCP response. This method is NAT-safe.

Below is an example of a Linux DHCP configuration file (dhcpd.conf) showing the required format of Option 67:

```
ddns-update-style ad-hoc;
default-lease-time 3600;
max-lease-time 3600;
class "audiocodes" {
   match if(substring(hardware, 1, 3) = 00:90:8f);
subnet 10.31.0.0 netmask 255.255.0.0 {
   pool {
          allow members of "audiocodes";
          range 10.31.4.53 10.31.4.75;
                                          10.31.0.1;
          option routers
                                          255.255.0.0;
          option subnet-mask
         option domain-name-servers
                                         10.1.0.11;
         option bootfile-name
"INI=http://www.corp.com/master.ini";
          option dhcp-parameter-request-list 1,3,6,51,67;
```

38.2.4 Provisioning from TFTP Server using DHCP Option 66

This method is suitable when the network in which the device is deployed contains a provisioning TFTP server for all network equipment, without being able to distinguish between AudioCodes and non-AudioCodes devices.

Upon startup, the device searches for Option 66 in the DHCP response from the DHCP server. If Option 66 contains a valid IP address, the device attempts to download, through TFTP, a file that has a filename containing the device's MAC address (e.g., 00908f0130aa.ini). This method requires a provisioning server at the customer premises.

This method loads the configuration file to the device as a one-time action. The download is only repeated if the device is manually restored to factory defaults (by pressing the hardware reset button while the Ethernet cable is not connected) and DHCP is enabled (see note below).

Notes:

- For TFTP configuration using DHCP Option 66, enable DHCP on your device: DHCPEnable = 1 and DHCPRequestTFTPParams = 1.
- Access to the core network using TFTP is not NAT-safe.
- The TFTP data block size (packets) when downloading a file from a TFTP server for the Automatic Update mechanism can be configured using the AUPDTftpBlockSize parameter.

38.2.5 HTTP-based Provisioning

An HTTP or HTTPS server can be located in the network in which the device is deployed, storing configuration and software files for the device to download. This does not require additional servers and is NAT-safe.

For example, assume the core network HTTPS server is https://www.corp.com. A master configuration ini file can be stored on the server, e.g., https://www.corp.com/gateways/master.ini. This file could point to additional ini files, auxiliary files (e.g., call progress tones), and software files (cmp), all on the same HTTP server or different HTTP servers in the network.

The main advantage of this method is that the device can be configured to periodically check the HTTP server for file updates. HTTP(S) is not sensitive to NAT devices, enabling configuration whenever needed without on-site intervention. For additional security, the URL may contain a different port, and username and password.

The only configuration required is to preconfigure the device(s) with the URL of the initial (master) ini file. This can be done using one of the following methods:

- DHCP as described in 'DHCP-based Provisioning' on page 589 or via TFTP at a staging warehouse. The URL is configured using the IniFileURL parameter.
- Private labeling (preconfigured during the manufacturing process).
- Using DHCP Option 67 (see Provisioning from HTTP Server using DHCP Option 67 on page 591).
- Manually on-site, using the RS-232 port or Web interface.

When the device is deployed at the customer site, local DHCP server provides the devices with IP addressing and DNS server information. From the URL provided in the DHCP response, the device can then contact the HTTP server at the core network and automatically download its configuration. The URL can be a simple file name or contain the device's MAC or IP address, e.g.:

- http://corp.com/config-<MAC>.ini which becomes, for example, http://corp.com/config-00908f030012.ini
- http://corp.com/<IP>/config.ini which becomes, for example, http://corp.com/192.168.0.7/config.ini

For more information on HTTP-based provisioning, see 'HTTP/S-Based Provisioning using the Automatic Update Feature' on page .

38.2.6 Loading Files Securely by Disabling TFTP

The TFTP protocol is not considered secure and some network operators block it using a firewall. It is possible to disable TFTP completely, using the *ini* file parameter EnableSecureStartup (set to 1). This way, secure protocols such as HTTPS may be used to fetch the device configuration.

- To download the ini file to the device using HTTPS instead of TFTP:
- 1. Prepare the device's configuration file on an HTTPS server and obtain a URL to the file (e.g., https://192.168.100.53/gateways.ini).
- 2. Enable DHCP, if necessary.
- 3. Enable SSH and connect to it.
- 4. In the CLI, use the *ini* file parameters IniFileURL (for defining the URL of the configuration file) and EnableSecureStartup (for disabling TFTP), and then restart the device with the new configuration:

```
/conf/scp IniFileURL https://192.168.100.53/gateways.ini
/conf/scp EnableSecureStartup 1
/conf/sar bootp
```

Note: Once Secure Startup has been enabled, it can only be disabled by setting EnableSecureStartup to 0 using the CLI. Loading a new ini file using BootP/TFTP is not possible until EnableSecureStartup is disabled.

38.2.7 FTP- or NFS-based Provisioning

Some networks block access to HTTP(S). The Automatic Update feature provides limited support for FTP/FTPS connectivity. Periodic polling for updates is not possible since these protocols do not support conditional fetching, i.e., updating files only if it is changed on the server.

The only difference between this method and those described in 'HTTP-based Provisioning' on page 592 and Provisioning from HTTP Server using DHCP Option 67 on page 591 is that the protocol in the URL is "ftp" (instead of "http").

Notes:

- Unlike FTP, NFS is not NAT-safe.
- NFS v2/v3 is also supported.

38.2.8 Provisioning using AudioCodes EMS

AudioCodes EMS server functions as a core-network provisioning server. The device's SNMP Manager should be configured with the IP address of the EMS server, using one of the methods detailed in the previous sections. As soon as a registered device contacts the EMS server through SNMP, the EMS server handles all required configuration automatically, upgrading software as needed. This alternative method doesn't require additional servers at the customer premises, and is NAT-safe.

38.3 HTTP/S-Based Provisioning using the Automatic Update Feature

The Automatic Update feature can be used for automatic provisioning of the device through HTTP/S. Automatic provisioning is useful for large-scale deployment of devices. In some cases, the devices are shipped to the end customer directly from the manufacturer. In other cases, they may pass through a staging warehouse. Configuration may occur at the staging warehouse or at the end-customer premises.

The device may be preconfigured during the manufacturing process (commonly known as private labeling). Typically, a two-stage configuration process is implemented whereby initial configuration includes only basic configuration, while the final configuration is done only when the device is deployed in the live network.

Warnings: If you use the IniFileURL parameter for the Automatic Update feature, do not use the Web interface to configure the device. If you do configure the device through the Web interface and save (burn) the new settings to the device's flash memory, the IniFileURL parameter is automatically set to 0 and Automatic Updates is consequently disabled. To enable Automatic Updates again, you need to re-load the ini file (using the Web interface or BootP) with the correct IniFileURL settings. As a safeguard to an unintended burn-to-flash when resetting the device, if the device is configured for Automatic Updates, the 'Burn To FLASH' field under the Reset Configuration group in the Web interface's Maintenance Actions page is automatically set to **No** by default.

Note: For a description of all the Automatic Update parameters, see Automatic Update Parameters or refer to the CLI Reference Guide.

For additional security, use HTTPS or FTPS. The device supports HTTPS (RFC 2818) and FTPS using the AUTH TLS method <draft-murray-auth-ftp-ssl-16>

38.3.1 Files Provisioned by Automatic Update

You can use the Automatic Update feature to update the device with any of the following files:

- Software file (cmp)
- Auxiliary files (e.g., Call Progress Tones, SSL Certificates, SSL Private Key)
- Configuration file (ini file)

38.3.2 File Location for Automatic Update

The files for updating the device can be stored on any standard Web (HTTP/S), FTP, or NFS server. The files can be loaded periodically to the device using HTTP, HTTPS, FTP, or NFS. This mechanism can be used even when the device is installed behind NAT and firewalls.

The Automatic Update feature is done per file and configured by specifying the file name and URL address of the provisioning server where the file is located. For a description of the parameters used to configure URLs per file, see Automatic Update Parameters.

Below are examples for configuring the file names and their URLs for Automatic Update:

ini File:

```
IniFileURL = 'http://www.corp.com/configuration.ini'
CptFileURL = 'http://www.corp.com/call_progress.dat'
AutoCmpFileUrl = 'http://www.corp.com/SIP_F6.80A.008.cmp
```

CLI

configure system
(config-system)# automatic update
(automatic-update)# cli-script https://company.com/cli/<MAC>
(automatic-update)# startup-script https://company.com/startup/<MAC>
(automatic-update)# voice-configuration http://www.company.com/configuration.ini
(automatic-update)# call-progress-tones http://www.company.com/call_progress.dat
(automatic-update)# auto-firmware http://www.company.com/SIP_F6.80A.008.cmp

Note: For configuration files (ini), the file name in the URL can automatically contain the device's MAC address for enabling the device to download a file unique to the device. For more information, see 'MAC Address Automatically Inserted in Configuration File Name' on page 600.

38.3.3 Triggers for Automatic Update

The Automatic Update feature can be triggered by the following:

Upon device startup (reset or power up). To disable this trigger, run the following CLI command:

(config-system)# automatic-update (automatic-update)# run-on-reboot off

- Upon startup, but before the device is operational, if the Secure Startup feature is enabled (see Loading Files Securely by Disabling TFTP).
- Periodically:
 - Specified time of day (e.g., 18:00), configured by the ini file parameter AutoUpdatePredefinedTime or CLI command configure system > automaticupdate > predefined-time.
 - Interval between Automatic Updates (e.g., every 60 minutes), configured by the ini file parameter AutoUpdateFrequency or CLI command configure system > automatic-update > update-frequency.
- Centralized provisioning server request:
 - Upon receipt of an SNMP request from the provisioning server.
 - Upon receipt of a special SIP NOTIFY message from the provisioning server. The NOTIFY message includes an Event header with the AudioCodes proprietary value, "check-sync;reboot=false", as shown in the example below:

```
NOTIFY sip: <user>@<dsthost> SIP/2.0
To: sip: <user>@<dsthost>
From: sip: sipsak@<srchost>
CSeq: 10 NOTIFY
Call-ID: 1234@<srchost>
Event: check-sync; reboot=false
```

To enable this feature through the Web interface:

- Open the Advanced Parameters page (Configuration tab > VolP menu > SIP Definitions > Advanced Parameters).
- **b.** Under the **Misc Parameters** group, set the 'SIP Remote Reset' parameter to **Enable**.
- c. Click Submit.

To enable through CLI: configure voip > sip-definition advanced-settings > sip-remote-reset.

38.3.4 Access Authentication with HTTP Server

You can configure the device to authenticate itself with the HTTP/S server. The device authenticates itself by providing the HTTP/S server with its authentication username and password. You can configure one of the following HTTP authentication schemes:

- Basic Access Authentication: The device provides its username and password to the HTTP server. The username and password is configured in the URL that you define for downloading the file:
 - ini file:

```
AutoCmpFileUrl = 'https://<username>:<password>@<IP address
or domain name>/<file name>'
```

CLI:

```
# configure system
(config-system)# automatic update
(automatic-update)# auto-firmware
https://<username>:<password>@<IP address or domain
name>/<file name>
```

■ **Digest Access Authentication:** The authentication username and password is negotiated between the device and HTTP/S server, using digest MD5 cryptographic hashing. This method is safer than basic access authentication. The digest authentication username and password are configured using the AUPDDigestUsername and AUPDDigestPassword parameters, respectively.

38.3.5 Querying Provisioning Server for Updated Files

Each time the Automatic Update feature is triggered, for each file and its configured URL the device does the following:

- If you have configured the device to authenticate itself to the HTTP/S server for secure
 access, the device sends the access authentication username and password to the
 HTTP/S server (for more information, see Access Authentication with HTTP Server on
 page 596). If authentication succeeds, Step 2 occurs.
- 2. The device establishes an HTTP/S connection with the URL host (provisioning server). If the connection is HTTPS, the device verifies the certificate of the provisioning server, and presents its own certificate if requested by the server.
- Get request. This request contains the HTTP User-Agent Header, which identifies the device to the provisioning server. By default, the header includes the device's model name, MAC address, and currently installed software and configuration versions. Based on its own dynamic applications for logic decision making, the provisioning server uses this information to check if it has relevant files available for the device and determines which files must be downloaded (working in conjunction with the HTTP If-Modified-Since header, described further on in this section).

You can configure the information that is sent in the User-Agent header, using the AupdHttpUserAgent parameter or CLI command, configure system > http-user-agent.

The information can include any user-defined string value or the following supported string variable tags (case-sensitive):

- NAME> product name, according to the installed Software License Key
- <MAC> device's MAC address
- VER> software version currently installed on the device, e.g., "6.80.200.001"
- **<CONF>** configuration version, as configured in the ini file parameter, INIFileVersion or CLI command, configuration-version

The device automatically populates these tag variables with actual values in the sent header:

```
User-Agent: Mozilla/4.0 (compatible; AudioCodes;
<NAME>;<MAC>;<VER>;<CONF>).
```

For example, if you set AupdHttpUserAgent = <NAME>;<VER>, the device sends the following User-Agent header:

```
Mozilla/4.0 (compatible; AudioCodes; Mediant; 6.80.200.001)
```

- 4. If the provisioning server has relevant files available for the device, the following occurs, depending on file type and configuration:
 - File Download upon each Automatic Update process: This is applicable to software (.cmp), ini files. In the sent HTTP Get request, the device uses the HTTP If-Modified-Since header to determine whether to download these files. The header contains the date and time (timestamp) of when the device last downloaded the file from the specific URL. This date and time is regardless of whether the file was installed or not on the device. An example of an If-Modified-Since header is shown below:

```
If-Modified-Since: Mon, 1 January 2014 19:43:31 GMT
```

If the file on the provisioning server was unchanged (modified) since the date and time specified in the header, the server replies with an HTTP 304 response and the file is not downloaded. If the file was modified, the provisioning server sends an HTTP 200 OK response with the file in the body of the HTTP response. The device downloads the file and compares the version of the file with the currently installed version on its flash memory. If the downloaded file is of a later version, the device installs it after the device resets (which is only done after the device completes all file downloads); otherwise, the device does not reset and does not install the file.

To enable the automatic software (.cmp) file download method based on this timestamp method, use the ini file parameter, AutoCmpFileUrl or CLI command, configure system > automatic-update > auto-firmware <URL>. The device uses the same configured URL to download the .cmp file for each subsequent Automatic Update process.

Notes:

- When this method is used, there is typically no need for the provisioning server to check the device's current firmware version using the HTTP-User-Agent header.
- The Automatic Update feature assumes that the Web server conforms to the
 HTTP standard. If the Web server ignores the If-Modified-Since header or doesn't
 provide the current date and time during the HTTP 200 OK response, the device
 may reset itself repeatedly. To overcome this problem, modify the update
 frequency, using the ini file parameter AutoUpdateFrequency or CLI command
 configure system > automatic update > update-frequency.

One-time File Download: This is applicable to software (.cmp) and Auxiliary
(e.g., call progress tone / CPT) files. The device downloads these files only once,
regardless of how many times the device may repeat the Automatic Update
process. Once they are downloaded, the device discards their configured URLs.
To update these files again, you need to configure their URL addresses and
filenames again. Below is an example of how to configure URLs for some of
these files:

Auxiliary Files:

• ini:

CptFileURL = 'https://www.company.com/call_progress.dat'

CLI:

(config-system)# automatic-update (automatic-update)# call-progress-tones http://www.company.com/call_progress.dat (automatic-update)# tls-root-cert https://company.com/root.pem

Software (.cmp) File:

ini:

CmpFileUrl =
'https://www.company.com/device/v.6.80A.227.005.cmp'

CLI:

(config-system)# automatic-update (automatic-update)# firmware https://www.company.com/device/v.6.80A.227.005.cmp

Notes:

- For one-time file download, the HTTP Get request sent by the device does not include the If-Modified-Since header. Instead, the HTTP-User-Agent header can be used in the HTTP Get request to determine whether firmware update is required.
- When downloading SSL certificates (Auxiliary file), it is recommended to use HTTPS with mutual authentication for secure transfer of the SSL Private Key.
- If the device receives an HTTP 301/302/303 redirect response from the provisioning server, it establishes a connection with the new server at the redirect URL and resends the HTTP Get request.

38.3.6 File Download Sequence

Whenever the Automatic Update feature is triggered (see 'Triggers for Automatic Update' on page 595), the device attempts to download each file from the configured URLs, in the following order:

- 1. ini file
- 2. Periodic software file (.cmp) download
- 3. One-time software file (.cmp) download
- Auxiliary file(s)

The following files automatically instruct the device to reset:

- Periodic software file (.cmp)
- One-time software file (.cmp)

When multiple files requiring a reset are downloaded, the device resets only **after** it has downloaded and installed **all** the files. However, you can explicitly instruct the device to immediately reset for the following files:

ini file: Use the ResetNow in file parameter

Warning: If you use the ResetNow parameter in an ini file for periodic automatic provisioning with non-HTTP (e.g., TFTP) and without CRC, the device resets after every file download. Therefore, use this parameter with caution and only if necessary for your deployment requirements.

Notes:

- For ini file downloads, by default, parameters not included in the file are set to defaults. To retain the current settings of these parameters, set the SetDefaultOnINIFileProcess parameter to 0.
- If you have configured one-time software file (.cmp) download (configured by the
 ini file parameter CmpFileURL or CLI command configure system > automaticupdate > firmware), the device will only apply the file if one-time software updates
 are enabled. This is disabled by default to prevent unintentional software
 upgrades. To enable one-time software upgrades, set the ini file parameter
 AutoUpdateCmpFile to 1 or CLI command, configure system > automatic-update >
 update-firmware on.
- If you need to update the device's software and configuration, it is recommended to first update the software. This is because the current ("old") software (before the upgrade) may not be compatible with the new configuration. However, if both files are available for download on the provisioning server(s), the device first downloads and applies the new configuration, and only then does it download and install the new software. Therefore, this is a very important issue to take into consideration.

38.3.7 Cyclic Redundancy Check on Downloaded Configuration Files

You can enable the device to perform cyclic redundancy checks (CRC) on downloaded configuration files (ini) during the Automatic Update process. The CRC checks whether the content (raw data) of the downloaded file is different to the content of the previously downloaded file from the previous Automatic Update process. The device compares the CRC check value (code) result with the check value of the previously downloaded file. If the check values are identical, it indicates that the file has no new configuration settings, and the device discards the file. If the check values are different, it indicates that the downloaded file is different (i.e., includes updates), and the device installs the downloaded file and applies the new configuration settings.

CRC is useful, for example, when the service provider replaces a file, on the provisioning server, with another file whose contents are the same. When the device sends an HTTP Get request during the Automatic Update process, the provisioning server sends the new file to the device. This occurs as the timestamp between the previously downloaded file and this new file is different (determined by the HTTP If-Modified-Since header in the Get request). Therefore, the CRC feature can be used to prevent the device from installing such files.

For enabling CRC, use the ini file parameter AUPDCheckIfIniChanged or CLI command, configure system > automatic-update > crc-check regular. By default, CRC is disabled. For more information on the parameter, see Automatic Update Parameters.

38.3.8 MAC Address Automatically Inserted in Configuration File Name

You can configure the file name of the configuration file (ini) in the URL to automatically include the MAC address of the device. As described in 'File Location for Automatic Update' on page 594, the file name is included in the configured URL of the provisioning server where the file is located.

Including the MAC address in the file name is useful if you want the device to download a file that is unique to the device. This feature is typically implemented in mass provisioning of devices where each device downloads a specific configuration file. In such a setup, the provisioning server stores configuration files per device, where each file includes the MAC address of a specific device in its file name.

To support this feature, you need to include the case-sensitive string, "<MAC>" anywhere in the configured file name of the URL, for example:

```
IniFileURL = 'https://www.company.com/config_<MAC>.ini'
```

The device automatically replaces the string with its hardware MAC address, resulting in a file name request that contains the device's MAC address, for example, <code>config_00908F033512.ini</code>. Therefore, you can configure all the devices with the same URL and file name.

38.3.9 Automatic Update Configuration Examples

This section provides a few examples on configuring the Automatic Update feature.

38.3.9.1 Automatic Update for Single Device

This simple example describes how to configure the Automatic Update feature for updating a single device. In this example, the device queries the provisioning server for software, configuration and auxiliary files every 24 hours.

- To set up Automatic Provisioning for single device (example):
- 1. Set up an HTTP Web server (e.g., http://www.company.com) and place all the required configuration files on this server.
- 2. Configure the device with the IP address of the DNS server for resolving the domain name (e.g., http://www.company.com) that is used in the URL of the provisioning server. You configure this in the Interface table:
 - ini File:

```
[ InterfaceTable ]

FORMAT InterfaceTable_Index =

InterfaceTable_ApplicationTypes,

InterfaceTable_InterfaceMode, InterfaceTable_IPAddress,

InterfaceTable_PrefixLength, InterfaceTable_Gateway,

InterfaceTable_VlanID, InterfaceTable_InterfaceName,

InterfaceTable_PrimaryDNSServerIPAddress,

InterfaceTable_SecondaryDNSServerIPAddress,

InterfaceTable_UnderlyingDevice;

InterfaceTable 0 = 6, 10, 10.15.7.95, 16, 10.15.0.1, 1,

"Voice", 80.179.52.100, 0.0.0.0, "vlan 1";

[ \InterfaceTable ]
```

CLI:

configure voip (config-voip)# interface network-if 0 (network-if-0)# primary-dns 80.179.52.100

- 3. Configure the device with the following Automatic Update settings:
 - a. Automatic Update is done every 24 hours (1440 minutes):
 - ini File:

AutoUpdateFrequency = 1440

CLI:

configure system

(config-system)# automatic update

(automatic-update)# update-frequency 1440

- **b.** Automatic Update of software file (.cmp):
 - ini File

AutoCmpFileUrl = 'https://www.company.com/sw.cmp'

CLI:

configure system

(config-system)# automatic update

automatic-update)# auto-firmware 'http://www.company.com/sw.cmp'

- c. Automatic Update of Call Progress Tone file:
 - ini File:

CptFileURL = 'https://www.company.com/call_progress.dat'

CLI:

configure system

(config-system)# automatic update

(automatic-update)# call-progress-tones

'http://www.company.com/call_progress.dat'

- d. Automatic Update of ini configuration file:
 - ini File:

IniFileURL = 'https://www.company.com/config.ini'

CLI:

configure system

(config-system)# automatic update

(automatic-update)# voice-configuration 'http://www.company.com/config.ini'

- e. Enable Cyclical Redundancy Check (CRC) on downloaded ini file:
 - ini File:

AUPDCheckIfIniChanged = 1

CLI:

configure system

(config-system)# automatic update

(automatic-update)# crc-check regular

4. Power down and then power up the device.

38.3.9.2 Automatic Update from NFS, FTP and HTTP Servers

This example describes how to configure the Automatic Update feature where files are stored and downloaded from different file server types. The example scenario includes the following:

- NFS server (Version 2) at 10.13.2.10 for storing the CPT file.
- FTPS server at ftpserver.corp.com for storing the Voice Prompts (VP) file. The login credentials to the server are username "root" and password "wheel".
- HTTP server at www.company.com for storing the ini configuration file.
- DNS server at 80.179.52.100 for resolving the domain names of the provisioning servers (FTPS and HTTP).
- To set up Automatic Provisioning for files stored on different server types (example):

1. CPT file:

- Set up an NFS server and copy the CPT file to the directory /usr/shared/public on the NFS server.
- **b.** Configure the device with the NFS server:

```
[ NFSServers ]
FORMAT NFSServers_Index = NFSServers_HostOrIP,
NFSServers_RootPath, NFSServers_NfsVersion,
NFSServers_AuthType, NFSServers_UID, NFSServers_GID,
NFSServers_VlanType;
NFSServers 0 = "10.31.2.10", "/usr/share/public/", 2, 1, 0,
1, 1;
[ \NFSServers ]
```

c. Configure the device with the URL path of the CPT file:

```
CptFileUrl =
'file://10.31.2.10/usr/share/public/usa_tones.dat'
```

2. VP file:

- a. Set up an FTPS server and copy the VP file to the server.
- b. Configure the device with the URL path of the VP file:

```
VPFileUrl = 'ftps://root:wheel@ftpserver.corp.com/vp.dat'
```

3. Software (.cmp) and ini files:

- a. Set up an HTTP Web server and copy the .cmp and ini files to the server.
- b. Configure the device with the URL paths of the .cmp and ini files:

```
AutoCmpFileUrl = 'http://www.company.com/device/sw.cmp'
IniFileURL = 'http://www.company.com/device/inifile.ini'
```

4. Configure the device with the IP address of the DNS server for resolving the domain names of the FTPS and HTTP servers:

```
[ InterfaceTable ]

FORMAT InterfaceTable_Index = InterfaceTable_ApplicationTypes,
InterfaceTable_InterfaceMode, InterfaceTable_IPAddress,
InterfaceTable_PrefixLength, InterfaceTable_Gateway,
InterfaceTable_VlanID, InterfaceTable_InterfaceName,
InterfaceTable_PrimaryDNSServerIPAddress,
InterfaceTable_SecondaryDNSServerIPAddress,
InterfaceTable_UnderlyingDevice;
InterfaceTable 0 = 6, 10, 10.15.7.95, 16, 10.15.0.1, 1,
"Voice", 80.179.52.100, 0.0.0.0, "vlan 1";
[ \InterfaceTable ]
```

5. Configure the device to perform the Automatic Update process daily at 03:00 (3 a.m):

AutoUpdatePredefinedTime = '03:00'

38.3.9.3 Automatic Update for Mass Deployment

This example describes how to configure the Automatic Update feature for updating multiple devices (i.e., mass deployment) using an HTTP provisioning server. In this example, all the devices are configured to download the same "master" configuration file. This file serves as the configuration template and instructs the devices which files to download and how often to perform the Automatic Update process. In addition, the master file also instructs each device to download an ini configuration file whose file name contains the MAC address of the device.

The example scenario is as follows:

- All devices download a "master" configuration file that contains the following:
 - Common configuration shared by all device's.
 - Specific configuration that instructs each device to download a specific configuration file based on the device's MAC address, using the special string "<MAC>" in the URL, as described in 'MAC Address Automatically Inserted in Configuration File Name' on page 600.
- Device queries the provisioning server daily at 24:00 (midnight) for software, configuration and auxiliary files.
- HTTP-based provisioning server at www.company.com for storing the files.
- DNS server at 80.179.52.100 for resolving the domain name of the provisioning server.

- To set up automatic provisioning for mass provisioning (example):
- 1. Create an ini file named "master_configuration.ini" with the following settings:
 - a. Common configuration for all devices:

```
# Check for updates daily at 24:00
AutoUpdatePredefinedTime = '24:00'
# CPT file update:
CptFileURL = 'https://www.company.com/call_progress.dat'
# Software (.cmp) file update:
AutoCmpFileUrl = 'https://www.company.com/sw.cmp'
```

b. Configuration per device based on MAC address:

```
IniFileURL = 'http://www.company.com/config_<MAC>.ini'
```

- 2. Copy the *master_configuration.ini* file as well as the CPT and .cmp files to the HTTP-based provisioning server.
- 3. Configure each device with the following:
 - **a.** URL of the *master_configuration.ini* file for Automatic Update:
 - ini File:

```
IniFileURL =
'http://www.company.com/master_configuration.ini'
```

CLI

configure system (config-system)# automatic update (automatic-update)# voice-configuration 'http://www.company.com/master_configuration.ini'

- **b.** Configure the device with the IP address of the DNS server for resolving the domain name (e.g., http://www.company.com) that is used in the URL for the provisioning server. This is done in the Interface table:
 - ini File:

```
[ InterfaceTable ]

FORMAT InterfaceTable_Index =
InterfaceTable_ApplicationTypes,
InterfaceTable_InterfaceMode, InterfaceTable_IPAddress,
InterfaceTable_PrefixLength, InterfaceTable_Gateway,
InterfaceTable_VlanID, InterfaceTable_InterfaceName,
InterfaceTable_PrimaryDNSServerIPAddress,
InterfaceTable_SecondaryDNSServerIPAddress,
InterfaceTable_UnderlyingDevice;
InterfaceTable 0 = 6, 10, 10.15.7.95, 16, 10.15.0.1, 1,
"Voice", 80.179.52.100, 0.0.0.0, "vlan 1";
[ \InterfaceTable ]
```

• CLI:

```
# configure voip
(config-voip)# interface network-if 0
(network-if-0)# primary-dns 80.179.52.100
```

4. Power down and then power up the device.

39 Restoring Factory Defaults

You can restore the device's configuration to factory defaults using one of the following methods:

- CLI (see "Restoring Defaults using CLI" on page 605)
- Loading an empty *ini* file (see "Restoring Defaults using an ini File" on page 606)

39.1 Restoring Defaults using CLI

The device can be restored to factory defaults using CLI, as described in the procedure below.

Note: Restoring factory defaults using CLI is supported only by Mediant 3000 Simplex.

To restore factory defaults using CLI:

- 1. Access the CLI:
 - a. Connect the RS-232 serial port of the device to the communication port on your computer. For serial cabling, refer to the *Hardware Installation Manual*.
 - b. Establish serial communication with the device using a serial communication program (such as HyperTerminal[™]) with the following communication port settings:

Baud Rate: 115,200 bps

Data Bits: 8Parity: NoneStop Bits: 1

Flow Control: None

2. At the CLI prompt, type the following command to access the configuration mode, and then press Enter:

conf

3. At the prompt, type the following command to reset the device to default settings, and then press Enter:

RestoreFactorySettings

39.2 Restoring Defaults using an ini File

You can restore the device to factory default settings by loading an empty *ini* file to the device. This is done using the Web interface's Configuration File page (see "Backing Up and Loading Configuration File" on page 585). If the *ini* file does include content (e.g., parameters), ensure that they are on lines beginning with comment signs (i.e., semicolons ";") so that the device ignores them.

Note: The only settings that are not restored to default are the management (OAMP) LAN IP address and the Web interface's login user name and password.

Part IX

Status, Performance Monitoring and Reporting

User's Manual 40. System Status

40 System Status

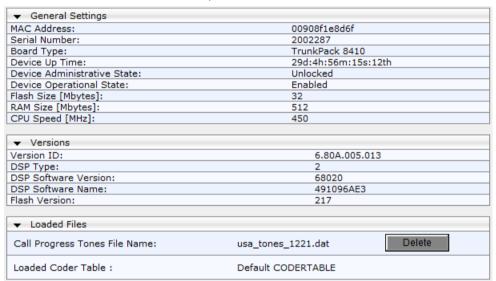

This section describes how to view various system statuses.

40.1 Viewing Device Information

The Device Information page displays hardware and software information about the device. This page also lists any Auxiliary files that have been installed on the device and allows you to remove them.

To access the Device Information page:

 Open the Device Information page (Status & Diagnostics tab > System Status menu > Device Information).

> To delete a loaded file:

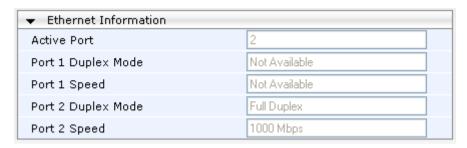

Click the **Delete** button corresponding to the file that you want to delete. Deleting a file takes effect only after device reset (see "Resetting the Device" on page 547).

40.2 Viewing Ethernet Port Information

The Ethernet Port Information page displays read-only information about the Ethernet Port connections.

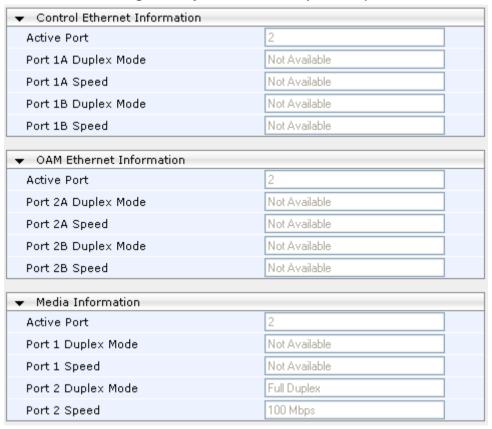

- > To view Ethernet port information:
- Open the Ethernet Port Information page:
 - Navigation menu tree: Status & Diagnostics tab > System Status menu > Ethernet Port Info
 - On the Home page, click any Ethernet port on the graphical display of the device (see "Viewing the Home Page" on page 66)

When Physical Network Separation is enabled on Mediant 3000 with TP-8410 (using the parameter EnableNetworkPhysicalSeparation - see Networking Parameters on page 703), the Ethernet Port Information page displays the ports for the Control, OAMP, and Media network interfaces, as shown below:

Figure 40-1: Ethernet Port Page for Physical Network Separation (Mediant 3000 with TP-8410)

The different Ethernet ports are located on the Mediant 3000 chassis as follows:

- Control: Port 1A bottom PEM module; Port 1B top PEM module.
- OAMP: Port 2A bottom PEM module; Port 2B top PEM module.
- Media: Port 1 and Port 2 are located on the RTM-8410 blade.

Table 40-1: Ethernet Port Information Parameters

Parameter	Description	
Active Port	Displays the active Ethernet port (1 or 2).	
Port Duplex Mode	Displays whether the port is in half or duplex mode.	
Port Speed	Displays the speed (in Mbps) of the Ethernet port.	

User's Manual 610 Document #: LTRT-89725

User's Manual 40. System Status

40.3 Viewing Timing Module Information

The Timing Module Information page provides read-only, real-time information of the device's timing modules (i.e., SAT blade).

Note: This page appears only if the device is in HA mode.

- > To view the timing module information:
- Open the Timing Module Information page (Status & Diagnostics tab > VolP Status menu > Timing Module Information).

Figure 40-2: Timing Module Information Page

SAT #0	
Geographical Position	Slot 2
Туре	SAT BoardID 2, BoardVer 2, TimeID 15, AlarmID 2
Init Information	InitIsMissing
Timing Unit Existence	Not Exist
Timing Ref Selection	BITSNOREF
SAT #1	
Geographical Position	Slot 4
Туре	SAT BoardID 2, BoardVer 2, TimeID 15, AlarmID 2
Init Information	InitIsMissing
Timing Unit Existence	Not Exist
Timing Ref Selection	BITSNOREF

40.4 Viewing Hardware Components Status

The Components Status page provides read-only, real-time status of the device's chassis components such as slot occupants, fans, and power supply units.

Note: You can also access this page from the Home page (see "Viewing the Home Page" on page 66).

- To view the status of the device's hardware components:
- Open the Components Status page (Status & Diagnostics tab > System Status menu > Components Status).

Slots	
Slot #1	TP6310, Active, Temperature(Celsius)=38
Slot #2	SAT 2, Active
Slot #3	TP6310, Redundant, Temperature(Celsius)=37
Slot #4	SAT 2, Redundant

Fan Status	
Tray	Fan Tray ID : 2, Version 0
1 Bottom Front Fan	Speed = 13680 (RPM)
2 Bottom Middle Fan	Speed = 12360 (RPM)
3 Bottom Middle Fan	Speed = 12120 (RPM)
4 Bottom Rear Fan	Speed = 10200 (RPM)
5 Top Front Fan	Speed = 12360 (RPM)
6 Top Middle Fan	Speed = 12840 (RPM)
7 Top Middle Fan	Speed = 12960 (RPM)
8 Top Rear Fan	Speed = 10560 (RPM)

Power Supply		
Тор	No Alarm	
Bottom	Major	

PEM	
Тор	PEM 1 Tray ID : 1, Version : 1, EPLD Version : 1, XBoard ID 7, XBoard Assembly 7
Bottom	PEM 2 Tray ID: 1, Version: 1, EPLD Version: 1, XBoard ID 1, XBoard Assembly 1

41 Carrier-Grade Alarms

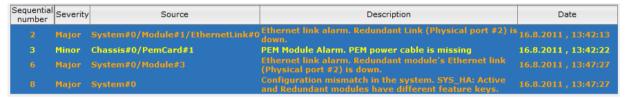

This section describes how to view the following types of alarms:

- Active alarms see "Viewing Active Alarms" on page 613
- Alarm history see "Viewing Alarm History" on page 613

41.1 Viewing Active Alarms

The Active Alarms page displays a list of currently active alarms. You can also access this page from the Home page (see "Viewing the Home Page" on page 66).

- > To view the list of active alarms:
- Open the Active Alarms page (Status & Diagnostics tab > System Status menu > Carrier-Grade Alarms > Active Alarms).

For each alarm, the following information is provided:

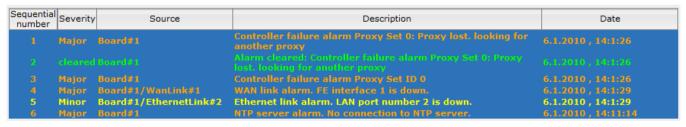

- **Severity:** severity level of the alarm:
 - Critical (red)
 - Major (orange)
 - Minor (yellow)
- Source: unit from which the alarm was raised
- **Description:** brief explanation of the alarm
- Date: date and time that the alarm was generated

You can view the next 20 alarms (if exist), by clicking the Go to page button.

41.2 Viewing Alarm History

The Alarms History page displays a list of alarms that have been raised and traps that have been cleared.

- To view the list of history alarms:
- Open the Alarms History page (Status & Diagnostics tab > System Status menu > Carrier-Grade Alarms > Alarms History).

For each alarm, the following information is provided:

- **Severity:** severity level of the alarm:
 - Critical (red)
 - Major (range)
 - Minor (yellow)
 - Cleared (green)
- Source: unit from which the alarm was raised
- **Description:** brief explanation of the alarm
- Date: date and time that the alarm was generated

To view the next 20 alarms (if exist), click the Go to page button.

- > To delete all the alarms in the table:
- 1. Click the **Delete History Table** button; a confirmation message box appears.
- 2. Click **OK** to confirm.

42 Performance Monitoring

This section describes how to view performance monitoring.

42.1 Viewing MOS per Media Realm

The MOS Per Media Realm page displays statistics on Media Realms (configured in "Configuring Media Realms" on page 263). This page provides two graphs:

- Upper graph: displays the Mean Opinion Score (MOS) quality in RTCP data per selected Media Realm.
- Lower graph: displays the bandwidth of transmitted media (in Kbps) in RTCP data per Media Realm.
- > To view the MOS per Media Realm graph:
- 1. Open the MOS Per Media Realm page (Status & Diagnostics tab > Performance Monitoring menu > MOS Per Media Realm).

Figure 42-1: MOS Per Media Realm Graph

2. From the 'Media Realm' drop-down list, select the Media Realm for which you want to view.

Use the **Zoom In** button to increase the displayed time resolution or the **Zoom Out**

button to decrease it. Instead of using these zoom buttons, you can use the slide ruler. As you increase the resolution, more data is displayed on the graph. The minimum resolution is about 30 seconds; the maximum resolution is about an hour.

To pause the graph, click the Pause button; click Play to resume.

42.2 Viewing Trunk Utilization

The Trunk Utilization page provides an X-Y graph that displays the number of active channels per trunk over time. The x-axis indicates the time; the y-axis indicates the number of active trunk channels.

Notes:

- The Trunk Utilization page is available only if your device is equipped with have trunks and the SBC application is disabled.
- If you navigate to a different page, the data displayed in the graph and all its settings are cleared.

To view the number of active trunk channels

1. Open the Trunk Utilization page (Status & Diagnostics tab > Performance Monitoring menu > Trunk Utilization).

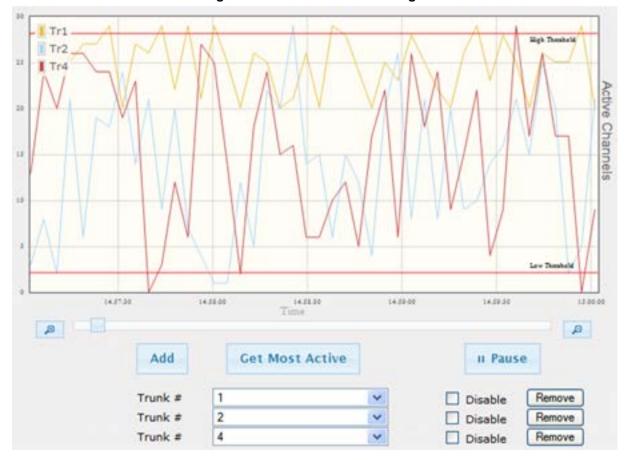

Figure 42-2: Trunk Utilization Page

2. From the 'Trunk' drop-down list, select the trunk for which you want to view active channels.

For more graph functionality, see the following table:

Table 42-1: Additional Graph Functionality for Trunk Utilization

Button	Description
Add button	Displays additional trunks in the graph. Up to five trunks can be displayed simultaneously in the graph. To view another trunk, click this button and then from the new 'Trunk' drop-down list, select the required trunk. Each trunk is displayed in a different color, according to the legend shown in the top-left corner of the graph.
Remove button	Removes the selected trunk display from the graph.
Disable check box	Hides or shows an already selected trunk. Select this check box to temporarily hide the trunk display; clear this check box to show the trunk. This is useful if you do not want to remove the trunk entirely (using the Remove button).
Get Most Active button	Displays only the trunk with the most active channels (i.e., trunk with the most calls).
Pause button	Pauses the display in the graph.
Play button	Resumes the display in the graph.
Zoom slide ruler and buttons	Increases or reduces the trunk utilization display resolution concerning time. The Zoom In button increases the time resolution; the Zoom Out button decreases it. Instead of using the buttons, you can use the slide ruler. As you increase the resolution, more data is displayed on the graph. The minimum resolution is about 30 seconds; the maximum resolution is about an hour.

42.3 Viewing Quality of Experience

The Quality Of Experience page provides statistical information on calls per SRD or IP Group. The statistics can be further filtered to display incoming and/or outgoing call direction, and type of SIP dialog (INVITE, SUBSCRIBE, or all).

Note: This page is available only if the SBC application has been enabled.

This page provides three pie charts:

- Dialog Success Ratio: displays the SIP call and subscribe (SUBSCRIBE) dialog success-failed ratio.
- Dialog Failed Attempts: displays the failed call attempts. This includes the number of calls and subscribes which were successfully and abnormally terminated.
- Dialog Termination Ratio: displays call termination by reason (e.g., due to no answer).

> To view Quality of Experience:

1. Open the Quality Of Experience page (Status & Diagnostics tab > Performance Monitoring menu > Quality Of Experience).

Figure 42-3: Quality Of Experience Graph

- 2. From the 'SRD/lpGroup' drop-down list, select whether you want to view QoE for an SRD or IP Group.
- 3. From the 'Index' drop-down list, select the SRD or IP Group index.

- 4. From the 'Dir' drop-down list, select the call direction:
 - In incoming calls
 - Out outgoing calls
 - Both incoming and outgoing calls
- 5. From the 'Type' drop-down list, select the SIP message type:
 - Invite INVITE
 - Subscribe SUBSCRIBE
 - Other all SIP messages

To refresh the charts, click **Refresh**. To reset the counters, click **Reset Counters**.

42.4 Viewing Average Call Duration

The Average Call Duration page displays information about a specific SRD or IP Group. This page includes two graphs:

- Upper graph: displays the number of calls (INVITEs).
- Lower graph: displays the average call duration.

Note: This page is available only if the SBC application has been enabled.

> To view average call duration:

1. Open the Average Call Duration page (Status & Diagnostics tab > Performance Monitoring menu > Average Call Duration).

Figure 42-4: Average Call Duration Graph

- 2. From the 'SRD/lpGroup' drop-down list, select whether you want to view information for an SRD or IP Group.
- 3. From the 'Index' drop-down list, select the SRD or IP Group index.

Use the **Zoom In** button to increase the displayed time resolution or the **Zoom Out** button to decrease it. Instead of using these zoom buttons, you can use the slide ruler. As you increase the resolution, more data is displayed on the graph. The minimum resolution is about 30 seconds; the maximum resolution is about an hour.

To pause the graph, click the Pause button; click Play to resume.

43 VoIP Status

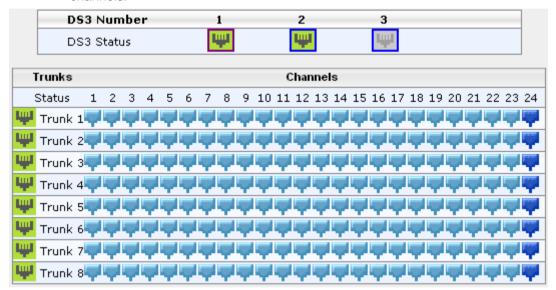

This section describes how to view VoIP status and statistics.

43.1 Viewing Trunks & Channels Status

The Trunks & Channels Status page displays the status of the device's trunks and corresponding channels. It also enables you to view trunk configuration and channel information.

> To view the status of the device's trunks and channels:

1. Open the Trunks & Channels Status page (Status & Diagnostics tab > VoIP Status menu > Trunks & Channels Status). The page displays the first eight trunks and their channels:

Note: The number of displayed trunks and channels and the type of interface (i.e., DS3 or SDH/SONET) depends on configuration. SONET/SDH interface is applicable only when using the TP-6310 blade.

The status of the trunks is depicted by color-coded icons, as described in the table below:

Table 43-1: Description of Color-Coded Icons for Trunk Status

Icon	Color	Trunk	SDH	DS3
		Label	Description	Description
m	Gray	Disabled	Disabled	Disabled
·w	Green	Active - OK	No Alarms (Working)	No Alarms
w	Yellow	RAI Alarm	No Alarms (Protection)	RAI Alarm
m	Red	LOS / LOF Alarm	LOS/LOF/MS- AIS/MS-RDI Alarm	LOS/LOF/AIS Alarm

Icon	Color	Trunk	SDH	DS3
щ	Blue	AIS Alarm	-	-
щ	Light Orange	D-Channel Alarm	-	DS3 Not Configured
щ	Dark Orange	NFAS Alarm	-	-
щ	Purple	Lower Layer Down (DS3 physical layer is disabled)	-	-

The status of the channels is depicted by color-coded icons, as described in the table below:

Table 43-2: Description of Color-Coded Icons for Channel Status

Icon	Color	Label	Description
·	Light blue	Inactive	Channel is configured, but currently has no calls
-	Green	Active	Call in progress (RTP traffic) and no alarms
-	Purple	SS7	Channel is configured for SS7 Note: Currently, SS7 is not supported.
light.	Gray	Non Voice	Channel is not configured
-	Blue	ISDN Signaling	Channel is configured as a D-channel
-	Yellow	CAS Blocked	-
-	Dark Orange	Maintenance	B-channel has been intentionally taken out of service due to maintenance
-	Red	Out Of Service	B-channel is out of service

2. To view the next consecutive eight trunks, click the Go To Page 🚭 icon, described in the figure below:

Figure 43-1: Example of a Selected Page Icon for Displaying Trunks 17-24

3. To view detailed information on a specific trunk's channel, click the required channel icon; the Basic Channel Information page appears, displaying information under the **Basic** tab (displayed in green):

Figure 43-2: Basic Channel Information Page

To view additional channel information, click the required tab (SIP, RTP/RTCP, and Voice Settings).

4. To view the settings of a specific trunk, click the required trunk icon, and then from the shortcut menu, choose **Port Settings**; the Trunk Settings page opens, displaying the trunk's settings. If needed, you can modify the settings (see "Configuring Trunk Settings" on page 345).

43.2 Viewing NFAS Groups and D-Channel Status

The NFAS Group & D-Channel Status page displays the status of the device's D-channels and NFAS groups. The status of a D-channel and NFAS group can be "In Service" or "Out of Service". This page also indicates whether the D-channel is a primary or backup D-channel.

This page also enables you to manually switchover between active and standby D-channels belonging to the same NFAS group. This is done using the **Switch Activity** button. For more information, see "Performing Manual D-Channel Switchover in NFAS Group" on page 364.

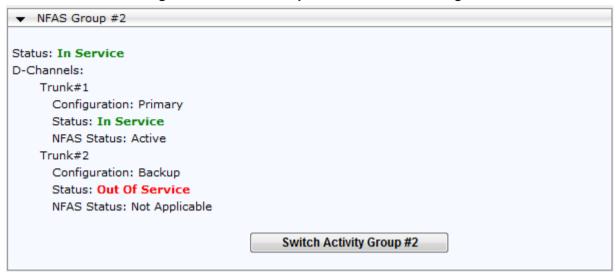

Note: This page is applicable only to T1 ISDN protocols supporting NFAS, and only if the NFAS group is configured with two D-channels.

- To view the status of the D-channels and NFAS groups:
- Open the NFAS Group & D-Channel Status page (Status & Diagnostics tab > VolP Status menu > NFAS Group & D-Channel Status).

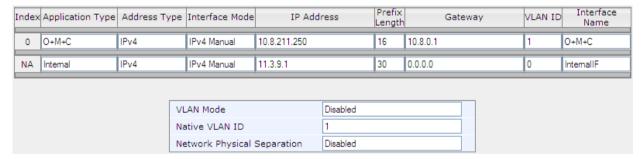

Figure 43-3: NFAS Group & D-Channel Status Page

43.3 Viewing Active IP Interfaces

The IP Interface Status page displays the device's active IP interfaces that are listed in the Interface table (see "Configuring IP Network Interfaces" on page 126).

- > To view active IP network interfaces:
- Open the IP Interface Status page (Status & Diagnostics tab > VoIP Status menu > IP Interface Status).

43.4 Viewing Static Routes Status

The IP Routing Status Table page displays the status of the static routes. These are routes configured in the Static Route table (see "Configuring Static IP Routing" on page 134) and routes through the Default Gateway.

The status of the static routes can be one of the following:

- "Active": Static route is used by the device.
- "Inactive": Static route is not used. When the destination IP address is not on the same segment with the next hop, or the interface does not exist, the route state changes to "Inactive".

To view the status of static IP routing:

Open the IP Routing Status Table page (Status & Diagnostics tab > VolP Status menu > Static Route Status).

Index	Destination IP Address	Prefix Length	Gateway IP Address	Metric	Device Name	Status	Description
NA	169.254.254.252	30	0.0.0.0	0	InternalIF 1	Active	
NA	10.8.0.0	16	0.0.0.0	0	vlan 1	Active	
NA	0.0.0.0	0	10.8.0.1	1	vlan 1	Active	
NA	0.0.0.0	0	169.254.254.253	2	InternalIF 1	Active	
0	10.37.5.5	16	10.8.0.1	1	Unknown	Inactive	

43.5 Viewing Performance Statistics

The Basic Statistics page provides read-only, device performance statistics. This page is refreshed every 60 seconds. The duration that the currently displayed statistics has been collected is displayed above the statistics table.

- > To view performance statistics:
- Open the Basic Statistics page (Status & Diagnostics tab > VolP Status menu > Performance Statistics).

Figure 43-5: Basic Statistics Page

(Statistics for 759525 seconds)	
Active TDM channels	0
Active DSP resources	0
Active analog channels	0
Active G.711 channels	0
Average voice delay (ms)	5
Average voice jitter (ms)	11
Total RTP packets TX	4250
Total RTP packets RX	4241
Total call attempts	6

The duration that the displayed statistics were collected is displayed in seconds above the table. To reset the performance statistics to zero, click the **Reset Statistics** button.

43.6 Viewing Call Counters

The IP to Tel Calls Count page and Tel to IP Calls Count page provide you with statistical information on incoming (IP-to-Tel) and outgoing (Tel-to-IP) calls. The statistical information is updated according to the release reason that is received after a call is terminated (during the same time as the end-of-call Call Detail Record or CDR message is sent). The release reason can be viewed in the 'Termination Reason' field in the CDR message.

You can reset the statistical data displayed on the page (i.e., refresh the display), by clicking the **Reset Counters** button located below the table.

To view IP-to-Tel and Tel-to-IP call counters:

Open the Call Counters page that you want to view (Status & Diagnostics tab > VoIP Status menu > IP to Tel Calls Count or Tel to IP Calls Count); the figure below shows the IP to Tel Calls Count page.

Figure 43-6: Calls Count Page

▼	
Number of Attempted Calls	19
Number of Established Calls	14
Percentage of Successful Calls(ASR)	73.684211
Number of Calls Terminated due to a Busy Line	2
Number of Calls Terminated due to No Answer	0
Number of Calls Terminated due to Forward	0
Number of Failed Calls due to No Route	0
Number of Failed Calls due to No Matched Capabilities	0
Number of Failed Calls due to No Resources	0
Number of Failed Calls due to Other Failures	0
Average Call Duration(ACD)[sec]	25
Attempted Fax Calls Counter	0
Successful Fax Calls Counter	0

The fields in this page are described in the following table:

Table 43-3: Call Counters Description

Table 43-3: Gail Counters Description		
Counter	Description	
Number of Attempted Calls	Indicates the number of attempted calls. It is composed of established and failed calls. The number of established calls is represented by the 'Number of Established Calls' counter. The number of failed calls is represented by the failed-call counters. Only one of the established / failed call counters is incremented every time.	
Number of Established Calls	Indicates the number of established calls. It is incremented as a result of one of the following release reasons if the duration of the call is greater than zero: GWAPP_REASON_NOT_RELEVANT (0) GWAPP_NORMAL_CALL_CLEAR (16) GWAPP_NORMAL_UNSPECIFIED (31) And the internal reasons: RELEASE_BECAUSE_UNKNOWN_REASON RELEASE_BECAUSE_REMOTE_CANCEL_CALL RELEASE_BECAUSE_MANUAL_DISC RELEASE_BECAUSE_SILENCE_DISC RELEASE_BECAUSE_DISCONNECT_CODE Note: When the duration of the call is zero, the release reason GWAPP_NORMAL_CALL_CLEAR increments the 'Number of Failed Calls due to No Answer' counter. The rest of the release reasons increment the 'Number of Failed Calls due to Other Failures' counter.	
Percentage of Successful Calls (ASR)	The percentage of established calls from attempted calls.	
Number of Calls Terminated due to a Busy Line	Indicates the number of calls that failed as a result of a busy line. It is incremented as a result of the following release reason: GWAPP_USER_BUSY (17)	
Number of Calls Terminated due to No Answer	Indicates the number of calls that weren't answered. It's incremented as a result of one of the following release reasons: GWAPP_NO_USER_RESPONDING (18)	

Counter	Description
	 GWAPP_NO_ANSWER_FROM_USER_ALERTED (19) GWAPP_NORMAL_CALL_CLEAR (16) (when the call duration is zero)
Number of Calls Terminated due to Forward	Indicates the number of calls that were terminated due to a call forward. The counter is incremented as a result of the following release reason: RELEASE_BECAUSE_FORWARD
Number of Failed Calls due to No Route	Indicates the number of calls whose destinations weren't found. It is incremented as a result of one of the following release reasons: GWAPP_UNASSIGNED_NUMBER (1) GWAPP_NO_ROUTE_TO_DESTINATION (3)
Number of Failed Calls due to No Matched Capabilities	Indicates the number of calls that failed due to mismatched device capabilities. It is incremented as a result of an internal identification of capability mismatch. This mismatch is reflected to CDR via the value of the parameter DefaultReleaseReason (default is GWAPP_NO_ROUTE_TO_DESTINATION (3)) or by the GWAPP_SERVICE_NOT_IMPLEMENTED_UNSPECIFIED (79) reason.
Number of Failed Calls due to No Resources	Indicates the number of calls that failed due to unavailable resources or a device lock. The counter is incremented as a result of one of the following release reasons: GWAPP_RESOURCE_UNAVAILABLE_UNSPECIFIED RELEASE_BECAUSE_GW_LOCKED
Number of Failed Calls due to Other Failures	This counter is incremented as a result of calls that failed due to reasons not covered by the other counters.
Average Call Duration (ACD) [sec]	The average call duration (ACD) in seconds of established calls. The ACD value is refreshed every 15 minutes and therefore, this value reflects the average duration of all established calls made within a 15 minute period.
Attempted Fax Calls Counter	Indicates the number of attempted fax calls.
Successful Fax Calls Counter	Indicates the number of successful fax calls.

43.7 Viewing Registered Users

You can view SAS and SBC users listed in the device's Users Registration database. The list shows each Address of Record (AOR) and its corresponding contact. The contact's registration status is also shown:

- "Active status:1" indicates that the contact has been successfully registered and thus, calls can be routed to it.
- "Active status:0" indicates that the device has recently received a REGISTER request from the contact, but the contact has yet to be registered. The device removes the contact from the database if no response is received within a few seconds from the proxy/registrar server.

An AOR is a SIP or SIPS URI that points to a domain with a location service that can map the URI to another URI (contact) where the user might be available. A contact is a SIP URI that can be used to contact that specific instance of the user agent for subsequent requests.

- To view registered SAS/SBC users in the Users Registration database:
- Web: SAS/SBC Registered Users page (Status & Diagnostics tab > VolP Status menu > SAS/SBC Registered Users).

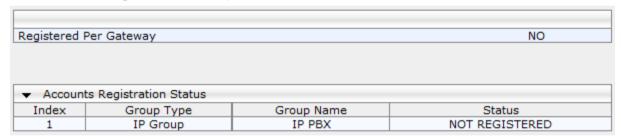

Figure 43-7: SAS/SBC Registered Users Page

Address Of Record	Contact
1000@10.8.5.71	<sip:1000@10.8.5.71:5060>;expires=180; Active status: 1</sip:1000@10.8.5.71:5060>
1001@10.8.5.71	<sip:1001@10.8.5.71:5060>;expires=180; Active status: 1</sip:1001@10.8.5.71:5060>
1100@10.8.5.71	<sip:1100@10.8.5.71:5060>;expires=180; Active status: 1</sip:1100@10.8.5.71:5060>
1101@10.8.5.71	<sip:1101@10.8.5.71:5060>;expires=180; Active status: 1</sip:1101@10.8.5.71:5060>
2000@10.8.5.72	<sip:2000@10.8.5.72:5060>;expires=180; Active status: 1</sip:2000@10.8.5.72:5060>

43.8 Viewing Registration Status

The Registration Status page displays the registration status of the device's SIP Accounts, which are configured in the Accounts table (see "Configuring Registration Accounts" on page 291).

- > To view the registration status:
- Open the Registration Status page (Status & Diagnostics tab > VolP Status menu > Registration Status).

- Registered Per Gateway: Registration of device as one entity "YES" or "NO"
- Accounts Registration Status:
 - Group Type: served Trunk Group or IP Group
 - Group Name: name of the served Trunk Group or IP Group, if applicable
 - Status: "Registered" or "Unregistered"

Note: The registration mode (i.e., per device, endpoint, account. or no registration) is configured in the Trunk Group Settings table (see "Configuring Trunk Group Settings" on page 377) or using the TrunkGroupSettings *ini* file parameter.

43.9 Viewing Call Routing Status

The Call Routing Status page provides you with information on the current routing method used by the device. This information includes the IP address and FQDN (if used) of the Proxy server with which the device currently operates.

- > To view call routing status:
- Open the Call Routing Status page (Status & Diagnostics tab > VolP Status menu > Call Routing Status).

Figure 43-8: Call Routing Status Page

Call-Ro	uting Method Routing Table	Routing Table		
▼ Act	ive Proxy Sets Status			
ID	IP Address	State		
0	Not Used ()			
1	10.8.230.64 (10.8.230.64)	OK		
2	10.9.244.80 (10.9.244.80)	OK		
3	10.10.244.80 (10.10.244.80)	OK		
4	10.11.244.80 (10.11.244.80)	OK		
5	10.12.244.80 (10.12.244.80)	OK		
6	Not Used ()			
7	Not Used ()			
8	Not Used ()			
9	10.8.244.81 (10.8.244.81)	OK		
10	Not Used ()			
11	Not Used ()			
12	Not Used ()			

Table 43-4: Call Routing Status Parameters

Parameter	Description	
Call-Routing Method	 Proxy/GK = Proxy server (Proxy Set) is used to route calls. For configuring Proxy Sets, see "Configuring Proxy Sets" on page 284. Routing Table = Calls are routed using the routing table: ✓ Gateway calls: Outbound IP Routing table (Configuring Outbound IP Routing Table on page 407) ✓ SBC calls: SBC IP-to-IP Routing table (Configuring SBC IP-to-IP Routing Rules on page 510) 	
IP Address	 Not Used = Proxy server isn't defined. IP address and FQDN (if exists) of the Proxy server with which the device currently operates. 	
State	 N/A = Proxy server isn't defined. OK = Communication with the Proxy server is in order. Fail = No response from any of the defined Proxies. 	

43.10 Viewing IP Connectivity

The IP Connectivity page displays on-line, read-only network diagnostic connectivity information on all destination IP addresses configured in the Outbound IP Routing table page (see "Configuring Outbound IP Routing Table" on page 407).

Note: he information in columns 'Quality Status' and 'Quality Info' (per IP address) is reset if two minutes elapse without a call to that destination.

To view IP connectivity information:

- 1. In the Routing General Parameters page, set the 'Enable Alt Routing Tel to IP' parameter (AltRoutingTel2IPMode) to **Enable** or **Status Only** (see "Configuring General Routing Parameters" on page 407).
- Open the IP Connectivity page (Status & Diagnostics tab > VoIP Status menu > IP Connectivity).

Connectivity Connectivity Quality IP Address Host Name Quality Info DNS Status Status Status Unused Ping 2 Unused Ping 3 Unused Ping ---------4 Unused Ping 5 Unused Ping 6 Unused Ping Unused Ping 8 Unused Ping Unused Ping 10 Unused Ping 11 Unused Ping 12 Unused Ping ------

Figure 43-9: IP Connectivity Page

Column Name	Description
IP Address	 The IP address can be one of the following: IP address defined as the destination IP address in the Outbound IP Routing table. IP address resolved from the host name defined as the destination IP address in the Outbound IP Routing table.
Host Name	Host name (or IP address) as defined in the Outbound IP Routing table.
Connectivity Method	The method according to which the destination IP address is queried periodically (ICMP ping or SIP OPTIONS request).
Connectivity Status	The status of the IP address' connectivity according to the method in the 'Connectivity Method' field. OK = Remote side responds to periodic connectivity queries. Lost = Remote side didn't respond for a short period. Fail = Remote side doesn't respond. Init = Connectivity queries not started (e.g., IP address not resolved).

User's Manual 630 Document #: LTRT-89725

Column Name	Description
	 Disable = The connectivity option is disabled, i.e., parameter 'Alt Routing Tel to IP Mode' (AltRoutingTel2IPMode ini) is set to 'None' or 'QoS'.
Quality Status	Determines the QoS (according to packet loss and delay) of the IP address. Unknown = Recent quality information isn't available. OK Poor
	 Notes: This parameter is applicable only if the parameter 'Alt Routing Tel to IP Mode' is set to 'QoS' or 'Both' (AltRoutingTel2IPMode = 2 or 3). This parameter is reset if no QoS information is received for 2 minutes.
Quality Info.	Displays QoS information: delay and packet loss, calculated according to previous calls. Notes:
	 This parameter is applicable only if the parameter 'Alt Routing Tel to IP Mode' is set to 'QoS' or 'Both' (AltRoutingTel2IPMode = 2 or 3). This parameter is reset if no QoS information is received for 2 minutes.
DNS Status	DNS status can be one of the following: DNS Disable DNS Resolved DNS Unresolved

This page is intentionally left blank.

44 Reporting Information to External Party

This section describes features for reporting various information to an external party.

44.1 Configuring RTCP XR

RTP Control Protocol Extended Reports (RTCP XR) is a VoIP management control that defines a set of metrics containing information for assessing VoIP call quality and for diagnosing problems. RTCP XR (RFC 3611) extends the RTCP reports defined in RFC 3550 by providing additional VoIP metrics (Quality of Experience). RTCP XR information publishing is implemented in the device according to RFC 6035. This draft defines how a SIP User Agent (UA) publishes the detailed information to a defined collector. RTCP XR measures VoIP call quality such as packet loss, delay, signal / noise / echo levels, estimated R-factor, and mean opinion score (MOS). RTCP XR measures these parameters using metrics as listed in the table below.

Note: The RTCP XR feature is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see "Software License Key" on page 575.

RTCP XR messages containing key call-quality-related metrics are exchanged periodically (user-defined) between the device and the SIP UA. This allows an analyzer to monitor these metrics midstream, or a device to retrieve them using SNMP. The device sends RTCP XR reports to an Event State Compositor (ESC) server, using SIP PUBLISH messages. These reports can be sent at the end of each call and according to a user-defined interval between consecutive reports.

Table 44-1: RTCP XR Published VolP Metrics

Group	Metric Name
General	Start Timestamp
	Stop Timestamp
	Call-ID
	Local Address (IP, Port & SSRC)
	Remote Address (IP, Port & SSRC)
Session Description	Payload Type
	Payload Description

```

To configure RTCP XR:

Open the RTP/RTCP Settings page (Configuration tab > VolP menu > Media > RTP/RTCP Settings). The RTCP XR parameters are listed under the RTCP XR Settings group:

Figure 44-1: RTCP XR Parameters in RTP/RTCP Settings Page

- Under the RTCP XR Settings group, configure the following:
 - 'Enable RTCP XR' (VQMonEnable) enables voice quality monitoring and RTCP XR.

- 'Burst Threshold' (VQMonBurstHR) defines the voice quality monitoring excessive burst alert threshold.
- 'Delay Threshold' (*VQMonDelayTHR*) defines the voice quality monitoring excessive delay alert threshold.
- 'R-Value Delay Threshold' (VQMonEOCRValTHR) defines the voice quality monitoring end of call low quality alert threshold.
- 'Minimum Gap Size' (*VQMonGMin*) defines the voice quality monitoring minimum gap size (number of frames).
- 'RTCP XR Packet Interval' (*RTCPInterval*) defines the time interval between adjacent RTCP reports.
- 'Disable RTCP XR Interval Randomization' (*DisableRTCPRandomize*) determines whether RTCP report intervals are randomized or whether each
 report interval accords exactly to the parameter RTCPInterval.
- 3. Under the RTCP XR Setting SIP Collection group, configure the following:
 - (Gateway Application Only) 'Gateway RTCP XR Report Mode' (RTCPXRReportMode) - determines whether RTCP XR reports are sent to the ESC server and defines the interval at which they are sent.
 - (Gateway Application Only) 'RTCP XR Collection Server' (RTCPXREscIP) defines the IP address of the ESC server.
 - (Gateway Application Only) 'RTCP XR Collection Server Transport Type'
 (RTCPXRESCTransportType) determines the transport layer for outgoing SIP
 dialogs initiated by the device to the ESC server.
 - (SBC Application Only) 'SBC RTCP XR Report Mode' (SBCRtcpXrReportMode)

 enables the sending of RTCP XR reports of QoE metrics at the end of each call session (i.e., after a SIP BYE).
- Click Submit, and then reset the device with a save ("burn") for your settings to take effect.

44.2 Generating Call Detail Records

The Call Detail Record (CDR) contains vital statistic information on calls made from the device. The device can be configured to generate and report CDRs for various stages of the call, including SIP messages and/or media. You can configure when CDRs for a call are generated, for example, only at the end of the call or only at the start and end of the call. Once generated, the device sends the CDRs to a user-defined Syslog server.

The CDR Syslog message complies with RFC 3161 and is identified by Facility 17 (local1) and Severity 6 (Informational).

For CDR in RADIUS format, see "Configuring RADIUS Accounting" on page 647.

Note: The device reports the IP address of SIP UAs located behind NAT, in SIP PUBLISH messages for CDRs. During SIP signaling negotiation between it and the SIP UA, the SIP UA provides its media IP address. However, in scenarios where the SIP UA is located behind NAT, this IP address is the NAT'ed IP address and not the SIP UA's source media IP address. The SIP UAs media IP address is acquired only upon receipt of the first incoming RTP packet, where the device "latches" on to the RTP media and obtains the IP address of the SIP UA. From this point on, the device publishes CDRs with this correct IP address instead of the NAT IP address.

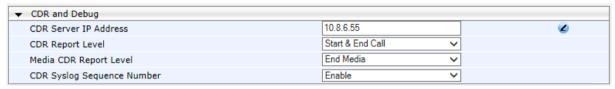

44.2.1 Configuring CDR Reporting

The following procedure describes how to configure CDR reporting.

➤ To configure CDR reporting:

- 1. Enable the Syslog feature for sending log messages generated by the device to a collecting log message server. For more information, see "Enabling Syslog" on page 662.
- Open the Advanced Parameters page (Configuration tab > VolP menu > SIP Definitions > Advanced Parameters). The CDR parameters appear under the 'CDR and Debug' group, as shown below:

Figure 44-2: CDR Parameters in Advanced Parameters Page

- **3.** Configure the parameters as required. For a description of the parameters, see "Syslog, CDR and Debug Parameters" on page 716.
- **4.** (Optional) Disable the inclusion of the Sequence Number in Syslog messages, by setting the 'CDR Session ID' parameter to **Disable**.
- 5. Click Submit.

Note: If the CDR server IP address is not configured, the CDRs are sent to the Syslog server, configured in "Enabling Syslog" on page 662.

44.2.2 CDR Field Description

This section describes the CDR fields that are generated by the device.

44.2.2.1 CDR Fields for SBC Signaling

The CDR fields for SBC signaling are listed in the table below.

A typical SBC session consists of two SBC legs. Each leg generates its own signaling CDRs. Each leg generates three CDR types: at call start (SBCReportType=CALL_START), connect time (SBCReportType=CALL_CONNECT) and when the call ends (SBCReportType=CALL_END). CDRs belonging to the same SBC session (both legs) have the same Session ID (SessionId CDR field). CDRs belonging to the same SBC leg have the same SIP Call ID (SIPCallId CDR field).

For billing applications, the CDR that is sent when the call ends (CALL_END) is usually sufficient. Billing may be based on the following:

- Call ID (SIPCallId CDR field)
- Source URI (SrcURI CDR field)
- Destination URI (DstURI CDR field)
- Call originator (Orig CDR field) indicates the call direction (caller)
- Call duration (Durat CDR field) call duration (elapsed time) from call connect
- Call time is based on SetupTime, ConnectTime and ReleaseTime CDR fields

Table 44-2: CDR Fields for SBC Signaling

CDR Field Name	Description	Format
SBCReportType	Report Type: "CALL_START" "CALL_CONNECT" "CALL_END" "DIALOG_START" "DIALOG_END"	String
ЕРТур	Endpoint type: "SBC"	String
SIPMethod	SIP message type	String of up to 10 characters
SIPCallId	Unique ID of call	String of up to 50 characters
SessionId	Unique Session ID	String of up to 10 characters
Orig	Call originator: "LCL" - local "RMT" - remote	String
Sourcelp	Source IP address	String of up to 20 characters
SourcePort	Source UDP port	String of up to 10 characters
DestIp	Destination IP address	String of up to 20 characters
DestPort	Destination UDP port	String of up to 10 characters
TransportType	Transport type: "UDP" "TCP" "TLS"	String
SrcURI	Source URI	String of up to 41 characters
SrcURIBeforeMap	Source URI before manipulation	String of up to 41 characters
DstURI	Destination URI	String of up to 41 characters
DstURIBeforeMap	Destination URI before manipulation	String of up to 41 characters
Durat	Call duration (in seconds)	String of up to 5 characters
TrmSd	Termination side: "LCL" – local "RMT" - remote	String
TrmReason	Termination reason	String of up to 40 characters
TrmReasonCategory	Termination reason category: Calls with duration 0 (i.e., not connected): NO_ANSWER: "GWAPP_NORMAL_CALL_CLEAR" "GWAPP_NO_USER_RESPONDING" "GWAPP_NO_ANSWER_FROM_USER_ALERTED" BUSY:	String of up to 17 characters

CDR Field Name	Description	Format
	 ✓ "GWAPP_USER_BUSY" NO_RESOURCES: ✓ "GWAPP_RESOUUCE_UNAVAIL ABLE_UNSPECIFIED" ✓ "RELEASE_BECAUSE_NO_CON FERENCE_RESOURCES_LEFT" ✓ "RESOURCE_BECAUSE_NO_TR ANSCODING_RESOURCES_LEF T" ✓ "RELEASE_BECAUSE_GW_LOC KED" NO_MATCH: ✓ "RELEASE_BECAUSE_UNMATC HED_CAPABILITIES" FORWARDED: ✓ "RELEASE_BECAUSE_FORWAR D" GENERAL_FAILED: Any other reason Calls with duration: NORMAL_CALL_CLEAR: ✓ "GWAPP_NORMAL_CALL_CLEAR R" ABNORMALLY_TERMINATED: Anything else N/A: Reasons not belonging to above categories 	
SetupTime	Call setup time	String of up to 35 characters
ConnectTime	Call connect time	String of up to 35 characters
ReleaseTime	Call release time	String of up to 35 characters
RedirectReason	Redirect reason	String of up to 15 characters
RedirectURINum	Redirection URI	String of up to 41 characters
RedirectURINumBeforeMap	Redirect URI number before manipulation	String of up to 41 characters
TxSigIPDiffServ	Signaling IP DiffServ	String of up to 15 characters
IPGroup	IP Group ID and name	String of up to 40 characters
Srdld	SRD ID and name	String of up to 29 characters
SIPInterfaceId	SIP Interface ID	String of up to 15 characters
ProxySetId	Proxy Set ID	String of up to 15 characters
IpProfileId	IP Profile ID and name	String of up to 34 characters
MediaRealmld	Media Realm ID and name	String of up to 55 characters
DirectMedia	Direct media or traversing SBC: "yes" "no"	String
SIPTrmReason	SIP call termination reason (BYE, CANCEL, or SIP error codes, e.g., 404)	String of up to 12 characters.

CDR Field Name	Description	Format
SipTermDesc	 Description of SIP termination reason: SIP Reason header, if exists, for example: SIP; cause=200; text="Call completed elsewhere". If no SIP Reason header exists, the description is taken from the reason text, if exists, of the SIP response code, for example: "417 Unknown Resource-Priority". If no reason text exists in the SIP response code, the description is taken from an internal SIP response mapping mechanism. For example, if the device receives a SIP response "422", it sends in the CDR "422 Session Interval Too Small method" as the description. 	String of up to 26 characters
Caller	Name of caller	String of up to 36 characters
Callee	Name of called party	String of up to 36 characters

Below shows an example of an SBC signaling CDR sent at the end of a call (call was terminated normally):

```
[S=40] |SBCReportType |EPTyp |SIPCallId |SessionId |Orig |SourceIp
SourcePort | DestIp | DestPort | TransportType | SrcURI

```

44.2.2.2 CDR Fields for SBC Media

The CDR fields for SBC media are listed in the table below. The media CDRs are published for each active media stream, thereby allowing multiple media CDRs, where each media CDR has a unique call ID corresponding to the signaling CDR.

Table 44-3: CDR Fields for SBC Media

CDR Field Name	Description
MediaReportType	Report type (media start, update, or end)
SIPCallid	Unique call ID
Cid	Channel CID

User's Manual 640 Document #: LTRT-89725

CDR Field Name	Description
MediaType	Media type (audio, video, or text)
Coder	Coder name
PacketInterval	Coder packet interval
LocalRtplp	Local RTP IP address
LocalRtpPort	Local RTP port
RemoteRtplp	Remote RTP IP address
RemoteRtpPort	Remote RTP port
InPackets	Number of received packets
OutPackets	Number of sent packets
LocalPackLoss	Local packet loss
RemotePackLoss	Remote packet loss
RTPdelay	RTP delay
RTPjitter	RTP jitter
TxRTPssrc	Tx RTP SSRC
RxRTPssrc	Local RTP SSRC
LocalRFactor	Local conversation quality
RemoteRFactor	Remote conversation quality
LocalMosCQ	Local MOS for conversation
RemoteMosCQ	Remote MOS for conversation
TxRTPIPDiffServ	Media IP DiffServ
LatchedRtplp	Remote IP address of the incoming RTP stream that the device "latched" on to as a result of the RTP latching mechanism for NAT traversal.
LatchedRtpPort	Remote RTP port of the incoming RTP stream that the device "latched" on to as a result of the RTP latching mechanism for NAT traversal.
LatchedT38lp	Latching of a new T.38 stream - new IP address
LatchedT38Port	Latching of a new T.38 stream - new port

44.2.2.3 CDR Fields for Gateway/IP-to-IP Application

The CDR fields for the Gateway / IP-to-IP application are listed in the table below.

Table 44-4: CDR Fields for Gateway/IP-to-IP Application

Field Name	Description
GWReportType	Report type: CALL_START CALL_CONNECT CALL_END

Field Name	Description					
Cid	Port number					
SessionId	SIP session identifier					
Trunk	Physical trunk number Note: This field is applicable only to the Gateway application.					
BChan	Selected B-channel Note: This field is applicable only to the Gateway application.					
Conld	SIP conference ID Note: This field is applicable only to the Gateway application.					
TG	Trunk Group ID Note: This field is applicable only to the Gateway application.					
ЕРТур	Endpoint type: FXO FXS EANDM ISDN CAS DAA IPMEDIA NETANN STREAMING TRANSPARENT MSCML VXML					
Orig	Call originator: LCL (Tel side) RMT (IP side)					
Sourcelp	Source IP address					
Destlp	Destination IP address					
TON	Source phone number type Note: This field is applicable only to the Gateway application.					
NPI	Source phone number plan Note: This field is applicable only to the Gateway application.					
SrcPhoneNum	Source phone number					
SrcNumBeforeMap	Source number before manipulation					
TON	Destination phone number type Note: This field is applicable only to the Gateway application.					
NPI	Destination phone number plan Note: This field is applicable only to the Gateway application.					
DstPhoneNum	Destination phone number					
DstNumBeforeMap	Destination number before manipulation					

Field Name	Description					
Durat	Call duration					
Coder	Selected coder					
Intrv	Packet interval					
Rtplp	RTP IP address					
Port	Remote RTP port					
TrmSd	Initiator of call release (IP, Tel, or Unknown)					
TrmReason	SIP call termination reason (see "Release Reasons in CDR" on page 645)					
Fax	Fax transaction during call					
InPackets	Number of incoming packets					
OutPackets	Number of outgoing packets					
PackLoss	Local packet loss					
RemotePackLoss	Number of outgoing lost packets					
SIPCalld	Unique SIP call ID					
SetupTime	Call setup time					
ConnectTime	Call connect time					
ReleaseTime	Call release time					
RTPdelay	RTP delay					
RTPjitter	RTP jitter					
RTPssrc	Local RTP SSRC					
RemoteRTPssrc	Remote RTP SSRC					
RedirectReason	Redirect reason					
TON	Redirection phone number type Note: This field is applicable only to the Gateway application.					
NPI	Redirection phone number plan Note: This field is applicable only to the Gateway application.					
RedirectPhonNum	Redirection phone number					
MeteringPulses	Number of generated metering pulses Note: This field is applicable only to the Gateway application.					
SrcHost	Source host name					
SrcHostBeforeMap	Source host name before manipulation					
DstHost	Destination host name					
DstHostBeforeMap	Destination host name before manipulation					
IPG	IP Group description					
LocalRtplp	Remote RTP IP address					
LocalRtpPort	Local RTP port					

Field Name	Description					
Amount	0-999999 Data is stored per call and sent in the syslog as follows: currency-type: amount multiplier for currency charge (euro or usd) recorded-units: for unit charge (1-999999) 0,001-1000 (in steps of 10) (See explanation above.)					
TrmReasonCategory	Termination reason category: Calls with duration 0 (i.e., not connected): NO_ANSWER - GWAPP_NORMAL_CALL_CLEAR, GWAPP_NO_USER_RESPONDING, GWAPP_NO_ANSWER_FROM_USER_ALERTED BUSY - GWAPP_USER_BUSY NO_RESOURCES - GWAPP_RESOUUCE_UNAVAILABLE_UNSPECIFIED, RELEASE_BECAUSE_NO_CONFERENCE_RESOURCES_LEFT, RESOURCE_BECAUSE_NO_TRANSCODING_RESOURCES_LEFT, RELEASE_BECAUSE_GW_LOCKED NO_MATCH - RELEASE_BECAUSE_UNMATCHED_CAPABILITIES FORWARDED - RELEASE_BECAUSE_FORWARD GENERAL_FAILED - any other reason Calls with duration: NORMAL_CALL_CLEAR - GWAPP_NORMAL_CALL_CLEAR ABNORMALLY_TERMINATED - Anything else N/A - Reasons not belonging to above categories					
RedirectNumBeforeMap	Redirect number before manipulation					
Srdld	SRD ID name					
SIPInterfaceId	SIP interface ID					
ProxySetId	Proxy Set ID					
IpProfileId	IP Profile ID name					
MediaRealmld	Media Realm name					
SigTransportType	SIP signaling transport type (UDP, TCP, or TLS)					
TxRTPIPDiffServ	Media IP DiffServ					
TxSigIPDiffServ	Signaling IP DiffServ					
LocalRFactor	Local R-factor					
RemoteRFactor	Remote R-factor					
LocalMosCQ	Local MOS for conversation quality					
RemoteMosCQ	Remote MOS for conversation quality					
SigSourcePort	SIP source port					
SigDestPort	SIP destination port					
MediaType	Media type - audio, video, or text					

Field Name	Description					
AMD	Information relating to the Automatic Machine Detection (AMD) feature: V - voice A - answer machine S - silence U - unknown					
%	Information relating to AMD that shows the success that the answering type (probability) was correctly detected					
SIPTrmReason	SIP call termination reason (BYE, CANCEL, or SIP error codes, e.g., 404)					
SipTermDesc	 Description of SIP termination reason: SIP Reason header, if exists, for example: SIP ;cause=200 ;text="Call completed elsewhere". If no SIP Reason header exists, the description is taken from the reason text, if exists, of the SIP response code, for example: "417 Unknown Resource-Priority". If no reason text exists in the SIP response code, the description is taken from an internal SIP response mapping mechanism. For example, if the device receives a SIP response "422", it sends in the CDR "422 Session Interval Too Small method" as the description. 					
PstnTermReason	Q.850 protocol termination reason (0-127).					
LatchedRtplp	Remote IP address of the incoming RTP stream that the device "latched" on to as a result of the RTP latching mechanism for NAT traversal.					
LatchedRtpPort	Remote RTP port of the incoming RTP stream that the device "latched" on to as a result of the RTP latching mechanism for NAT traversal.					
LatchedT38Ip	Latching of a new T.38 stream - new IP address					
LatchedT38Port	Latching of a new T.38 stream - new port					

44.2.2.4 Release Reasons in CDR

The possible reasons for call termination for the Gateway / IP-to-IP application which is represented in the CDR field **TrmReason** are listed below:

- REASON N/A"
- "RELEASE_BECAUSE_NORMAL_CALL_DROP"
- "RELEASE_BECAUSE_DESTINATION_UNREACHABLE"
- "RELEASE_BECAUSE_DESTINATION_BUSY"
- "RELEASE_BECAUSE_NOANSWER"
- "RELEASE_BECAUSE_UNKNOWN_REASON"
- "RELEASE_BECAUSE_REMOTE_CANCEL_CALL"
- "RELEASE_BECAUSE_UNMATCHED_CAPABILITIES"
- "RELEASE_BECAUSE_UNMATCHED_CREDENTIALS"
- "RELEASE_BECAUSE_UNABLE_TO_HANDLE_REMOTE_REQUEST"
- "RELEASE_BECAUSE_NO_CONFERENCE_RESOURCES_LEFT"
- "RELEASE_BECAUSE_CONFERENCE_FULL"
- "RELEASE_BECAUSE_VOICE_PROMPT_PLAY_ENDED"
- "RELEASE_BECAUSE_VOICE_PROMPT_NOT_FOUND"

- "RELEASE_BECAUSE_TRUNK_DISCONNECTED"
- "RELEASE_BECAUSE_RSRC_PROBLEM"
- "RELEASE_BECAUSE_MANUAL_DISC"
- "RELEASE_BECAUSE_SILENCE_DISC"
- "RELEASE_BECAUSE_RTP_CONN_BROKEN"
- "RELEASE_BECAUSE_DISCONNECT_CODE"
- "RELEASE_BECAUSE_GW_LOCKED"
- "RELEASE_BECAUSE_NORTEL_XFER_SUCCESS"
- "RELEASE_BECAUSE_FAIL"
- "RELEASE_BECAUSE_FORWARD"
- "RELEASE_BECAUSE_ANONYMOUS_SOURCE"
- "RELEASE_BECAUSE_IP_PROFILE_CALL_LIMIT"
- "GWAPP_UNASSIGNED_NUMBER"
- "GWAPP_NO_ROUTE_TO_TRANSIT_NET"
- "GWAPP NO ROUTE TO DESTINATION"
- "GWAPP_CHANNEL_UNACCEPTABLE"
- "GWAPP_CALL_AWARDED_AND "
- "GWAPP_PREEMPTION"
- "PREEMPTION_CIRCUIT_RESERVED_FOR_REUSE"
- "GWAPP_NORMAL_CALL_CLEAR"
- "GWAPP_USER_BUSY"
- "GWAPP_NO_USER_RESPONDING"
- "GWAPP_NO_ANSWER_FROM_USER_ALERTED"
- "MFCR2_ACCEPT_CALL"
- "GWAPP_CALL_REJECTED"
- "GWAPP_NUMBER_CHANGED"
- "GWAPP_NON_SELECTED_USER_CLEARING"
- "GWAPP_INVALID_NUMBER_FORMAT"
- "GWAPP_FACILITY_REJECT"
- "GWAPP_RESPONSE_TO_STATUS_ENQUIRY"
- "GWAPP_NORMAL_UNSPECIFIED"
- "GWAPP_CIRCUIT_CONGESTION"
- "GWAPP_USER_CONGESTION"
- "GWAPP_NO_CIRCUIT_AVAILABLE"
- "GWAPP_NETWORK_OUT_OF_ORDER"
- "GWAPP NETWORK TEMPORARY FAILURE"
- "GWAPP_NETWORK_CONGESTION"
- "GWAPP_ACCESS_INFORMATION_DISCARDED"
- "GWAPP_REQUESTED_CIRCUIT_NOT_AVAILABLE"
- "GWAPP_RESOURCE_UNAVAILABLE_UNSPECIFIED"
- "GWAPP_PERM_FR_MODE_CONN_OUT_OF_S"
- "GWAPP_PERM_FR_MODE_CONN_OPERATIONAL"
- "GWAPP_PRECEDENCE_CALL_BLOCKED"
 - "RELEASE_BECAUSE_PREEMPTION_ANALOG_CIRCUIT_RESERVED_FOR_ REUSE"

- "RELEASE BECAUSE PRECEDENCE CALL BLOCKED"
- "GWAPP QUALITY OF SERVICE UNAVAILABLE"
- "GWAPP REQUESTED FAC NOT SUBSCRIBED"
- "GWAPP_BC_NOT_AUTHORIZED"
- "GWAPP BC NOT PRESENTLY AVAILABLE"
- "GWAPP_SERVICE_NOT_AVAILABLE"
- "GWAPP CUG OUT CALLS BARRED"
- "GWAPP_CUG_INC_CALLS_BARRED"
- "GWAPP ACCES INFO SUBS CLASS INCONS"
- "GWAPP_BC_NOT_IMPLEMENTED"
- "GWAPP_CHANNEL_TYPE_NOT_IMPLEMENTED"
- "GWAPP REQUESTED FAC NOT IMPLEMENTED"
- "GWAPP ONLY RESTRICTED INFO BEARER"
- "GWAPP SERVICE NOT IMPLEMENTED UNSPECIFIED"
- "GWAPP INVALID CALL REF"
- "GWAPP_IDENTIFIED_CHANNEL_NOT_EXIST"
- "GWAPP SUSPENDED CALL BUT CALL ID NOT EXIST"
- "GWAPP_CALL_ID_IN_USE"
- "GWAPP NO CALL SUSPENDED"
- "GWAPP_CALL_HAVING_CALL_ID_CLEARED"
- "GWAPP INCOMPATIBLE DESTINATION"
- "GWAPP_INVALID_TRANSIT_NETWORK_SELECTION"
- "GWAPP_INVALID_MESSAGE_UNSPECIFIED"
- "GWAPP NOT CUG MEMBER"
- "GWAPP_CUG_NON_EXISTENT"
- "GWAPP_MANDATORY_IE_MISSING"
- "GWAPP_MESSAGE_TYPE_NON_EXISTENT"
- "GWAPP_MESSAGE_STATE_INCONSISTENCY"
- "GWAPP_NON_EXISTENT_IE"
- "GWAPP INVALID IE CONTENT"
- "GWAPP_MESSAGE_NOT_COMPATIBLE"
- "GWAPP RECOVERY ON TIMER EXPIRY"
- "GWAPP_PROTOCOL_ERROR_UNSPECIFIED"
- "GWAPP INTERWORKING UNSPECIFIED"
- "GWAPP_UKNOWN_ERROR"
- "RELEASE BECAUSE HELD TIMEOUT"

44.3 Configuring RADIUS Accounting

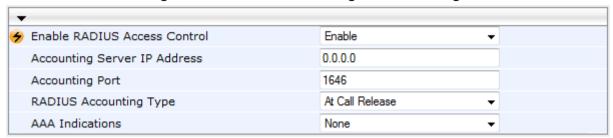

The device can send accounting data of SIP calls as call detail records (CDR) to a RADIUS Accounting server. The device can send the accounting messages to the RADIUS server upon call release, call connection and release, or call setup and release. For a list of the CDR attributes, see the table following the procedure below.

To configure RADIUS accounting:

 Open the RADIUS Parameters page (Configuration tab > VolP menu > SIP Definitions > RADIUS Parameters Settings).

Figure 44-3: RADIUS Accounting Parameters Page

- 2. Set the 'Enable RADIUS Access Control' parameter to **Enable**.
- **3.** Configure the remaining parameters as required. For a description of these parameters, see "RADIUS Parameters" on page 733.
- 4. Click Submit.
- 5. For your settings to take effect, reset the device with a flash burn.

The table below lists the RADIUS Accounting CDR attributes included in the communication packets transmitted between the device and a RADIUS server.

Table 44-5: Supported RADIUS Accounting CDR Attributes

Attribute Number	Attribute Name	Vendor Specific Attribute (VSA) No.	Purpose	Value Format	Example	AAA				
Request Attributes										
1	user-name	-	Account number or calling party number or blank	String up to 15 digits long	5421385747	Start Acc Stop Acc				
4	nas-ip- address	-	IP address of the requesting device	Numeric	192.168.14.43	Start Acc Stop Acc				
6	service-type	-	Type of service requested	Numeric	1: login	Start Acc Stop Acc				
26	h323- incoming- conf-id	1	SIP call identifier	Up to 32 octets	-	Start Acc Stop Acc				
26	h323-remote- address	23	IP address of the remote gateway	Numeric	-	Stop Acc				
26	h323-conf-id	24	H.323/SIP call identifier	Up to 32 octets	-	Start Acc Stop Acc				
26	h323-setup- time	25	Setup time in NTP format 1	String	-	Start Acc Stop Acc				
26	h323-call- origin	26	The call's originator: Answering (IP) or Originator (PSTN)	String	Answer, Originate etc	Start Acc Stop Acc				
26	h323-call- type	27	Protocol type or family used on this leg of the call	String	VolP	Start Acc Stop Acc				

User's Manual 648 Document #: LTRT-89725

Attribute Number	Attribute Name	Vendor Specific Attribute (VSA) No.	Purpose	Value Format	Example	AAA
26	h323- connect-time	28	Connect time in NTP format	String	-	Stop Acc
26	h323- disconnect- time	29	Disconnect time in NTP format	String	-	Stop Acc
26	H323- Disconnect- Cause	30	Q.931 disconnect cause code	Numeric	-	Stop Acc
26	h323-gw-id	33	Name of the gateway	String	SIPIDString	Start Acc Stop Acc
26	sip-call-id	34	SIP Call ID	String	abcde@ac.com	Start Acc Stop Acc
26	call- terminator	35	The call's terminator: PSTN-terminated call (Yes); IP-terminated call (No).	String	Yes, No	Stop Acc
30	called- station-id	-	Destination phone number (Gateway / IP-to-IP call) or Destination URI (SBC call)	String	8004567145	Start Acc
31	calling- station-id	-	Calling Party Number (ANI) (Gateway call) or Source URI (SBC call)	String	5135672127	Start Acc Stop Acc
40	acct-status- type	-	Account Request Type (start or stop) Note: 'start' isn't supported on the Calling Card application.	Numeric	1: start, 2: stop	Start Acc Stop Acc
41	acct-delay- time	-	No. of seconds tried in sending a particular record	Numeric	5	Start Acc Stop Acc
42	acct-input- octets	-	Number of octets received for that call duration (Gateway call)	Numeric	-	Stop Acc
43	acct-output- octets	-	Number of octets sent for that call duration (Gateway call)	Numeric	-	Stop Acc
44	acct-session- id	-	A unique accounting identifier - match start & stop	String	34832	Start Acc Stop Acc

Attribute Number	Attribute Name	Vendor Specific Attribute (VSA) No.	Purpose	Value Format	Example	AAA
46	acct-session- time	-	For how many seconds the user received the service	Numeric	-	Stop Acc
47	acct-input- packets	-	Number of packets received during the call	Numeric	-	Stop Acc
48	acct-oputput- packets	-	Number of packets sent during the call	Numeric	-	Stop Acc
61	nas-port-type	-	Physical port type of device on which the call is active	String	0: Asynchronous	Start Acc Stop Acc
Response	Response Attributes					
26	h323-return- code	103	The reason for failing authentication (0 = ok, other number failed)	Numeric	0 Request accepted	Stop Acc
44	acct-session- id	-	A unique accounting identifier – match start & stop	String	-	Stop Acc

Below is an example of RADIUS Accounting, where the non-standard parameters are preceded with brackets:

```
Accounting-Request (361)
user-name = 111
acct-session-id = 1
nas-ip-address = 212.179.22.213
nas-port-type = 0
acct-status-type = 2
acct-input-octets = 4841
acct-output-octets = 8800
acct-session-time = 1
acct-input-packets = 122
acct-output-packets = 220
called-station-id = 201
calling-station-id = 202
// Accounting non-standard parameters:
(4923 \ 33) \ h323-gw-id =
(4923 23) h323-remote-address = 212.179.22.214
(4923 1) h323-ivr-out = h323-incoming-conf-id:02102944 600a1899
3fd61009 0e2f3cc5
(4923 \ 30) \ h323-disconnect-cause = 22 \ (0x16)
(4923 27) h323-call-type = VOIP
(4923 26) h323-call-origin = Originate
(4923 24) h323-conf-id = 02102944 600a1899 3fd61009 0e2f3cc5
```

44.4 Event Notification using X-Detect Header

The device can notify a remote party of the occurrence (or detection) of certain events in the media stream. The device detects events and notifies their occurrence, using the SIP X-Detect message header and only when establishing a SIP dialog.

Note: This feature is applicable only to the Gateway application (not SBC).

The table below lists the supported event types (and subtypes) and the corresponding device configurations that you need to do:

Events Type Subtype **Required Configuration** EnableDSPIPMDetectors = 1 **AMD** voice automatic AMDTimeout = 2000 (msec) silence For AMD beep detection, AMDBeepDetectionMode = 1 or 2 unknown beep **CPT** SIT-NC SITDetectorEnable = 1 UserDefinedToneDetectorEnable = 1 SIT-IC Notes: SIT-VC Ensure that the CPT file is configured with the required tone SIT-RO Busy On beep detection, a SIP INFO message is sent with type Reorder AMD/CPT and subtype beep. Ringtone The beep detection must be started using regular X-detect beep extension, with AMD or CPT request. FAX CED (IsFaxUsed \neq 0) or (IsFaxUsed = 0, and FaxTransportMode \neq 0) modem VxxModemTransportType = 3 PTT voice-start EnableDSPIPMDetectors = 1 voice-end

Table 44-6: Supported X-Detect Event Types

The device can detect and report the following Special Information Tones (SIT) types from the PSTN:

- SIT-NC (No Circuit found)
- SIT-IC (Operator Intercept)
- SIT-VC (Vacant Circuit non-registered number)
- SIT-RO (Reorder System Busy)

There are additional three SIT tones that are detected as one of the above SIT tones:

- The NC* SIT tone is detected as NC
- The RO* SIT tone is detected as RO
- The IO* SIT tone is detected as VC

The device can map these SIT tones to a Q.850 cause and then map them to SIP 5xx/4xx responses, using the parameters SITQ850Cause, SITQ850CauseForNC, SITQ850CauseForIC, SITQ850CauseForVC, and SITQ850CauseForRO.

Table 44-7: Special Information Tones (SITs) Reported by the device

Special Information Tones (SITs) Name	Description	First Tone Frequency Duration		Second Tone Frequency Duration		Third Tone Frequency Duration	
Name		(Hz)	(ms)	(Hz)	(ms)	(Hz)	(ms)
NC1	No circuit found	985.2	380	1428.5	380	1776.7	380
IC	Operator intercept	913.8	274	1370.6	274	1776.7	380
VC	Vacant circuit (non registered number)	985.2	380	1370.6	274	1776.7	380
RO1	Reorder (system busy)	913.8	274	1428.5	380	1776.7	380
NC*	-	913.8	380	1370.6	380	1776.7	380
RO*	-	985.2	274	1370.6	380	1776.7	380
IO*	-	913.8	380	1428.5	274	1776.7	380

For example:

INFO sip:5001@10.33.2.36 SIP/2.0

Supported: em,timer,replaces,path,resource-priority

Content-Type: application/x-detect

Content-Length: 28

Type= CPT

SubType= SIT-IC

The X-Detect event notification process is as follows:

- 1. For IP-to-Tel or Tel-to-IP calls, the device receives a SIP request message (using the X-Detect header) that the remote party wishes to detect events on the media stream. For incoming (IP-to-Tel) calls, the request must be indicated in the initial INVITE and responded to either in the 183 response (for early dialogs) or in the 200 OK response (for confirmed dialogs).
- 2. Once the device receives such a request, it sends a SIP response message (using the X-Detect header) to the remote party, listing all supported events that can be detected. The absence of the X-Detect header indicates that no detections are available.
- **3.** Each time the device detects a supported event, the event is notified to the remote party by sending an INFO message with the following message body:
 - Content-Type: application/X-DETECT
 - Type = [AMD | CPT | FAX | PTT...]
 - Subtype = xxx (according to the defined subtypes of each type)

Below is an example of SIP messages using the X-Detect header:

INVITE sip:101@10.33.2.53;user=phone SIP/2.0

44.5 Querying Device Channel Resources using SIP OPTIONS

The device reports its maximum and available channel resources in SIP 200 OK responses upon receipt of SIP OPTIONS messages. The device sends this information in the SIP X-Resources header with the following parameters:

- **telchs:** Specifies the total telephone channels and the number of free (available) telephone channels.
- mediachs: Not applicable.

Below is an example of the X-Resources:

X-Resources: telchs= 140/100; mediachs=0/0

In the example above, "telchs" specifies the number of available channels and the number of occupied channels (100 channels are occupied and 140 channels are available).

Note: This feature is applicable only to the Gateway / IP-to-IP application.

Part X

Diagnostics

45 Syslog and Debug Recordings

Syslog is an event notification protocol that enables a device to send event notification messages across IP networks to event message collectors, also known as Syslog servers. The device contains an embedded Syslog client, which sends error reports / events that it generates to a remote Syslog server using the IP / UDP protocol. This information is a collection of error, warning, and system messages that records every internal operation of the device.

For receiving Syslog messages generated by the device, you can use any of the following Syslog servers:

- Device's embedded Syslog server: The device provides an embedded Syslog server, which is accessed through the Web interface. This provides limited Syslog server functionality.
- Wireshark: Third-party network protocol analyzer (http://www.wireshark.org).
- Third-party, Syslog server: Any third-party Syslog server program that enables filtering of messages according to parameters such as priority, IP sender address, time, and date.

45.1 Syslog Message Format

The Syslog message is sent from the device to a Syslog server as an ASCII (American Standard Code for Information Interchange) message. Syslog uses UDP as its underlying transport layer mechanism. By default, UDP port 514 is assigned to Syslog, but this can be changed (see "Enabling Syslog" on page 662).

Below is an example of a Syslog message:

```
13:10:57.811 : 10.13.4.12 : NOTICE : [S=235][SID:1034099026] (
lgr_flow)(63 ) UdpTransportObject#0- Adding socket event
for address 10.33.2.42:5060 [Time: 04-19-2012@18:29:39]
```

Table 45-1: Syslog Message Format Description

Message Item	Description
Message Types	 Syslog generates the following types of messages: ERROR: Indicates that a problem has been identified that requires immediate handling. WARNING: Indicates an error that might occur if measures are not taken to prevent it. NOTICE: Indicates that an unusual event has occurred. INFO: Indicates an operational message. DEBUG: Messages used for debugging. Notes: The INFO and DEBUG messages are required only for advanced debugging. Therefore, by default, they are not sent by the device. When viewing Syslog messages in the Web interface, these message types are color coded.
Message Sequence Number [S= <number>]</number>	By default, Syslog messages are sequentially numbered in the format [S= <number>], for example, "[S=643]". A skip in the number sequence of messages indicates a loss of message packets. For example, in the below Syslog message, messages 238 through 300 were not received. In other words, 63 Syslog messages were lost (the sequential numbers are indicated below in bold font): 18:38:14. 52: 10.33.45.72: NOTICE:</number>

Message Item	Description		
	<pre>[S=235][SID:1034099026] (lgr_psbrdex)(619) recv < DIGIT(0) Ch:0 OnTime:0 InterTime:100 Direction:0 System:1 [File: Line:-1] 18:38:14. 83 : 10.33.45.72 : NOTICE: [S=236][SID:1034099026] (lgr_flow)(620) #0:DIGIT_EV [File: Line:-1] 18:38:14. 83 : 10.33.45.72 : NOTICE: [S=237][SID:1034099026] (lgr_flow)(621) #0:DIGIT_EV [File: Line:-1] 18:38:14.958 : 10.33.45.72 : NOTICE: [S=301][SID:1034099026] (lgr_flow)(625) #0:DIGIT_EV [File: Line:-1]</pre>		
	You can disable the inclusion of the message sequence number in Syslog messages, by setting the 'CDR Session ID' parameter to Disable (see Configuring CDR Reporting on page 637).		
Log Number (lgr)(number)	Ignore this number; it has been replaced by the Message Sequence Number (described previously).		
Session ID	 Automatically assigned (random), unique session identifier (session-id / SID) number per call in the CDR of sent Syslog messages and debug recording packets. This enables you to filter the information (such as SIP, Syslog, and media) according to the SID. Gateway application: A call session is considered either as a Tel-to-IP leg or an IP-to-Tel leg, where each leg is assigned a unique SID. SBC application: A session is considered as both the outgoing and incoming legs, where both legs share the same SID. The benefit of this unique numbering is that it enables you to filter the information (such as SIP, Syslog, and media) according to a specific SID. Note: Forked legs and alternative legs share the same SID. 		
Message Body	Describes the message.		
Timestamp	When the Network Time Protocol (NTP) is enabled, a timestamp string [hour:minutes:seconds] is added to all Syslog messages.		

45.1.1 Event Representation in Syslog Messages

The Syslog message events that the device sends are represented by unique abbreviations. An example of an abbreviated event in a Syslog message indicating packet loss (PL) is shown below:

```
Apr 4 12:00:12 172.30.1.14 PL:5 [Code:3a002] [CID:3294] [Time: 20:17:00]
```

The table below lists these unique event abbreviations:

Table 45-2: Syslog Error Name Descriptions

Error Abbreviation	Error Name Description	
AA	Invalid Accumulated Packets Counter	
AC	Invalid Channel ID	
AL	Invalid Header Length	
AO Invalid Codec Type		

Error Abbreviation	Error Name Description	
AP	Unknown Aggregation Payload Type	
AR	Invalid Routing Flag Received	
AT	Simple Aggregation Packets Lost	
CC	Command Checksum Error	
CE	Invalid Cell Coder Code	
CS	Command Sequence Error	
ES	8 sec Timeout Before Disconnect	
НО	Host Received Overrun	
IA	Invalid AMR Payload	
IC	Invalid CID Error	
IG	Invalid G723 Code	
IP	Invalid payload length	
IR	Invalid RTCP Packet	
IS	Invalid SID Length	
LC	Transmitter Received Illegal Command	
LF	Lost Fax Frames In High Speed Mode	
LM	Lost Modem Frames In High Speed Mode	
MI	Misalignment Error	
MR	Modem Relay Is Not Supported	
OR	DSP JB Overrun	
PH	Packet Header Error	
PL	RTP Packet Loss	
RB	Counts the number of BFI Frames Received From The Host	
RD	No Available Release Descriptor	
RO	RTP Reorder	
RP	Unknown RTP Payload Type	
RS	RTP SSRC Error	
UF	Unrecognized Fax Relay Command	
AA	Invalid Accumulated Packets Counter	
AC	Invalid Channel ID	
AL	Invalid Header Length	
AO	Invalid Codec Type	
AP	Unknown Aggregation Payload Type	
AR	Invalid Routing Flag Received	

45.1.2 Unique Device Identification in Syslog Messages

Syslog messages includes the following unique string for the device:

The main operations and events of the Mediant 3000 High Availability (HA) are sent to the Syslog with the prefix "M3K_HA". All Syslog messages and events of the redundant TP-6310 blade are sent to the Syslog by the active TP-6310 blade with the "Redundant module message" message prefix.

45.1.3 Identifying AudioCodes Syslog Messages using Facility Levels

The device's Syslog messages can easily be identified and distinguished from Syslog messages from other equipment, by setting its Facility level. The Facility levels of the device's Syslog messages are numerically coded with decimal values. Facility level may use any of the "local use" facilities (0 through 7), according to RFC 3164. Implementing Facility levels is useful, for example, if you collect the device's as well as other equipments' Syslog messages on the same server. Therefore, in addition to filtering Syslog messages according to IP address, the messages can be filtered according to Facility level.

The Facility level is configured using the SyslogFacility ini file parameter, which provides the following options:

Numerical Value	Facility Level
16 (default)	local use 0 (local0)
17	local use 1 (local1)
18	local use 2 (local2)
19	local use 3 (local3)
20	local use 4 (local4)
21	local use 5 (local5)
22	local use 6 (local6)
23	local use 7 (local7)

Table 45-3: Syslog Facility Levels

Syslog messages begin with a less-than ("<") character, followed by a number, which is followed by a greater-than (">") character. This is optionally followed by a single ASCII space. The number is known as the *Priority* and represents both the Facility level and the Severity level. A Syslog message with Facility level 16 is shown below:

Facility: LOCALO - reserved for local use (16)

45.1.4 Syslog Fields for Answering Machine Detection

The Syslog message can include information relating to the Answering Machine Detection (AMD) feature. AMD is used to detect whether a human (including a fax machine), an answering machine, silence, or answering machine beeps have answered the call on the remote side. This feature is applicable only to the Gateway application.

- AMDSignal this field can acquire one of the following values:
 - voice (V)
 - answer machine (A)
 - silence (S)
 - unknown (U)
- AMDDecisionProbability probability (in %) success that correctly detects answering type

Below is an example of such a Syslog message with AMD information:

```
CallMachine:EVENT_DETECTED_EV - AMDSignal = <type - V/A/S/U>,
AMDDecisionProbability = <percentage> %
```

If there is no AMD detection, the AMDSignal field is shown empty (i.e. AMDSignal =). For more information on the AMD feature, see 'Answering Machine Detection (AMD)' on page 196.

45.1.5 SNMP Alarms in Syslog Messages

SNMP alerts are sent to the Syslog server using the following formats:

Raised Alarms: RAISE-ALARM: <Alarm Name>; Textual Description: <Textual Description>; Severity <Alarm Severity>; Source <Alarm Source>; Unique ID: <Alarm Unique ID >.

If additional information exists in the alarm, then these are also added: Additional Info1:/ Additional Info2:/ Additional Info3

The Messages' Severity is as follows:

Table 45-4: Syslog Message Severity

ITU Perceived Severity (SNMP Alarm's Severity)	AudioCodes' Syslog Severity
Critical	RecoverableMsg
Major	RecoverableMsg
Minor	RecoverableMsg
Warning	Notice
Indeterminate	Notice
Cleared	Notice

■ Cleared Alarms: CLEAR-ALARM: <Alarm Name>; Textual Description: <Textual Description>; Severity <Alarm Severity>; Source <Alarm Source>; Unique ID: <Alarm Unique ID >: If exists Additional Info1:/ Additional Info2:/ Additional Info3:

45.2 Enabling Syslog

The following procedure describes how to enable and configure Syslog.

Notes:

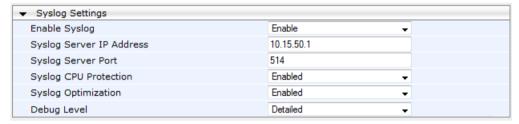

- For configuring CDR reporting, see "Configuring CDR Reporting" on page 637.
- For viewing Syslog messages in the Web interface, see "Viewing Syslog Messages" on page 668.
- For a detailed description on the Syslog parameters, see "Syslog, CDR and Debug Parameters" on page 716.

To configure Syslog:

 Open the Syslog Settings page (Configuration tab > System menu > Syslog Settings).

Figure 45-1: Syslog Settings Page

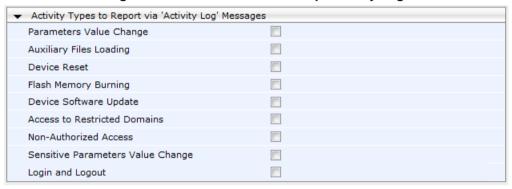

- 2. Enable the Syslog feature by setting 'Enable Syslog' to **Enable**.
- **3.** Define the Syslog server using the 'Syslog Server IP Address' and 'Syslog Server Port' parameters.
- **4.** Configure the debug level using the 'Debug Level' parameter. This determines the level of messages that the device sends to the Syslog server. If set to Basic or Detailed, you can also configure related features using the following parameters:
 - 'Syslog Optimization' (SyslogOptimization): Enables the device to accumulate
 and bundle multiple debug messages into a single UDP packet and then send it
 to a Syslog server. The benefit of this feature is that it reduces the number of
 UDP Syslog packets, thereby improving (optimizing) CPU utilization. The size of
 the bundled message is configured by the MaxBundleSyslogLength parameter.
 - 'Syslog CPU Protection' (SyslogCpuProtection): Enables the protection of the device's CPU resources during debug reporting, ensuring voice traffic is unaffected. If CPU resources drop (i.e., high CPU usage) to a critical level (threshold), the device automatically lowers the debug level to free up CPU resources that were required for the previous debug-level functionality. When CPU resources become available again, the device increases the debug level. The threshold is configured by the DebugLevelHighThreshold parameter (see below).
 - DebugLevelHighThreshold: Defines the threshold (in percentage) for automatically switching to a different debug level, depending on CPU usage. For more information about this functionality, refer to the parameter's description in Syslog, CDR and Debug Parameters on page 716.
- 5. Click Submit.

45.3 Configuring Web Operations to Report to Syslog

You can define the operations (activities) in the Web interface that must be reported to the Syslog server. The following procedure describes how to configure this in the Web interface. You can also configure this using the ini file parameter, ActivityListToLog or CLI command, config-system > logging > activity-log.

- > To define Web activities to report to Syslog server:
- Open the Syslog Settings page (Configuration tab > System menu > Syslog Settings).
- 2. Under the Activity Types to Report via Activity Log Messages group, select the Web actions to report to the Syslog server. For more information, see "Syslog, CDR and Debug Parameters" on page 716.

Figure 45-2: Web Activities to Report to Syslog

Click Submit.

45.4 Configuring Debug Recording

The device enables you to activate debug recording and send debug recording packets to a defined capturing server. When the debug recording is activated, the device duplicates all messages that are sent and/or received by it and then sends them to an external IP address. The debug recording can be done for different types of traffic for example, RTP/RTCP, T.38, ISDN, CAS, and SIP.

Debug recording is used for advanced debugging when you need to analyze internal messages and signals. Debug recording is also useful for recording network traffic in environments where hub or port mirroring is unavailable and for recording internal traffic between two endpoints on the same device.

Note: Debug recording is collected only on the device's OAMP interface.

To configure and activate debug recording:

Open the Logging Settings page (Configuration tab > System menu > Logging >
 Logging Settings).

Figure 45-3: Logging Settings Page

- Configure the debug capturing server using the 'Debug Recording Destination IP' and 'Debug Recording Destination Port' parameters.
- **3.** From the 'Debug Recording Status' drop-down list, select **Start** to start the debug recording or **Stop** to end the recording.
- 4. Click Submit.

For a detailed description of these parameters, see "Syslog, CDR and Debug Parameters" on page 716.

45.5 Filtering Syslog Messages and Debug Recordings

The device can filter Syslog messages and debug recording (DR) packets, which are sent to a Syslog server and packet capturing application (such as Wireshark), respectively. Filtering can be useful to reduce CPU consumption and minimize negative impact on VoIP performance.

You can configure up to 30 filtering rules, each based on a selected filtering criteria (e.g., an IP Group). Each filtering criteria can be configured with a range. For example, you can filter Syslog messages for IP Groups 1 through 4. For each filter criteria, you can enable or disable Syslog messages and debug recording.

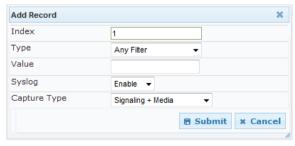

Debug recording can also be filtered using various filtering criteria such as SIP signaling or signaling and media.

The following procedure describes how to configure Logging Filter rules in the Web interface. You can also configure Logging Filter rules using the table ini file parameter, LoggingFilters.

To configure a logging filtering rule:

- Open the Logging Filters Table page (Configuration tab > System menu > Logging > Logging Filters Table).
- Click Add; the following dialog box appears:

Figure 45-4: Logging Filters Table - Add Record Dialog Box

- 3. Configure a logging filter according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Note: To configure the Syslog debug level, use the 'Debug Level' parameter (see "Enabling Syslog" on page 662).

Table 45-5: Logging Filters Table Parameter Descriptions

Parameter	Description
Index	Defines an index number for the new table record.
[LoggingFilters_Index]	Note: Each table row must be configured with a unique index.
Filter Type [LoggingFilters_FilterType]	Defines the filter type criteria. • [1] Any (default)
	 [2] Trunk ID = Filters according to a specified Trunk ID (applicable only to the Gateway application)
	 [3] Trunk Group ID = Filters according to a specified Trunk Group ID (applicable only to the Gateway application)
	 [4] Trunk & B-channel = Filters according to a specified Trunk and B-channel (applicable only to the Gateway application)
	 [6] Tel-to-IP = Filters according to a specified Tel-to-IP routing rule listed in the Outbound IP Routing table (applicable only to the Gateway application)
	 [7] IP-to-Tel = Filters according to a specified IP-to-Tel routing rule listed in the Inbound IP Routing table (applicable only to the Gateway application)
	 [8] IP Group = Filters according to a specified IP Group ID listed in the IP Group table
	 [9] SRD = Filters according to a specified SRD ID listed in the SRD table
	 [10] Classification = Filters according to a specified Classification rule listed in the Classification table (applicable only to the SBC application)
	 [11] IP-to-IP Routing = Filters according to a specified SBC IP- to-IP routing rule listed in the IP-to-IP Routing table (applicable only to the SBC application)
	 [12] User = Filters according to a specified user defined by username or user@host.
	 [13] IP Trace = Filters according to a specified IP network trace wireshark-like expression. For a detailed description on configuring IP traces, see "Filtering IP Network Traces" on page 667.

Parameter	Description
Value [LoggingFilters_Value]	 Defines the value of the selected filtering type in the 'Filter Type' parameter. The value can be the following: A single value A range, using a hyphen "-" between the two values, e.g., "1-3" Multiple, non-contiguous values, using commas "," between each value, e.g., "1,3,9" Trunks pertaining to a module, using the syntax module number/port or port, for example: ✓ "1/2", means module 1, port 2 ✓ "1/[2-4]", means module 1, ports 2 through 4 Any to indicate all For IP trace expressions, see "Filtering IP Network Traces" on page 667
Syslog [LoggingFilters_Syslog]	Enables Syslog messages for the defined logging filter: • [0] Disable (default) • [1] Enable Note: This parameter is not applicable when 'Filter Type' is set to IP Trace.
Capture Type [LoggingFilters_CaptureType]	 Enables debug recordings for the defined logging filter and defines what to record: [0] None (default) [1] Signaling = Information related to signaling such as SIP signaling messages, Syslog, CDR, and the device's internal processing messages. [2] Signaling & Media = Signaling and media (RTP/RTCP/T.38). [3] Signaling & Media & PCM = Signaling, media, and PCM (voice signals from and to TDM). [4] PSTN trace = ISDN and CAS traces - applicable only for Trunk-related filters. Note: This parameter is not applicable when 'Filter Type' is set to IP Trace.

45.5.1 Filtering IP Network Traces

You can filter Syslog and debug recording messages for IP network traces, by setting the 'Filter Type' parameter to **IP Trace** in the Logging Filters table. IP traces are used to record any IP stream that is not associated with media (RTP/RTCP), according to destination and/or source IP address, or port and Layer-4 protocol (UDP, TCP or any other IP type as defined by http://www.iana.com). Network traces are typically used to record HTTP.

When the **IP Trace** option is selected, only the 'Value' parameter is applicable; the 'Syslog' and 'Capture Type' parameters are not relevant. The 'Value' parameter configures the Wireshark-like filtering expressions for your IP trace. The following Wireshark-like expressions are supported:

Table 45-6: Supported Wireshark-like Expressions for 'Value' Parameter

Expression	Description
ip.src, ip.dst	Source and destination IP address
ip.addr	IP address - up to two IP addresses can be entered
ip.proto	IP protocol type (PDU) entered as an enumeration value (e.g., 1 is ICMP, 6 is TCP, 17 is UDP)
udp, tcp, icmp, sip, ldap, http, https	Single expressions for protocol type
udp.port, tcp.port	Transport layer
udp.srcport, tcp.srcport	Transport layer for source port
udp.dstport, tcp.dstport	Transport layer for destination port
and, &&, ==, <, >	Between expressions

Below are examples of configured expressions for the 'Value' parameter:

- udp && ip.addr==10.8.6.55
- ip.src==10.8.6.55 && udp.port>=5000 and udp.port<6000
- ip.dst==10.8.0.1/16
- ip.addr==10.8.6.40

For conditions requiring the "or" / "||" expression, add multiple table rows. For example, the Wireshark condition "(ip.src == 1.1.1.1 or ip.src == 2.2.2.2) and ip.dst == 3.3.3.3" can be configured using the following two table row entries:

- 1. ip.src == 1.1.1.1 and ip.dst == 3.3.3.3
- 2. ip.src == 2.2.2.2 and ip.dst == 3.3.3.3

Note: If the 'Value' field is not defined, the device records all IP traffic types.

45.6 Viewing Syslog Messages

You can use the following tools to view the Syslog messages sent by the device:

- Web interface's Message Log page (see below).
- Any third-party Syslog server (e.g., Wireshark).

The following procedure describes how to view Syslog messages in the Web interface.

Notes:

- It's not recommended to keep a Message Log session open for a prolonged period. This may cause the device to overload. For prolonged (and detailed) debugging, use an external Syslog server.
- You can select the Syslog messages in this page, and copy and paste them into a text editor such as Notepad. This text file (txt) can then be sent to AudioCodes Technical Support for diagnosis and troubleshooting.

> To activate the Web interface's Message Log:

- 1. Enable Syslog (see "Enabling Syslog" on page 662).
- Open the Message Log page (Status & Diagnostics tab > System Status menu > Message Log); the Message Log page is displayed and the log is activated.

Figure 45-5: Message Log Page

```
Log is Activated

```

The displayed logged messages are color-coded as follows:

- Yellow fatal error message
- Blue recoverable error message (i.e., non-fatal error)
- Black notice message

To stop and clear the Message Log:

Close the Message Log page by accessing any another page in the Web interface.

45.7 Collecting Debug Recording Messages

To collect debug recording packets, use the open source program Wireshark. AudioCodes proprietary plug-in files for Wireshark are required.

Notes:

- The default debug recording port is 925. You can change the port in Wireshark
 (Edit menu > Preferences > Protocols > AC DR).
- The plug-in files are per major software release of Wireshark. For more information, contact your AudioCodes sales representative.
- The plug-in files are applicable only to Wireshark 32-bit for Windows.

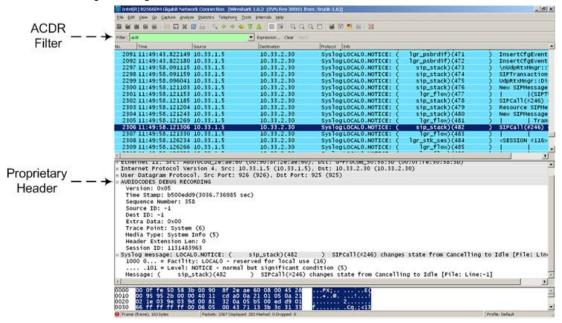

To install Wireshark and the plug-ins for debug recording:

- 1. Install Wireshark on your computer. The Wireshark program can be downloaded from http://www.wireshark.org.
- 2. Download the proprietary plug-in files from www.audiocodes.com/downloads.
- 3. Copy the plug-in files to the directory in which you installed Wireshark, as follows:

Copy this file	To this folder on your PC
\dtds\cdr.dtd	Wireshark\dtds\
\plugins\ <wireshark ver.="">*.dll</wireshark>	Wireshark\plugins\ <wireshark ver.=""></wireshark>
\tpncp\tpncp.dat	Wireshark\tpncp

- 4. Start Wireshark.
- 5. In the Filter field, type "acdr" (see the figure below) to view the debug recording messages. Note that the source IP address of the messages is always the OAMP IP address of the device.

The device adds the header "AUDIOCODES DEBUG RECORDING" to each debug recording message, as shown below:

For ISDN trace messages, the additional header, "NetBricks Trace" is added below the "AUDIOCODES DEBUG RECORDING" header, as shown in the example below:

AUDIOCODES DEBUG RECORDING

NetBricks Trace System time: 3559

Direction: Message received from internal server queue (73)

From (Entity origination ID): DL_D (DL LAPD Q.921) (100)
To (Entity destination ID): PH D (D channel physical) (68)

User's Manual 46. Self-Testing

46 Self-Testing

The device features the following self-testing modes to identify faulty hardware components:

Detailed Test (Configurable): This test verifies the correct functioning of the different hardware components on the device. This test is done when the device is taken out of service (i.e., not in regular service for processing calls). The test is performed on startup when initialization of the device completes.

To enable this test, set the ini file parameter, EnableDiagnostics to 1 or 2, and then reset the device. Upon completion of the test and if the test fails, the device sends information on the test results of each hardware component to the Syslog server.

The following hardware components are tested:

- RAM when EnableDiagnostics = 1 or 2
- Flash memory when EnableDiagnostics = 1 or 2
- DSPs when EnableDiagnostics = 1 or 2
- Physical Ethernet ports when EnableDiagnostics = 1 or 2
- UTOPIA Bridge when EnableDiagnostics = 2

Notes:

- To return the device to regular operation and service, disable the test by setting the ini file parameter, EnableDiagnostics to 0, and then reset the device.
- While the test is enabled, ignore errors sent to the Syslog server.
- Startup Test (automatic): This hardware test has minor impact in real-time. While this test is executed, the regular operation of the device is disabled. If an error is detected, an error message is sent to the Syslog.
- Periodic Test (automatic): This test monitors the device during run-time. This test is performed after startup, even when there is full traffic on the device (quality is not degraded). This is a short test phase in which the only error detected and reported is failure in initializing hardware components or malfunction in running hardware components. If an error is detected, an error message is sent to the Syslog.

This page is intentionally left blank.

47 Creating Core Dump and Debug Files upon Device Crash

For debugging purposes, you can create a core dump file and/or debug file. These files may help you easily identify the cause of the crash. The core dump can either be included in or excluded from the debug file, or alternatively, sent separately to a TFTP server. The files can then be sent to AudioCodes support team for troubleshooting.

- Core Dump File: You can enable the device to send a core dump file to a remote destination upon a device crash. The core dump is a copy of the memory image at the time of the crash. It provides a powerful tool for determining the root cause of the crash. When enabled, the core dump file is sent to a user-defined TFTP server (IP address). If no address is configured, the core dump file is saved to the device's flash memory (if it has sufficient memory). The core dump file is saved as a binary file in the following name format: "core_<device name>_ver_<firmware version>_mac_<MAC address>_<ti>core_<ti>core_acMediant_ver_680-8-4 mac 00908F099096 1-11-2014 3-29-29.
- **Debug File:** You can manually retrieve the debug file from the device and save it to a folder on your local PC. The debug file contains the following information:
 - Exception information, indicating the specific point in the code where the crash occurred.
 - Latest log messages that were recorded prior to the crash.
 - Core dump (only if enabled, no IP address has been defined, and the device has sufficient memory on its flash).
 - May include additional application-proprietary debug information.

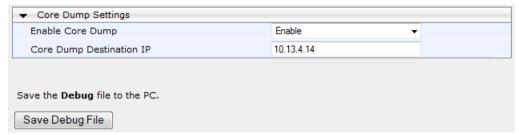

The debug file is saved as a zipped file in the following name format: "debug_<device name>_ver_<firmware version>_mac_<MAC address>_<date>_<time>", for example, debug acMediant ver 680-8-4 mac 00908F099096 1-11-2014 3-29-29.

The following procedure describes how to configure core dump file creation in the Web interface.

> To enable core dump creation:

 Open the Debug Utilities page (Maintenance tab > Maintenance menu > Debug Utilities).

Figure 47-1: Debug Utilities Page

- 2. From the 'Enable Core Dump' drop-down list, select **Enable**.
- 3. In the 'Core Dump Destination IP' field, enter an IP address of the remote server to where you want the file to be sent (optional).
- 4. Click Submit.

The following procedure describes how to retrieve the debug file from the device in the Web interface.

- To save the debug file from the device:
- In the Debug Utilities page, click the **Save Debug File** button.

This page is intentionally left blank.

48 Testing SIP Signaling Calls

A simulated endpoint can be configured on the device to test SIP signaling of calls between it and a remote destination. This feature is useful in that it can remotely verify SIP message flow without involving the remote end side in the debug process. The SIP test call simulates the SIP signaling process - call setup, SIP 1xx responses, through to completing the SIP transaction with a 200 OK.

The test call sends Syslog messages to a Syslog server, showing the SIP message flow, tone signals (e.g., DTMF), termination reasons, as well as voice quality statistics and thresholds (e.g., MOS).

48.1 Configuring Test Call Endpoints

The Test Call table lets you test the SIP signaling (setup and registration) and media (DTMF signals) of calls between a simulated phone on the device and a remote endpoint. These tests involve both incoming and outgoing calls, where the test endpoint can be configured as the caller or called party. Test calls can be dialed automatically at a user-defined interval and/or manually when required. The simulated phone and remote endpoints are defined as SIP URIs (user@host) and the remote destination can be defined as an IP Group, IP address, or according to an Outbound IP Routing rule. You can also enable automatic registration of the endpoint.

When a SIP test call is initiated, the device generates a SIP INVITE towards the remote endpoint (e.g., a SIP proxy server or softswitch). It simulates the SIP call setup process, managing SIP 1xx responses and completing the SIP transaction with a 200 OK.

Note: By default, you can configure up to five test calls. However, this number can be increased by installing the relevant Software License Key. For more information, contact your AudioCodes sales representative.

The following procedure describes how to configure test calls in the Web interface. You can also configure this using the table ini file parameter, Test Call.

- To configure a test call:
- Open the Test Call Table page (Configuration tab > System menu > Test Call >
 Test Call Table).
- Click Add; the following dialog box appears:

Authentication Test Setting Endpoint URI Called URI Route By GW Tel2IF IP Group ID -1 Destination Address Destination Transport Type SRD Application Type GW & IP2IP OoE Profile None Bandwidth Profile None Submit × Cancel

Figure 48-1: General Tab of Test Call Table

- 3. Configure a test call according to the parameters described in the table below.
- 4. Click **Submit**, and then save ("burn") your settings to flash memory.

Table 48-1: Test Call Table Parameter Descriptions

Parameter	Description
General Tab	
Endpoint URI [Test_Call_EndpointURI]	Defines the endpoint's URI. This can be defined as a user or user@host. The device identifies this endpoint only by the URI's user part. The URI's host part is used in the SIP From header in REGISTER requests. The valid value is a string of up to 150 characters. By default, this
	parameter is not configured.
Called URI [Test_Call_CalledURI]	Defines the destination (called) URI (user@host). The valid value is a string of up to 150 characters. By default, this parameter is not configured.
Route By [Test_Call_RouteBy]	 Defines the type of routing method. This applies to incoming and outgoing calls. [0] GW Tel2IP = (Default) Calls are matched by (or routed to) an SRD and Application type (defined in the SRD and Application Type parameters below). [1] IP Group = Calls are matched by (or routed to) an IP Group ID. [2] Dest Address = Calls are matched by (or routed to) an SRD and application type. Notes: For REGISTER messages, the option [0] cannot be used as the routing method. For REGISTER messages, if option [1] is used, only Server-type IP Groups can be used.
IP Group ID [Test_Call_IPGroupID]	Defines the IP Group ID to which the test call is sent or from which it is received. Notes: This parameter is applicable only if option [1] is configured for the 'Route By' parameter. This IP Group is used for incoming and outgoing calls.
Destination Address [Test_Call_DestAddress]	Defines the destination host. This can be defined as an IP address[:port] or DNS name[:port]. Note: This parameter is applicable only if the 'Route By' parameter is set to [2] (Dest Address).
Destination Transport Type [Test_Call_DestTransportType]	Defines the transport type for outgoing calls. • [-1] = Not configured (default) • [0] UDP • [1] TCP • [2] TLS Note: This parameter is applicable only if the 'Route By' parameter is set to [2] (Dest Address).

Parameter	Description
SRD CLI: srd [Test_Call_SRD]	Defines the SRD for the endpoint. The default is SRD 0. Note: This parameter is applicable only if the 'Route By' parameter is set any option except [1] (IP Group).
Application Type [Test_Call_ApplicationType]	Defines the application type for the endpoint. This, in effect, associates the IP Group and SRD to a specific SIP interface. For example, assume two SIP Interfaces are configured in the SIP Interface table where one is set to "GW & IP2IP" and one to "SBC" for the 'Application Type'. If this parameter is set ot "SBC", the device uses the SIP Interface set to "SBC". • [0] GW & IP2IP (default) • [2] SBC
QoE Profile [Test_Call_QOEProfile]	Assigns a QoE Profile to the test call. To configure QoE Profiles, see "Configuring Quality of Experience Profiles" on page 254.
Bandwidth Profile [Test_Call_BWProfile]	Assigns a Bandwidth Profile to the test call. To configure Bandwidth Profiles, see "Configuring Bandwidth Profiles" on page 258.
Authentication Tab Note: These parameters are applicable only if the Call Party parameter is set to Caller.	
Auto Register [Test_Call_AutoRegister]	Enables automatic registration of the endpoint. The endpoint can register to the device itself or to the 'Destination Address' or 'IP Group ID' parameter settings (see above). • [0] Disable (default) • [1] Enable
Username [Test_Call_UserName]	Defines the authentication username. By default, no username is defined.
Password [Test_Call_Password]	Defines the authentication password. By default, no password is defined.
Test Settings Tab	
Call Party [Test_Call_CallParty]	Defines whether the test endpoint is the initiator or receiving side of the test call. • [0] Caller (default) • [1] Called
Maximum Channels for Session [Test_Call_MaxChannels]	Defines the maximum number of concurrent channels for the test session. For example, if you have configured an endpoint "101" and you set this parameter to "3", the device automatically creates three simulated endpoints - "101", "102" and "103" (i.e., consecutive endpoint URIs are assigned). The default is 1.
Call Duration [Test_Call_CallDuration]	Defines the call duration (in seconds). The valid value is -1 to 100000. The default is 20. A value of 0 means infinite. A value of -1 means that the parameter value is automatically calculated according to the values of the 'Calls per Second' and 'Maximum Channels for Session' parameters. Note: This parameter is applicable only if 'Call Party' is set to
	Caller.

Parameter	Description
Calls per Second [Test_Call_CallsPerSecond]	Defines the number of calls per second. Note: This parameter is applicable only if 'Call Party' is set to Caller.
Test Mode [Test_Call_TestMode]	 Defines the test session mode. [0] Once = (Default) The test runs until the lowest value between the following is reached: ✓ Maximum channels is reached for the test session, configured by 'Maximum Channels for Session'. ✓ Call duration ('Call Duration') multiplied by calls per second ('Calls per Second'). ✓ Test duration expires, configured by 'Test Duration'. [1] Continuous = The test runs until the configured test duration is reached. If it reaches the maximum channels configured for the test session (in the 'Maximum Channels for Session'), it waits until the configured call duration of a currently established tested call expires before making the next test call. In this way, the test session stays within the configured maximum channels. Note: This parameter is applicable only if 'Call Party' is set to Caller.
Test Duration [Test_Call_TestDuration]	Defines the test duration (in minutes). The valid value is 0 to 100000. The default is 0 (i.e., unlimited). Note: This parameter is applicable only if 'Call Party' is set to Caller.
Play [Test_Call_Play]	 Enables and defines the playing of a tone to the answered side of the call. [0] Disable [1] DTMF (default) = Plays a user-defined DTMF string, configured in "Configuring DTMF Tones for Test Calls" on page 681. [2] PRT = Plays a non-DTMF tone from the PRT file (Dial Tone 2). For this option, a PRT file must be loaded to the device (see "Prerecorded Tones File" on page 560). Notes: To configure the DTMF signaling type (e.g., out-of-band or in-band) use the 'DTMF Transport Type' parameter (see "Configuring DTMF Transport Types" on page 193). This parameter is applicable only if 'Call Party' is set to Caller.
Schedule Interval [Test_Call_ScheduleInterval]	Defines the interval (in minutes) between automatic outgoing test calls. The valid value range is 0 to 100000. The default is 0 (i.e., scheduling is disabled). Note: This parameter is applicable only if 'Call Party' is set to Caller.

48.2 Starting and Stopping Test Calls

The following procedure describes how to start, stop, and restart test calls.

- To start, stop, and restart a test call:
- 1. In the Test Call table, select the required test call entry; the **Actions** button appears above the table.
- 2. From the **Actions** drop-down list, choose the required command:
 - **Dial:** starts the test call (this action is applicable only if the test call party is the caller).
 - Drop Call: stops the test call.
 - Restart: ends all established calls and then starts the test call session again.

The status of the test call is displayed in the 'Test Status' field of the Test Call table:

- "Idle": test call is not active.
- "Scheduled": test call is planned to run (according to 'Schedule Interval' parameter settings)
- "Running": test call has been started (i.e., the **Dial** command was clicked)
- "Receiving": test call has been automatically activated by calls received for the test call endpoint from the remote endpoint (when all these calls end, the status returns to "Idle")
- "Terminating": test call is in the process of terminating the currently established calls (this occurs if the **Drop Call** command is clicked to stop the test)
- "Done": test call has been successfully completed (or was prematurely stopped by clicking the **Drop Call** command)

A more detailed description of this field is displayed below the table when you click the **Show/Hide** button (see "Viewing Test Call Statistics" on page 679).

48.3 Viewing Test Call Statistics

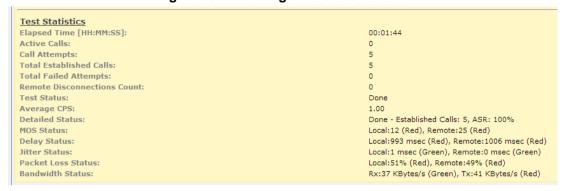

In addition to viewing a brief status description of the test call in the 'Test Status' field (as described in "Starting, Stopping and Restarting Test Calls" on page 679), you can also view a more detailed status description which includes test call statistics.

- To view statistics of a test call:
- Open the Test Call Table page (Configuration tab > System menu > Test Call >
 Test Call Table).
- Select the test call table entry whose call statistics you want to view.

3. Click the **Show/Hide** button; the call statistics are displayed in the **Test Statistics** pane located below the table, as shown below:

Figure 48-2: Viewing Test Call Statistics

The 'Test Statistics' pane displays the following test session information:

- **Elapsed Time:** Duration of the test call since it was started (or restarted).
- Active Calls: Number of currently established test calls.
- **Call Attempts:** Number of calls that were attempted.
- Total Established Calls: Total number of calls that were successfully established.
- Total Failed Attempts: Total number of call attempts that failed.
- Remote Disconnections Count: Number of calls that were disconnected by the remote side.
- Average CPS: Average calls per second.
- Test Status: Displays the status (brief description) as displayed in the 'Test Status' field (see "Starting, Stopping and Restarting Test Calls" on page 679).
- Average CPS: Average calls per second.
- **Detailed Status:** Displays a detailed description of the test call status:
 - "Idle": test call is currently not active.
 - "Scheduled Established Calls: <number of established calls>, ASR: <%>": test
 call is planned to run (according to 'Schedule Interval' parameter settings) and
 also shows the following summary of completed test calls:
 - Total number of test calls that were established.
 - Number of successfully answered calls out of the total number of calls attempted (ASR).
 - "Running (Calls: <number of active calls>, ASR: <%>)": test call has been started (i.e., the **Dial** command was clicked) and shows the following:
 - Number of currently active test calls.
 - Number of successfully answered calls out of the total number of calls attempted (Answer Seizure Ratio or ASR).
 - "Receiving (<number of active calls>)": test call has been automatically activated by calls received for this configured test call endpoint from the configured remote endpoint. When all these calls terminate, the status returns to "Idle".
 - "Terminating (<number of active calls>)": the **Drop Call** command has been clicked to stop the test call and the test call is in the process of terminating the currently active test calls.
 - "Done Established Calls: <number of established calls>, ASR: <%>": test call
 has been successfully completed (or was prematurely stopped by clicking the
 Drop Call command) and shows the following:
 - Total number of test calls that were established.
 - Number of successfully answered calls out of the total number of calls attempted (ASR).

- MOS Status: MOS count and color threshold status of local and remote sides according to the assigned QoE Profile.
- **Delay Status:** Packet delay count and color-threshold status of local and remote sides according to the assigned QoE Profile.
- Jitter Status: Jitter count and color-threshold status of local and remote sides according to the assigned QoE Profile.
- Packet Loss Status: Packet loss count and color-threshold status of local and remote sides according to the assigned QoE Profile.
- Bandwidth Status: Tx/Rx bandwidth and color-threshold status according to the assigned Bandwidth Profile.

Note: On the receiving side, when the first call is accepted in "Idle" state, statistics are reset

48.4 Configuring DTMF Tones for Test Calls

By default, no DTMF signal is played to an answered test call (incoming or outgoing). However, you can enable this per configured test call in the Test Call table (see "Configuring Test Call Endpoints" on page 675). If enabled, the default DTMF signal that is played is "3212333". You can change this as described below.

Notes:

- The DTMF signaling type (e.g., out-of-band or in-band) can be configured using the 'DTMF Transport Type' parameter. For more information, see "Dual-Tone Multi-Frequency Signaling" on page 193.
- To generate DTMF tones, the device's DSP resources are required.
- > To configure the played DTMF signal to answered test call:
- Open the Test Call Settings page (Configuration tab > System menu > Test Call >
 Test Call Settings).

Figure 48-3: DTMF in Test Call Settings Page

Test Call DTMF String 3212333

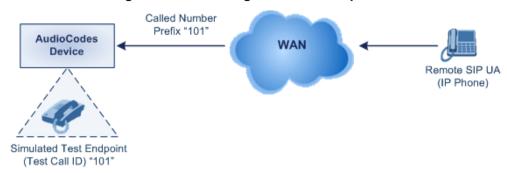

- 2. In the 'Test Call DTMF String' field, enter the DTMF string (up to 15 digits).
- 3. Click Submit.

48.5 Configuring Basic Test Call

The Basic Test Call feature tests incoming Gateway calls from a remote SIP endpoint to a simulated test endpoint on the device. The only required configuration is to assign a prefix number (*test call ID*) to the simulated endpoint. All incoming calls with this called (destination) prefix number is identified as a test call and sent to the simulated endpoint. The figure below displays a basic test call example.

Figure 48-4: Incoming Test Call Example

To configure basic call testing:

Open the Test Call Settings page (Configuration tab > System menu > Test Call >
Test Call Settings).

Figure 48-5: Test Call Settings Page

- 2. In the 'Test Call ID' field, enter a prefix for the simulated endpoint.
- 3. Click Submit.

Notes:

- The Basic Test Call feature tests incoming calls only and is initiated only upon receipt of incoming calls with the configured prefix.
- For a full description of this parameter, see "SIP Test Call Parameters" on page 715
- This call test is done on all SIP interfaces.
- This call test is applicable only to the Gateway application.

48.6 Configuring SBC Test Call with External Proxy

The SBC Test Call feature tests incoming SBC SIP call flow between a simulated test endpoint on the device and a remote SIP endpoint, when registration and routing is done through an external proxy/registrar server such as a hosted IP PBX in the WAN. In other words, the complete SIP flow, including the path to/from the external proxy/registrar can be tested.

Notes:

- The SBC Test Call feature is initiated only upon receipt of incoming calls and with the configured prefix.
- This call test is done on all SIP interfaces.

As this test call type involves an SBC call, you need to configure regular SBC rules such as classification and IP-to-IP routing. Therefore, this test call also allows you to verify correct SBC configuration.

For this test call, you also need to configure the following call IDs:

- Test Call ID prefix number of the simulated endpoint on the device.
- SBC Test ID prefix number of called number for identifying incoming call as SBC test call. The device removes this prefix, enabling it to route the call according to the IP-to-IP Routing rules to the external proxy/registrar, instead of directly to the simulated endpoint. Only when the device receives the call from the proxy/registrar, does it route the call to the simulated endpoint.

The figure below displays an example of an SBC test call:

AudioCodes
Device

Simulated Test Endpoint
Test Call ID = "101"

Figure 48-6: SBC Test Call Example

- The call is received from the remote endpoint with the called number prefix "8101".
- As the 'SBC Test ID' parameter is set to "8", the device identifies this call as a test call and removes the digit "8" from the called number prefix, leaving it as "101".
- 3. The device performs the regular SBC processing such as classification and manipulation.
- **4.** The device routes the call, according to the configured SBC IP-to-IP routing rules, to the proxy server.
- **5.** The device receives the call from the proxy server.
- 6. As the 'Test Call ID' parameter is set to "101", the device identifies the incoming call as a test call and sends it directly to the simulated test endpoint "101".

To configure SBC call testing:

- Configure the test call parameters (for a full description, see "SIP Test Call Parameters" on page 715):
 - a. Open the Test Call Settings page (Configuration tab > System menu > Test Call > Test Call Settings).

Figure 48-7: Test Call Settings Page

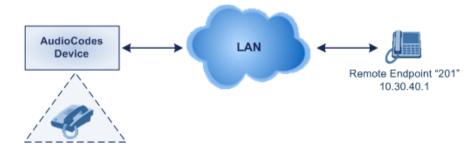

- b. In the 'Test Call ID' field, enter a prefix number for the simulated test endpoint on the device.
- **c.** In the 'SBC Test ID' field, enter a called prefix number for identifying the call as an SBC test call.
- d. Click Submit.
- 2. Configure regular SBC call processing rules for called number prefix "101", such as classification and IP-to-IP routing through a proxy server.

48.7 Test Call Configuration Examples

Below are a few examples of test call configurations.

Single Test Call Scenario: This example describes the configuration of a simple test call scenario that includes a single test call between a simulated test endpoint on the device and a remote endpoint.

Figure 48-8: Single Test Call Example

Simulated Test Endpoint "101"

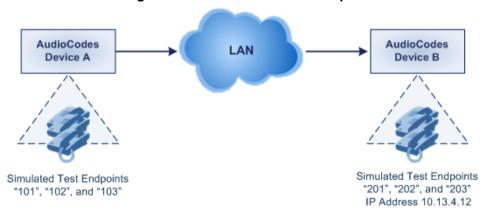

- Test Call table configuration:
 - Endpoint URI: "101"
 - Called URI: "201"
 - Route By: Dest Address
 - Destination Address: "10.30.40.01"
 - Call Party: CallerTest Mode: Once

Alternatively, if you want to route the test call using the Outbound IP Routing table for the Gateway / IP-to-IP application, configure the following:

- Test Call table configuration:
 - Endpoint URI: 101@10.0.0.1
 - Route By: GW Tel2IP
 - Called URI: 201@10.30.40.1
 - Call Party: Caller

- Outbound IP Routing table configuration:
 - Dest. Phone Prefix: 201 (i.e., the Called URI user-part)
 - Source Phone Prefix: 101 (i.e., the Endpoint URI user-part)
 - Dest. IP Address: 10.30.40.1
- Batch Test Call Scenario: This example describes the configuration of a batch test call setup for scheduled and continuous call testing of multiple endpoints. The test call is done between two AudioCodes devices Device A and Device B with simulated test endpoints. This eliminates the need for phone users, who would otherwise need to answer and end calls many times for batch testing. The calls are initiated from Device A, where Device B serves as the remote answering endpoint.

Figure 48-9: Batch Test Call Example

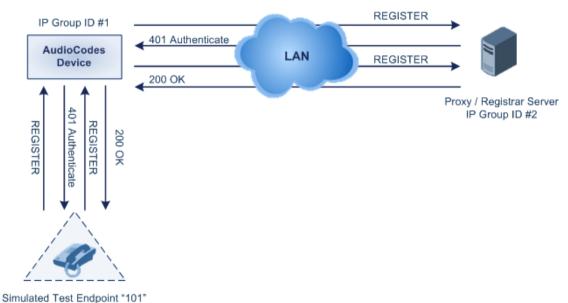

- Test Call table configuration at Device A:
 - Endpoint URI: "101"
 - Called URI: "201"
 - Route By: Dest Address
 - Destination Address: "10.13.4.12"
 - Call Party: Caller
 - Maximum Channels for Session: "3" (configures three endpoints "101", "102" and "103)
 - Call Duration: "5" (seconds)
 - Calls per Sec: "1"
 - Test Mode: Continuous
 - Test Duration: "3" (minutes)
 - Schedule Interval: "180" (minutes)
- Test Call table configuration at Device B:
 - Endpoint URI: "201"
 - Maximum Channels for Session: "3" (configures three endpoints "201", "202" and "203)

Registration Test Call Scenario: This example describes the configuration for testing the registration and authentication (i.e., username and pas,sword) process of a simulated test endpoint on the device with an external proxy/registrar server. This is useful, for example, for verifying that endpoints located in the LAN can register with an external proxy and subsequently, communicate with one another.

Figure 48-10: Test Call Registration Example

This example assumes that you have configured your device for communication between LAN phone users such as IP Groups to represent the device (10.13.4.12) and the proxy server, and IP-to-IP routing rules to route calls between these IP Groups.

Test Call table configuration:

Endpoint URI: "101"

Called URI: "itsp"

Route By: Dest Address

Destination Address: "10.13.4.12" (this is the IP address of the device itself)

Auto Register: Enable
 User Name: "testuser"
 Password: "12345"
 Call Party: Caller

Part XI

Appendix

49 Dialing Plan Notation for Routing and Manipulation

The device supports flexible dialing plan notations for denoting the prefix and/or suffix source and/or destination numbers and SIP URI user names in the routing and manipulation tables.

Table 49-1: Dialing Plan Notations for Prefixes and Suffixes

Notation	Description
x (letter "x")	Wildcard that denotes any single digit or character.
# (pound symbol)	 When used at the end of a prefix, it denotes the end of a number. For example, 54324# represents a 5-digit number that starts with the digits 54324. When used anywhere else in the number (not at the end), it is part of the number (pound key). For example, 3#45 represents the prefix number 3#45. To denote the pound key when it appears at the end of the number, the pound key must be enclosed in square brackets. For example, 134[#] represents any number that starts with 134#.
* (asterisk symbol)	 When used on its own, it denotes any number or string. When used as part of a number, it denotes the asterisk key. For example, *345 represents a number that starts with *345.
\$ (dollar sign)	Denotes an empty prefix for incoming IP calls that do not have a user part in the Request-URI, or for incoming Tel calls that do not have a called or calling number. This is used for the following matching criteria: Source and Destination Phone Prefix Source and Destination Username Source and Destination Calling Name Prefix

Range of Digits

Notes:

- Dial plans denoting a prefix that is a range must be enclosed in square brackets, e.g., [4-8] or 23xx[456].
- Dial plans denoting a prefix that is not a range is not enclosed, e.g., 12345#.
- Dial plans denoting a suffix must be enclosed in parenthesis, e.g., (4) and (4-8).
- Dial plans denoting a suffix that include multiple ranges, the range must be enclosed in square brackets, e.g., (23xx[4,5,6]).
- An example for entering a combined prefix and suffix dial plan assume you want to match a rule whose destination phone prefix is 4 to 8, and suffix is 234, 235, or 236. The entered value would be the following: [4-8](23[4,5,6]).

[n-m] or (n-m)	Represents a range of numbers.
	Examples:
	 To depict prefix numbers from 5551200 to 5551300:
	✓ [5551200-5551300]#
	 To depict prefix numbers from 123100 to 123200:
	✓ 123[100-200]#
	 To depict prefix and suffix numbers together:
	√ 03(100): for any number that starts with 03 and ends with 100.
	 [100-199](100,101,105): for a number that starts with 100 to 199 and ends with 100, 101 or 105.
	√ 03(abc): for any number that starts with 03 and ends with abc.

Notation	Description	
	 03(5xx): for any number that starts with 03 and ends with 5xx. 03(400,401,405): for any number that starts with 03 and ends wor 401 or 405. Notes:	vith 400
	The value <i>n</i> must be less than the value <i>m</i> .	
	Only numerical ranges are supported (not alphabetical letters).	
	 For suffix ranges, the starting (n) and ending (m) numbers in the rar include the same number of digits. For example, (23-34) is correct, is not. 	
[n,m,] or (n,m,)	Represents multiple numbers. The value can include digits or characte Examples:	rs.
	• To depict a one-digit number starting with 2, 3, 4, 5, or 6: [2,3,4,5,6]	
	• To depict a one-digit number ending with 7, 8, or 9: (7,8,9)	
	 Prefix with Suffix: [2,3,4,5,6](7,8,9) - prefix is denoted in square brasuffix in parenthesis 	ckets;
	For prefix only , the notations <i>d[n,m]e</i> and <i>d[n-m]e</i> can also be used:	
	 To depict a five-digit number that starts with 11, 22, or 33: [11,22,33] To depict a six-digit number that starts with 111 or 222: [111,222]xx 	_
[n1-m1,n2- m2,a,b,c,n3-m3] or (n1-m1,n2- m2,a,b,c,n3-m3)	Represents a mixed notation of single numbers and multiple ranges. For example, to depict numbers 123 to 130, 455, 766, and 780 to 790: • Prefix: [123-130,455,766,780-790] • Suffix: (123-130,455,766,780-790)	
	Note: The ranges and the single numbers used in the dial plan must has same number of digits. For example, each number range and single number dialing plan example above consists of three digits.	
Special ASCII Characters	The device does not support the use of ASCII characters in manipulation rules and therefore, for LDAP-based queries, the device can use the hexadecimal (HEX) format of the ASCII characters for phone numbers instead. The HEX value must be preceded by a backslash "\". For example, you can configure a manipulation rule that changes the number +49 (7303) 165-xxxxx to +49 \287303\29 165-xxxxx, where \28 is the ASCII HEX value for "(" and \29 is the ASCII HEX value for ")". The manipulation rule in this example would denote the parenthesis in the destination number prefix using "x" wildcards (e.g., xx165xxxxx#); the prefix to add to the number would include the HEX values (e.g., +49 \287303\29 165-).	
	Below is a list of common ASCII characters and their corresponding HEX values:	
	ASCII Character HEX Value	
	* \2a	
	(\28	
) \29	
	\ \5c	
	/ \2f	

Note: When configuring phone numbers or prefixes in the Web interface, enter them only as digits without any other characters. For example, if you wish to enter the phone number 555-1212, it must be entered as 5551212 without the hyphen (-). If the hyphen is entered, the entry is invalid.

50 Configuration Parameters Reference

The device's configuration parameters, default values, and their descriptions are documented in this section.

Note: Parameters and values enclosed in square brackets [...] represent the *ini* file parameters and their enumeration values.

50.1 Management Parameters

This section describes the device's management-related parameters.

50.1.1 General Parameters

The general management parameters are described in the table below.

Table 50-1: General Management Parameters

Parameter	Description
Web: Web and Telnet Access List Table EMS: Web Access Addresses [WebAccessList_x]	This table configures up to ten IP addresses that are permitted to access the device's Web interface and Telnet interfaces. Access from an undefined IP address is denied. When no IP addresses are defined in this table, this security feature is inactive (i.e., the device can be accessed from any IP address).
	The default is 0.0.0.0 (i.e., the device can be accessed from any IP address). For example: WebAccessList_0 = 10.13.2.66 WebAccessList_1 = 10.13.77.7 For a description of this parameter, see "Configuring Web and Telnet Access List" on page 77.

50.1.2 Web Parameters

The Web parameters are described in the table below.

Table 50-2: Web Parameters

Parameter	Description
Web: Password Change Interval [WebUserPassChangeInt erval]	Defines the duration (in minutes) of the validity of Web login passwords. When this duration expires, the password of the Web user must be changed. The valid value is 0 to 100000, where 0 means that the password is always valid. The default is 1140.
	Note: This parameter is applicable only when using the Web Users table, where the default value of the 'Password Age' parameter in the Web Users table inherits this parameter's value.

Parameter	Description
Web: User Inactivity Timer [UserInactivityTimer]	Defines the duration (in days) for which a user has not logged in to the Web interface, after which the status of the user becomes inactive and can no longer access the Web interface. These users can only log in to the Web interface if their status is changed (to New or Valid) by a System Administrator or Master user.
	The valid value is 0 to 10000, where 0 means inactive. The default is 90.
	Note: This parameter is applicable only when using the Web Users table.
Web: Session Timeout [WebSessionTimeout]	Defines the duration (in minutes) of Web inactivity of a logged-in user, after which the user is automatically logged off the Web interface.
	The valid value is 0-100000, where 0 means no timeout. The default is 15.
	Note: This parameter can apply to all users, or per user when set in the Web Users table.
Web: Deny Access On Fail Count	Defines the maximum number of failed login attempts, after which the requesting IP address is blocked.
[DenyAccessOnFailCount]	The valid value range is 0 to 10. The values 0 and 1 mean immediate block. The default is 3.
Web: Deny Authentication Timer EMS: WEB Deny Authentication Timer [DenyAuthenticationTime r]	Defines the duration (in seconds) for which login to the Web interface is denied from a specific IP address (for all users) when the number of failed login attempts has exceeded the maximum. This maximum is defined by the DenyAccessOnFailCount parameter. Only after this time expires can users attempt to login from this same IP address. The valid value is 0 to 100000, where 0 means that login is not denied regardless of number of failed login attempts. The default is 60.
Web: Display Login Information [DisplayLoginInformation]	Enables display of user's login information on each successful login attempt. • [0] = Disable (default) • [1] = Enable
[EnableMgmtTwoFactorA uthentication]	Enables Web login authentication using a third-party, smart card. • [0] = Disable (default) • [1] = Enable
	When enabled, the device retrieves the Web user's login username from the smart card, which is automatically displayed (read-only) in the Web Login screen; the user is then required to provide only the login password.
	Typically, a TLS connection is established between the smart card and the device's Web interface, and a RADIUS server is implemented to authenticate the password with the username. Thus, this feature implements a two-factor authentication - what the user has (the physical card) and what the user knows (i.e., the login password).
EMS: HTTPS Port [HTTPport]	Defines the LAN HTTP port for Web management (default is 80). To enable Web management from the LAN, configure the desired port. Note: For this parameter to take effect, a device reset is required.
EMS: Diochlo MED Confin	
EMS: Disable WEB Config [DisableWebConfig]	Determines whether the entire Web interface is read-only. • [0] = (Default) Enables modifications of parameters.
	• [1] = Web interface is read-only.
	When in read-only mode, parameters can't be modified. In addition, the

Parameter	Description
	following pages can't be accessed: 'Web User Accounts', 'Certificates', 'Regional Settings', 'Maintenance Actions' and all file-loading pages ('Load Auxiliary Files', 'Software Upgrade Wizard', and 'Configuration File'). Notes: For this parameter to take effect, a device reset is required. To return to read/write after you have applied read-only using this parameter (set to 1), you need to reboot your device with an ini file that doesn't include this parameter, using the AcBootP utility.
[ResetWebPassword]	Resets the username and password of the primary ("Admin") and secondary ("User") accounts to their default settings ("Admin" and "Admin" respectively), and deletes all other users that may have been configured. • [0] = (Default) Password and username retain their values. • [1] = Password and username are reset. Notes: • For this parameter to take effect, a device reset is required. • You cannot reset the username and password through the Web interface (by loading an ini file or on the AdminPage). To reset the username and password: • BootP: Set this parameter in an ini file and load it to the device through BootP (for more information, refer to the AcBootP Utility User's Guide). • SNMP: 1) Set acSysGenericINILine to WEBPasswordControlViaSNMP = 1, and reset the device with a flash burn (set acSysActionSetResetControl to 1 and acSysActionSetReset to 1). 2) Change the username and password in the acSysWEBAccessEntry table. Use the following format: Username acSysWEBAccessUserName: old/pass/new
[WelcomeMessage]	Password acSysWEBAccessUserCode: username/old/new Enables and defines a Welcome message that appears on the Web Login page for logging in to the Web interface. The format of this parameter is as follows: [WelcomeMessage] FORMAT WelcomeMessage_Index = WelcomeMessage_Text [\WelcomeMessage] For Example: FORMAT WelcomeMessage_Index = WelcomeMessage_Text WelcomeMessage 1 = "**********************************

50.1.3 Telnet Parameters

The Telnet parameters are described in the table below.

Table 50-3: Telnet Parameters

Parameter	Description
Web: Embedded Telnet Server EMS: Server Enable [TelnetServerEnable]	Enables the device's embedded Telnet server. Telnet is disabled by default for security. • [0] Disable (default) • [1] Enable Unsecured • [2] Enable Secured Note: Only the primary Web User Account (which has Security Administration access level) can access the device using Telnet (see "Configuring Web User Accounts" on page 68).
Web: Telnet Server TCP Port EMS: Server Port [TelnetServerPort]	Defines the port number for the embedded Telnet server. The valid range is all valid port numbers. The default port is 23.
Web: Telnet Server Idle Timeout EMS: Server Idle Disconnect [TelnetServerIdleDisconnect]	Defines the timeout (in minutes) for disconnection of an idle Telnet session. When set to zero, idle sessions are not disconnected. The valid range is any value. The default is 0. Note: For this parameter to take effect, a device reset is required.
Web: Maximum Telnet Sessions [TelnetMaxSessions]	Defines the maximum number of permitted, concurrent Telnet/SSH sessions. The valid range is 1 to 5 sessions. The default is 2. Note: Before changing the value, make sure that not more than this number of sessions are currently active; otherwise, the new setting will not take effect.

50.1.4 ini File Parameters

The parameters relating to ini-file management are described in the table below.

Table 50-4: ini File Parameters

Parameter	Description
[INIPasswordsDisplayType]	Defines how passwords are displayed in the ini file.
	 [0] Disable (default) = Passwords are obscured ("encoded"). The passwords are displayed in the following syntax: \$1\$<obscured password> (e.g., \$1\$S3p+fno=).</obscured
	• [1] Enable = All passwords are hidden and replaced by an asterisk (*).

50.1.5 SNMP Parameters

The SNMP parameters are described in the table below.

Table 50-5: SNMP Parameters

Parameter	Description
Web: Enable SNMP	Enables SNMP.

User's Manual 694 Document #: LTRT-89725

Parameter	Description
[DisableSNMP]	 [0] Enable (default) [1] Disable = SNMP is disabled and no traps are sent.
[SNMPPort]	Defines the device's local (LAN) UDP port used for SNMP Get/Set commands.
	The range is 100 to 3999. The default port is 161.
	Note: For this parameter to take effect, a device reset is required.
[ChassisPhysicalAlias]	Defines the 'alias' name object for the physical entity as specified by a network manager, and provides a non-volatile 'handle' for the physical entity. The valid range is a string of up to 255 characters.
[ChassisPhysicalAssetID]	Defines the user-assigned asset tracking identifier object for the device's chassis as specified by an EMS, and provides non-volatile storage of this information. The valid range is a string of up to 255 characters.
[ifAlias]	Defines the textual name of the interface. The value is equal to the ifAlias SNMP MIB object. The valid range is a string of up to 64 characters.
[SendKeepAliveTrap]	Enables the device to send NAT keep-alive traps to the port of the SNMP network management station (e.g., AudioCodes EMS). This is used for NAT traversal, and allows SNMP communication with AudioCodes EMS management platform, located in the WAN, when the device is located behind NAT. It is needed to keep the NAT pinhole open for the SNMP messages sent from EMS to the device. The device sends the trap periodically - every 9/10 of the time configured by the NATBindingDefaultTimeout parameter. The trap that is sent is acKeepAlive. For more information on the SNMP trap, refer to the SNMP Reference Guide. • [0] = (Default) Disable • [1] = Enable For configuring the port number, use the KeepAliveTrapPort parameter. Note: For this parameter to take effect, a device reset is required.
EMS: Keep Alive Trap Port [KeepAliveTrapPort]	Defines the port of the SNMP network management station to which the device sends keep-alive traps. The valid range is 0 to 65534. The default is 162. To enable NAT keep-alive traps, use the SendKeepAliveTrap parameter.
[SNMPSysOid]	Defines the base product system OID. The default is eSNMP_AC_PRODUCT_BASE_OID_D. Note: For this parameter to take effect, a device reset is required.
[SNMPTrapEnterpriseOid]	Defines the Trap Enterprise OID.
	The default is eSNMP_AC_ENTERPRISE_OID. The inner shift of the trap in the AcTrap subtree is added to the end of the OID in this parameter.
	Note: For this parameter to take effect, a device reset is required.
[acUserInputAlarmDescrip tion]	Defines the description of the input alarm.

Parameter	Description
[acUserInputAlarmSeverity]	Defines the severity of the input alarm.
[AlarmHistoryTableMaxSiz e]	Defines the maximum number of rows in the Alarm History table. This parameter can be controlled by the Config Global Entry Limit MIB (located in the Notification Log MIB). The valid range is 50 to 1000. The default is 500. Note: For this parameter to take effect, a device reset is required.
[SNMPEngineIDString]	Defines the SNMP engine ID for SNMPv2/SNMPv3 agents. This is used for authenticating a user attempting to access the SNMP agent on the device. The ID can be a string of up to 36 characters. The default is 00:00:00:00:00:00:00:00:00:00:00:00:00 (12 Hex octets characters). The provided key must be set with 12 Hex values delimited by a colon (":") in the format xx:xx::xx. For example, 00:11:22:33:44:55:66:77:88:99:aa:bb Notes: For this parameter to take effect, a device reset is required. Before setting this parameter, all SNMPv3 users must be deleted; otherwise, the parameter setting is ignored. If the supplied key does not pass validation of the 12 Hex values input or it is set with the default value, the engine ID is generated according to RFC 3411.
Web: SNMP Trap Destinatio EMS: Network > SNMP Mana Note: Up to five SNMP trap m	gers Table
SNMP Manager [SNMPManagerIsUsed_x]	Determines the validity of the parameters (IP address and port number) of the corresponding SNMP Manager used to receive SNMP traps. • [0] (Check box cleared) = Disabled (default) • [1] (Check box selected) = Enabled
Web: IP Address EMS: Address [SNMPManagerTableIP_x]	Defines the IP address of the remote host used as an SNMP Manager. The device sends SNMP traps to this IP address. Enter the IP address in dotted-decimal notation, e.g., 108.10.1.255.
Web: Trap Port EMS: Port [SNMPManagerTrapPort_x]	Defines the port number of the remote SNMP Manager. The device sends SNMP traps to this port. The valid SNMP trap port range is 100 to 4000. The default port is 162.
Web: Trap Enable [SNMPManagerTrapSendin gEnable_x]	 Enables the sending of traps to the corresponding SNMP manager. [0] Disable = Sending is disabled. [1] Enable = (Default) Sending is enabled.
Web: Trap User [SNMPManagerTrapUser_x]	Defines the SNMPv3 USM user or SNMPv2 user to associate with the trap destination. This determines the trap format, authentication level, and encryption level. By default, it is associated with the SNMPv2 user (SNMP trap community string). The valid value is a string.
Web: Trap Manager Host Name [SNMPTrapManagerHostN	Defines an FQDN of the remote host used as an SNMP manager. The resolved IP address replaces the last entry in the Trap Manager table (defined by the SNMPManagerTableIP parameter) and the last trap

Parameter	Description
ame]	manager entry of snmpTargetAddrTable in the snmpTargetMIB. For example: 'mngr.corp.mycompany.com'. The valid range is a string of up to 99 characters.
SNMP Community String Pa	arameters
Community String [SNMPReadOnlyCommunit yString_x]	Defines up to five read-only SNMP community strings (up to 19 characters each). The default string is 'public'.
Community String [SNMPReadWriteCommunityString_x]	Defines up to five read/write SNMP community strings (up to 19 characters each). The default string is 'private'.
Trap Community String [SNMPTrapCommunityString]	Defines the Community string used in traps (up to 19 characters). The default string is 'trapuser'.
SNMP Trusted Managers Ta	ble
Web: SNMP Trusted Managers [SNMPTrustedMgr_x]	Defines up to five IP addresses of remote trusted SNMP managers from which the SNMP agent accepts and processes SNMP Get and Set requests. Notes: By default, the SNMP agent accepts SNMP Get and Set requests from any IP address, as long as the correct community string is used in the request. Security can be enhanced by using Trusted Managers, which is an IP address from which the SNMP agent accepts and processes SNMP requests. If no values are assigned to these parameters any manager can access the device. Trusted managers can work with all community strings.
SNMP V3 Users Table	
Web/EMS: SNMP V3 Users [SNMPUsers]	This parameter table defines SNMP v3 users. The format of this parameter is as follows: [SNMPUsers] FORMAT SNMPUsers_Index = SNMPUsers_Username, SNMPUsers_AuthProtocol, SNMPUsers_PrivProtocol, SNMPUsers_AuthKey, SNMPUsers_PrivKey, SNMPUsers_Group; [\SNMPUsers] For example: SNMPUsers 1 = v3admin1, 1, 0, myauthkey, -, 1; The example above configures user 'v3admin1' with security level authNoPriv(2), authentication protocol MD5, authentication text password 'myauthkey', and ReadWriteGroup2. For a description of this table, see "Configuring SNMP V3 Users" on page 97.

50.1.6 Serial Parameters

The RS-232 serial parameters are described in the table below.

Table 50-6: Serial Parameters

Table 50-0. Serial Farameters	
Parameter	Description
[DisableRS232]	 Enables the device's RS-232 (serial) port. [0] = (Default) Enabled [1] = Disabled The RS-232 serial port can be used to change the networking parameters and view error/notification messages. For how to establish a serial communication with the device, refer to the <i>Installation Manual</i>. Note: For this parameter to take effect, a device reset is required.
EMS: Baud Rate [SerialBaudRate]	Defines the RS-232 baud rate. The valid values include the following: 1200, 2400, 9600, 14400, 19200, 38400, 57600, or 115200 (default). Note: For this parameter to take effect, a device reset is required.
EMS: Data [SerialData]	Defines the RS-232 data bit. • [7] = 7-bit • [8] = (Default) 8-bit Note: For this parameter to take effect, a device reset is required.
EMS: Parity [SerialParity]	Defines the RS-232 polarity. • [0] = (Default) None • [1] = Odd • [2] = Even Note: For this parameter to take effect, a device reset is required.
EMS: Stop [SerialStop]	Defines the RS-232 stop bit. • [1] = (Default) 1-bit (default) • [2] = 2-bit Note: For this parameter to take effect, a device reset is required.
EMS: Flow Control [SerialFlowControl]	Defines the RS-232 flow control. • [0] = (Default) None • [1] = Hardware Note: For this parameter to take effect, a device reset is required.

50.1.7 Auxiliary and Configuration File Name Parameters

The configuration files (i.e., auxiliary files) can be loaded to the device using the Web interface or a TFTP session. For loading these files using the *ini* file, you need to configure these files in the *ini* file and configured whether they must be stored in the non-volatile memory. The table below lists the *ini* file parameters associated with these auxiliary files. For more information on the auxiliary files, see "Loading Auxiliary Files" on page 555.

Table 50-7: Auxiliary and Configuration File Parameters

Parameter	Description
General Parameters	
[SetDefaultOnIniFileProcess]	Determines if all the device's parameters are set to their defaults before processing the updated <i>ini</i> file.
	 [0] = Disable - parameters not included in the downloaded <i>ini</i> file are not returned to default settings (i.e., retain their current settings). [1] = Enable (default).
	Note: This parameter is applicable only for automatic HTTP update or Web <i>ini</i> file upload (not applicable if the <i>ini</i> file is loaded using BootP).
[SaveConfiguration]	Determines if the device's configuration (parameters and files) is saved to flash (non-volatile memory).
	 [0] = Configuration isn't saved to flash memory. [1] = (Default) Configuration is saved to flash memory.
Auxiliary and Configuration Fil	e Name Parameters
Web/EMS: Call Progress Tones File [CallProgressTonesFilename]	Defines the name of the file containing the Call Progress Tones definitions. For more information on how to create and load this file, refer to <i>DConvert Utility User's Guide</i> .
	Note: For this parameter to take effect, a device reset is required.
Web/EMS: Prerecorded Tones File	Defines the name (and path) of the file containing the Prerecorded Tones.
[PrerecordedTonesFileName]	Note: For this parameter to take effect, a device reset is required.
Web: CAS File EMS: Trunk Cas Table Index [CASFileName_x]	Defines the CAS file name (e.g., 'E_M_WinkTable.dat'), which defines the CAS protocol (where x denotes the CAS file ID 0 to 7). It is possible to define up to eight different CAS files by repeating this parameter. Each CAS file can be associated with one or more of the device's trunks, using the parameter CASTableIndex or it can be associated per B-channel using the parameter CASChannelIndex. Note: For this parameter to take effect, a device reset is required.
Web: Dial Plan	Defines the Dial Plan name (up to 11-character strings) per trunk.
EMS: Dial Plan Name [CasTrunkDialPlanName_x]	Note: The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web: Dial Plan File EMS: Dial Plan File Name [DialPlanFileName]	Defines the name (and path) of the Dial Plan file. This file should be created using AudioCodes DConvert utility (refer to <i>DConvert Utility User's Guide</i>).
[UserInfoFileName]	Defines the name (and path) of the file containing the User Information data.

50.1.8 Automatic Update Parameters

The automatic update of software and configuration files parameters are described in the table below.

Note: Auxiliary file upload through TFTP is not supported by HA mode.

Table 50-8: Automatic Update of Software and Configuration Files Parameters

Parameter	Description
General Automatic Update Pa	rameters
[AutoUpdateCmpFile]	 Enables the Automatic Update mechanism for the cmp file. [0] = (Default) The Automatic Update mechanism doesn't apply to the cmp file. [1] = The Automatic Update mechanism includes the cmp file. Note: For this parameter to take effect, a device reset is required.
[AutoUpdateFrequency]	Defines the number of minutes that the device waits between automatic updates. The default is 0 (i.e., the update at fixed intervals mechanism is disabled). Note: For this parameter to take effect, a device reset is required.
[AutoUpdatePredefinedTime]	Defines schedules (time of day) for automatic updates. The format syntax of this parameter is 'hh:mm', where hh denotes the hour and mm the minutes. The value must be enclosed in single apostrophes. For example, '20:18'. Notes:
	 For this parameter to take effect, a device reset is required. The actual update time is randomized by five minutes to reduce the load on the Web servers.
[AupdHttpUserAgent]	Defines the User-Agent HTTP header in the HTTP Get requests sent by the device to the provisioning server for the Automatic Update mechanism. The valid value is a string of up to 511 characters. By default, this parameter is not defined. In other words, the User-Agent header is
	 set to "Mozilla/4.0 (compatible; AudioCodes; <name>;<ver>)", where the tags are replaced with actual values.</ver></name> Notes: The variable tags are case-sensitive. The tags can be defined in any order. The tags must be defined adjacent to one another (i.e., no spaces or special characters).
[AutoCmpFileUrl]	Defines the filename and path (URL) to the provisioning server from where the software file (.cmp) can be downloaded, based on timestamp for the Automatic Updated mechanism. The valid value is an IP address in dotted-decimal notation or an FQDN.

Parameter	Description
EMS: AUPD Verify Certificates [AUPDVerifyCertificates]	Determines whether the Automatic Update mechanism verifies server certificates when using HTTPS. • [0] = Disable (default) • [1] = Enable
[AUPDDigestUsername]	Defines the username for digest (MD5 cryptographic hashing) access authentication with the HTTP server used for the Automatic Update feature. The valid value is a string of up to 50 characters. By default, no
	value is defined.
[AUPDDigestPassword]	Defines the password for digest (MD5 cryptographic hashing) access authentication with the HTTP server used for the Automatic Update feature. The valid value is a string of up to 50 characters. By default, no
	value is defined.
[AUPDCheckIfIniChanged]	Enables the device to perform cyclic redundancy checks (CRC) on downloaded configuration files (ini) during the Automatic Update process. The CRC checks whether the content (raw data) of the downloaded file is different to the content of the previously downloaded file from the previous Automatic Update process. The device compares the CRC check value (code) result with the check value of the previously downloaded file. If the check values are identical, it indicates that the file has no new configuration settings, and the device discards the file. If the check values are different, the device installs the downloaded file and applies the new configuration settings. Ignormal [0] = (Default) Disable - the device does not perform CRC and installs the downloaded file regardless. Ignormal [1] = Enable CRC for the entire file, including line order (i.e., same text must be on the same lines). If there are differences between the files, the device installs the downloaded file. If there are no differences, the device discards the newly downloaded file. Ignormal [2] = Enable CRC for individual lines only. Same as option [1], except that the CRC ignores the order of lines (i.e., same text can be on different lines).
[AUPDTftpBlockSize]	Defines the size of the TFTP data blocks (packets) when downloading a file from a TFTP server for the Automatic Update mechanism. This is in accordance to RFC 2348. TFTP block size is the physical packet size (in bytes) that a network can transmit. When configured to a value higher than the default (512 bytes), but lower than the client network's Maximum Transmission Unit (MTU), the file download speed can be significantly increased. The valid value is 512 to 8192. The default is 512. Notes: A higher value does not necessarily mean better performance. The block size should be small enough to avoid IP fragmentation in the client network (i.e., below MTU). This feature is applicable only to TFTP servers that support this option.

Version 6.8 701 Mediant 3000

Parameter	Description
[ResetNow]	Invokes an immediate device reset. This option can be used to activate offline (i.e., not on-the-fly) parameters that are loaded using the parameter IniFileUrl.
	 [0] = (Default) The immediate restart mechanism is disabled. [1] = The device immediately resets after an <i>ini</i> file with this parameter set to 1 is loaded.
	Note: If you use this parameter in an ini file for periodic automatic provisioning with non-HTTP (e.g., TFTP) and without CRC, the device resets after every file download.
Software/Configuration File U	RL Path for Automatic Update Parameters
[CmpFileURL]	Defines the name of the <i>cmp</i> file and the path to the server (IP address or FQDN) from where the device can load the <i>cmp</i> file and update itself. The <i>cmp</i> file can be loaded using HTTP/HTTPS, FTP, FTPS, or NFS. For example: http://192.168.0.1/filename
	Notes:
	 For this parameter to take effect, a device reset is required. When this parameter is configured, the device always loads the <i>cmp</i> file after it is reset.
	 The cmp file is validated before it's burned to flash. The checksum of the cmp file is also compared to the previously burnt checksum to avoid unnecessary resets.
	The maximum length of the URL address is 255 characters.
[IniFileURL]	Defines the name of the <i>ini</i> file and the path to the server (IP address or FQDN) on which it is located. The <i>ini</i> file can be loaded using HTTP/HTTPS, FTP, FTPS, or NFS. For example: http://192.168.0.1/filename http://192.8.77.13/config <mac> https://<username>:<pre>rassword>@<ip address="">/<file name=""></file></ip></pre></username></mac>
	Notes:
	 For this parameter to take effect, a device reset is required. When using HTTP or HTTPS, the date and time of the <i>ini</i> file are validated. Only more recently dated <i>ini</i> files are loaded. The case-sensitive string, "<mac>" can be used in the file name for instructing the device to replace it with the device's MAC address. For more information, see MAC Address Automatically Inserted in Configuration File Name on page 600.</mac> The maximum length of the URL address is 99 characters.
CLI: prerecorded-tones [PrtFileURL]	Defines the name of the Prerecorded Tones (PRT) file and the path to the server (IP address or FQDN) on which it is located. For example: http://server_name/file, https://server_name/file.
	Note: The maximum length of the URL address is 99 characters.
[CptFileURL]	Defines the name of the CPT file and the path to the server (IP address or FQDN) on which it is located. For example: http://server_name/file, https://server_name/file.
	Note: The maximum length of the URL address is 99 characters.

Parameter	Description
[CasFileURL]	Defines the name of the CAS file and the path to the server (IP address or FQDN) on which it is located. For example: http://server_name/file, https://server_name/file. Note: The maximum length of the URL address is 99 characters.
[TLSRootFileUrl]	Defines the name of the TLS trusted root certificate file and the URL from where it can be downloaded. Note: For this parameter to take effect, a device reset is required.
[TLSCertFileUrl]	Defines the name of the TLS certificate file and the URL from where it can be downloaded. Note: For this parameter to take effect, a device reset is required.
[TLSPkeyFileUrl]	Defines the URL for downloading a TLS private key file using the Automatic Update facility.
[UserInfoFileURL]	Defines the name of the User Information file and the path to the server (IP address or FQDN) on which it is located. For example: http://server_name/file, https://server_name/file Note: The maximum length of the URL address is 99 characters.

50.2 Networking Parameters

This subsection describes the device's networking parameters.

50.2.1 Ethernet Parameters

The Ethernet parameters are described in the table below.

Table 50-9: Ethernet Parameters

Parameter	Description
EMS: Physical Configuration [EthernetPhyConfiguration]	Defines the Ethernet connection mode type. • [0] = 10Base-T half-duplex (Not applicable) • [1] = 10Base-T full-duplex • [2] = 100Base-TX half-duplex (Not applicable) • [3] = 100Base-TX full-duplex • [4] = (Default) Auto-negotiate • [6] = 1000Base-TX half-duplex (Not applicable) • [7] = 1000Base-TX full-duplex Note: For this parameter to take effect, a device reset is required.

50.2.2 Multiple VolP Network Interfaces and VLAN Parameters

The IP network interfaces and VLAN parameters are described in the table below.

Table 50-10: IP Network Interfaces and VLAN Parameters

Table 50-10: IP Network Interfaces and VLAN Parameters	
Parameter	Description
Interface Table	
Web: Interface Table EMS: IP Interface Settings [InterfaceTable]	This table parameter configures the Interface table. The format of the ini file table parameter is as follows: [InterfaceTable] FORMAT InterfaceTable_Index = InterfaceTable_ApplicationTypes, InterfaceTable_InterfaceMode, InterfaceTable_IPAddress, InterfaceTable_PrefixLength, InterfaceTable_Gateway, InterfaceTable_VlanID, InterfaceTable_InterfaceName, InterfaceTable_PrimaryDNSServerIPAddress, InterfaceTable_SecondaryDNSServerIPAddress, InterfaceTable_UnderlyingInterface; [\InterfaceTable] For a detailed description of this table, see "Configuring IP Network Interfaces" on page 126. Note: For this parameter to take effect, a device reset is
Physical Network Separation Feature	required.
Web/EMS: Network Physical Separation [EnableNetworkPhysicalSeparation]	 Enables physical separation (dedicated ports) for each network type (Media, Control, and OAMP). [0] Disable (default) [1] Enable Notes: For this parameter to take effect, a device reset is required. This parameter is applicable only to Mediant 3000 with TP-8410. When the parameter is enabled, user VLANs are not supported (i.e., VIANMode is set to 1). For a description of the Physical Network Separation feature, see Physical Network Separation Mode on page 539.
VLAN Parameters	
Web/EMS: VLAN Mode [VLANMode]	 Enables VLANs tagging (IEEE 802.1Q). [0] Disable (default) [1] Enable Notes: For this parameter to take effect, a device reset is required. To operate with multiple network interfaces, VLANs must be enabled. If this parameter is enabled, separate physical networks for Media, OAMP, and Control network types (configured with the EnableNetworkPhysicalSeparation parameter) is disabled. VLANs are available only when booting the device from

Parameter	Description
	flash. When booting using BootP/DHCP protocols, VLANs are disabled to allow easier maintenance access. In this scenario, multiple network interface capabilities (including IPv6) are unavailable.
Web/EMS: Native VLAN ID [VLANNativeVLANID]	Defines the Native VLAN ID. This is the VLAN ID to which untagged incoming traffic is assigned. Outgoing packets sent to this VLAN are sent only with a priority tag (VLAN ID = 0). When the Native VLAN ID is equal to one of the VLAN IDs listed in the Multiple Interface table (and VLANs are enabled), untagged incoming traffic is considered as incoming traffic for that interface. Outgoing traffic sent from this interface is sent with the priority tag (tagged with VLAN ID = 0). When the Native VLAN ID is different to any value in the 'VLAN ID' column in the table, untagged incoming traffic is discarded and all outgoing traffic is tagged. The default Native VLAN ID is 1. Note: If this parameter is not configured (i.e., default value is 1) and one of the interfaces has a VLAN ID set to 1, this interface is still considered the 'Native' VLAN. If you do not wish to have a 'Native' VLAN ID and want to use VLAN ID in the table.
[EnableNTPasOAM]	Defines the application type for Network Time Protocol (NTP) services. • [1] = OAMP (default) • [0] = Control Note: For this parameter to take effect, a device reset is required.
[VLANSendNonTaggedOnNative]	Determines whether to send non-tagged packets on the native VLAN. • [0] = (Default) Sends priority tag packets. • [1] = Sends regular packets (with no VLAN tag). Note: For this parameter to take effect, a device reset is required.

50.2.3 Routing Parameters

The IP network routing parameters are described in the table below.

Table 50-11: IP Network Routing Parameters

Parameter	Description
Web: Send ICMP Unreachable Messages [DisableICMPUnreachable]	 Enables sending of ICMP Unreachable messages. [0] Enable = (Default) Device sends these messages. [1] Disable = Device does not send these messages.
Web: Send and Receive ICMP Redirect Messages [DisableICMPRedirects]	 Enables sending and receiving of ICMP Redirect messages. [0] Enable = (Default) Device sends and accepts these messages. [1] Disable = Device rejects these messages and also does not send them.

Parameter	Description
Static Route Table	
Web/EMS: Static Route Table [StaticRouteTable]	Defines up to 30 static IP routes for the device. The format of the ini file table parameter is as follows: [StaticRouteTable] FORMAT StaticRouteTable_Index = StaticRouteTable_DeviceName, StaticRouteTable_Destination, StaticRouteTable_PrefixLength, StaticRouteTable_Gateway, StaticRouteTable_Description; [\StaticRouteTable] For a description of this parameter, see "Configuring Static IP Routes" on page 134.

50.2.4 Quality of Service Parameters

The Quality of Service (QoS) parameters are described in the table below.

Table 50-12: QoS Parameters

_		
Parameter	Description	
Layer-2 Class Of Service (CoS) Pa	arameters (VLAN Tag Priority Field)	
Web: Network Priority EMS: Network Service Class Priority [VLANNetworkServiceClassPriority]	Defines the VLAN priority (IEEE 802.1p) for Network Class of Service (CoS) content. The valid range is 0 to 7. The default is 7.	
Web: Media Premium EMS: Premium Service Class Media Priority Priority [VLANPremiumServiceClassMedia Priority]	Defines the VLAN priority (IEEE 802.1p) for the Premium CoS content and media traffic. The valid range is 0 to 7. The default is 6.	
Web: Control Premium Priority EMS: Premium Service Class Control Priority [VLANPremiumServiceClassControlPriority]	Defines the VLAN priority (IEEE 802.1p) for the Premium CoS content and control traffic. The valid range is 0 to 7. The default is 6.	
Web: Gold Priority EMS: Gold Service Class Priority [VlanGoldServiceClassPriority]	Defines the VLAN priority (IEEE 802.1p) for the Gold CoS content. The valid range is 0 to 7. The default is 4.	
Web: Bronze Priority EMS: Bronze Service Class Priority [VLANBronzeServiceClassPriority]	Defines the VLAN priority (IEEE 802.1p) for the Bronze CoS content. The valid range is 0 to 7. The default is 2.	
Layer-3 Class of Service (TOS/DiffServ) Parameters		
Web: Network QoS EMS: Network Service Class Diff Serv [NetworkServiceClassDiffServ]	Defines the Differentiated Services (DiffServ) value for Network CoS content. The valid range is 0 to 63. The default is 48. Note: For this parameter to take effect, a device reset is required.	
Web: Media Premium QoS	Global parameter that defines the DiffServ value for Premium	

Parameter	Description
EMS: Premium Service Class Media Diff Serv [PremiumServiceClassMediaDiff Serv]	Media CoS content. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_IPDiffServ). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Control Premium QoS EMS: Premium Service Class Control Diff Serv [PremiumServiceClassControlDi ffServ]	Global parameter that defines the DiffServ value for Premium Control CoS content (Call Control applications). You can also configure this functionality per specific calls, using IP Profiles (IpProfile_SigIPDiffServ). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Gold QoS EMS: Gold Service Class Diff Serv [GoldServiceClassDiffServ]	Defines the DiffServ value for the Gold CoS content (Streaming applications). The valid range is 0 to 63. The default is 26.
Web: Bronze QoS EMS: Bronze Service Class Diff Serv [BronzeServiceClassDiffServ]	Defines the DiffServ value for the Bronze CoS content (OAMP applications). The valid range is 0 to 63. The default is 10.

50.2.5 NAT and STUN Parameters

The Network Address Translation (NAT) and Simple Traversal of UDP through NAT (STUN) parameters are described in the table below.

Table 50-13: NAT and STUN Parameters

Parameter	Description
STUN Parameters	
Web: Enable STUN EMS: STUN Enable [EnableSTUN]	Enables Simple Traversal of UDP through NATs (STUN).[0] Disable (default)[1] Enable
	When enabled, the device functions as a STUN client and communicates with a STUN server located in the public Internet. STUN is used to discover whether the device is located behind a NAT and the type of NAT. It is also used to determine the IP addresses and port numbers that the NAT assigns to outgoing signaling messages (using SIP) and media streams (using RTP, RTCP and T.38). STUN works with many existing NAT types and does not require any special behavior from them.
	Notes:
	For this parameter to take effect, a device reset is required.
	 For defining the STUN server domain name, use the parameter STUNServerDomainName.
	For more information on STUN, see Configuring STUN on page

Parameter	Description
	146.
Web: STUN Server Primary IP EMS: Primary Server IP [STUNServerPrimaryIP]	Defines the IP address of the primary STUN server. The valid range is the legal IP addresses. The default is 0.0.0.0. Note: For this parameter to take effect, a device reset is required.
Web: STUN Server Secondary IP EMS: Secondary Server IP [STUNServerSecondaryIP]	Defines the IP address of the secondary STUN server. The valid range is the legal IP addresses. The default is 0.0.0.0. Note: For this parameter to take effect, a device reset is required.
[STUNServerDomainName]	Defines the domain name for the Simple Traversal of User Datagram Protocol (STUN) server's address (used for retrieving all STUN servers with an SRV query). The STUN client can perform the required SRV query to resolve this domain name to an IP address and port, sort the server list, and use the servers according to the sorted list. Notes: For this parameter to take effect, a device reset is required. Use either the STUNServerPrimaryIP or the
NAT Devementare	STUNServerDomainName parameter, with priority to the first one.
NAT Parameters	
Web/EMS: NAT Mode CLI: disable-NAT-traversal [NATMode]	 Enables the NAT feature for media when the device communicates with UAs located behind NAT. [0] Auto-Detect = NAT is performed only if necessary. If the UA is identified as being located behind NAT, the device sends the media packets to the public IP address:port obtained from the source address of the first media packet received from the UA. Otherwise, the packets are sent using the IP address:port obtained from the address in the first received SIP message. Note that if the SIP session is established (ACK) and the device (not the UA) sends the first packet, it sends it to the address obtained from the SIP message and only after the device receives the first packet from the UA, does it determine whether the UA is behind NAT. [1] NAT Is Not Used = (Default) NAT feature is disabled. The device always sends the media packets to the remote UA using the IP address:port obtained from the first received SIP message. [2] NAT Is Used = NAT is always performed. The device always sends the media packets to the remote UA using the source address obtained from the first media packet from the UA. In this mode, the device does not send any packets until it receives the first packet from the UA (in order to obtain the IP address). For more information on handling calls from UAs behind NAT, see "First Incoming Packet Mechanism" on page 150.
Web: NAT IP Address EMS: Static NAT IP Address [StaticNatIP]	Defines the global (public) IP address of the device to enable static NAT between the device and the Internet. Note: For this parameter to take effect, a device reset is required.
EMS: Binding Life Time [NATBindingDefaultTimeout]	The device sends SNMP keep-alive traps periodically - every 9/10 of the time configured by this parameter (in seconds). Therefore, the parameter is applicable only if the SendKeepAliveTrap parameter is set to 1. The parameter is used to allow SNMP communication with AudioCodes EMS management platform, located in the WAN, when the device is located behind NAT. It is needed to keep the NAT pinhole

Parameter	Description
	open for the SNMP messages sent from EMS to the device. In addition, the parameter also defines the default NAT binding time (in seconds) for STUN packets. STUN packets refresh the NAT binding when this time expires. This feature is applicable only if the EnableSTUN parameter is set to 1. The valid range is 0 to 2,592,000. The default is 30. Note: For this parameter to take effect, a device reset is required.
[EnableIPAddrTranslation]	 Enables IP address translation for RTP, RTCP, and T.38 packets. [0] = Disable IP address translation. [1] = (Default) Enable IP address translation. When enabled, the device compares the source IP address of the first incoming packet to the remote IP address stated in the opening of the channel. If the two IP addresses don't match, the NAT mechanism is activated. Consequently, the remote IP address of the outgoing stream is replaced by the source IP address of the first incoming packet. Notes:
	 The NAT mechanism must be enabled for this parameter to take effect (see the NATMode parameter).
[EnableUDPPortTranslation]	 [0] = (Default) Disables UDP port translation. [1] = Enables UDP port translation. The device compares the source UDP port of the first incoming packet to the remote UDP port stated in the opening of the channel. If the two UDP ports don't match, the NAT mechanism is activated. Consequently, the remote UDP port of the outgoing stream is replaced by the source UDP port of the first incoming packet.
	 Notes: For this parameter to take effect, a device reset is required. The NAT mechanism and the IP address translation must be enabled for this parameter to take effect, using the NATMode and EnablelpAddrTranslation parameters, respectively.
Web: SIP NAT Detection [SIPNatDetection]	 Enables the device to detect whether the incoming INVITE message is sent from an endpoint located behind NAT. [0] Disable = Disables the device's NAT Detection mechanism. Incoming SIP messages are processed as received from endpoints that are not located behind NAT and sent according to the SIP standard. [1] Enable (default) = Enables the device's NAT Detection mechanism.

50.2.6 NFS Parameters

The Network File Systems (NFS) configuration parameters are described in the table below.

Table 50-14: NFS Parameters

Parameter	Description
[NFSBasePort]	Defines the start of the range of numbers used for local UDP ports used by the NFS client. The maximum number of local ports is maximum channels plus maximum NFS servers.
	The valid range is 0 to 65535. The default is 47000.
NFS Table	
Web: NFS Table EMS: NFS Settings [NFSServers]	This table parameter defines up to 16 NFS file systems so that the device can access a remote server's shared files and directories for loading cmp, ini, and auxiliary files (using the Automatic Update mechanism). The format of this table ini file parameter is as follows:
	[NFSServers] FORMAT NFSServers_Index = NFSServers_HostOrIP, NFSServers_RootPath, NFSServers_NfsVersion, NFSServers_AuthType, NFSServers_UID, NFSServers_GID, NFSServers_VlanType; [\NFSServers]
	For example: NFSServers 1 = 101.1.13, /audio1, 3, 1, 0, 1, 1;
	For a detailed description of this table, see "Configuring NFS Settings" on page 143.

50.2.7 DNS Parameters

The Domain name System (DNS) parameters are described in the table below.

Table 50-15: DNS Parameters

Parameter	Description
Internal DNS Table	
Web: Internal DNS Table EMS: DNS Information [DNS2IP]	This table parameter defines the internal DNS table for resolving host names into IP addresses. Up to four different IP addresses (in dotted-decimal notation) can be assigned to a host name. The format of this parameter is as follows:
	[Dns2lp] FORMAT Dns2lp_Index = Dns2lp_DomainName, Dns2lp_FirstlpAddress, Dns2lp_SecondlpAddress, Dns2lp_ThirdlpAddress, Dns2lp_FourthlpAddress; [\Dns2lp]
	For example: Dns2lp 0 = DnsName, 1.1.1.1, 2.2.2.2, 3.3.3.3, 4.4.4.4;
	For a detailed description of this table, see "Configuring the Internal DNS Table" on page 140.
Internal SRV Table	

Parameter	Description
Web: Internal SRV Table EMS: DNS Information [SRV2IP]	This table parameter defines the internal SRV table for resolving host names into DNS A-Records. Three different A-Records can be assigned to a host name. Each A-Record contains the host name, priority, weight, and port. The format of this parameter is as follows: [SRV2IP] FORMAT SRV2IP_Index = SRV2IP_InternalDomain, SRV2IP_TransportType, SRV2IP_Dns1, SRV2IP_Priority1, SRV2IP_Weight1, SRV2IP_Port1, SRV2IP_Dns2, SRV2IP_Priority2, SRV2IP_Weight2, SRV2IP_Port2, SRV2IP_Dns3, SRV2IP_Priority3, SRV2IP_Weight3, SRV2IP_Port3; [\SRV2IP]
	For example: SRV2IP 0 = SrvDomain,0,Dnsname1,1,1,500,Dnsname2,2,2,501,\$\$,0,0,0; For a detailed description of this table, see "Configuring the Internal SRV Table" on page 142.

50.2.8 DHCP Parameters

The Dynamic Host Control Protocol (DHCP) parameters are described in the table below.

Table 50-16: DHCP Parameters

Parameter	Description
Web: Enable DHCP EMS: DHCP Enable [DHCPEnable]	 Enables Dynamic Host Control Protocol (DHCP) functionality. [0] Disable (default) [1] Enable Notes: For this parameter to take effect, a device reset is required. For a detailed description of DHCP, see "DHCP-based Configuration Server" on page 604. This parameter is a "hidden" parameter. Once defined and saved to flash memory, its value doesn't revert to default even if the parameter doesn't appear in the <i>ini</i> file.
EMS: DHCP Speed Factor [DHCPSpeedFactor]	Defines the DHCP renewal speed. • [0] = Disable • [1] = (Default) Normal • [2] to [10] = Fast When set to 0, the DHCP lease renewal is disabled. Otherwise, the renewal time is divided by this factor. Some DHCP-enabled routers perform better when set to 4. Note: For this parameter to take effect, a device reset is required.

50.2.9 NTP and Daylight Saving Time Parameters

The Network Time Protocol (NTP) and daylight saving time parameters are described in the table below.

Table 50-17: NTP and Daylight Saving Time Parameters

Parameter	Description
NTP Parameters Note: For more information on Network Time Protocol (NTP), see "Simple Network Time Protocol Support" on page 119.	
Web: NTP Server Address EMS: Server IP Address [NTPServerIP]	Defines the IP address (in dotted-decimal notation or as an FQDN) of the NTP server. The advantage of using an FQDN is that multiple IP addresses can be resolved from the DNS server, providing NTP server redundancy. The default IP address is 0.0.0.0 (i.e., internal NTP client is disabled).
Web: NTP Secondary Server Address [NTPSecondaryServerIP]	Defines a second NTP server's address as an FQDN or an IP address (in dotted-decimal notation). This NTP is used for redundancy; if the primary NTP server fails, then this NTP server is used. The default IP address is 0.0.0.0.
Web: NTP UTC Offset EMS: UTC Offset [NTPServerUTCOffset]	Defines the Universal Time Coordinate (UTC) offset (in seconds) from the NTP server. The default offset is 0. The offset range is -43200 to 43200. Note: The offset setting is applied only on the hour. For example, if you configure this parameter at 15:42, the device applies the setting only at 16:00.
Web: NTP Update Interval EMS: Update Interval [NTPUpdateInterval]	Defines the time interval (in seconds) that the NTP client requests for a time update. The default interval is 86400 (i.e., 24 hours). The range is 0 to 214783647. Note: It is not recommend to set this parameter to beyond one month (i.e., 2592000 seconds).
Web: NTP Authentication Key Identifier [NtpAuthKeyId]	Defines the NTP authentication key identifier for authenticating NTP messages. The identifier must match the value configured on the NTP server. The NTP server may have several keys configured for different clients; this number identifies which key is used. The valid value is 1 to 65535. The default is 0 (i.e., no authentication is done).
Web: NTP Authentication Secret Key [ntpAuthMd5Key]	Defines the secret authentication key shared between the device (client) and the NTP server, for authenticating NTP messages. The valid value is a string of up to 32 characters. By default, no key is defined.
Daylight Saving Time Parameters	
Web: Day Light Saving Time EMS: Mode [DayLightSavingTimeEnable]	Enables daylight saving time.[0] Disable (default)[1] Enable
Web: Start Time / Day of Month Start	Defines the date and time when daylight saving begins. This value can be configured using any of the following formats:

Parameter	Description
EMS: Start [DayLightSavingTimeStart]	 Day of year - mm:dd:hh:mm, where: mm denotes month dd denotes date of the month hh denotes hour mm denotes minutes For example, "05:01:08:00" denotes daylight saving starting from May 1 at 8 A.M. Day of month - mm:day/wk:hh:mm, where: mm denotes month (e.g., 04) day denotes day of week (e.g., FRI) wk denotes week of the month (e.g., 03) hh denotes hour (e.g., 23) mm denotes minutes (e.g., 10) For example, "04:FRI/03:23:00" denotes Friday, the third week of April, at 11 P.M. The week field can be 1-5, where 5 denotes the last occurrence of the specified day in the specified month. For example, "04:FRI/05:23:00" denotes the last Friday of April, at 11 P.M.
Web: End Time / Day of Month End EMS: End [DayLightSavingTimeEnd]	Defines the date and time when daylight saving ends. For a description of the format of this value, see the DayLightSavingTimeStart parameter.
Web/EMS: Offset	Defines the daylight saving time offset (in minutes).
[DayLightSavingTimeOffset]	The valid range is 0 to 120. The default is 60.
	Note: The offset setting is applied only on the hour. For example, if you configure this parameter at 15:42, the device applies the setting only at 16:00.

50.3 Debugging and Diagnostics Parameters

This subsection describes the device's debugging and diagnostic parameters.

50.3.1 General Parameters

The general debugging and diagnostic parameters are described in the table below.

Table 50-18: General Debugging and Diagnostic Parameters

Parameter	Description
EMS: Enable Diagnostics [EnableDiagnostics]	Determines the method for verifying correct functioning of the different hardware components on the device. On completion of the check and if the test fails, the device sends information on the test results of each hardware component to the Syslog server. • [0] = (Default) Rapid and Enhanced self-test mode. • [1] = Detailed self-test mode (full test of DSPs, PCM, Switch, LAN, PHY and Flash). • [2] = A quicker version of the Detailed self-test mode (full test of DSPs, PCM, Switch, LAN, PHY, but partial test of Flash). Note: For this parameter to take effect, a device reset is required.
Web: Enable LAN Watchdog [EnableLanWatchDog]	 Enables the LAN watchdog feature, which detects any logical network failure. [0] Disable (default) [1] Enable & Reset = Enables LAN watchdog. If the device detects a network failure, the device resets. [2] Enable & No Reset = Enables LAN watchdog. If the device detects a network failure, it does not undergo a reset. The LAN watchdog periodically checks the device's overall communication integrity by pinging the network. If it detects a communication failure for more than three minutes, the device performs a self test: Test succeeds: The problem is due to a logical link failure (i.e., Ethernet cable disconnected on the remote switch) and the following mechanisms are activated if enabled: ✓ Busy Out mechanism (see the EnableBusyOut parameter) Test fails: The device resets (if this parameter is set to [2]) to overcome the internal communication error. Notes: For this parameter to take effect, a device reset is required. LAN watchdog is applicable only if the Ethernet connection is full duplex.
Web: Delay After Reset [sec] [GWAppDelayTime]	Defines the time interval (in seconds) that the device's operation is delayed after a reset. The valid range is 0 to 45. The default is 7 seconds. Note: This feature helps overcome connection problems caused by some LAN routers or IP configuration parameters' modifications by a DHCP server.

Parameter	Description
[EnableAutoRAITransmitBER]	Enables the device to send a remote alarm indication (RAI) when the bit error rate (BER) is greater than 0.001.
	[0] Disable (default)[1] Enable

50.3.2 SIP Test Call Parameters

The SIP Signaling Test Call parameters are described in the table below.

Table 50-19: SIP Test Call Parameters

Parameter	Description
Web: Test Call DTMF String [TestCallDtmfString]	Defines the DTMF tone that is played for answered test calls (incoming and outgoing).
	The DTMF string can be up to 15 strings. The default is "3212333". If no string is defined (empty), DTMF is not played.
Web: Test Call ID [TestCallID]	Defines the test call prefix number (<i>ID</i>) of the simulated phone on the device. Incoming calls received with this called prefix number are identified as test calls.
	This can be any string of up to 15 characters. By default, no number is defined.
	Notes:
	 This parameter is only for testing incoming calls destined to this prefix number.
	This feature is applicable to all applications (Gateway and SBC).
Web: SBC Test ID CLI: sbc-test-id [SBCtestID]	Defines the SBC test call prefix (ID) for identifying SBC test calls that traverse the device to register with an external routing entity such as an IP PBX or proxy server.
	This parameter functions together with the TestCallID parameter, which defines the prefix of the simulated endpoint. Upon receiving an incoming call with this prefix, the device removes the prefix, enabling it to forward the test call to the external entity. Upon receiving the call from the external entity, the device identifies the call as a test call according to its prefix, defined by the TestCallID, and then sends the call to the simulated endpoint.
	For example, assume SBCTestID is set to 4 and TestCallID to 2. If a call is received with called destination 4200, the device removes the prefix 4 and routes the call to the IP PBX. When it receives the call from the IP PBX, it identifies the call as a test call (i.e., prefix 2) and therefore, sends it to the simulated endpoint.
	The valid value can be any string of up to 15 characters. By default, no number is defined.
	Note: This feature is applicable only to the SBC application.
Test Call Table	
Web: Test Call Table [Test_Call]	Defines the local and remote endpoints to be tested.
	[Test_Call]
	FORMAT Test_Call_Index = Test_Call_EndpointURI, Test_Call_CalledURI, Test_Call_RouteBy, Test_Call_IPGroupID, Test_Call_DestAddress, Test_Call_DestTransportType, Test_Call_SRD,

Parameter	Description
	Test_Call_ApplicationType, Test_Call_AutoRegister, Test_Call_UserName, Test_Call_Password, Test_Call_CallParty, Test_Call_MaxChannels, Test_Call_CallDuration, Test_Call_CallsPerSecond, Test_Call_TestMode, Test_Call_TestDuration, Test_Call_Play, Test_Call_ScheduleInterval, Test_Call_QOEProfile, Test_Call_BWProfile; [\Test_Call]
	For a description of this table, see "Configuring Test Call Endpoints" on page 675.

50.3.3 Syslog, CDR and Debug Parameters

The Syslog, CDR and debug parameters are described in the table below.

Table 50-20: Syslog, CDR and Debug Parameters

Parameter	Description
Web: Enable Syslog EMS: Syslog enable [EnableSyslog]	Determines whether the device sends logs and error messages (e.g., CDRs) generated by the device to a Syslog server. • [0] Disable (default) • [1] Enable Notes: • If you enable Syslog, you must enter an IP address of the Syslog server (using the SyslogServerIP parameter). • Syslog messages may increase the network traffic. • To configure Syslog SIP message logging levels, use the GwDebugLevel parameter.
Web/EMS: Syslog Server IP Address [SyslogServerIP]	Defines the IP address (in dotted-decimal notation) of the computer on which the Syslog server is running. The Syslog server is an application designed to collect the logs and error messages generated by the device. The default IP address is 0.0.0.0.
Web: Syslog Server Port EMS: Syslog Server Port Number [SyslogServerPort]	Defines the UDP port of the Syslog server. The valid range is 0 to 65,535. The default port is 514.
Web: CDR Server IP Address EMS: IP Address of CDR Server [CDRSyslogServerIP]	Defines the destination IP address to where CDR logs are sent. The default value is a null string, which causes CDR messages to be sent with all Syslog messages to the Syslog server. Notes: The CDR messages are sent to UDP port 514 (default Syslog port). This mechanism is active only when Syslog is enabled (i.e., the parameter EnableSyslog is set to 1).
Web/EMS: CDR Report Level [CDRReportLevel]	 Enables media and signaling-related CDRs to be sent to a Syslog server and determines the call stage at which they are sent. [0] None = (Default) CDRs are not used. [1] End Call = CDR is sent to the Syslog server at the end of each call. [2] Start & End Call = CDR report is sent to Syslog at the start and

Parameter	Description
	 end of each call. [3] Connect & End Call = CDR report is sent to Syslog at connection and at the end of each call. [4] Start & End & Connect Call = CDR report is sent to Syslog at the start, at connection, and at the end of each call. Notes: For the SBC application, this parameter enables only signaling-related CDRs. To enable media-related CDRs for SBC calls, use the MediaCDRReportLevel parameter. The CDR Syslog message complies with RFC 3161 and is identified by: Facility = 17 (local1) and Severity = 6 (Informational). This mechanism is active only when Syslog is enabled (i.e., the parameter EnableSyslog is set to 1).
Web: Media CDR Report Level [MediaCDRReportLevel]	 Enables media-related CDRs of SBC calls to be sent to a Syslog server and determines the call stage at which they are sent. [0] None = (Default) No media-related CDR is sent. [1] End Media = Sends a CDR only at the end of the call. [2] Start & End Media = Sends a CDR once the media starts. In some calls it may only be after the call is established, but in other calls the media may start at ringback tone. A CDR is also sent upon termination (end) of the media in the call. [3] Update & End Media = Sends a CDR when an update occurs in the media of the call. For example, a call starts and a ringback tone occurs, a re-INVITE is sent for a fax call and as a result, a CDR with the MediaReportType field set to "Update" is sent, as the media was changed from voice to T.38. A CDR is also sent upon termination (end) of the media in the call. [4] Start & End & Update Media = Sends a CDR at the start of the media, upon an update in the media (if occurs), and at the end of the media. Note: To enable CDR generation as well as enable signaling-related CDRs, use the CDRReportLevel parameter.
Web/EMS: Debug Level CLI: configure system/logging/debug-level [GwDebugLevel]	 Enables Syslog debug reporting and logging level. [0] No Debug = (Default) Debug is disabled. [1] Basic = Sends debug logs of incoming and outgoing SIP messages. [5] Detailed = Sends debug logs of incoming and outgoing SIP message as well as many other logged processes. Note: When debug reporting is enabled, in order to view Syslog messages with Wireshark, you need to install AudioCodes Wireshark plug-in (acsyslog.dll). Once the plug-in is installed, the Syslog messages are decoded as "AC SYSLOG" and are displayed using the 'acsyslog' filter instead of the regular 'syslog' filter.
Web: Syslog Optimization CLI: configure system/logging/syslog- optimization [SyslogOptimization]	Enables the device to accumulate and bundle multiple debug messages into a single UDP packet and then send it to a Syslog server. The benefit of this feature is that it reduces the number of UDP Syslog packets, thereby improving (optimizing) CPU utilization. • [0] Disable • [1] Enable (default) Note: The size of the bundled message is configured by the

Parameter	Description
	MaxBundleSyslogLength parameter.
CLI: mx-syslog-lgth [MaxBundleSyslogLength]	Defines the maximum size (in bytes) threshold of logged Syslog messages bundled into a single UDP packet, after which they are sent to a Syslog server. The valid value range is 0 to 1220 (where 0 indicates that no bundling occurs). The default is 1220. Note: This parameter is applicable only if the GWDebugLevel parameter is enabled.
Web: Syslog CPU Protection CLI: configure system/logging/syslog-cpu- protection [SyslogCpuProtection]	Enables the protection of the device's CPU resources during debug reporting, ensuring voice traffic is unaffected. If CPU resources drop (i.e., high CPU usage) to a critical level (threshold), the device automatically lowers the debug level to free up CPU resources that were required for the previous debug-level functionality. When sufficient CPU resources become available again, the device increases the debug level. The threshold is configured by the 'Debug Level High Threshold' parameter (see below). [0] Disable [1] Enable (default)
Web: Debug Level High Threshold CLI: debug-level-high- threshold [DebugLevelHighThreshold]	Defines the threshold (in percentage) for automatically switching to a different debug level, depending on CPU usage. The parameter is applicable only if the 'Syslog CPU Protection' parameter is enabled. The valid value is 0 to 100. The default is 90. The debug level is changed upon the following scenarios: CPU usage equals threshold: Debug level is reduced one level. CPU usage is at least 5% greater than threshold: Debug level is reduced another level. CPU usage is 5 to 19% less than threshold: Debug level is increased by one level. CPU usage is at least 20% less than threshold: Debug level is increased by another level. For example, assume that the threshold is set to 70% and the Debug Level to Detailed (5). When CPU usage reaches 70%, the debug level is reduced to Basic (1). When CPU usage increases by 5% or more than the threshold (i.e., greater than 75%), the debug level is disabled - No Debug (0). When the CPU usage decreases to 5% less than the threshold (e.g., 65%), the debug level is increased to Basic (1). When the CPU usage decreases to 20% less than the threshold (e.g., 50%), the debug level changes to Detailed (5). Note: The device does not increase the debug level to a level that is higher than what you configured for the 'Debug Level' parameter.
Web: Syslog Facility Number EMS: SyslogFacility [SyslogFacility]	Defines the Facility level (0 through 7) of the device's Syslog messages, according to RFC 3164. This allows you to identify Syslog messages generated by the device. This is useful, for example, if you collect the device's and other equipments' Syslog messages, at one single server. The device's Syslog messages can easily be identified and distinguished from other Syslog messages by its Facility level. Therefore, in addition to filtering Syslog messages according to IP address, the messages can be filtered according to Facility level. • [16] = (Default) local use 0 (local0) • [17] = local use 1 (local1)

Parameter	Description
	 [18] = local use 2 (local2) [19] = local use 3 (local3) [20] = local use 4 (local4) [21] = local use 5 (local5) [22] = local use 6 (local6) [23] = local use 7 (local7)
Web: CDR Session ID [CDRSyslogSeqNum]	Enables or disables the inclusion of the sequence number (S=) in CDR Syslog messages. • [0] Disable • [1] Enable (default)
Web: Activity Types to Report via Activity Log Messages [ActivityListToLog]	Defines the operations (activities) in the Web interface that are reported to a Syslog server. Ipvc] Parameters Value Change = Changes made on-the-fly to parameters. Note that the <i>ini</i> file parameter, EnableParametersMonitoring can also be used to set this option, using values [0] (disable) or [1] (enable). Iafl] Auxiliary Files Loading = Loading of auxiliary files. Idr] Device Reset = Resetting of device through the Maintenance Actions page. Note: For this option to take effect, a device reset is required. Ifb] Flash Memory Burning = Saving configuration with burn to flash (in Maintenance Actions page). Iswu] Device Software Update = Software updates (i.e., loading of cmp file) through the Software Upgrade Wizard. Iard] Access to Restricted Domains = Access to restricted Web pages: (1) ini parameters (AdminPage) (2) General Security Settings (3) Configuration File (4) IP Security Proposal / IP Security Associations Tables (5) Software Upgrade Key Status (6) Firewall Settings (7) Web & Telnet Access List (8) WEB User Accounts Inaa] Non-Authorized Access = Attempts to access the Web interface with a false or empty username or password. Ispc] Sensitive Parameters: (1) IP Address (2) Subnet Mask (3) Default Gateway IP Address (4) ActivityListToLog III] Login and Logout = Web login and logout attempts. Note: For the <i>ini</i> file parameter, enclose values in single quotation marks, for example: ActivityListToLog = 'pvc', 'aff', 'dr', 'fb', 'swu', 'ard', 'naa', 'spc'.
[FacilityTrace]	Enables ISDN traces of Facility Information Elements (IE) for ISDN call diagnostics. This allows you to trace all the parameters contained in the Facility IE and view them in the Syslog. • [0] Disable (default) • [1] Enable

Parameter	Description
	Note: For this feature to be functional, the GWDebugLevel parameter must be enabled.
Web: Debug Recording Destination IP [DebugRecordingDestIP]	Defines the IP address of the server for capturing debug recording.
Web: Debug Recording Destination Port [DebugRecordingDestPort]	Defines the UDP port of the server for capturing debug recording. The default is 925.
Debug Recording Status [DebugRecordingStatus]	Activates or de-activates debug recording. • [0] Stop (default) • [1] Start
Web: Enable Core Dump [EnableCoreDump]	Enables the automatic generation of a Core Dump file upon a device crash. • [0] Disable (disable) • [1] Enable
Web: Core Dump Destination IP [CoreDumpDestIP]	Defines the IP address of the remote server where you want the device to send the Core Dump file. By default, no IP address is defined.
Logging Filters Table	
Web: Logging Filters Table [LoggingFilters]	This table parameter defines logging filtering rules for Syslog messages and debug recordings. The format of the ini file table parameter is: [LoggingFilters] FORMAT LoggingFilters_Index = LoggingFilters_FilterType, LoggingFilters_Value, LoggingFilters_Syslog, LoggingFilters_CaptureType; [\LoggingFilters] For a detailed description of this table, see "Filtering Syslog Messages and Debug Recordings" on page 664.

50.3.4 Heartbeat Packet Parameters

The Heartbeat packet parameters are described in the table below. The device sends a heartbeat packet to ensure that the far-end is passing traffic.

Table 50-21: Heartbeat Packet Parameters

Parameter	Description
EMS: APS IP Address [HeartBeatDestIP]	Defines the destination IP address (in dotted format notation) to which the device sends proprietary UDP 'ping' packets.
	The default IP address is 0.0.0.0.
	Note: For this parameter to take effect, a device reset is required.

Parameter	Description
EMS: APS Port [HeartBeatDestPort]	Defines the destination UDP port to which the heartbeat packets are sent. The range is 0 to 64000. The default is 0. Note: For this parameter to take effect, a device reset is required.
[HeartBeatIntervalmsec]	Defines the delay (in msec) between consecutive heartbeat packets. • [10] = 100000 • [-1] = (Default) disabled Note: For this parameter to take effect, a device reset is required.

50.3.5 Resource Allocation Indication Parameters

The Resource Allocation Indication (RAI) parameters are described in the table below.

Table 50-22: RAI Parameters

Parameter	Description
[EnableRAI]	Enables Resource Available Indication (RAI) alarm generation if the device's busy endpoints exceed a user-defined threshold, configured by the RAIHighThreshold parameter. When enabled and the threshold is crossed, the device sends the SNMP trap, acBoardCallResourcesAlarm. • [0] = (Default) Disable • [1] = Enable Note: For this parameter to take effect, a device reset is required.
[RAIHighThreshold]	Defines the high threshold percentage of total calls that are active (busy endpoints). When the percentage of the device's busy endpoints exceeds this high threshold, the device sends the SNMP acBoardCallResourcesAlarm alarm trap with a 'major' alarm status. The range is 0 to 100. The default is 90. Note: The percentage of busy endpoints is calculated by dividing the number of busy endpoints by the total number of "enabled" endpoints (trunks are physically connected and synchronized with no alarms and endpoints are defined in the Trunk Group table).
[RAILowThreshold]	Defines the low threshold percentage of total calls that are active (busy endpoints). When the percentage of the device's busy endpoints falls below this low threshold, the device sends an SNMP acBoardCallResourcesAlarm alarm trap with a 'cleared' alarm status. The range is 0 to 100%. The default is 90%.
[RAILoopTime]	Defines the time interval (in seconds) that the device periodically checks call resource availability. The valid range is 1 to 200. The default is 10.

50.3.6 BootP Parameters

The BootP parameters are described in the table below. The BootP parameters are special 'hidden' parameters. Once defined and saved in the device's flash memory, they are used even if they don't appear in the *ini* file.

Version 6.8 721 Mediant 3000

Table 50-23: BootP Parameters

Parameter	Description	
[BootPRetries]	Note: For this parameter to take effect, a device reset is required. This parameter is used to:	
	Defines the number of BootP requests that the device sends during start-up. The device stops sending BootP requests when either BootP reply is received or number of retries is reached. Ill = 1 BootP retry, 1 sec. Ill = 2 BootP retries, 3 sec. Ill = 10 BootP retries, 30 sec. Ill = 10 BootP retries, 60 sec. Ill = 40 BootP retries, 120 sec. Ill = 100 BootP retries, 300 sec. Ill = BootP retries indefinitely.	Defines the number of DHCP packets that the device sends. If after all packets are sent there's still no reply, the device loads from flash. • [1] = 4 DHCP packets • [2] = 5 DHCP packets • [3] = (Default) 6 DHCP packets • [4] = 7 DHCP packets • [5] = 8 DHCP packets • [6] = 9 DHCP packets • [7] = 10 DHCP packets • [15] = 18 DHCP packets
[BootPSelectiveEnable]	Enables the Selective BootP mecha [1] = Enabled	anism.
	responses to the device's BootP rec Notes: For this parameter to take effect	client to filter unsolicited BootP replies that contain the text nation field). This option is useful in otP/DHCP servers provide undesired quests. , a device reset is required. he parameter DHCPEnable is set to
[BootPDelay]	Defines the interval between the de BootP/DHCP request that is issued [1] = (Default) 1 second [2] = 3 second [3] = 6 second [4] = 30 second [5] = 60 second Note: For this parameter to take eff	by the device.
[ExtBootPReqEnable]	device uses the Vendor Specific request to provide device-related device type, current IP address, Vendor Specific Information field	e device-related initial startup ion to be sent in BootP requests. The

Parameter	Description	
	column.	
	Notes:	
	 For this parameter to take effect, a device reset is required. 	
	This option is not available on DHCP servers.	

50.4 Security Parameters

This subsection describes the device's security parameters.

50.4.1 General Security Parameters

The general security parameters are described in the table below.

Table 50-24: General Security Parameters

Tubic 60 24. General Security Farameters		
Parameter	Description	
[EnableSecureStartup]	 Enables the Secure Startup mode. In this mode, downloading the ini file to the device is restricted to a URL provided in initial configuration (see the parameter IniFileURL) or using DHCP. [0] Disable (default). [1] Enable = disables TFTP and allows secure protocols such as HTTPS to fetch the device configuration. Note: For this parameter to take effect, a device reset is required. 	
Firewall Table		
Web/EMS: Internal Firewall Parameters [AccessList]	This table parameter defines the device's access list (firewall), which defines network traffic filtering rules. The format of this parameter is as follows: [AccessList] FORMAT AccessList_Index = AccessList_Source_IP, AccessList_Source_Port, AccessList_PrefixLen, AccessList_Source_Port, AccessList_Start_Port, AccessList_End_Port, AccessList_Protocol, AccessList_Use_Specific_Interface, AccessList_Interface_ID, AccessList_Packet_Size, AccessList_Byte_Rate, AccessList_Byte_Burst, AccessList_Allow_Type; [\AccessList] For example: AccessList 10 = mgmt.customer.com, , , 32, 0, 80, tcp, 1, OAMP, 0, 0, 0, allow; AccessList 22 = 10.4.0.0, , , 16, 4000, 9000, any, 0, , 0, 0, 0, block; In the example above, Rule #10 allows traffic from the host 'mgmt.customer.com' destined to TCP ports 0 to 80 on interface OAMP (OAMP). Rule #22 blocks traffic from the subnet 10.4.xxx.yyy destined to ports 4000 to 9000. For a detailed description of this table, see "Configuring Firewall Settings" on page 153.	

50.4.2 HTTPS Parameters

The Secure Hypertext Transport Protocol (HTTPS) parameters are described in the table below.

Table 50-25: HTTPS Parameters

Parameter	Description
Web: Secured Web Connection (HTTPS) EMS: HTTPS Only [HTTPSOnly]	Determines the protocol used to access the Web interface. • [0] HTTP and HTTPS (default). • [1] HTTPs Only = Unencrypted HTTP packets are blocked. Note: For this parameter to take effect, a device reset is required.
EMS: HTTPS Port [HTTPSPort]	Defines the local Secured HTTPS port of the device. This parameter allows secure remote device Web management from the LAN. To enable secure Web management from the LAN, configure the desired port. The valid range is 1 to 65535 (other restrictions may apply within this range). The default port is 443. Note: For this parameter to take effect, a device reset is required.
Web/EMS: HTTPS Cipher String [HTTPSCipherString]	Defines the Cipher string for HTTPS (in OpenSSL cipher list format). For the valid range values, refer to URL http://www.openssl.org/docs/apps/ciphers.html . The default is 'RC4:EXP' (Export encryption algorithms). For example, use 'ALL' for all ciphers suites (e.g., for ARIA encryption for TLS). The only ciphers available are RC4 and DES, and the cipher bit strength is limited to 56 bits. Notes: For this parameter to take effect, a device reset is required. If the installed Software License Key includes the Strong Encryption feature, the default of this parameter is changed to 'RC4:EXP', enabling RC-128bit encryption. The value 'ALL' can be configured only if the installed Software License Key includes the Strong Encryption feature.
Web: HTTP Authentication Mode EMS: Web Authentication Mode [WebAuthMode]	Determines the authentication mode used for the Web interface. [0] Basic Mode =Basic authentication (clear text) is used. [1] Web Based Authentication = (Default) Digest authentication (MD5) is used. Note: If you enable RADIUS login (i.e., the WebRADIUSLogin parameter is set to 1), you must set the WebAuthMode parameter to Basic Mode [0].
Web: Requires Client Certificates for HTTPS connection [HTTPSRequireClientCertificate]	 Determines whether client certificates are required for HTTPS connection. [0] Disable = (Default) Client certificates are not required. [1] Enable = Client certificates are required. The client certificate must be preloaded to the device and its matching private key must be installed on the managing PC. Time and date must be correctly set on the device for the client certificate to be verified. Notes: For this parameter to take effect, a device reset is required. For a description on implementing client certificates, see TLS

Parameter	Description
	for Remote Device Management on page 117.
[HTTPSRootFileName]	Defines the name of the HTTPS trusted root certificate file to be loaded using TFTP. The file must be in base64-encoded PEM (Privacy Enhanced Mail) format.
	The valid range is a 47-character string.
	Note: This parameter is applicable only when the device is loaded using BootP/TFTP.
[HTTPSPkeyFileName]	Defines the name of a private key file (in unencrypted PEM format) to be loaded from the TFTP server.
[HTTPSCertFileName]	Defines the name of the HTTPS server certificate file to be loaded using TFTP. The file must be in base64-encoded PEM format. The valid range is a 47-character string. Note: This parameter is only applicable when the device is loaded using BootP/TFTP.

50.4.3 SRTP Parameters

The Secure Real-Time Transport Protocol (SRTP) parameters are described in the table below.

Table 50-26: SRTP Parameters

Parameter	Description
Web: Media Security EMS: Enable Media Security [EnableMediaSecurity]	 Enables Secure Real-Time Transport Protocol (SRTP). [0] Disable (default) [1] Enable Notes: For this parameter to take effect, a device reset is required. SRTP causes a reduction of 12.5% in available channels (i.e., 84 channels instead of 96 per DSP) when using DSP Template 0. In other words, instead of 2,016 (21 * 96) channels, 1,764 (21 * 84) are available. For a depopulated system, 504 channels are available (6 * 84). The DSP-depopulated blade is used for configurations with 21 spans and less. Therefore, no capacity reduction occurs in these sizes for T1 configurations (504/24 = 21 T1s). However, only 15 E1s instead of 16 (504/32 = 15.75) may be available.
Web/EMS: Media Security Behavior [MediaSecurityBehaviour]	Global parameter that defines the handling of SRTP (when the EnableMediaSecurity parameter is set to 1). You can also configure this functionality per specific calls, using IP Profiles (IpProfile_MediaSecurityBehaviour). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile. Note: This parameter is applicable only to the Gateway application.

Parameter	Description
Web: Master Key Identifier (MKI) Size EMS: Packet MKI Size [SRTPTxPacketMKISize]	Global parameter that defines the size (in bytes) of the Master Key Identifier (MKI) in SRTP Tx packets. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_MKISize). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Symmetric MKI Negotiation EMS: Enable Symmetric MKI [EnableSymmetricMKI]	Global parameter that enables symmetric MKI negotiation. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_EnableSymmetricMKI). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web/EMS: Offered SRTP Cipher Suites [SRTPofferedSuites]	 Defines the offered crypto suites (cipher encryption algorithms) for SRTP. [0] All = (Default) All available crypto suites. [1] AES-CM-128-HMAC-SHA1-80 = device uses AES-CM encryption with a 128-bit key and HMAC-SHA1 message authentication with a 80-bit tag. [2] AES-CM-128-HMAC-SHA1-32 = device uses AES-CM encryption with a 128-bit key and HMAC-SHA1 message authentication with a 32-bit tag. [4] ARIA-CM-128-HMAC-SHA1-80 = device uses ARIA encryption algorithm with a 128-bit key and HMAC-SHA1 message authentication with a 32-bit tag. [8] ARIA-CM-192-HMAC-SHA1-80 = device uses ARIA encryption algorithm with a 192-bit key and HMAC-SHA1 message authentication with a 32-bit tag. Notes: For enabling ARIA encryption, use the AriaProtocolSupport parameter. This parameter also affects the selection of the crypto in the device's answer. For example, if the device receives an offer with two crypto lines containing HMAC_SHA1_80 and HMAC_SHA_32, it uses the HMAC_SHA_32 key in its SIP 200 OK response if the parameter is set to 2.

Parameter	Description
Web: Aria Protocol Support [AriaProtocolSupport]	 Enables ARIA algorithm cipher encryption for SRTP. This is an alternative option to the existing support for the AES algorithm. ARIA is a symmetric key block cipher algorithm standard developed by the Korean National Security Research Institute. [0] Disable (default) [1] Enable Notes: To configure the ARIA bit-key encryption size (128 or 192 bit) with HMAC SHA-1 cryptographic hash function, use the SRTPofferedSuites parameter. The ARIA feature is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see Software License Key on page 575.
Web: Disable Authentication On Transmitted RTP Packets EMS: RTP AuthenticationDisable Tx [RTPAuthenticationDisableTx]	Enables authentication on transmitted RTP packets in a secured RTP session. [0] Enable (default) [1] Disable
Web: Disable Encryption On Transmitted RTP Packets EMS: RTP EncryptionDisable Tx [RTPEncryptionDisableTx]	Enables encryption on transmitted RTP packets in a secured RTP session. • [0] Enable (default) • [1] Disable
Web: Disable Encryption On Transmitted RTCP Packets EMS: RTCP EncryptionDisable Tx [RTCPEncryptionDisableTx]	Enables encryption on transmitted RTCP packets in a secured RTP session. • [0] Enable (default) • [1] Disable
[ResetSRTPStateUponRekey]	Global parameter that enables synchronization of the SRTP state between the device and a server when a new SRTP key is generated upon a SIP session expire. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_ResetSRTPStateUponRekey). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.

50.4.4 TLS Parameters

The Transport Layer Security (TLS) parameters are described in the table below.

Table 50-27: TLS Parameters

Parameter	Description
Web: TLS Contexts Table	Defines SSL/TLS certificates.
CLI: configure system > tls #	The format of the ini file table parameter is as follows:

Parameter	Description
[TLSContexts]	[TLSContexts] FORMAT TLSContexts_Index = TLSContexts_Name, TLSContexts_TLSVersion, TLSContexts_ServerCipherString, TLSContexts_ClientCipherString, TLSContexts_OcspEnable, TLSContexts_OcspServerPrimary, TLSContexts_OcspServerSecondary, TLSContexts_OcspServerPort, TLSContexts_OcspDefaultResponse; [\TLSContexts] For a detailed description of this table, see Configuring TLS Certificate Contexts on page 107.
Web: TLS Client Re-Handshake Interval EMS: TLS Re Handshake Interval [TLSReHandshakeInterval]	Defines the time interval (in minutes) between TLS Re- Handshakes initiated by the device. The interval range is 0 to 1,500 minutes. The default is 0 (i.e., no TLS Re-Handshake).
Web: TLS Mutual Authentication EMS: SIPS Require Client Certificate [SIPSRequireClientCertificate]	 Defines the device's mode of operation regarding mutual authentication and certificate verification for TLS connections. [0] Disable = (Default) ✓ Device acts as a client: Verification of the server's certificate depends on the VerifyServerCertificate parameter. ✓ Device acts as a server: The device does not request the client certificate. [1] Enable = ✓ Device acts as a client: Verification of the server certificate is required to establish the TLS connection. ✓ Device acts as a server: The device requires the receipt and verification of the client certificate to establish the TLS connection. Notes: For this parameter to take effect, a device reset is required. This feature can be configured per SIP Interface (see Configuring SIP Interfaces on page 270). The SIPS certificate files can be changed using the parameters HTTPSCertFileName and HTTPSRootFileName.
Web/EMS: Peer Host Name Verification Mode [PeerHostNameVerificationMode]	 Determines whether the device verifies the Subject Name of a remote certificate when establishing TLS connections. [0] Disable (default). [1] Server Only = Verify Subject Name only when acting as a client for the TLS connection. [2] Server & Client = Verify Subject Name when acting as a server or client for the TLS connection. When the device receives a remote certificate and this parameter is not disabled, the IP address from which the certificate is received is compared with the addresses defined for the Proxy Sets. If no Proxy Set with the source address is found, the connection is refused. Otherwise, the value of SubjectAltName field in the certificate is compared with the addresses\ DNS Names of the classified Proxy Set. If a match is found for any of the configured Proxies, the TLS connection is established.

Parameter	Description
	The comparison is performed if the SubjectAltName is either a DNS name (DNSName) or an IP address. If no match is found and the SubjectAltName is marked as 'critical', the TLS connection is not established. If DNSName is used, the certificate can also use wildcards ('*') to replace parts of the domain name.
	If the SubjectAltName is not marked as 'critical' and there is no match, the CN value of the SubjectName field is compared with the parameter TLSRemoteSubjectName. If a match is found, the connection is established. Otherwise, the connection is terminated.
	Note: If you set this parameter to [2] (Server & Client), for this functionality to operate, you also need to set the SIPSRequireClientCertificate parameter to [1] (Enable).
Web: TLS Client Verify Server Certificate EMS: Verify Server Certificate [VerifyServerCertificate]	Determines whether the device, when acting as a client for TLS connections, verifies the Server certificate. The certificate is verified with the Root CA information. • [0] Disable (default) • [1] Enable Note: If Subject Name verification is necessary, the parameter PeerHostNameVerificationMode must be used as well.
Web: Strict Certificate Extension Validation [RequireStrictCert]	Enables the validation of the extensions (keyUsage and extentedKeyUsage) of peer certificates. This validation ensures that the signing CA is authorized to sign certificates and that the end-entity certificate is authorized to negotiate a secure TLS connection. [0] Disable (default) [1] Enable
Web/EMS: TLS Remote Subject Name [TLSRemoteSubjectName]	Defines the Subject Name that is compared with the name defined in the remote side certificate when establishing TLS connections. If the SubjectAltName of the received certificate is not equal to any of the defined Proxies Host names/IP addresses and is not marked as 'critical', the Common Name (CN) of the Subject field is compared with this value. If not equal, the TLS connection is not established. If the CN uses a domain name, the certificate can also use wildcards ('*') to replace parts of the domain name. The valid range is a string of up to 49 characters. Note: This parameter is applicable only if the parameter
	PeerHostNameVerificationMode is set to 1 or 2.
Web: TLS Expiry Check Start [TLSExpiryCheckStart]	Defines the number of days before the installed TLS server certificate is to expire at which the device must send a trap (acCertificateExpiryNotifiaction) to notify of this. The valid value is 0 to 3650. The default is 60.
Web: TLS Expiry Check Period [TLSExpiryCheckPeriod]	Defines the periodical interval (in days) for checking the TLS server certificate expiry date. The valid value is 1 to 3650. The default is 7.

Parameter	Description
Web: TLS FIPS 140 Mode [TLS_Fips140_Mode]	Enables FIPS 140-2 conformance mode for TLS.[0] Disable (default)[1] Enable

50.4.5 SSH Parameters

Secure Shell (SSH) parameters are described in the table below.

Table 50-28: SSH Parameters

Parameter	Description	
Web/EMS: Enable SSH Server [SSHServerEnable]	Enables the device's embedded SSH server.[0] Disable (default)[1] Enable	
Web/EMS: Server Port [SSHServerPort]	Defines the port number for the embedded SSH server. Range is any valid port number. The default port is 22.	
Web/EMS: SSH Admin Key [SSHAdminKey]	Defines the RSA public key for strong authentication for logging in to the SSH interface (if enabled).	
	The value should be a base64-encoded string. The value can be a maximum length of 511 characters.	
Web: Require Public Key EMS: EMS: SSH Require Public Key [SSHRequirePublicKey]	 Enables RSA public keys for SSH. [0] = (Default) RSA public keys are optional if a value is configured for the parameter SSHAdminKey. [1] = RSA public keys are mandatory. Note: To define the key size, use the TLSPkeySize parameter. 	
Web: Max Payload Size EMS: SSH Max Payload Size [SSHMaxPayloadSize]	Defines the maximum uncompressed payload size (in bytes) for SSH packets. The valid value is 550 to 32768. The default is 32768.	
Web: Max Binary Packet Size EMS: SSH Max Binary Packet Size [SSHMaxBinaryPacketSize]	Defines the maximum packet size (in bytes) for SSH packets. The valid value is 582 to 35000. The default is 35000.	
Web: Maximum SSH Sessions EMS: Telnet SSH Max Sessions [SSHMaxSessions]	Defines the maximum number of simultaneous SSH sessions. The valid range is 1 to 5. The default is 2 sessions.	
Web: Enable Last Login Message [SSHEnableLastLoginMessage]	Enables message display in SSH sessions of the time and date of the last SSH login. The SSH login message displays the number of unsuccessful login attempts since the last successful login. • [0] Disable • [1] Enable (default) Note: The last SSH login information is cleared when the device is reset.	
Web: Max Login Attempts [SSHMaxLoginAttempts]	Defines the maximum SSH login attempts allowed for entering an incorrect password by an administrator before the SSH session is rejected. The valid range is 1 to 3. the default is 3.	

50.4.6 IDS Parameters

The Intrusion Detection System (IDS) parameters are described in the table below.

Table 50-29: IDS Parameters

Parameters		
Parameter	Description	
Web: Intrusion Detection System (IDS) [EnableIDS]	 Enables the IDS feature. [0] Disable (default) [1] Enable Note: For this parameter to take effect, a device reset is required. 	
	Defines the interval (in seconds) after which an IDS alarm is cleared from	
[IDSAlarmClearPeriod]	the Active Alarms table if no thresholds are crossed during this time. However, this "quiet" period must be at least twice the Threshold Window value. For example, if IDSAlarmClearPeriod is set to 20 sec and the Threshold Window is set to 15 sec, the IDSAlarmClearPeriod parameter is ignored and the alarm is cleared only after 30 seconds (2 x 15 sec). The valid value is 0 to 86400. The default is 300.	
IDO Dallas Table	The valid value is 0 to 00400. The delault is 500.	
IDS Policy Table		
Web: IDS Policy Table [IDSPolicy]	Defines IDS Policies. The format of the ini file parameter is:	
	<pre>[IDSPolicy] FORMAT IDSPolicy_Index = IDSPolicy_Name, IDSPolicy_Description; [\IDSPolicy]</pre>	
	For a detailed description of this table, see "Configuring IDS Policies" on page 159.	
IDS Rule Table		
Web: IDS Rule Table [IDSRule]	Defines rules for IDS Policies. The format of the ini file parameter is:	
	[IDSRule] FORMAT IDSRule_Index = IDSRule_Policy, IDSRule_RuleID, IDSRule_Reason, IDSRule_ThresholdScope, IDSRule_ThresholdWindow, IDSRule_MinorAlarmThreshold, IDSRule_MajorAlarmThreshold, IDSRule_CriticalAlarmThreshold, IDSRule_DenyThreshold, IDSRule_DenyPeriod; [\IDSRule]	
	For a detailed description of this table, see "Configuring IDS Policies" on page 159.	
IDS Match Table		
Web: IDS Match Table	Defines target rules per IDS Policy.	
[IDSMatch]	The format of the ini file parameter is:	
	[IDSMatch] FORMAT IDSMatch_Index = IDSMatch_SIPInterface, IDSMatch_ProxySet, IDSMatch_Subnet, IDSMatch_Policy; [\IDSMatch]	
	For a detailed description of this table, see "Assigning IDS Policies" on page 163.	

50.4.7 IPSec Parameters

The Internet Protocol security (IPSec) parameters are described in the table below.

Table 50-30: IPSec Parameters

Parameter	Description
IPSec Parameters	
Web: Enable IP Security EMS: IPSec Enable [EnableIPSec]	Enables IPSec on the device. • [0] Disable (default) • [1] Enable Note: For this parameter to take effect, a device reset is required.
Web: IKE Certificate Ext Validate [IKEcertificateExtValidate]	Enables the validation of the extensions (keyUsage and extentedKeyUsage) of peer certificates. This validation ensures that the signing CA is authorized to sign certificates and that the end-entity certificate is authorized to negotiate a secure IPSec connection. • [0] Disable (default) • [1] Enable
IPSec Associations Table	
Web: IP Security Associations Table EMS: IPSec SA Table [IPSecSATable]	This table parameter defines the IPSec SA table. This table allows you to configure the Internet Key Exchange (IKE) and IP Security (IPSec) protocols. The format of this parameter is as follows: [IPsecSATable] FORMAT IPsecSATable_Index = IPsecSATable_RemoteEndpointAddressOrName, IPsecSATable_AuthenticationMethod, IPsecSATable_SharedKey, IPsecSATable_SourcePort, IPsecSATable_DestPort, IPsecSATable_Protocol, IPsecSATable_Phase1SaLifetimeInSec, IPsecSATable_Phase2SaLifetimeInSec, IPsecSATable_Phase2SaLifetimeInKB, IPsecSATable_DPDmode, IPsecSATable_Phase2SaLifetimeInKB, IPsecSATable_DPDmode, IPsecSATable_IPsecMode, IPsecSATable_RemoteTunnelAddress, IPsecSATable_RemoteSubnetIPAddress, IPsecSATable_RemoteSubnetPrefixLength, IPsecSATable_InterfaceName; [\IPsecSATable_InterfaceName; [\IPsecSATable] Note: For a detailed description of this table, see "Configuring IP Security Associations Table" on page 169.
IPSec Proposal Table	
Web: IP Security Proposal Table EMS: IPSec Proposal Table [IPSecProposalTable]	This table parameter defines up to four IKE proposal settings, where each proposal defines an encryption algorithm, an authentication algorithm, and a Diffie-Hellman group identifier. [IPsecProposalTable] FORMAT IPsecProposalTable_Index = IPsecProposalTable_EncryptionAlgorithm, IPsecProposalTable_AuthenticationAlgorithm, IPsecProposalTable_DHGroup; [\IPsecProposalTable] For example: IPsecProposalTable 0 = 3, 2, 1; IPsecProposalTable 1 = 2, 2, 1; In the example above, two proposals are defined: Proposal 0: AES, SHA1, DH group 2

Parameter	Description
	Proposal 1: 3DES, SHA1, DH group 2
	Note: For a detailed description of this table, see "Configuring IP Security Proposal Table" on page 167.

50.5 Quality of Experience Parameters

The Quality of Experience (QoE) parameters are described in the table below.

Table 50-31: Quality of Experience Parameters

Table 50-31: Quality of Experience Parameters		
Parameter	Description	
SEM Parameters		
Web: Server IP CLI: configure voip/qoe configuration/server-ip [QOEServerIP]	Defines the IP address of AudioCodes primary Session Experience Manager (SEM) server to where the quality experience reports are sent. Note: For this parameter to take effect, a device reset is required.	
Redundant Server IP CLI: configure voip > qoe configuration > set secondary-server-ip [QOESecondaryServerIp]	Defines the IP address of the secondary SEM server to where the quality experience reports are sent. This is applicable when the SEM/EMS server is in Geographical Redundancy HA mode. Note: For this parameter to take effect, a device reset is required.	
Web: Port [QOEPort]	Defines the port of the SEM server. The valid value range is 0 to 65534. The default is 5000.	
Web: Interface Name [QOEInterfaceName]	Defines the IP network interface on which the quality experience reports are sent. The default is the OAMP interface. Note: For this parameter to take effect, a device reset is required.	
Quality of Experience Profil	e Table	
Web: Quality of Experience Profile [QOEProfile]	This table parameter defines Quality of Experience Profiles. The format of the ini file table parameter is as follows: [QOEProfile] FORMAT QOEProfile_Index = QOEProfile_Name, QOEProfile_SensitivityLevel; [\QOEProfile] For a detailed description of this table, see "Configuring Quality of Experience Profiles" on page 254.	
Quality of Experience Color Rules Table		
Web: Quality of Experience Color Rules [QOEColorRules]	This table parameter defines Quality of Experience Color Rules. The format of the ini file table parameter is as follows: [QOEColorRules] FORMAT QOEColorRules_Index = QOEColorRules_QoeProfile, QOEColorRules_ColorRuleIndex, QOEColorRules_monitoredParam, QOEColorRules_direction, QOEColorRules_profile, QOEColorRules_GreenYellowThreshold, QOEColorRules_GreenYellowHysteresis,	

Parameter	Description
	QOEColorRules_YellowRedThreshold, QOEColorRules_YellowRedHysteresis; [\QOEColorRules]
	For a detailed description of this table, see "Configuring Quality of Experience Profiles" on page 254.
Bandwidth Profile Table	
Web: Bandwidth Profile [BWProfile]	This table parameter defines Bandwidth Profiles. The format of the ini file table parameter is as follows:
	[BWProfile] FORMAT BWProfile_Index = BWProfile_Name, BWProfile_EgressAudioBandwidth, BWProfile_IngressAudioBandwidth, BWProfile_EgressVideoBandwidth, BWProfile_IngressVideoBandwidth, BWProfile_TotalEgressBandwidth, BWProfile_TotalIngressBandwidth, BWProfile_TotalIngressBandwidth, BWProfile_Hysteresis, BWProfile_GenerateAlarms; [\BWProfile]
	For a detailed description of this table, see "Configuring Bandwidth Profiles" on page 258.
	Note: For this parameter to take effect, a device reset is required.
Media Enhancement Profile	Table
Web: Media Enhancement	This table parameter defines Media Enhancement Profiles.
Profile [MediaEnhancementProfile]	The format of the ini file table parameter is as follows: [MediaEnhancementProfile] FORMAT MediaEnhancementProfile_Index = MediaEnhancementProfile_ProfileName; [MediaEnhancementProfile]
	For a detailed description of this table, see "Configuring Media Enhancement Profiles" on page 260.
Media Enhancement Rules T	able
Web: Media Enhancement	This table parameter defines Media Enhancement Rules.
Rules [MediaEnhancementRules]	The format of the ini file table parameter is as follows: [MediaEnhancementRules] FORMAT MediaEnhancementRules_Index = MediaEnhancementRules_MediaEnhancementProfile, MediaEnhancementRules_RuleIndex, MediaEnhancementRules_Trigger, MediaEnhancementRules_Color, MediaEnhancementRules_ActionRule, MediaEnhancementRules_ActionValue; [MediaEnhancementRules]
	For a detailed description of this table, see "Configuring Media Enhancement Profiles" on page 260.

50.6 Control Network Parameters

50.6.1 IP Group, Proxy, Registration and Authentication Parameters

The proxy server, registration and authentication SIP parameters are described in the table below.

Table 50-32: Proxy. Registration and Authentication SIP Parameters

Tubic 00 02: 1 10xy, 1	Registration and Authentication SIP Parameters
Parameter	Description
IP Group Table	
Web: IP Group Table EMS: Endpoints > IP Group [IPGroup]	This table configures IP Groups. The ini file format of this parameter is as follows: [IPGroup] FORMAT IPGroup_Index = IPGroup_Type, IPGroup_Description, IPGroup_ProxySetId, IPGroup_SIPGroupName, IPGroup_ContactUser, IPGroup_EnableSurvivability, IPGroup_ServingIPGroup, IPGroup_SipReRoutingMode, IPGroup_AlwaysUseRouteTable, IPGroup_RoutingMode, IPGroup_SRD, IPGroup_MediaRealm, IPGroup_ClassifyByProxySet, IPGroup_ProfileId, IPGroup_MaxNumOfRegUsers, IPGroup_InboundManSet, IPGroup_OutboundManSet, IPGroup_RegistrationMode, IPGroup_AuthenticationMode, IPGroup_MethodList, IPGroup_EnableSBCClientForking, IPGroup_SourceUriInput, IPGroup_DestUriInput, IPGroup_ContactName, IPGroup_DestUriInput, IPGroup_Password, IPGroup_UUIFormat, IPGroup_QOEProfile, IPGroup_BWProfile, IPGroup_MediaEnhancementProfile, IPGroup_AlwaysUseSourceAddr; [/IPGroup] For a description of this table, see "Configuring IP Groups" on page 273. Note: For this parameter to take effect, a device reset is required.
Account Table	
Web: Account Table EMS: SIP Endpoints > Account [Account]	This table parameter configures the Account table for registering and/or authenticating (digest) Trunk Groups or IP Groups (e.g., an IP-PBX) to another Serving IP Group (e.g., an Internet Telephony Service Provider - ITSP). The format of the ini file table parameter is as follows: [Account] FORMAT Account_Index = Account_ServedTrunkGroup, Account_ServedIPGroup, Account_ServingIPGroup, Account_Username, Account_Password, Account_HostName, Account_Register, Account_ContactUser, Account_ApplicationType; [\Account] For a detailed description of this table, see "Configuring Registration Accounts" on page 291.

Parameter	Description
Proxy Registration Parameters	
Web: Use Default Proxy EMS: Proxy Used [IsProxyUsed]	 Enables the use of a SIP proxy server (Proxy Set ID 0). [0] No = (Default) Proxy isn't used and instead, the internal routing table is used. [1] Yes = Proxy server is used. Note: This parameter must be used only for backward compatibility. If not required for backward compatibility, make sure that this parameter is disabled, and use the Proxy Set table for configuring all your Proxy Sets (except for Proxy Set ID 0). If you are not using a proxy server, you must configure routing rules to route the call. This parameter is applicable only to the Gateway
Web/EMS: Proxy Name [ProxyName]	application. Defines the Home Proxy domain name. If specified, this name is used as the Request-URI in REGISTER, INVITE and other SIP messages, and as the host part of the To header in INVITE messages. If not specified, the Proxy IP address is used instead. The valid value is a string of up to 49 characters. Note: This parameter functions together with the UseProxyIPasHost parameter.
Web: Use Proxy IP as Host [UseProxyIPasHost]	Enables the use of the proxy server's IP address (in dotted-decimal notation) as the host name in SIP From and To headers in REGISTER requests. • [0] Disable (default) • [1] Enable If this parameter is disabled and the device registers to an IP Group (i.e., proxy server), it uses the string configured by the ProxyName parameter as the host name in the REGISTER's Request-URI and uses the string configured by the IP Group table parameter, SIPGroupName as the host name in the To and From headers. If the IP Group is configured with a Proxy Set that has multiple IP addresses, all the REGISTER messages sent to these proxies are sent with the same host name. Note: If this parameter is disabled and the ProxyName parameter is not configured, the proxy's IP address is used as the host name in the REGISTER Request-URI.
Web: Redundancy Mode EMS: Proxy Redundancy Mode [ProxyRedundancyMode]	 Determines whether the device switches back to the primary Proxy after using a redundant Proxy. [0] Parking = (Default) The device continues working with a redundant (now active) Proxy until the next failure, after which it works with the next redundant Proxy. [1] Homing = The device always tries to work with the primary Proxy server (i.e., switches back to the primary Proxy whenever it's available). Note: To use this Proxy Redundancy mechanism, you need to enable the keep-alive with Proxy option, by setting the parameter EnableProxyKeepAlive to 1 or 2.

Parameter	Description
Web: Proxy IP List Refresh Time EMS: IP List Refresh Time	Defines the time interval (in seconds) between each Proxy IP list refresh.
[ProxylPListRefreshTime]	The range is 5 to 2,000,000. The default interval is 60.
Web: Enable Fallback to Routing Table EMS: Fallback Used [IsFallbackUsed]	Determines whether the device falls back to the Outbound IP Routing table for call routing when Proxy servers are unavailable. • [0] Disable = (Default) Fallback is not used. • [1] Enable = The Outbound IP Routing table is used when Proxy servers are unavailable.
	When the device falls back to the Outbound IP Routing table, it continues scanning for a Proxy. When the device locates an active Proxy, it switches from internal routing back to Proxy routing. Note: To enable the redundant Proxies mechanism, set the
	parameter EnableProxyKeepAlive to 1 or 2.
Web/EMS: Prefer Routing Table [PreferRouteTable]	Determines whether the device's internal routing table takes precedence over a Proxy for routing calls. • [0] No = (Default) Only a Proxy server is used to route calls.
	[1] Yes = The device checks the routing rules in the Outbound IP Routing table for a match with the Tel-to-IP call. Only if a match is not found is a Proxy used.
Web/EMS: Always Use Proxy [AlwaysSendToProxy]	Determines whether the device sends SIP messages and responses through a Proxy server.
	 [0] Disable = (Default) Use standard SIP routing rules. [1] Enable = All SIP messages and responses are sent to the Proxy server.
	Note: This parameter is applicable only if a Proxy server is used (i.e., the parameter IsProxyUsed is set to 1).
Web: SIP ReRouting Mode EMS: SIP Re-Routing Mode [SIPReroutingMode]	Determines the routing mode after a call redirection (i.e., a 3xx SIP response is received) or transfer (i.e., a SIP REFER request is received).
	• [0] Standard = (Default) INVITE messages that are generated as a result of Transfer or Redirect are sent directly to the URI, according to the Refer-To header in the REFER message, or Contact header in the 3xx response.
	• [1] Proxy = Sends a new INVITE to the Proxy. Note: This option is applicable only if a Proxy server is used and the parameter AlwaysSendtoProxy is set to 0.
	 [2] Routing Table = Uses the Routing table to locate the destination and then sends a new INVITE to this destination.
	Notes: This parameter is applicable only to the Gateway
	application.
	 When this parameter is set to [1] and the INVITE sent to the Proxy fails, the device re-routes the call according to the Standard mode [0].
	 When this parameter is set to [2] and the INVITE fails, the device re-routes the call according to the Standard mode [0]. If DNS resolution fails, the device attempts to route the

Parameter	Description
	 call to the Proxy. If routing to the Proxy also fails, the Redirect/Transfer request is rejected. When this parameter is set to [2], the XferPrefix parameter can be used to define different routing rules for redirect calls. This parameter is disregarded if the parameter AlwaysSendToProxy is set to 1.
Web/EMS: DNS Query Type [DNSQueryType]	Enables the use of DNS Naming Authority Pointer (NAPTR) and Service Record (SRV) queries to resolve Proxy and Registrar servers and to resolve all domain names that appear in the SIP Contact and Record-Route headers.
	 [0] A-Record = (Default) No NAPTR or SRV queries are performed. [1] SRV = If the Proxy/Registrar IP address parameter, Contact/Record-Route headers, or IP address configured in the routing tables contain a domain name, an SRV query is performed. The device uses the first host name received from the SRV query. The device then performs a DNS A-record query for the host name to locate an IP address. [2] NAPTR = An NAPTR query is performed. If it is successful, an SRV query is sent according to the information received in the NAPTR response. If the NAPTR query fails, an SRV query is performed according to the configured transport type.
	Notes:
	 If the Proxy/Registrar IP address parameter, the domain name in the Contact/Record-Route headers, or the IP address configured in the routing tables contain a domain name with a port definition, the device performs a regular DNS A-record query.
	 If a specific Transport Type is configured, a NAPTR query is not performed.
	 To enable NAPTR/SRV queries for Proxy servers only, use the global parameter ProxyDNSQueryType, or use the proxy Set table.
Web: Proxy DNS Query Type [ProxyDNSQueryType]	Global parameter that defines the DNS query record type for resolving the Proxy server's configured domain name (FQDN) into an IP address.
	 [0] A-Record (default) = A-record DNS query. [1] SRV = If the Proxy IP address parameter contains a domain name without port definition (e.g., ProxyIP = domain.com), an SRV query is performed. The SRV query returns up to four Proxy host names and their weights. The device then performs DNS A-record queries for each Proxy host name (according to the received weights) to locate up to four Proxy IP addresses. Thus, if the first SRV query returns two domain names and the A-record queries return two IP addresses each, no additional searches are performed. [2] NAPTR = NAPTR query is done. If successful, an SRV query is sent according to the information received in the NAPTR response. If the NAPTR query fails, an SRV query is done according to the configured transport type. If the Proxy IP address parameter contains a domain name with

Parameter	Description
	 port definition (e.g., ProxyIP = domain.com:5080), the device performs a regular DNS A-record query. If a specific Transport Type is defined, a NAPTR query is not performed. Notes: This functionality can be configured per Proxy Set in the Proxy Set table (see "Configuring Proxy Sets" on page 284). When enabled, NAPTR/SRV queries are used to discover Proxy servers even if the parameter DNSQueryType is disabled.
Web/EMS: Use Gateway Name for OPTIONS CLI: use-gw-name-for-opt [UseGatewayNameForOptions]	Determines whether the device uses its IP address or string name ("gateway name") in keep-alive SIP OPTIONS messages (host part of the Request-URI). The "gateway name" is configured using the SIPGatewayName parameter. The device uses the OPTIONS request as a keep-alive message with its primary and redundant SIP proxy servers (i.e., the EnableProxyKeepAlive parameter is set to 1). • [0] No = (Default) Device's IP address is used in keep-alive OPTIONS messages. • [1] Yes = Device's "gateway name" is used in keep-alive OPTIONS messages. • [2] Server = Device's IP address is used in the From and To headers in keep-alive OPTIONS messages.
Web/EMS: User Name [UserName]	Defines the user name used for registration and Basic/Digest authentication with a Proxy/Registrar server. By default, no value is defined. Note: This parameter is applicable only to the Gateway application. This parameter is applicable only if single device registration is used (i.e., the parameter AuthenticationMode is set to authentication per gateway).
Web/EMS: Password [Password]	Defines the password for Basic/Digest authentication with a Proxy/Registrar server. A single password is used for all device ports. The default is 'Default_Passwd'.
Web/EMS: Cnonce [Cnonce]	Defines the Cnonce string used by the SIP server and client to provide mutual authentication. The value is free format, i.e., 'Cnonce = 0a4f113b'. The default is 'Default_Cnonce'.
Web/EMS: Mutual Authentication Mode [MutualAuthenticationMode]	Determines the device's mode of operation when Authentication and Key Agreement (AKA) Digest Authentication is used. • [0] Optional = (Default) Incoming requests that don't include AKA authentication information are accepted. • [1] Mandatory = Incoming requests that don't include AKA authentication information are rejected.
Web/EMS: Challenge Caching	Determines the mode for Challenge Caching, which reduces

Version 6.8 739 Mediant 3000

Parameter	Description
Mode [SIPChallengeCachingMode]	the number of SIP messages transmitted through the network. The first request to the Proxy is sent without authorization. The Proxy sends a 401/407 response with a challenge. This response is saved for further uses. A new request is re-sent with the appropriate credentials. Subsequent requests to the Proxy are automatically sent with credentials (calculated from the saved challenge). If the Proxy doesn't accept the new request and sends another challenge, the old challenge is replaced with the new one. • [0] None = (Default) Challenges are not cached. Every new request is sent without preliminary authorization. If the request is challenged, a new request with authorization data is sent. • [1] INVITE Only = Challenges issued for INVITE requests are cached. This prevents a mixture of REGISTER and INVITE authorizations. • [2] Full = Caches all challenges from the proxies. Notes: • This parameter is applicable only to the Gateway application. • Challenge Caching is used with all proxies and not only with the active one.
Proxy IP Table	the active one.
Web: Proxy IP Table EMS: Proxy IP [ProxyIP]	This table parameter defines the Proxy Set table with Proxy Set IDs, each with up to 10 Proxy server IP addresses (or FQDN). The format of the ini file table parameter is as follows: [ProxyIP] FORMAT ProxyIp_Index = ProxyIp_IpAddress, ProxyIp_TransportType, ProxyIp_ProxySetId; [\ProxyIP] For a description of this table, see "Configuring Proxy Sets" on page 284. To configure the Proxy Set attributes (such as Proxy Load Balancing) in the ini file, use the ProxySet parameter.
Proxy Set Table	
Web: Proxy Set Table EMS: Proxy Set [ProxySet]	This table parameter defines the Proxy Set ID table. This includes, for example, Proxy keep-alive and load balancing and redundancy mechanisms. The format of the ini file table parameter is as follows: [ProxySet] FORMAT ProxySet_Index = ProxySet_ProxyName, ProxySet_EnableProxyKeepAlive, ProxySet_ProxyKeepAliveTime, ProxySet_ProxyLoadBalancingMethod, ProxySet_IsProxyHotSwap, ProxySet_SRD, ProxySet_ClassificationInput, ProxySet_ProxyRedundancyMode, ProxySet_DNSResolveMethod, ProxySet_DNSResolveMethod, ProxySet_KeepAliveFailureResp; [\ProxySet] For a description of this table, see "Configuring Proxy Sets" on

Parameter	Description
	page 284. For configuring the IP addresses per Proxy Set in the ini file, use the ProxyIP parameter.
Registrar Parameters	
Web: Enable Registration EMS: Is Register Needed [IsRegisterNeeded]	 Enables the device to register to a Proxy/Registrar server. [0] Disable = (Default) The device doesn't register to Proxy/Registrar server. [1] Enable = The device registers to Proxy/Registrar server when the device is powered up and at every user-defined interval (configured by the parameter RegistrationTime). Notes: This parameter is applicable only to the Gateway application. The device sends a REGISTER request for each channel or for the entire device (according to the AuthenticationMode parameter).
Web/EMS: Registrar Name [RegistrarName]	Defines the Registrar domain name. If specified, the name is used as the Request-URI in REGISTER messages. If it isn't specified (default), the Registrar IP address, or Proxy name or IP address is used instead. The valid range is up to 100 characters. Note: This parameter is applicable only to the Gateway application.
Web: Registrar IP Address EMS: Registrar IP [RegistrarIP]	 Defines the IP address (or FQDN) and port number (optional) of the Registrar server. The IP address is in dotted-decimal notation, e.g., 201.10.8.1:<5080>. Notes: This parameter is applicable only to the Gateway application. If not specified, the REGISTER request is sent to the primary Proxy server. When a port number is specified, DNS NAPTR/SRV queries aren't performed, even if the parameter DNSQueryType is set to 1 or 2. If the parameter RegistrarIP is set to an FQDN and is resolved to multiple addresses, the device also provides real-time switching (hotswap mode) between different Registrar IP addresses (the parameter IsProxyHotSwap is set to 1). If the first Registrar doesn't respond to the REGISTER message, the same REGISTER message is sent immediately to the next Proxy. To allow this mechanism, the parameter EnableProxyKeepAlive must be set to 0. When a specific transport type is defined using the parameter RegistrarTransportType, a DNS NAPTR query is not performed even if the parameter DNSQueryType is set to 2.
Web/EMS: Registrar Transport Type [RegistrarTransportType]	Determines the transport layer used for outgoing SIP dialogs initiated by the device to the Registrar. • [-1] Not Configured (default)

Version 6.8 741 Mediant 3000

Parameter	Description
	 [0] UDP [1] TCP [2] TLS Notes: This parameter is applicable only to the Gateway application. When set to 'Not Configured', the value of the parameter SIPTransportType is used.
Web/EMS: Registration Time [RegistrationTime]	Defines the time interval (in seconds) for registering to a Proxy server. The value is used in the SIP Expires header. This parameter also defines the time interval between Keep-Alive messages when the parameter EnableProxyKeepAlive is set to 2 (REGISTER). Typically, the device registers every 3,600 sec (i.e., one hour). The device resumes registration according to the parameter RegistrationTimeDivider. The valid range is 10 to 2,000,000. The default is 180.
Web: Re-registration Timing [%] EMS: Time Divider [RegistrationTimeDivider]	Defines the re-registration timing (in percentage). The timing is a percentage of the re-register timing set by the Registrar server. The valid range is 50 to 100. The default is 50. For example: If this parameter is set to 70% and the Registration Expires time is 3600, the device re-sends its registration request after 3600 x 70% (i.e., 2520 sec). Notes: This parameter may be overridden if the parameter RegistrationTimeThreshold is greater than 0.
Web/EMS: Registration Retry Time [RegistrationRetryTime]	Defines the time interval (in seconds) after which a registration request is re-sent if registration fails with a 4xx response or if there is no response from the Proxy/Registrar server. The default is 30 seconds. The range is 10 to 3600.
Web: Registration Time Threshold EMS: Time Threshold [RegistrationTimeThreshold]	Defines a threshold (in seconds) for re-registration timing. If this parameter is greater than 0, but lower than the computed re-registration timing (according to the parameter RegistrationTimeDivider), the re-registration timing is set to the following: timing set by the Registration server in the SIP Expires header minus the value of the parameter RegistrationTimeThreshold. The valid range is 0 to 2,000,000. The default is 0.
Web: Re-register On INVITE Failure EMS: Register On Invite Failure CLI: reg-on-invite-fail [RegisterOnInviteFailure]	 Enables immediate re-registration if no response is received for an INVITE request sent by the device. [0] Disable (default) [1] Enable = The device immediately expires its reregistration timer and commences re-registration to the same Proxy upon any of the following scenarios: The response to an INVITE request is 407 (Proxy Authentication Required) without an authentication header included. The remote SIP UA abandons a call before the device has received any provisional response (indicative of an outbound proxy server failure).

Parameter	Description
	 ✓ The remote SIP UA abandons a call and the only provisional response the device has received for the call is 100 Trying (indicative of a home proxy server failure, i.e., the failure of a proxy in the route after the outbound proxy). ✓ The device terminates a call due to the expiration of RFC 3261 Timer B or due to the receipt of a 408 (Request Timeout) response and the device has not received any provisional response for the call (indicative of an outbound proxy server failure). ✓ The device terminates a call due to the receipt of a 408 (Request Timeout) response and the only provisional response the device has received for the call is the 100 Trying provisional response (indicative of a home proxy server failure). Note: This parameter is applicable only to the Gateway application.
Web: Re-register On INVITE Failure EMS: Register On Invite Failure [RegisterOnInviteFailure]	Enables immediate re-registration if no response is received for an INVITE request sent by the device. [0] Disable (default) [1] Enable
	 When enabled, the device immediately expires its reregistration timer and commences re-registration to the same Proxy upon any of the following scenarios: The response to an INVITE request is 407 (Proxy Authentication Required) without an authentication header included. The remote SIP UA abandons a call before the device has received any provisional response (indicative of an outbound proxy server failure). The remote SIP UA abandons a call and the only provisional response the device has received for the call is 100 Trying (indicative of a home proxy server failure, i.e., the failure of a proxy in the route after the outbound proxy).
	 The device terminates a call due to the expiration of RFC 3261 Timer B or due to the receipt of a 408 (Request Timeout) response and the device has not received any provisional response for the call (indicative of an outbound proxy server failure). The device terminates a call due to the receipt of a 408 (Request Timeout) response and the only provisional response the device has received for the call is the 100 Trying provisional response (indicative of a home proxy server failure).
Web: ReRegister On Connection Failure EMS: Re Register On Connection Failure [ReRegisterOnConnectionFailure]	Enables the device to perform SIP re-registration upon TCP/TLS connection failure. • [0] Disable (default) • [1] Enable
Web: Gateway Registration Name EMS: Name [GWRegistrationName]	Defines the user name that is used in the From and To headers in SIP REGISTER messages. If no value is specified (default) for this parameter, the UserName parameter is used

Parameter	Description
	 instead. Notes: This parameter is applicable only to the Gateway application. This parameter is applicable only for single registration per device (i.e., AuthenticationMode is set to 1). When the device registers each channel separately (i.e., AuthenticationMode is set to 0), the user name is set to the channel's phone number.
Web/EMS: Registration Mode [AuthenticationMode]	 Determines the device's registration and authentication method. [0] Per Endpoint = Registration and authentication is performed separately for each B-channel. [1] Per Gateway = (Default) Single registration and authentication for the entire device. This is typically used for and digital modules. Note: This parameter is applicable only to the Gateway application.
Web: Set Out-Of-Service On Registration Failure EMS: Set OOS On Registration Fail [OOSOnRegistrationFail]	Enables setting the , trunk, or entire device (i.e., all endpoints) to out-of-service if registration fails. • [0] Disable (default) • [1] Enable If the registration is per endpoint (i.e., AuthenticationMode is set to 0) or per Account (see Configuring Trunk Group Settings on page 377) and a specific endpoint/Account registration fails (SIP 4xx or no response), then that endpoint is set to out-of-service until a success response is received in a subsequent registration request. When the registration is per the entire device (i.e., AuthenticationMode is set to 1) and registration fails, all endpoints are set to out-of-service. If all the Accounts of a specific Trunk Group fail registration and if the Trunk Group comprises a complete trunk, then the entire trunk is set to out-of-service. Note: This parameter is applicable only to the Gateway application.
[UnregistrationMode]	 [0] Disable (default) [1] Enable = The device sends an asterisk ("*") value in the SIP Contact header, instructing the Registrar server to remove all previous registration bindings. The device removes SIP User Agent (UA) registration bindings in a Registrar, according to RFC 3261. Registrations are soft state and expire unless refreshed, but they can also be explicitly removed. A client can attempt to influence the expiration interval selected by the Registrar. A UA requests the immediate removal of a binding by specifying an expiration interval of "0" for that contact address in a REGISTER request. UA's should support this mechanism so that bindings can be removed before their expiration interval has passed. Use of the "*" Contact header field value allows a registering UA to remove all bindings associated with an address-of-record (AOR) without knowing their precise values.

Parameter	Description
	Note: The REGISTER-specific Contact header field value of "*" applies to all registrations, but it can only be used if the Expires header field is present with a value of "0".
Web/EMS: Add Empty Authorization Header [EmptyAuthorizationHeader]	Enables the inclusion of the SIP Authorization header in initial registration (REGISTER) requests sent by the device. • [0] Disable (default) • [1] Enable The Authorization header carries the credentials of a user agent (UA) in a request to a server. The sent REGISTER message populates the Authorization header with the following parameters: • username - set to the value of the private user identity • realm - set to the domain name of the home network • uri - set to the SIP URI of the domain name of the home network • nonce - set to an empty value • response - set to an empty value For example: Authorization: Digest username=alice_private@homel.net, realm="homel.net", nonce="", response="e56131d19580cd833064787ecc" Note: This registration header is according to the IMS 3GPP TS24.229 and PKT-SP-24.220 specifications.
Web: Add initial Route Header [InitialRouteHeader]	Enables the inclusion of the SIP Route header in initial registration or re-registration (REGISTER) requests sent by the device. • [0] Disable (default) • [1] Enable When the device sends a REGISTER message, the Route header includes either the Proxy's FQDN, or IP address and port according to the configured Proxy Set, for example: Route: <sip:10.10.10.10;lr;transport=udp> or Route: <sip: gm.ims.rr.com;lr;transport="udp" pcscf-=""></sip:></sip:10.10.10.10;lr;transport=udp>
EMS: Ping Pong Keep Alive [UsePingPongKeepAlive]	Enables the use of the carriage-return and line-feed sequences (CRLF) Keep-Alive mechanism, according to RFC 5626 "Managing Client-Initiated Connections in the Session Initiation Protocol (SIP)" for reliable, connection-orientated transport types such as TCP. • [0] Disable (default) • [1] Enable The SIP user agent/client (i.e., device) uses a simple periodic message as a keep-alive mechanism to keep their flow to the proxy or registrar alive (used for example, to keep NAT bindings open). For connection-oriented transports such as TCP/TLS this is based on CRLF. This mechanism uses a client-to-server "ping" keep-alive and a corresponding server-to-client "pong" message. This ping-pong sequence allows the

Parameter	Description
	client, and optionally the server, to tell if its flow is still active and useful for SIP traffic. If the client does not receive a pong in response to its ping, it declares the flow "dead" and opens a new flow in its place. In the CRLF Keep-Alive mechanism the client periodically (defined by the PingPongKeepAliveTime parameter) sends a double-CRLF (the "ping") then waits to receive a single CRLF (the "pong"). If the client does not receive a "pong" within an appropriate amount of time, it considers the flow failed.
	Note: The device sends a CRLF message to the Proxy Set only if the Proxy Keep-Alive feature (EnableProxyKeepAlive parameter) is enabled and its transport type is set to TCP or TLS. The device first sends a SIP OPTION message to establish the TCP/TLS connection and if it receives any SIP response, it continues sending the CRLF keep-alive sequences.
EMS: Ping Pong Keep Alive Time [PingPongKeepAliveTime]	Defines the periodic interval (in seconds) after which a "ping" (double-CRLF) keep-alive is sent to a proxy/registrar, using the CRLF Keep-Alive mechanism. The default range is 5 to 2,000,000. The default is 120. The device uses the range of 80-100% of this user-defined value as the actual interval. For example, if the parameter value is set to 200 sec, the interval used is any random time between 160 to 200 seconds. This prevents an "avalanche" of keep-alive by multiple SIP UAs to a specific server.
Web: Max Generated Register Rate CLI: configure voip/sip-definition proxy-and-registration/max-gen-regrate [MaxGeneratedRegistersRate]	Defines the maximum number of user register requests that the device can send to a proxy (or registrar) server per second. This feature is useful in that it can be used to prevent an overload on the device's CPU caused by the sending of many (for example, 1,000) registration requests to a proxy server at any given time. The valid value is 30 to 300 register requests per second. The default is 100.

50.6.2 Network Application Parameters

The SIP network application parameters are described in the table below.

Table 50-33: SIP Network Application Parameters

Parameter	Description	
Signaling Routing Domai	Signaling Routing Domain Table	
Web: SRD Settings EMS: SRD Table [SRD]	This table parameter configures the Signaling Routing Domains (SRD). The format of the ini file table parameter is as follows: [SRD] FORMAT SRD_Index = SRD_Name, SRD_MediaRealm, SRD_IntraSRDMediaAnchoring, SRD_BlockUnRegUsers, SRD_MaxNumOfRegUsers, SRD_EnableUnAuthenticatedRegistrations; [\SRD] For a detailed description of this table, see "Configuring SRDs" on page 267.	

Parameter	Description
SIP Interface Table	
Web: SIP Interface Table EMS: SIP Interfaces Table [SIPInterface]	This table parameter configures SIP Interfaces. The SIP Interface represents a SIP signaling entity, comprising ports (UDP, TCP, and TLS) and associated with a specific IP interface and an SRD. The format of the ini file table parameter is as follows:
	[SIPInterface] FORMAT SIPInterface_Index = SIPInterface_InterfaceName, SIPInterface_NetworkInterface, SIPInterface_ApplicationType, SIPInterface_UDPPort, SIPInterface_TCPPort, SIPInterface_TLSPort, SIPInterface_SRD, SIPInterface_MessagePolicy, SIPInterface_TLSMutualAuthentication, SIPInterface_TCPKeepaliveEnable, SIPInterface_ClassificationFailureResponseType, SIPInterface_PreClassificationManSet; [\SIPInterface]
	For a detailed description of this table, see "Configuring SIP Interfaces" on page 270.
[TCPKeepAliveTime]	Defines the interval (in sec) between the last data packet sent and the first keep-alive probe to send.
	The valid value is 10 to 65,000. The default is 60. Notes:
	 Simple ACKs such as keepalives are not considered data packets. TCP keepalive is enabled per SIP Interface in the SIP Interface table.
[TCPKeepAliveInterval]	Defines the interval (in sec) between consecutive keep-alive probes, regardless of what the connection has exchanged in the meantime.
	The valid value is 10 to 65,000. The default is 10.
	Note: TCP keepalive is enabled per SIP Interface in the SIP Interface table.
[TCPKeepAliveRetry]	Defines the number of unacknowledged keep-alive probes to send before considering the connection down.
	The valid value is 1 to 100. The default is 5.
	Note: TCP keepalive is enabled per SIP Interface in the SIP Interface table.
NAT Translation Table	
Web: NAT Translation Table [NATTranslation]	This table parameter defines NAT rules for translating source IP addresses per VoIP interface (SIP control and RTP media traffic) into NAT IP addresses. This allows, for example, the separation of VoIP traffic between different ISTP's, and topology hiding (of internal IP addresses to the "public" network). Each IP interface (configured in the Interface table - InterfaceTable parameter) can be associated with a NAT rule in this table, translating the source IP address and port of the outgoing packet into the NAT address (IP address and port range).
	The format of the ini file table parameter is as follows:
	[NATTranslation] FORMAT NATTranslation_Index = NATTranslation_SourceIPInterfaceName, NATTranslation_TargetIPAddress, NATTranslation_SourceStartPort, NATTranslation_SourceEndPort, NATTranslation_TargetStartPort, NATTranslation_TargetEndPort;

Version 6.8 747 Mediant 3000

Parameter	Description
	[\NATTranslation] For a detailed description of this table, see "Configuring NAT Translation per IP Interface" on page 147.
Media Realm Table	
Web: Media Realm Table EMS: Media Realm [CpMediaRealm]	This table parameter defines Media Realms. The Media Realm table allows you to divide a Media-type interface (defined in the Interface table) into several realms, where each realm is specified by a UDP port range. The format of the ini file table parameter is as follows: [CpMediaRealm] FORMAT CpMediaRealm_Index = CpMediaRealm_MediaRealmName, CpMediaRealm_IPv4IF, CpMediaRealm_IPv6IF, CpMediaRealm_PortRangeStart, CpMediaRealm_MediaSessionLeg, CpMediaRealm_PortRangeEnd, CpMediaRealm_IsDefault, CpMediaRealm_QoeProfile, CpMediaRealm_BWProfile; [\CpMediaRealm] For a detailed description of this table, see "Configuring Media Realms" on page 263.
Remote Media Subnet Tal	ble
Web: Remote Media Subnet EMS: Remote Media Subnet [SubRealm]	This table parameter defines Remote Media Subnets. The format of the ini file table parameter is as follows: [RemoteMediaSubnet] FORMAT RemoteMediaSubnet_Index = RemoteMediaSubnet_Realm, RemoteMediaSubnet_RemoteMediaSubnetIndex, RemoteMediaSubnet_RemoteMediaSubnetName, RemoteMediaSubnet_PrefixLength, RemoteMediaSubnet_AddressFamily, RemoteMediaSubnet_DstIPAddress, RemoteMediaSubnet_QOEProfileName, RemoteMediaSubnet_BWProfileName; [\RemoteMediaSubnet] For a detailed description of this table, see "Configuring Remote Media Subnets" on page 265.

50.7 General SIP Parameters

The general SIP parameters are described in the table below.

Table 50-34: General SIP Parameters

Parameter	Description
Web: Send reject on overload CLI: configure voip/sip-definition advanced-settings/reject-on-ovrld [SendRejectOnOverload]	Disables the sending of SIP 503 (Service Unavailable) responses upon receipt of new SIP dialog-initiating requests when the device's CPU is overloaded and thus, unable to accept and process new SIP messages. • [0] Disable = No SIP 503 response is sent when CPU overloaded. • [1] Enable (default) = SIP 503 response is sent when CPU overloaded.
	Note: Even if this parameter is disabled (i.e., 503 is not sent), the device still discards new SIP dialog-initiating requests when the CPU is

Parameter	Description
	overloaded.
Web: SIP 408 Response upon non-INVITE [EnableNonInvite408Reply]	 Enables the device to send SIP 408 responses (Request Timeout) upon receipt of non-INVITE transactions. Disabling this response complies with RFC 4320/4321. By default, and in certain circumstances such as a timeout expiry, the device sends a SIP 408 Request Timeout in response to non-INVITE requests (e.g., REGISTER). [0] Disable = SIP 408 response is not sent upon receipt of non-INVITE messages (to comply with RFC 4320). [1] Enable = (Default) SIP 408 response is sent upon receipt of non-INVITE messages, if necessary.
Web: SIP Remote Reset [EnableSIPRemoteReset]	Enables a specific device action upon the receipt of a SIP NOTIFY request, where the action depends on the value received in the Event header. • [0] Disable (default) • [1] Enable The action depends on the Event header value: • 'check-sync;reboot=false': triggers the regular Automatic Update feature (if Automatic Update has been enabled on the device) • 'check-sync;reboot=true': triggers a device reset Note: The Event header value is proprietary to AudioCodes.
Web/EMS: Max SIP Message Length [KB] [MaxSIPMessageLength]	Defines the maximum size (in Kbytes) for each SIP message that can be sent over the network. The device rejects messages exceeding this user-defined size. The valid value range is 1 to 50. The default is 50.
[SIPForceRport]	 Determines whether the device sends SIP responses to the UDP port from where SIP requests are received even if the 'rport' parameter is not present in the SIP Via header. [0] = (Default) Disabled. The device sends the SIP response to the UDP port defined in the Via header. If the Via header contains the 'rport' parameter, the response is sent to the UDP port from where the SIP request is received. [1] = Enabled. SIP responses are sent to the UDP port from where SIP requests are received even if the 'rport' parameter is not present in the Via header.
Web: Reject Cancel after Connect [RejectCancelAfterConnect]	Determines whether the device accepts or rejects a SIP CANCEL request received after the receipt of a 200 OK, during an established call. • [0] = (Default) Accepts the CANCEL, by responding with a 200 OK and terminating the call session. • [1] = Rejects the CANCEL, by responding with a SIP 481 Call/Transaction Does Not Exist, and maintaining the call session.

RequestURI IN	nables the device to reject SIP requests (such as ACK, BYE, or re- IVITE) whose user part in the Request-URI is different from the user art received in the Contact header of the last sent SIP request.
	 [0] Disable = (Default) Even if the user is different, the device accepts the SIP request. [1] Enable = If the user is different, the device rejects the SIP request (BYE is responded with 481; re-INVITE is responded with 404; ACK is ignored).
Calls by EMS: Maximum Concurrent ar Calls The [MaxActiveCalls]	efines the maximum number of simultaneous active calls supported by the device. If the maximum number of calls is reached, new calls re not established. The valid range is 1 to the maximum number of supported channels. The default value is the maximum available channels (i.e., no estriction on the maximum number of calls).
	efines the maximum number of concurrent calls per IP Profile (see Configuring IP Profiles" on page 314).
Web: QoS statistics in SIP Release Call [QoSStatistics] The state of	nables the device to include call quality of service (QoS) statistics in IP BYE and SIP 200 OK response to BYE, using the proprietary SIP adder X-RTP-Stat. [0] = Disable (default) [1] = Enable he X-RTP-Stat header provides the following statistics: Number of received and sent voice packets Number of received and sent voice octets Received packet loss, jitter (in ms), and latency (in ms) he X-RTP-Stat header contains the following fields: PS= <voice packets="" sent=""> OS=<voice octets="" sent=""> PR=<voice packets="" received=""> OR=<voice octets="" received=""> PL=<receive loss="" packet=""> JI=<jitter in="" ms=""> LA=<latency in="" ms=""> elow is an example of the X-RTP-Stat header in a SIP BYE message: BYE sip:302@10.33.4.125 SIP/2.0 Via: SIP/2.0/UDP 10.33.4.126;branch=z9hG4bKac2127550866 Max-Forwards: 70 From: scip:401@10.33.4.126;user=phone>;tag=1c2113553324 TO: <sip:302@company.com>;tag=1c991751121 Tall-ID: 991750671245200001912@10.33.4.125 TSG=21 BYE C-RTP-Stat: PS=207;OS=49680;;PR=314;OR=50240;PL=0;JI=600;LA=40 PSUPPORTED: Disported: em,timer,replaces,path,resource-priority Mallow:</sip:302@company.com></latency></jitter></receive></voice></voice></voice></voice>

Parameter	Description
	<pre>K,REFER,INFO,SUBSCRIBE,UPDATE User-Agent: Sip-Gateway-/v.6.2A.008.006 Reason: Q.850 ;cause=16 ;text="local" Content-Length: 0</pre>
Web/EMS: PRACK Mode [PrackMode]	Determines the PRACK (Provisional Acknowledgment) mechanism mode for SIP 1xx reliable responses. • [0] Disable • [1] Supported (default) • [2] Required Notes: • The Supported and Required headers contain the '100rel' tag. • The device sends PRACK messages if 180/183 responses are received with '100rel' in the Supported or Required headers.
Web/EMS: Enable Early Media [EnableEarlyMedia]	Global parameter that enables the Early Media feature for sending media (e.g., ringing) before the call is established. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_EnableEarlyMedia) or Tel Profiles. For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314 or in the Tel Profile table, see Configuring Tel Profiles on page 312. Notes: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web/EMS: Enable Early 183 [EnableEarly183]	This parameter is applicable only to the Gateway application. Global parameter that enables the device to send SIP 183 responses with SDP to the IP upon receipt of INVITE messages. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_EnableEarly183). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
[IgnoreAlertAfterEarlyMedia]	Determines the device's interworking of Alerting messages from PRI to SIP. • [0] = Disabled (default) • [1] = Enabled When enabled, if the device sends a 183 response with an SDP (due to a received ISDN Progress or Proceeding with PI messages) and an Alerting message is then received from the Tel side (with or without Progress Indicator), the device does not send an additional 18x response, and the voice channel remains open. However, if the device did not send a 183 with an SDP and it receives an Alert without PI, the device sends a 180 (without SDP). If it receives an Alert with PI it sends a 183with an SDP. When disabled, the device sends additional 18x responses as a result of receiving Alerting and Progress messages, regardless of whether or not a 18x response was already sent. Note: This parameter is applicable only if the EnableEarlyMedia

Version 6.8 751 Mediant 3000

Parameter	Description
	parameter is set to 1 (i.e., enabled).
Web: 183 Message Behavior EMS: SIP 183 Behaviour [SIP183Behaviour]	Defines the ISDN message that is sent when the 183 Session Progress message is received for IP-to-Tel calls. • [0] Progress = (Default) The device sends a Progress message. • [1] Alert = The device sends an Alerting message (upon receipt of a 183 response) instead of an ISDN Progress message.
[ReleaseIP2ISDNCallOnPro gressWithCause]	Typically, if an Q.931 Progress message with a Cause is received from the PSTN for an outgoing IP-to-ISDN call and the EnableEarlyMedia parameter is set to 1 (i.e., the Early Media feature is enabled), the device interworks the Progress to 183 + SDP to enable the originating party to hear the PSTN announcement about the call failure. Conversely, if EnableEarlyMedia is set to 0, the device disconnects the call by sending a SIP 4xx response to the originating party. However, if the ReleaseIP2ISDNCallOnProgressWithCause parameter is set to 1, then the device sends a SIP 4xx response even if the EnableEarlyMedia parameter is set to 1. • [0] = (Default) If a Progress with Cause message is received from the PSTN for an outgoing IP-to-ISDN call, the device does not disconnect the call by sending a SIP 4xx response to the originating party. • [1] = The device sends a SIP 4xx response when the EnableEarlyMedia parameter is set to 0. • [2] = The device always sends a SIP 4xx response, even if he EnableEarlyMedia parameter is set to 1.
Web: Session-Expires Time EMS: Sip Session Expires [SIPSessionExpires]	Defines the numerical value sent in the Session-Expires header in the first INVITE request or response (if the call is answered). The valid range is 1 to 86,400 sec. The default is 0 (i.e., the Session-Expires header is disabled).
Web: Minimum Session- Expires EMS: Minimal Session Refresh Value [MinSE]	Defines the time (in seconds) that is used in the Min-SE header. This header defines the minimum time that the user agent refreshes the session. The valid range is 10 to 100,000. The default is 90.
Web/EMS: Session Expires Disconnect Time [SessionExpiresDisconne ctTime]	Defines a session expiry timeout. The device disconnects the session (sends a SIP BYE) if the refresher did not send a refresh request before one-third (1/3) of the session expires time, or before the time configured by this parameter (the minimum of the two). The valid range is 0 to 32 (in seconds). The default is 32.
Web/EMS: Session Expires Method [SessionExpiresMethod]	 Determines the SIP method used for session-timer updates. [0] Re-INVITE = (Default) Uses re-INVITE messages for session-timer updates. [1] UPDATE = Uses UPDATE messages. Notes: The device can receive session-timer refreshes using both methods. The UPDATE message used for session-timer is excluded from the SDP body.
[RemoveToTagInFailureRe sponse]	Determines whether the device removes the 'to' header tag from final SIP failure responses to INVITE transactions. • [0] = (Default) Do not remove tag.

Parameter	Description
	• [1] = Remove tag.
[EnableRTCPAttribute]	 Enables the use of the 'rtcp' attribute in the outgoing SDP. [0] = Disable (default) [1] = Enable Note: This parameter is applicable only to the Gateway application.
EMS: Options User Part [OPTIONSUserPart]	Defines the user part value of the Request-URI for outgoing SIP OPTIONS requests. If no value is configured, the configuration parameter 'Username' valueis used. A special value is 'empty', indicating that no user part in the Request-URI (host part only) is used. The valid range is a 30-character string. By default, this value is not defined.
CLI: trunk-status-reporting [TrunkStatusReportingMo de]	 Enables the device to not respond to received SIP OPTIONS messages from, and/or send keep-alive messages to, a proxy server associated with Trunk Group ID 1 if all its member trunks are down. [0] = Disable (default) [1] = The device does not respond to SIP OPTIONS received from the proxy associated with Trunk Group 1. [2] = The device does not send keep-alive messages to the proxy associated with Trunk Group 1. [3] = Both options [1] and [2]. Notes: When this parameter is set to not respond to SIP OPTIONS received from the proxy, it is applicable only if the OPTIONS message does not include a user part in the Request-URI. The proxy server is determined by the Proxy Set that is associated with the Serving IP Group defined for the Trunk Group in the Trunk Group Settings table.
Web: TDM Over IP Minimum Calls For Trunk Activation EMS: TDM Over IP Min Calls For Trunk Activation [TDMOverIPMinCallsForTr unkActivation]	Defines the minimal number of SIP dialogs that must be established when using TDM Tunneling to consider the specific trunk as active. When using TDM Tunneling, if calls from this defined number of B-channels pertaining to a specific Trunk fail (i.e., SIP dialogs are not correctly set up), an AIS alarm is sent on this trunk toward the PSTN and all current calls are dropped. The originator gateway continues the INVITE attempts. When this number of calls succeed (i.e., SIP dialogs are correctly set up), the AIS alarm is cleared. The valid range is 0 to 31. The default is 0 (i.e., don't send AIS alarms).
[TDMolPInitiateInviteTime]	Defines the time (in msec) between the first INVITE issued within the same trunk when implementing the TDM tunneling application. The valid value range is 2000 to 4000. The default is 2000.
[TDMoIPInviteRetryTime]	Defines the time (in msec) between call release and a new INVITE when implementing the TDM tunneling application. The valid value range is 30,000 to 60,000. The default is 30,000.
Web: Fax Signaling Method EMS: Fax Used [IsFaxUsed]	Global parameter that defines the SIP signaling method for establishing and transmitting a fax session when the device detects a fax. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_IsFaxUsed). For a detailed description of this parameter and for configuring this functionality in the IP Profile table,

Parameter	Description
	see "Configuring IP Profiles" on page 314.
	Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
[HandleG711asVBD]	 Enables the handling of G.711 as a G.711 Voice Band Data (VBD) coder. [0] = (Default) Disable. The device negotiates G.711 as a regular audio coder and sends an answer only with G.729 coder. For example, if the device is configured with G.729 and G.711 VBD coders and it receives an INVITE with an SDP offer containing G.729 and "regular" G.711 coders, it sends an SDP answer containing only the G.729 coder. [1] = Enable. The device assumes that the G.711 coder received in the INVITE SDP offer is a VBD coder. For example, if the device is configured with G.729 and G.711 VBD coders and it receives an INVITE with an SDP offer containing G.729 and "regular" G.711 coders, it sends an SDP answer containing G.729 and G.711 VBD coders, allowing a subsequent bypass (passthrough) session if fax/modem signals are detected during the call. Note: This parameter is applicable only if G.711 VBD coder(s) with regular G.711 payload types 0 or 8 are configured for the device (using the CodersGroup parameter).
[FaxVBDBehavior]	 Determines the device's fax transport behavior when G.711 VBD coder is negotiated at call start. [0] = (Default) If the device is configured with a VBD coder (see the CodersGroup parameter) and is negotiated OK at call start, then both fax and modem signals are sent over RTP using the bypass payload type (and no mid-call VBD or T.38 Re-INVITEs occur). [1] = If the IsFaxUsed parameter is set to 1, the channel opens with the FaxTransportMode parameter set to 1 (relay). This is required to detect mid-call fax tones and to send T.38 Re-INVITE messages upon fax detection. If the remote party supports T.38, the fax is relayed over T.38. Notes: If VBD coder negotiation fails at call start and if the IsFaxUsed parameter is set to 1 (or 3), then the channel opens with the FaxTransportMode parameter set to 1 (relay) to allow future detection of fax tones and sending of T.38 Re-INVITES. In such a scenario, the FaxVBDBehavior parameter has no effect. This feature can be used only if the remote party supports T.38 fax relay; otherwise, the fax fails.
[NoAudioPayloadType]	Defines the payload type of the outgoing SDP offer. The valid value range is 96 to 127 (dynamic payload type). The default is 0 (i.e. NoAudio is not supported). For example, if set to 120, the following is added to the INVITE SDP: a=rtpmap:120 NoAudio/8000\r\n Note: For incoming SDP offers, NoAudio is always supported.

Parameter	Description
Web: SIP Transport Type EMS: Transport Type [SIPTransportType]	Determines the default transport layer for outgoing SIP calls initiated by the device. • [0] UDP (default) • [1] TCP • [2] TLS (SIPS) Notes: • It's recommended to use TLS for communication with a SIP Proxy and not for direct device-to-device communication. • For received calls (i.e., incoming), the device accepts all these protocols. • The value of this parameter is also used by the SAS application as the default transport layer for outgoing SIP calls.
Web: SIP UDP Local Port EMS: Local SIP Port [LocalSIPPort]	Defines the local UDP port for SIP messages. The valid range is 1 to 65534. The default is 5060.
Web: SIP TCP Local Port EMS: TCP Local SIP Port [TCPLocalSIPPort]	Defines the local TCP port for SIP messages. The valid range is 1 to 65535. The default is 5060.
Web: SIP TLS Local Port EMS: TLS Local SIP Port [TLSLocalSIPPort]	Defines the local TLS port for SIP messages. The valid range is 1 to 65535. The default is 5061. Note: The value of this parameter must be different from the value of the parameter TCPLocalSIPPort.
Web: Display Default SIP Port CLI: display-default-sip-port [DisplayDefaultSIPPort]	Enables the device to add the default SIP port 5060 (UDP/TCP) or 5061 (TLS) to outgoing messages that are received without a port. This condition also applies to manipulated messages where the resulting message has no port number. The device adds the default port number to the following SIP headers: Request-Uri, To, From, P-Asserted-Identity, P-Preferred-Identity, and P-Called-Party-ID. If the message is received with a port number other than the default, for example, 5070, the port number is not changed. An example of a SIP From header with the default port is shown below: From:
	<pre><sip:+4000@10.8.4.105:5060;user=phone>;tag=f25419a 96a;epid=009FAB8F3E • [0] Disable (default) • [1] Enable</sip:+4000@10.8.4.105:5060;user=phone></pre>
Web/EMS: Enable SIPS [EnableSIPS]	Enables secured SIP (SIPS URI) connections over multiple hops. • [0] Disable (default) • [1] Enable When the SIPTransportType parameter is set to 2 (i.e., TLS) and the parameter EnableSIPS is disabled, TLS is used for the next network hop only. When the parameter SIPTransportType is set to 2 or 1 (i.e., TCP or TLS) and EnableSIPS is enabled, TLS is used through the entire connection (over multiple hops). Note: If this parameter is enabled and the parameter SIPTransportType is set to 0 (i.e., UDP), the connection fails.
Web/EMS: Enable TCP Connection Reuse	Enables the reuse of the same TCP connection for all calls to the same destination.

Version 6.8 755 Mediant 3000

Parameter	Description
[EnableTCPConnectionRe use]	 [0] Disable = Uses a separate TCP connection for each call. [1] Enable = (Default) Uses the same TCP connection for all calls. Notes: This parameter must be left at its default value (and not set to 0). For the SAS application, this feature is configured using the SASConnectionReuse parameter.
Web: Fake TCP alias [FakeTCPalias]	Enables the re-use of the same TCP/TLS connection for sessions with the same user, even if the "alias" parameter is not present in the SIP Via header of the first INVITE. • [0] Disable = (Default) TCP/TLS connection reuse is done only if the "alias" parameter is present in the Via header of the first INVITE. • [1] Enable Note: To enable TCP/TLS connection re-use, set the EnableTCPConnectionReuse parameter to 1.
Web/EMS: Reliable Connection Persistent Mode [ReliableConnectionPersis tentMode]	 Enables setting of all TCP/TLS connections as persistent and therefore, not released. [0] = (Default) Disable. All TCP connections (except those that are set to a proxy IP) are released if not used by any SIP dialog\transaction. [1] = Enable - TCP connections to all destinations are persistent and not released unless the device reaches 70% of its maximum TCP resources. While trying to send a SIP message connection, reuse policy determines whether live connections to the specific destination are reused. Persistent TCP connection ensures less network traffic due to fewer setting up and tearing down of TCP connections and reduced latency on subsequent requests due to avoidance of initial TCP handshake. For TLS, persistent connection may reduce the number of costly TLS handshakes to establish security associations, in addition to the initial TCP connection set up. Note: If the destination is a Proxy server, the TCP/TLS connection is persistent regardless of the settings of this parameter.
Web/EMS: TCP Timeout [SIPTCPTimeout]	Defines the Timer B (INVITE transaction timeout timer) and Timer F (non-INVITE transaction timeout timer), as defined in RFC 3261, when the SIP transport type is TCP. The valid range is 0 to 40 sec. The default is 64 * SipT1Rtx parameter value. For example, if SipT1Rtx is set to 500 msec, then the default of SIPTCPTimeout is 32 sec.
Web: SIP Destination Port EMS: Destination Port [SIPDestinationPort]	Defines the SIP destination port for sending initial SIP requests. The valid range is 1 to 65534. The default port is 5060. Note: SIP responses are sent to the port specified in the Via header.
Web: Use user=phone in SIP URL EMS: Is User Phone [IsUserPhone]	Determines whether the 'user=phone' string is added to the SIP URI and SIP To header. • [0] No = 'user=phone' string is not added. • [1] Yes = (Default) 'user=phone' string is part of the SIP URI and SIP To header.
Web: Use user=phone in From Header	Determines whether the 'user=phone' string is added to the From and Contact SIP headers.

Parameter	Des	scription
EMS: Is User Phone In From [IsUserPhoneInFrom]	 [0] No = (Default) Doesn't add [1] Yes = 'user=phone' string headers. 	d 'user=phone' string. is part of the From and Contact
Web: Use Tel URI for Asserted Identity [UseTelURIForAssertedID]	Determines the format of the UR Preferred-Identity headers. • [0] Disable = (Default) 'sip:' • [1] Enable = 'tel:'	I in the P-Asserted-Identity and P-
Web: Tel to IP No Answer Timeout EMS: IP Alert Timeout [IPAlertTimeout]	Defines the time (in seconds) that response from the called party (I message. If the timer expires, the The valid range is 0 to 3600. The	P side) after sending an INVITE e call is released.
Web: Enable Remote Party ID EMS: Enable RPI Header [EnableRPIheader] Web: Enable History-Info Header EMS: Enable History Info [EnableHistoryInfo]	for Tel-to-IP calls. [0] Disable (default). [1] Enable = Remote-Party-Io INVITE messages for both call invite messages for b	vior: fo header is equal to the Request-URI. fo received, it is added as an additional oppropriate reason. for response, the device copies the eason of the failure response to the last widestination to it (if an additional)
	searches for a Redirect reason	onse (success or failure), the device on in the History-Info (i.e., 3xx/4xx SIP to ISDN according to the following
	SIP Reason Code	ISDN Redirecting Reason
	302 - Moved Temporarily	Call Forward Universal (CFU)
	408 - Request Timeout	Call Forward No Answer (CFNA)
	480 - Temporarily Unavailable	
	487 - Request Terminated	
	486 - Busy Here	Call Forward Busy (CFB)
	600 - Busy Everywhere	
	 The History-Info header is set 	
	•	History-Info, the UAS checks the

Parameter	Description
	policy in the request. If a 'session', 'header', or 'history' policy tag is found, the (final) response is sent without History-Info; otherwise, it is copied from the request.
Web: Use Tgrp Information EMS: Use SIP Tgrp [UseSIPTgrp]	Determines whether the SIP 'tgrp' parameter is used. This SIP parameter specifies the Trunk Group to which the call belongs (according to RFC 4904). For example, the SIP message below indicates that the call belongs to Trunk Group ID 1:
	INVITE sip::+16305550100;tgrp=1;trunk-context=example.com@10.1.0.3;user=phone SIP/2.0 • [0] Disable = (Default) The 'tgrp' parameter isn't used. • [1] Send Only = The Trunk Group number or name (configured in the Trunk Group Settings) is added to the 'tgrp' parameter value in the Contact header of outgoing SIP messages. If a Trunk Group number / name is not associated with the call, the 'tgrp' parameter isn't included. If a 'tgrp' value is specified in incoming messages, it is ignored. • [2] Send and Receive = The functionality of outgoing SIP messages is identical to the functionality described for option [1]. In addition, for incoming SIP INVITEs, if the Request-URI includes a 'tgrp' parameter, the device routes the call according to that value (if possible). The Contact header in the outgoing SIP INVITE (Tel-to-IP call) contains "tgrp= <source group="" id="" trunk=""/> ;trunk-context= <gateway address="" ip="">". The <source group="" id="" trunk=""/> is the Trunk Group ID where incoming calls from Tel is received. For IP-Tel calls, the SIP 200 OK device's response contains "tgrp=<destination group="" id="" trunk="">;trunk-context=<gateway address="" ip="">". The <qateway address="" ip="">". The (address)" in "trunk Group ID used for outgoing Tel calls. The <qateway address="" ip=""> in "trunk Group ID used for outgoing Tel calls. The <qateway address="" ip=""> in "trunk-context" can be configured using the SIP GatewayName parameter. • [3] Hotline = Interworks the hotline "Off Hook Indicator" parameter between SIP and ISDN: • For IP-to-ISDN calls: • The device interworks the SIP tgrp=hotline parameter (received in INVITE) to ISDN Setup with the Off Hook Indicator IE of "Voice", and "Speech" Bearer Capability IE. Note that the Off Hook Indicator IE of "Data", and with "Unrestricted 64k" Bearer Capability IE. The following is an example of the INVITE with tgrp=hotline-ccdata parameter (received in INVITE) to ISDN Setup with an Off Hook Indicator of "Voice" to SIP INVITE with "tgrp=hotline-ccdata; trunk-context=dsn.mil" in the Contact header. • The device interwork</qateway></qateway></qateway></gateway></destination></gateway>

Parameter	Description
	 [4] Hotline Extended = Interworks the ISDN Setup message's hotline "OffHook Indicator" Information Element (IE) to SIP INVITE's Request-URI and Contact headers. (Note: For IP-to-ISDN calls, the device handles the call as described in option [3].) ✓ The device interworks ISDN Setup with an Off Hook Indicator of "Voice" to SIP INVITE Request-URI and Contact header with "tgrp=hotline;trunk-context=dsn.mil". ✓ The device interworks ISDN Setup with an Off Hook indicator of "Data" to SIP INVITE Request-URI and Contact header with "tgrp=hotline-ccdata;trunk-context=dsn.mil". ✓ If ISDN Setup does not contain an Off Hook Indicator IE and the Bearer Capability IE contains "Unrestricted 64k", the outgoing INVITE Request-URI and Contact header includes "tgrp=ccdata;trunk-context=dsn.mil". If the Bearer Capability IE contains "Speech", the INVITE in this case does not contain tgrp and trunk-context parameters. Note: IP-to-Tel configuration (using the PSTNPrefix parameter) overrides the 'tgrp' parameter in incoming INVITE messages.
Web/EMS: TGRP Routing Precedence [TGRProutingPrecedence]	Determines the precedence method for routing IP-to-Tel calls - according to the Inbound IP Routing table or according to the SIP 'tgrp' parameter. • [0] = (Default) IP-to-Tel routing is determined by the Inbound IP Routing table (PSTNPrefix parameter). If a matching rule is not found in this table, the device uses the Trunk Group parameters for routing the call. • [1] = The device first places precedence on the 'tgrp' parameter for IP-to-Tel routing. If the received INVITE Request-URI does not contain the 'tgrp' parameter or if the Trunk Group number is not defined, then the Inbound IP Routing table is used for routing the call. Below is an example of an INVITE Request-URI with the 'tgrp' parameter, indicating that the IP call should be routed to Trunk Group 7: INVITE sip:200;tgrp=7;trunk-context=example.com@10.33.2.68;user=phone SIP/2.0 Notes: • For enabling routing based on the 'tgrp' parameter, the UseSIPTgrp parameter must be set to 2. • For IP-to-Tel routing based on the 'dtg' parameter (instead of the 'tgrp' parameter), use the parameter UseBroadsoftDTG.
[UseBroadsoftDTG]	Determines whether the device uses the 'dtg' parameter for routing IP-to-Tel calls to a specific Trunk Group. • [0] Disable (default) • [1] Enable When this parameter is enabled, if the Request-URI in the received SIP INVITE includes the 'dtg' parameter, the device routes the call to the Trunk Group according to its value. This parameter is used instead of the 'tgrp/trunk-context' parameters. The 'dtg' parameter appears in the INVITE Request-URI (and in the To header). For example, the received SIP message below routes the call to Trunk Group ID 56: INVITE sip:123456@192.168.1.2;dtg=56;user=phone SIP/2.0

Parameter	Description
	Note: If the Trunk Group is not found based on the 'dtg' parameter, the Inbound IP Routing table is used instead for routing the call to the appropriate Trunk Group.
Web/EMS: Enable GRUU [EnableGRUU]	Determines whether the Globally Routable User Agent URIs (GRUU) mechanism is used, according to RFC 5627. This is used for obtaining a GRUU from a registrar and for communicating a GRUU to a peer within a dialog. • [0] Disable (default) • [1] Enable
	A GRUU is a SIP URI that routes to an instance-specific UA and can be reachable from anywhere. There are a number of contexts in which it is desirable to have an identifier that addresses a single UA (using GRUU) rather than the group of UA's indicated by an Address of Record (AOR). For example, in call transfer where user A is talking to user B, and user A wants to transfer the call to user C. User A sends a REFER to user C:
	REFER sip: C@domain.com SIP/2.0
	From: sip:A@domain.com;tag=99asd To: sip:C@domain.com
	Refer-To: (URI that identifies B's UA)
	The Refer-To header needs to contain a URI that user C can use to place a call to user B. This call needs to route to the specific UA instance that user B is using to talk to user A. User B should provide user A with a URI that has to be usable by anyone. It needs to be a GRUU.
	Obtaining a GRUU: The mechanism for obtaining a GRUU is through registrations. A UA can obtain a GRUU by generating a REGISTER request containing a Supported header field with the value "gruu". The UA includes a "+sip.instance" Contact header parameter of each contact for which the GRUU is desired. This Contact parameter contains a globally unique ID that identifies the UA instance. The global unique ID is created from one of the following:
	 If the REGISTER is per the device's client (endpoint), it is the MAC address concatenated with the phone number of the client. If the REGISTER is per device, it is the MAC address only.
	✓ When using TP, "User Info" can be used for registering per endpoint. Thus, each endpoint can get a unique id – its phone number. The globally unique ID in TP is the MAC address concatenated with the phone number of the endpoint.
	If the remote server doesn't support GRUU, it ignores the parameters of the GRUU. Otherwise, if the remote side also supports GRUU, the REGISTER responses contain the "gruu" parameter in each Contact header. This parameter contains a SIP or SIPS URI that represents a GRUU corresponding to the UA instance that registered the contact. The server provides the same GRUU for the same AOR and instance-id when sending REGISTER again after registration expiration. RFC 5627 specifies that the remote target is a GRUU target if its' Contact URL has the "gr" parameter with or without a value.
	 Using GRUU: The UA can place the GRUU in any header field that can contain a URI. It must use the GRUU in the following messages: INVITE request, its 2xx response, SUBSCRIBE request, its 2xx response, NOTIFY request, REFER request and its 2xx

Parameter	Description
	response.
EMS: Is CISCO Sce Mode [IsCiscoSCEMode]	Determines whether a Cisco gateway exists at the remote side.
	 [0] = (Default) No Cisco gateway exists at the remote side. [1] = A Cisco gateway exists at the remote side.
	When a Cisco gateway exists at the remote side, the device must set the value of the 'annexb' parameter of the fmtp attribute in the SDP to 'no'. This logic is used if the parameter EnableSilenceCompression is set to 2 (enable without adaptation). In this case, Silence Suppression is used on the channel but not declared in the SDP.
	Note: The IsCiscoSCEMode parameter is applicable only when the selected coder is G.729.
Web: User-Agent Information EMS: User Agent Display	Defines the string that is used in the SIP User-Agent and Server response headers. When configured, the string <useragentdisplayinfo value="">/software version' is used, for example:</useragentdisplayinfo>
Info	User-Agent: myproduct/v.6.40.010.006
[UserAgentDisplayInfo]	If not configured, the default string, <audiocodes product-name="">/software version' is used, for example:</audiocodes>
	User-Agent: Audiocodes-Sip-Gateway-Mediant 3000/v.6.40.010.006
	The maximum string length is 50 characters.
	Note: The software version number and preceding forward slash (/) cannot be modified. Therefore, it is recommended not to include a forward slash in the parameter's value (to avoid two forward slashes in the SIP header, which may cause problems).
Web/EMS: SDP Session Owner	Defines the value of the Owner line ('o' field) in outgoing SDP messages.
[SIPSDPSessionOwner]	The valid range is a string of up to 39 characters. The default is "AudiocodesGW".
	For example:
	o=AudiocodesGW 1145023829 1145023705 IN IP4 10.33.4.126
[EnableSDPVersionNegoti ation]	Enables the device to ignore new SDP re-offers (from the media negotiation perspective) in certain scenarios (such as session expires). According to RFC 3264, once an SDP session is established, a new SDP offer is considered a new offer only when the SDP origin value is incremented. In scenarios such as session expires, SDP negotiation is irrelevant and thus, the origin field is not changed.
	Even though some SIP devices don't follow this behavior and don't increment the origin value even in scenarios where they want to renegotiate, the device can assume that the remote party operates according to RFC 3264, and in cases where the origin field is not incremented, the device does not re-negotiate SDP capabilities. • [0] Disable = (Default) The device negotiates any new SDP re-offer, regardless of the origin field.
	 [1] Enable = The device negotiates only an SDP re-offer with an incremented origin field.
Web/EMS: Subject [SIPSubject]	Defines the Subject header value in outgoing INVITE messages. If not specified, the Subject header isn't included (default). The maximum length is up to 50 characters.

Version 6.8 761 Mediant 3000

Parameter	Description
[CoderPriorityNegotiation]	 Defines the priority for coder negotiation in the incoming SDP offer, between the device's or remote UA's coder list. [0] = (Default) Coder negotiation is given higher priority to the remote UA's list of supported coders. [1] = Coder negotiation is given higher priority to the device's (local) supported coders list. Note: This parameter is applicable only to the Gateway/IP-to-IP
Web: Send All Coders on Retrieve [SendAllCodersOnRetrieve]	 application. Enables coder re-negotiation in the sent re-INVITE for retrieving an onhold call. [0] Disable = (Default) Sends only the initially chosen coder when the call was first established and then put on-hold. [1] Enable = Includes all supported coders in the SDP of the re-INVITE sent to the call made un-hold (retrieved). The used coder is therefore, re-negotiated. This parameter is useful in the following call scenario example: Party A calls party B and coder G.711 is chosen. Party B is put on-hold while Party A blind transfers Party B to Party C. Party C answers and Party B is made un-hold. However, as Party C supports only G.729 coder, re-negotiation of the supported coder is required. Note: This parameter is applicable only to the Gateway application.
Web: Multiple Packetization Time Format EMS: Multi Ptime Format [MultiPtimeFormat]	Determines whether the 'mptime' attribute is included in the outgoing SDP. • [0] None = (Default) Disabled. • [1] PacketCable = Includes the 'mptime' attribute in the outgoing SDP - PacketCable-defined format. The mptime' attribute enables the device to define a separate packetization period for each negotiated coder in the SDP. The 'mptime' attribute is only included if this parameter is enabled even if the remote side includes it in the SDP offer. Upon receipt, each coder receives its 'ptime' value in the following precedence: from 'mptime' attribute, from 'ptime' attribute, and then from default value.
EMS: Enable P Time [EnablePtime]	Determines whether the 'ptime' attribute is included in the SDP. • [0] = Remove the 'ptime' attribute from SDP. • [1] = (Default) Include the 'ptime' attribute in SDP.
Web/EMS: 3xx Behavior [3xxBehavior]	Determines the device's behavior regarding call identifiers when a 3xx response is received for an outgoing INVITE request. The device can either use the same call identifiers (Call-ID, To, and From tags) or change them in the new initiated INVITE. • [0] Forward = (Default) Use different call identifiers for a redirected INVITE message. • [1] Redirect = Use the same call identifiers.
Web/EMS: Enable P- Charging Vector [EnablePChargingVector]	Enables the inclusion of the P-Charging-Vector header to all outgoing INVITE messages. • [0] Disable (default) • [1] Enable
Web/EMS: Retry-After Time	Defines the time (in seconds) used in the Retry-After header when a

Parameter	Description
[RetryAfterTime]	503 (Service Unavailable) response is generated by the device. The time range is 0 to 3,600. The default is 0.
Web/EMS: Fake Retry After [sec] [FakeRetryAfter]	Determines whether the device, upon receipt of a SIP 503 response without a Retry-After header, behaves as if the 503 response included a Retry-After header and with the period (in seconds) specified by this parameter. • [0] Disable (default) • Any positive value (in seconds) for defining the period When enabled, this feature allows the device to operate with Proxy servers that do not include the Retry-After SIP header in SIP 503 (Service Unavailable) responses to indicate an unavailable service. The Retry-After header is used with the 503 (Service Unavailable) response to indicate how long the service is expected to be unavailable to the requesting SIP client. The device maintains a list of available proxies, by using the Keep-Alive mechanism. The device checks the availability of proxies by sending SIP OPTIONS every keep-alive timeout to all proxies. If the device receives a SIP 503 response to an INVITE, it also marks that the proxy is out of service for the defined "Retry-After" period.
Web/EMS: Enable P- Associated-URI Header [EnablePAssociatedURIHe ader]	Determines the device usage of the P-Associated-URI header. This header can be received in 200 OK responses to REGISTER requests. When enabled, the first URI in the P-Associated-URI header is used in subsequent requests as the From/P-Asserted-Identity headers value. • [0] Disable (default) • [1] Enable Note: P-Associated-URIs in registration responses is handled only if the device is registered per endpoint (using the User Information file).
Web/EMS: Source Number Preference [SourceNumberPreference]	 Determines from which SIP header the source (calling) number is obtained in incoming INVITE messages. If not configured or if any string other than "From" or "Pai2" is configured, the calling number is obtained from a specific header using the following logic: a. P-Preferred-Identity header. b. If the above header is not present, then the first P-Asserted-Identity header is used. c. If the above header is not present, then the Remote-Party-ID header is used. d. If the above header is not present, then the From header is used. "From" = The calling number is obtained from the From header. "Pai2" = The calling number is obtained using the following logic: a. If a P-Preferred-Identity header is present, the number is obtained from it. b. If no P-Preferred-Identity header is present, the number is obtained from the second P-Asserted-Identity header. c. If only one P-Asserted-Identity header is present, the calling number is obtained from it. Notes: The "From" and "Pai2" values are not case-sensitive. Once a URL is selected, all the calling party parameters are set

Version 6.8 763 Mediant 3000

Parameter	Description
	from this header. If P-Asserted-Identity is selected and the Privacy header is set to 'id', the calling number is assumed restricted.
[SelectSourceHeaderForC alledNumber]	 Determines the SIP header used for obtaining the called number (destination) for IP-to-Tel calls. [0] Request-URI header = (Default) Obtains the destination number from the user part of the Request-URI. [1] To header = Obtains the destination number from the user part of the To header. [2] P-Called-Party-ID header = Obtains the destination number from the P-Called-Party-ID header.
Web/EMS: Enable Reason Header [EnableReasonHeader]	Enables the usage of the SIP Reason header. • [0] Disable • [1] Enable (default)
Web/EMS: Gateway Name [SIPGatewayName]	Defines a name for the device (e.g., device123.com). This name is used as the host part of the SIP URI in the From header. If not specified, the device's IP address is used instead (default). Notes: Ensure that the parameter value is the one with which the Proxy has been configured with to identify the device. This parameter can also be configured for an IP Group (in the IP Group table).
[ZeroSDPHandling]	Determines the device's response to an incoming SDP that includes an IP address of 0.0.0.0 in the SDP's Connection Information field (i.e., "c=IN IP4 0.0.0.0"). • [0] = (Default) Sets the IP address of the outgoing SDP's c= field to 0.0.0.0. • [1] = Sets the IP address of the outgoing SDP c= field to the IP address of the device. If the incoming SDP doesn't contain the "a=inactive" line, the returned SDP contains the "a=recvonly" line.
Web/EMS: Enable Delayed Offer [EnableDelayedOffer]	Determines whether the device sends the initial INVITE message with or without an SDP. Sending the first INVITE without SDP is typically done by clients for obtaining the far-end's full list of capabilities before sending their own offer. (An alternative method for obtaining the list of supported capabilities is by using SIP OPTIONS, which is not supported by every SIP agent.) • [0] Disable = (Default) The device sends the initial INVITE message with an SDP. • [1] Enable = The device sends the initial INVITE message without an SDP.
[DisableCryptoLifeTimeIn SDP]	Enables the device to send "a=crypto" lines without the lifetime parameter in the SDP. For example, if the SDP contains "a=crypto:12 AES_CM_128_HMAC_SHA1_80 inline:hhQe10yZRcRcpIFPkH5xYY9R1de37ogh9G1MpvNp 2^31", it removes the lifetime parameter "2^31". • [0] Disable (default) • [1] Enable
Web/EMS: Enable Contact Restriction [EnableContactRestriction]	Determines whether the device sets the Contact header of outgoing INVITE requests to 'anonymous' for restricted calls. • [0] Disable (default) • [1] Enable

Parameter	Description
[AnonymousMode]	Determines whether the device's IP address is used as the URI host part instead of "anonymous.invalid" in the INVITE's From header for Tel-to-IP calls.
	• [0] = (Default) If the device receives a call from the Tel with blocked caller ID, it sends an INVITE with From: "anonymous" <anonymous@anonymous.invalid></anonymous@anonymous.invalid>
	• [1] = The device's IP address is used as the URI host part instead of "anonymous.invalid".
	This parameter may be useful, for example, for service providers who identify their SIP Trunking customers by their source phone number or IP address, reflected in the From header of the SIP INVITE. Therefore, even customers blocking their Caller ID can be identified by the service provider. Typically, if the device receives a call with blocked Caller ID from the PSTN side (e.g., Trunk connected to a PBX), it sends an INVITE to the IP with a From header as follows: From: "anonymous" <anonymous@anonymous.invalid>. This is in accordance with RFC 3325. However, when this parameter is set to 1, the device replaces the "anonymous.invalid" with its IP address.</anonymous@anonymous.invalid>
EMS: P Asserted User Name [PAssertedUserName]	Defines a 'representative number' (up to 50 characters) that is used as the user part of the Request-URI in the P-Asserted-Identity header of an outgoing INVITE for Tel-to-IP calls. The default is null.
EMS: Use URL In Refer To Header [UseAORInReferToHeader]	Defines the source for the SIP URI set in the Refer-To header of outgoing REFER messages. • [0] = (Default) Use SIP URI from Contact header of the initial call. • [1] = Use SIP URI from To/From header of the initial call.
Web: Enable User- Information Usage [EnableUserInfoUsage]	Enables the usage of the User Information, which is loaded to the device in the User Information auxiliary file. For a description on User Information, see "Loading Auxiliary Files" on page 555. [0] Disable (default) [1] Enable
[HandlaDaganHandar]	Note: For this parameter to take effect, a device reset is required.
[HandleReasonHeader]	Determines whether the device uses the value of the incoming SIP Reason header for Release Reason mapping.
	 [0] = Disregard Reason header in incoming SIP messages. [1] = (Default) Use the Reason header value for Release Reason mapping.
[EnableSilenceSuppInSDP]	Determines the device's behavior upon receipt of SIP Re-INVITE messages that include the SDP's 'silencesupp:off' attribute.
	 [0] = (Default) Disregard the 'silecesupp' attribute. [1] = Handle incoming Re-INVITE messages that include the 'silencesupp:off' attribute in the SDP as a request to switch to the Voice-Band-Data (VBD) mode. In addition, the device includes the attribute 'a=silencesupp:off' in its SDP offer.
	Note: This parameter is applicable only if the G.711 coder is used.
[EnableRport]	 Enables the usage of the 'rport' parameter in the Via header. [0] = Disabled (default) [1] = Enabled
	The device adds an 'rport' parameter to the Via header of each

Version 6.8 765 Mediant 3000

Parameter	Description
	outgoing SIP message. The first Proxy that receives this message sets the 'rport' value of the response to the actual port from where the request was received. This method is used, for example, to enable the device to identify its port mapping outside a NAT. If the Via header doesn't include the 'rport' parameter, the destination port of the response is obtained from the host part of the Via header. If the Via header includes the 'rport' parameter without a port value, the destination port of the response is the source port of the incoming request. If the Via header includes 'rport' with a port value (e.g., rport=1001), the destination port of the response is the port indicated in the 'rport'
	the destination port of the response is the port indicated in the 'rport' parmeter.
Web: Enable X-Channel Header EMS: X Channel Header	Determines whether the SIP X-Channel header is added to SIP messages for providing information on the physical Trunk/B-channel on which the call is received or placed.
[XChannelHeader]	• [0] Disable = (Default) X-Channel header is not used.
	 [1] Enable = X-Channel header is generated by the device and sent in INVITE messages and 180, 183, and 200 OK SIP responses. The header includes the Trunk number, B-channel, and the device's IP address. For example, 'x-channel: DS/DS1-5/8;IP=192.168.13.1', where: ✓ 'DS/DS-1' is a constant string ✓ '5' is the Trunk number ✓ '8' is the B-channel ✓ 'IP=192.168.13.1' is the device's IP address
Woh/EMS: Brogross	
Web/EMS: Progress Indicator to IP [ProgressIndicator2IP]	Global parameter that defines the progress indicator (PI) sent to the IP. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_ProgressIndicator2IP) or Tel Profiles. For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314 or in the Tel Profile table, see Configuring Tel Profiles on page 312. Note: If this functionality is configured for a specific profile, the settings
	of this global parameter is ignored for calls associated with the profile.
[EnableRekeyAfter181]	Enables the device to send a re-INVITE with a new (different) SRTP key (in the SDP) if a SIP 181 response is received ("call is being forwarded"). The re-INVITE is sent immediately upon receipt of the 200 OK (when the call is answered).
	• [0] = Disable (default)
	[1] = EnableNote: This parameter is applicable only if SRTP is used.
[NumberOf Active Dialoge]	
[NumberOfActiveDialogs]	Defines the maximum number of concurrent, outgoing SIP REGISTER dialogs. This parameter is used to control the registration rate.
	The valid range is 1 to 20. The default is 20.
	Notes:
	 Once a 200 OK is received in response to a REGISTER message, the REGISTER message is not considered in this maximum count limit.
	 This parameter applies only to outgoing REGISTER messages (i.e., incoming is unlimited).
EMS: Transparent Coder On	• [0] = (Default) Only use coders from the coder list.
Data Call [TransparentCoderOnDataC	 [1] = Use Transparent coder for data calls (according to RFC 4040).

Parameter	Description
all]	The Transparent coder can be used on data calls. When the device receives a Setup message from the ISDN with 'TransferCapabilities = data', it can initiate a call using the coder 'Transparent' (even if the coder is not included in the coder list).
	The initiated INVITE includes the following SDP attribute:
	a=rtpmap:97 CLEARMODE/8000 The default payload type is set according to the CodersGroup parameter. If the Transparent coder is not defined, the default is set to 56. The payload type is negotiated with the remote side, i.e., the selected payload type is according to the remote side selection. The receiving device must include the 'Transparent' coder in its coder list.
Web: IP to IP Application [EnableIP2IPApplication]	 Enables the IP-to-IP Call Routing application. [0] Disable (default) [1] Enable Note: For this parameter to take effect, a device reset is required.
NOODT I' M I I	Note: For this parameter to take effect, a device reset is required.
[IP2IPTranscodingMode]	Note: This parameter is no longer valid and must not be used. Defines the voice transcoding mode (media negotiation) between two user agents for the IP-to-IP application. This parameter must always be set to 1 when using the IP-to-IP application.
	 [0] Only if Required = Do not force transcoding. Many of the media settings (such as gain control) are not implemented on the voice stream. The device passes packets RTP to RTP packets without any processing. [1] Force = (Default) Force transcoding on the outgoing IP leg. The device interworks the media by implementing DSP transcoding.
Web: Enable RFC 4117 Transcoding [EnableRFC4117Transcoding]	 Enables transcoding of calls according to RFC 4117. [0] Disable (default) [1] Enable Notes:
	 For this parameter to take effect, a device reset is required. For more information on transcoding, see Transcoding using Third-Party Call Control.
Web: Enable Single DSP Transcoding [EnableSingleDSPTranscodi	Enables the use of a single DSP for transcoding between G.711 and LBR coders.
ng]	[0] Disable (default)[1] EnableNotes:
	 For this parameter to take effect, a device reset is required. If the TranscodingMode and IP2IPTranscodingMode parameters are set to 1 (i.e., Force), then this parameter is ignored.
Web/EMS: Default Release Cause [DefaultReleaseCause]	Defines the default Release Cause (sent to IP) for IP-to-Tel calls when the device initiates a call release and an explicit matching cause for this release is not found.
	The default release cause is NO_ROUTE_TO_DESTINATION (3). Other common values include NO_CIRCUIT_AVAILABLE (34), DESTINATION_OUT_OF_ORDER (27), etc.
	Notes:
	The default release cause is described in the Q.931 notation and is

Parameter	Description
	 translated to corresponding SIP 40x or 50x values (e.g., 3 to SIP 404, and 34 to SIP 503). When the Trunk is disconnected or is not synchronized, the internal cause is 27. This cause is mapped, by default, to SIP 502. For mapping SIP-to-Q.931 and Q.931-to-SIP release causes, see Configuring Release Cause Mapping on page 399. For a list of SIP responses-Q.931 release cause mapping, see "Alternative Routing to Trunk upon Q.931 Call Release Cause Code" on page 426.
Web: Enable Microsoft Extension [EnableMicrosoftExt]	Enables the modification of the called and calling number for numbers received with Microsoft's proprietary "ext=xxx" parameter in the SIP INVITE URI user part. Microsoft Office Communications Server sometimes uses this proprietary parameter to indicate the extension number of the called or calling party. • [0] Disable (default) • [1] Enable For example, if a calling party makes a call to telephone number 622125519100 Ext. 104, the device receives the SIP INVITE (from Microsoft's application) with the URI user part as INVITE sip:622125519100;ext=104@10.1.1.10 (or INVITE tel:622125519100;ext=104). If the parameter EnableMicrosofExt is enabled, the device modifies the called number by adding an "e" as the prefix, removing the "ext=" parameter, and adding the extension number as the suffix (e.g., e622125519100104). Once modified, the device can then manipulate the number further, using the Number Manipulation tables to leave only the last 3 digits (for example) for sending to a PBX.
EMS: Use SIP URI For Diversion Header [UseSIPURIForDiversionHeader]	Defines the URI format in the SIP Diversion header. • [0] = 'tel:' (default) • [1] = 'sip:'
[TimeoutBetween100And1 8x]	Defines the timeout (in msec) between receiving a 100 Trying response and a subsequent 18x response. If a 18x response is not received within this timeout period, the call is disconnected. The valid range is 0 to 180,000 (i.e., 3 minutes). The default is 32000 (i.e., 32 sec).
[EnableImmediateTrying]	 Determines if and when the device sends a 100 Trying in response to an incoming INVITE request. [0] = 100 Trying response is sent upon receipt of a Proceeding message from the PSTN. [1] = (Default) 100 Trying response is sent immediately upon receipt of INVITE request.
[TransparentCoderPresentat ion]	Determines the format of the Transparent coder representation in the SDP. • [0] = clearmode (default) • [1] = X-CCD
[IgnoreRemoteSDPMKI]	Determines whether the device ignores the Master Key Identifier (MKI) if present in the SDP received from the remote side. • [0] Disable (default) • [1] Enable
[TrunkStatusReportingMode	Determines whether the device responds to SIP OPTIONS if all the

Parameter	Description
1	 trunks pertaining to Trunk Group #1 are down. [0] Disable (default) [1] Enable = If all the trunks pertaining to Trunk Group #1 are down, the device does not respond to received SIP OPTIONS.
Web: Comfort Noise Generation Negotiation EMS: Comfort Noise Generation [ComfortNoiseNegotiation]	Enables negotiation and usage of Comfort Noise (CN) for Gateway calls. • [0] Disable • [1] Enable (default) The use of CN is indicated by including a payload type for CN on the media description line of the SDP. The device can use CN with a codec whose RTP time stamp clock rate is 8,000 Hz (G.711/G.726). The static payload type 13 is used. The use of CN is negotiated between sides. Therefore, if the remote side doesn't support CN, it is not used. Regardless of the device's settings, it always attempts to adapt to the remote SIP UA's request for CNG, as described below. To determine CNG support, the device uses the ComfortNoiseNegotiation parameter and the codec's SCE (silence suppression setting) using the CodersGroup parameter. If the ComfortNoiseNegotiation parameter is enabled, then the following occurs: If the device is the initiator, it sends a "CN" in the SDP only if the SCE of the codec is enabled. If the remote UA responds with a "CN" in the SDP, then CNG occurs; otherwise, CNG does not occur. If the device is the receiver and the remote SIP UA does not send a "CN" in the SDP, then no CNG occurs. If the remote side sends a "CN", the device attempts to be compatible with the remote side and even if the codec's SCE is disabled, CNG occurs. If the ComfortNoiseNegotiation parameter is disabled, then the device does not send "CN" in the SDP. However, if the codec's SCE is enabled, then CNG occurs. Note: This parameter is applicable only to the Gateway application.
[SDPEcanFormat]	Defines the echo canceller format in the outgoing SDP. The 'ecan' attribute is used in the SDP to indicate the use of echo cancellation. • [0] = (Default) The 'ecan' attribute appears on the 'a=gpmd' line. • [1] = The 'ecan' attribute appears as a separate attribute. • [2] = The 'ecan' attribute is not included in the SDP. • [3] = The 'ecan' attribute and the 'vbd' parameter are not included in the SDP. Note: This parameter is applicable only when the IsFaxUsed
	parameter is set to 2, and for re-INVITE messages generated by the device as result of modem or fax tone detection.

Parameter	Description
Web/EMS: First Call Ringback Tone ID [FirstCallRBTId]	Defines the index of the first ringback tone in the CPT file. This option enables an Application server to request the device to play a distinctive ringback tone to the calling party according to the destination of the call. The tone is played according to the Alert-Info header received in the 180 Ringing SIP response (the value of the Alert-Info header is added to the value of this parameter). The valid range is -1 to 1,000. The default is -1 (i.e., play standard
	ringback tone). Notes: It is assumed that all ringback tones are defined in sequence in the
	 CPT file. In case of an MLPP call, the device uses the value of this parameter plus 1 as the index of the ringback tone in the CPT file (e.g., if this value is set to 1, then the index is 2, i.e., 1 + 1).
Web: Reanswer Time EMS: Regret Time [RegretTime]	Defines the time period the device waits for an MFC R2 Resume (Reanswer) signal once a Suspend (Clear back) signal is received from the PBX. If this timer expires, the call is released. Note that this is applicable only to the MFC-R2 CAS Brazil variant. The valid range is 0 to 255 (in seconds). The default is 0.
Web: PSTN Alert Timeout EMS: Trunk PSTN Alert Timeout [PSTNAlertTimeout]	Defines the Alert Timeout (in seconds) for calls sent to the PSTN. This timer is used between the time a Setup message is sent to the Tel side (IP-to-Tel call establishment) and a Connect message is received. If an Alerting message is received, the timer is restarted. If the timer expires before the call is answered, the device disconnects the call and sends a SIP 408 request timeout response to the SIP party that initiated the call. The valid value range is 1 to 600 (in seconds). The default is 180. Note: If per trunk configuration (using TrunkPSTNAlertTimeout) is set to other than default, the PSTNAlertTimeout parameter value is overridden.
Web/EMS: RTP Only Mode [RTPOnlyMode]	Enables the device to send and receive RTP packets to and from remote endpoints without the need to establish a SIP session. The remote IP address is determined according to the Outbound IP Routing table (Prefix parameter). The port is the same port as the local RTP port (configured by the BaseUDPPort parameter and the channel on which the call is received).
	 [0] Disable (default) [1] Transmit & Receive = Send and receive RTP packets. [2] Transmit Only= Send RTP packets only.
	[3] Receive Only= Receive RTP packets only.
	Notes: To activate the RTP Only feature without using ISDN / CAS
	signaling, you must do the following: ✓ Configure E1/T1 Transparent protocol type (set the ProtocoType parameter to 5 or 6). ✓ Enable the TDM-over-IP feature (set the EnableTDMoverIP parameter to 1).
	To configure the RTP Only mode per trunk, use the RTPOnlyModeForTrunk_x parameter.
	 If per trunk configuration (using the RTPOnlyModeForTrunk_ID parameter) is set to a value other than the default, the

Parameter	Description
	RTPOnlyMode parameter value is ignored.
[RTPOnlyModeForTrunk_x]	Enables the RTP Only feature per trunk. The x in the parameter name denotes the trunk number, where 0 is Trunk 1. For a description of this parameter, see the RTPOnlyMode parameter. Note: For using the global parameter (i.e., setting the RTP Only
	feature for all trunks), set this parameter to -1 (default).
Web/EMS: Media IP Version Preference CLI: media-ip-ver-pref [MediaIPVersionPreference]	Global parameter that defines the preferred RTP media IP addressing version (IPv4 or IPv6) for outgoing SIP calls. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_MediaIPVersionPreference). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314.
Web/EMS: SIT Q850 Cause [SITQ850Cause]	Defines the Q.850 cause value specified in the SIP Reason header that is included in a 4xx response when a Special Information Tone (SIT) is detected on an IP-to-Tel call. The valid range is 0 to 127. The default is 34.
	Note: For mapping specific SIT tones, you can use the SITQ850CauseForNC, SITQ850CauseForIC, SITQ850CauseForVC, and SITQ850CauseForRO parameters.
Web/EMS: SIT Q850 Cause For NC [SITQ850CauseForNC]	Defines the Q.850 cause value specified in the SIP Reason header that is included in a 4xx response when SIT-NC (No Circuit Found Special Information Tone) is detected from the TelPSTN for IP-to-Tel calls.
	The valid range is 0 to 127. The default is 34.
	 Notes: When not configured (i.e., default), the SITQ850Cause parameter is used.
W 1 /5140 OLT 0050 O	This parameter is applicable only to FXO interfaces.
Web/EMS: SIT Q850 Cause For IC [SITQ850CauseForIC]	Defines the Q.850 cause value specified in the SIP Reason header that is included in a 4xx response when SIT-IC (Operator Intercept Special Information Tone) is detected from the PSTN for IP-to-Tel calls.
	The valid range is 0 to 127. The default is -1 (not configured).
	Note: When not configured (i.e., default), the SITQ850Cause parameter is used.
Web/EMS: SIT Q850 Cause For VC [SITQ850CauseForVC]	Defines the Q.850 cause value specified in the SIP Reason header that is included in a 4xx response when SIT-VC (Vacant Circuit - non-registered number Special Information Tone) is detected from the PSTN for IP-to-Tel calls.
	The valid range is 0 to 127. The default is -1 (not configured). Note: When not configured (i.e., default), the SITQ850Cause parameter is used.
Web/EMS: SIT Q850 Cause For RO [SITQ850CauseForRO]	Defines the Q.850 cause value specified in the SIP Reason header that is included in a 4xx response when SIT-RO (Reorder - System Busy Special Information Tone) is detected from the PSTN for IP-to-Tel calls.
	The valid range is 0 to 127. The default is -1 (not configured). Note: When not configured (i.e., default), the SITQ850Cause

Parameter	Description
	parameter is used.
[GWInboundManipulationSe t]	Selects the Manipulation Set ID for manipulating all inbound INVITE messages. The Manipulation Set is defined using the MessageManipulations parameter. By default, no manipulation is done (i.e. Manipulation Set ID is set to -1). Note: This parameter is applicable only to the Gateway application.
[GWOutboundManipulationS et]	Selects the Manipulation Set ID for manipulating all outbound INVITE messages. The Manipulation Set is defined using the MessageManipulations parameter. By default, no manipulation is done (i.e. Manipulation Set ID is set to -1). Notes: This parameter is used only if the Outbound Message Manipulation Set parameter of the destination IP Group is not set.
	 This parameter is applicable only to the Gateway application.
Out-of-Service (Busy Out) Pa	
Web/EMS: Enable Busy Out [EnableBusyOut]	Enables the Busy Out feature. • [0] Disable (Default) • [1] Enable
	 When Busy Out is enabled and certain scenarios exist, the device does the following: All E1/T1 trunks are automatically taken out of service by taking down the D-Channel or by sending a Service Out message for T1 PRI trunks supporting these messages (NI-2, 4/5-ESS, DMS-100, and Meridian).
	These behaviors are done upon one of the following scenarios:
	The device is physically disconnected from the network (i.e., Ethernet cable is disconnected).
	 The Ethernet cable is connected, but the device is unable to communicate with any host. For this scenario, the LAN Watchdog feature must be activated (i.e., set the EnableLANWatchDog parameter to 1).
	 The device can't communicate with the proxy (according to the Proxy Keep-Alive mechanism) and no other alternative route exists to send the call.
	 The IP Connectivity mechanism is enabled (using the AltRoutingTel2IPEnable parameter) and there is no connectivity to any destination IP address.
	Notes:
	 The Busy Out behavior depends on the PSTN protocol type. The Busy-Out condition can also be applied to a specific Trunk Group. If there is no connectivity to the Serving IP Group of a specific Trunk Group (defined in the Trunk Group Settings table), all physical trunks pertaining to that Trunk Group are set to the Busy-Out condition. Each trunk uses the proper Out-Of-Service method according to the selected ISDN/CAS variant. To configure the method for setting digital trunks to Out-Of-Service, use the DigitalOOSBehavior parameter.
Web/EMS: Graceful Busy Out Timeout [sec] [GracefulBusyOutTimeout]	Defines the timeout interval (in seconds) for Out-of-Service graceful shutdown mode for busy trunks (per trunk) if communication fails with a Proxy server (or Proxy Set). In such a scenario, the device rejects new calls from the PSTN (Serving Trunk Group), but maintains

Parameter	
	currently active calls for this user-defined timeout. Once this timeout elapses, the device terminates currently active calls and takes the trunk out of service (sending the PSTN busy-out signal). Trunks on which no calls are active are immediately taken out of service regardless of the timeout. The range is 0 to 3,600. The default is 0.
Web: Digital Out-Of-Service Behavior EMS: Digital OOS Behavior For Trunk Value [DigitalOOSBehaviorForTrunk_x]	 Defines the method for setting digital trunks to Out-of-Service state per trunk. To define the method for setting Out-Of-Service state for all trunks, see the DigitalOOSBehavior parameter. [-1] Not Configured = (Default) Use the settings of the DigitalOOSBehavior parameter ("global" parameter that applies to all trunks). [0] Default = ✓ ISDN: Use Service messages on supporting variants and use alarm on non-supporting variants. ✓ CAS: Use alarm. [1] Service = Sends ISDN In or Out of Service (only for ISDN protocols that support Service message). [2] D-Channel = Takes D-Channel down or up (ISDN only). [3] Alarm = Sends or clears PSTN AIS Alarm (ISDN and CAS). [4] Block = Blocks trunk (CAS only). Notes: The parameter is applicable only to digital interfaces.
	 To configure the timeout interval (in seconds) for Out-of-Service graceful shutdown mode for busy trunks if communication fails with a Proxy server (or Proxy Set), use the GracefulBusyOutTimeout parameter. The parameter is applicable only if the EnableBusyOut parameter is set to 1 (Enable). When configuring the parameter value at run-time, you must stop the trunk and then restart it for the settings to take effect. The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web: Digital Out-Of-Service Behavior CLI: dig-oos-behavior [DigitalOOSBehavior]	 Defines the method for setting digital trunks to out-of-service state. This configuration applies to all the device's trunks. To configure the out-of-service method per trunk, see the DigitalOOSBehaviorForTrunk_x parameter. [0] Default = (Default): ✓ ISDN: Sends ISDN Service messages to indicate out-of-service state (or in-service) for ISDN variants that support Service messages. For ISDN variants that do not support Service messages, the device sends an alarm. ✓ CAS: Use alarm. [1] Service = Sends an ISDN Service message indicating out-of-service state (or in-service). This is applicable only to ISDN variants that support Service messages. [2] D-Channel = Takes D-Channel down or up (ISDN only). [3] Alarm = Sends or clears a PSTN AIS alarm (ISDN and CAS). [4] Block = Blocks the trunk (CAS only). Notes: The parameter is applicable only to digital interfaces.

 Version 6.8
 773
 Mediant 3000

Parameter	Description
	 The parameter is applicable only if the EnableBusyOut parameter is set to 1 (Enable). To configure the timeout interval (in seconds) for out-of-service graceful shutdown mode for busy trunks if communication fails with a Proxy server (or Proxy Set), use the GracefulBusyOutTimeout parameter.
Retransmission Parameters	S
Web: SIP T1 Retransmission Timer [msec] EMS: T1 RTX [SipT1Rtx]	Defines the time interval (in msec) between the first transmission of a SIP message and the first retransmission of the same message. The default is 500. Note: The time interval between subsequent retransmissions of the same SIP message starts with SipT1Rtx. For INVITE requests, it is multiplied by two for each new retransmitted message. For all other SIP messages, it is multiplied by two until SipT2Rtx. For example, assuming SipT1Rtx = 500 and SipT2Rtx = 4000: The first retransmission is sent after 500 msec. The second retransmission is sent after 1000 (2*500) msec. The third retransmission and subsequent retransmissions until SIPMaxRtx are sent after 4000 (2*2000) msec.
Web: SIP T2 Retransmission Timer [msec] EMS: T2 RTX [SipT2Rtx]	Defines the maximum interval (in msec) between retransmissions of SIP messages (except for INVITE requests). The default is 4000. Note: The time interval between subsequent retransmissions of the same SIP message starts with SipT1Rtx and is multiplied by two until SipT2Rtx.
Web: SIP Maximum RTX EMS: Max RTX [SIPMaxRtx]	Defines the maximum number of UDP transmissions of SIP messages (first transmission plus retransmissions). The range is 1 to 30. The default is 7.
Web: Number of RTX Before Hot-Swap EMS: Proxy Hot Swap Rtx [HotSwapRtx]	Defines the number of retransmitted INVITE/REGISTER messages before the call is routed (hot swap) to another Proxy/Registrar. The valid range is 1 to 30. The default is 3. Note: This parameter is also used for alternative routing. If a domain name in the Outbound IP Routing table or SBC IP-to-IP Routing table is resolved into two IP addresses, and if there is no response for HotSwapRtx retransmissions to the INVITE message that is sent to the first IP address, the device immediately initiates a call to the second IP address.
SIP Message Manipulations	Table
Web: Message Manipulations EMS: Message Manipulations [MessageManipulations]	This table parameter defines manipulation rules for SIP header messages. The format of the ini file table parameter is as follows: [MessageManipulations] FORMAT MessageManipulations_Index = MessageManipulations_ManSetID, MessageManipulations_MessageType, MessageManipulations_Condition, MessageManipulations_ActionSubject, MessageManipulations_ActionType, MessageManipulations_ActionValue,

Description		
MessageManipulations_RowRole; [MessageManipulations]		
For example, the below configuration changes the user part of the SIP From header to 200:		
MessageManipulations 1 = 0, Invite.Request, , Header.From.Url.User, 2, 200, 0;		
For a detailed description of this table, see Configuring SIP Message Manipulation on page 298.		
Message Policy Table		
This table parameter configures SIP message policy rules for blocking (blacklist) unwanted incoming SIP messages or allowing (whitelist) receipt of desired messages.		
The format of the ini file table parameter is as follows:		
[MessagePolicy] FORMAT MessagePolicy_Index = MessagePolicy_Policy, MessagePolicy_MaxMessageLength, MessagePolicy_MaxHeaderLength, MessagePolicy_MaxBodyLength, MessagePolicy_MaxNumHeaders, MessagePolicy_MaxNumBodies, MessagePolicy_SendRejection, MessagePolicy_MethodListType,		
MessagePolicy_MethodList, MessagePolicy_BodyListType, MessagePolicy_BodyList; [/MessagePolicy] For a detailed description of this table, see Configuring SIP Message		

50.8 Coders and Profile Parameters

The profile parameters are described in the table below.

Table 50-35: Profile Parameters

Parameter	Description
Coders Table / Coder Grou	ps Table
Web: Coders Table/Coder Group Settings EMS: Coders Group [CodersGroup0] [CodersGroup1] [CodersGroup2] [CodersGroup3] [CodersGroup4] [CodersGroup5] [CodersGroup6] [CodersGroup7] [CodersGroup8] [CodersGroup9]	This table parameter defines the device's coders. Each group can consist of up to 10 coders. The first Coder Group is the default coder list and the default Coder Group.
	The format of the ini file table parameter is as follows: [CodersGroup<0-9>] FORMAT CodersGroup0_Index = CodersGroup0_Name, CodersGroup0_pTime, CodersGroup0_rate, CodersGroup0_PayloadType, CodersGroup0_Sce; [\CodersGroup<0-9]
	For example, below are defined two Coder Groups (0 and 1): [CodersGroup0] FORMAT CodersGroup0_Index = CodersGroup0_Name, CodersGroup0_pTime, CodersGroup0_rate, CodersGroup0_PayloadType, CodersGroup0_Sce; CodersGroup0 0 = g711Alaw64k, 20, 0, 255, 0; CodersGroup0 1 = eg711Ulaw, 10, 0, 71, 0; CodersGroup0 2 = eg711Ulaw, 10, 0, 71, 0;

Parameter	Description	
[\CodersGroup0] [CodersGroup1] FORMAT CodersGroup1_Index = CodersGroup1_Name, CodersGroup1_pTime, CodersGroup1_rate, CodersGroup1_PayloadType, CodersGroup1_Sce; CodersGroup1 0 = Transparent, 20, 0, 56, 0; CodersGroup1 1 = g726, 20, 0, 23, 0; [\CodersGroup1] Notes: For a list of supported coders and a detailed description of this to see Configuring Default Coders on page 307. For configuring Coder Groups, see "Configuring Coder Groups" page 310.		
IP Profile Table	The coder name is case-sensitive.	
ir rioille l'able		
Web: IP Profile Settings EMS: Protocol Definition IP Profile [IPProfile]	This table parameter configures the IP Profile table. Each IP Profile ID includes a set of parameters (which are typically configured separately using their individual "global" parameters). You can later assign these IF Profiles to outbound IP routing rules (Prefix parameter), inbound IP routing rules and IP Groups. The format of the ini file table parameter is as follows:	

as follows:

[IPProfile]

FORMAT IpProfile Index = IpProfile ProfileName,

IpProfile IpPreference, IpProfile CodersGroupID, IpProfile IsFaxUsed,

IpProfile JitterBufMinDelay, IpProfile JitterBufOptFactor,

IpProfile IPDiffServ, IpProfile SigIPDiffServ, IpProfile SCE.

IpProfile RTPRedundancyDepth, IpProfile RemoteBaseUDPPort,

IpProfile CNGmode, IpProfile VxxTransportType, IpProfile NSEMode,

IpProfile IsDTMFUsed IpProfile PlavRBTone2IP.

IpProfile EnableEarlyMedia, IpProfile ProgressIndicator2IP,

IpProfile EnableEchoCanceller, IpProfile CopyDest2RedirectNumber,

IpProfile MediaSecurityBehaviour, IpProfile CallLimit,

IpProfile_DisconnectOnBrokenConnection, IpProfile_FirstTxDtmfOption,

IpProfile_SecondTxDtmfOption, IpProfile_RxDTMFOption,

IpProfile_EnableHold, IpProfile_InputGain, IpProfile_VoiceVolume,

IpProfile_AddIEInSetup, IpProfile_SBCExtensionCodersGroupID, IpProfile_MedialPVersionPreference, IpProfile_TranscodingMode,

IpProfile SBCAllowedMediaTypes,

IpProfile SBCAllowedCodersGroupID.

IpProfile SBCAllowedVideoCodersGroupID.

IpProfile SBCAllowedCodersMode.

IpProfile SBCMediaSecurityBehaviour,

IpProfile_SBCRFC2833Behavior, IpProfile_SBCAlternativeDTMFMethod,

IpProfile SBCAssertIdentity, IpProfile AMDSensitivityParameterSuit,

IpProfile AMDSensitivityLevel, IpProfile AMDMaxGreetingTime,

IpProfile AMDMaxPostSilenceGreetingTime,

IpProfile SBCDiversionMode, IpProfile SBCHistoryInfoMode,

IpProfile EnableQSIGTunneling, IpProfile SBCFaxCodersGroupID,

IpProfile SBCFaxBehavior, IpProfile SBCFaxOfferMode,

IpProfile SBCFaxAnswerMode, IpProfile SbcPrackMode,

IpProfile_SBCSessionExpiresMode,

IpProfile_SBCRemoteUpdateSupport,

IpProfile_SBCRemoteReinviteSupport,

IpProfile_SBCRemoteDelayedOfferSupport,

IpProfile_SBCRemoteReferBehavior, IpProfile_SBCRemote3xxBehavior,

Parameter	Description	
	IpProfile_SBCRemoteEarlyMediaResponseType, IpProfile_SBCRemoteEarlyMediaSupport, IpProfile_EnableSymmetricMKI, IpProfile_MKISize, IpProfile_SBCEnforceMKISize, IpProfile_SBCRemoteEarlyMediaRTP, IpProfile_SBCRemoteSupportsRFC3960, IpProfile_SBCRemoteCanPlayRingback, IpProfile_EnableEarly183, IpProfile_EarlyAnswerTimeout, IpProfile_SBC2833DTMFPayloadType, IpProfile_SBCUserRegistrationTime, IpProfile_ResetSRTPStateUponRekey, IpProfile_AmdMode, IpProfile_SBCReliableHeldToneSource, IpProfile_GenerateSRTPKeys, IpProfile_SBCReliableHeldTone, IpProfile_SBCRemoteHoldFormat, IpProfile_SBCRemoteReplacesBehavior, IpProfile_SBCSDPPtimeAnswer, IpProfile_SBCPreferredPTime, IpProfile_SBCUseSilenceSupp, IpProfile_SBCRTPRedundancyBehavior, IpProfile_SBCPlayRBTToTransferee, IpProfile_SBCRTCPMode, IpProfile_SBCJitterCompensation, IpProfile_SBCRemoteRenegotiateOnFaxDetection, IpProfile_JitterBufMaxDelay; [\IPProfile] For a description of this table, see "Configuring IP Profiles" on page 314.	
Tel Profile Table		
Web: Tel Profile Settings EMS: Protocol Definition > Telephony Profile [TelProfile]	This table parameter configures the Tel Profile table. Each Tel Profile ID includes a set of parameters (which are typically configured separately using their individual, "global" parameters). You can later assign these Tel Profile IDs to other elements such as in the Trunk Group table (TrunkGroup parameter). Therefore, Tel Profiles allow you to apply the same settings of a group of parameters to multiple channels, or apply specific settings to different channels. The format of the ini file table parameter is as follows: [TelProfile] FORMAT TelProfile_Index = TelProfile_ProfileName, TelProfile_TelPreference, TelProfile_CodersGroupID, TelProfile_IsFaxUsed, TelProfile_JitterBufMinDelay, TelProfile_IsFaxUsed, TelProfile_JitterBufMinDelay, TelProfile_SiglPDiffServ, TelProfile_IPDiffServ, TelProfile_SiglPDiffServ, TelProfile_EnableReversePolarity, TelProfile_VoiceVolume, TelProfile_EnableReversePolarity, TelProfile_EnableCurrentDisconnect, TelProfile_EnableDigitDelivery, TelProfile_EnableEC, TelProfile_MWIAnalog, TelProfile_MWIDisplay, TelProfile_FlashHookPeriod, TelProfile_EnableEarlyMedia, TelProfile_ProgressIndicator2IP, TelProfile_TimeForReorderTone, TelProfile_EnableDIDWink, TelProfile_IsTwoStageDial, TelProfile_DisconnectOnBusyTone, TelProfile_EnableVoiceMailDelay, TelProfile_DialPlanIndex, TelProfile_Enable911PSAP, TelProfile_DialPlanIndex, TelProfile_Enable911PSAP, TelProfile_SwapTelTolpPhoneNumbers, TelProfile_EnableAGC, TelProfile_EnableFXODoubleAnswer, TelProfile_CallPriorityMode; [TelProfile] For a description of this parameter, see Configuring Tel Profiles on page 312.	

50.9 Channel Parameters

This subsection describes the device's channel parameters.

50.9.1 Voice Parameters

The voice parameters are described in the table below.

Table 50-36: Voice Parameters

Parameter	Description
Web/EMS: Input Gain [InputGain]	Global parameter that defines the pulse-code modulation (PCM) input (received) gain control level (in decibels). You can also configure this functionality per specific calls, using IP Profiles (IpProfile_InputGain) or Tel Profiles. For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314 or in the Tel Profile table, see Configuring Tel Profiles on page 312. Note: If this functionality is configured for a specific profile, the settings of this global parameter is ignored for calls associated with the profile.
Web: Voice Volume EMS: Volume (dB) [VoiceVolume]	Global parameter that defines the voice gain control (in decibels). This defines the level of the transmitted (IP-to-PSTN) signal. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_VoiceVolume) or Tel Profiles. For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314 or in the Tel Profile table, see Configuring Tel Profiles on page 312. Note: If this functionality is configured for a specific profile, the settings of this global parameter is ignored for calls associated with the profile.
EMS: Payload Format [VoicePayloadFormat]	Determines the bit ordering of the G.726/G.727 voice payload format. • [0] = (Default) Little Endian • [1] = Big Endian Note: To ensure high voice quality when using G.726/G.727, both communicating ends should use the same endianness format. Therefore, when the device communicates with a third-party entity that uses the G.726/G.727 voice coder and voice quality is poor, change the settings of this parameter (between Big Endian and Little Endian).
Web: MF Transport Type [MFTransportType]	Currently, not supported.
Web: Silence Suppression EMS: Silence Compression Mode [EnableSilenceCompression]	Global parameter that enables the Silence Suppression feature. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_SCE). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.

Parameter	Description
Web: Echo Canceler EMS: Echo Canceller Enable [EnableEchoCanceller]	Global parameter that enables echo cancellation (i.e., echo from voice calls is removed). You can also configure this functionality per specific calls, using IP Profiles (IpProfile_EnableEchoCanceller) or Tel Profiles. For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314 or Tel Profile table, see Configuring Tel Profiles on page 312. Note: If this functionality is configured for a specific profile, the
	settings of this global parameter is ignored for calls associated with the profile.
Web: Network Echo Suppressor Enable [AcousticEchoSuppressorSupport]	Enables the network Acoustic Echo Suppressor feature on SBC calls. This feature removes echoes and sends only the near-end's desired speech signal to the network (i.e., to the far-end party). • [0] Disable (default) • [1] Enable Note: For this parameter to take effect, a device reset is required.
Web: Echo Canceller Type [EchoCancellerType]	 Defines the echo canceller type. [0] Line echo canceller = (Default) Echo canceller for Tel side. [1] Acoustic Echo suppressor - netw = Echo canceller for IP side.
Web: Attenuation Intensity [AcousticEchoSuppAttenuationInt ensity]	Defines the acoustic echo suppressor signals identified as echo attenuation intensity. The valid range is 0 to 3. The default is 0.
Web: Max ERL Threshold - DB [AcousticEchoSuppMaxERLThre shold]	Defines the acoustic echo suppressor maximum ratio between signal level and returned echo from the phone (in decibels). The valid range is 0 to 60. The default is 10.
Web: Min Reference Delay x10 msec [AcousticEchoSuppMinRefDelayx 10ms]	Defines the acoustic echo suppressor minimum reference delay (in 10-ms units). The valid range is 0 to 40. The default is 0.
Web: Max Reference Delay x10 msec [AcousticEchoSuppMaxRefDelay x10ms]	Defines the acoustic echo suppressor maximum reference delay (in 10-ms units). The valid range is 0 to 40. The default is 40 (i.e., 40 x 10 = 400 ms).
EMS: Echo Canceller Hybrid Loss [ECHybridLoss]	Defines the four-wire to two-wire worst-case Hybrid loss, the ratio between the signal level sent to the hybrid and the echo level returning from the hybrid. • [0] = (Default) 6 dB • [1] = N/A • [2] = 0 dB • [3] = 3 dB
EMS: ECN lp Mode [ECNLPMode]	Defines the echo cancellation Non-Linear Processing (NLP) mode. • [0] = (Default) NLP adapts according to echo changes • [1] = Disables NLP • [2] = Silence output NLP Note: This parameter can also be configured in a Tel Profile.

Version 6.8 779 Mediant 3000

Parameter	Description		
[EchoCancellerAggressiveNLP]	 Enables the Aggressive NLP at the first 0.5 second of the call. [0] = Disable [1] = (Default) Enable. The echo is removed only in the first half of a second of the incoming IP signal. Note: For this parameter to take effect, a device reset is required. 		
[RTPSIDCoeffNum]	Defines the number of spectral coefficients added to an SID packet being sent according to RFC 3389. The valid values are [0] (default), [4], [6], [8] and [10].		
Answer Detector (AD) Parameter	Answer Detector (AD) Parameters		
Web: Enable Answer Detector [EnableAnswerDetector]	Currently, not supported.		
Web: Answer Detector Activity Delay [AnswerDetectorActivityDelay]	Defines the time (in 100-msec resolution) between activating the Answer Detector and the time that the detector actually starts to operate. The valid range is 0 to 1023. The default is 0.		
Web: Answer Detector Silence Time [AnswerDetectorSilenceTime]	Currently, not supported.		
Web: Answer Detector Redirection [AnswerDetectorRedirection]	Currently, not supported.		
Web: Answer Detector Sensitivity EMS: Sensitivity [AnswerDetectorSensitivity]	Defines the Answer Detector sensitivity. The range is 0 (most sensitive) to 2 (least sensitive). The default is 0.		

50.9.2 Coder Parameters

The coder parameters are described in the table below.

Table 50-37: Coder Parameters

Parameter	Description
Web: G729EV local MBS EMS: G729 EV Local MBS [G729EVLocalMBS]	Defines the maximal bit rate (in kilobits per second - Kbps) that can be used by the G.729EV coder for a specific channel. This parameter is defined per channel and may vary between the parties. The initial generation bit rate is the minimum between the MaxBitRate and the MBS values.
	• [0] 8 KBPS (default)
	• [1] 12 KBPS
	• [2] 14 KBPS
	• [3] 16 KBPS
	• [4] 18 KBPS
	• [5] 20 KBPS
	• [6] 22 KBPS
	• [7] 24 KBPS
	• [8] 26 KBPS
	• [9] 28 KBPS

Parameter	Description
	[10] 30 KBPS[11] 32 KBPS[15] Undefined
Web: G729EV Maximum Bit Rate EMS: G729 EV Max Bit Rate [G729EVMaxBitRate]	Defines the maximum generation bit rate for all participants in a session using G.729EV coder. This parameter is defined per session and is equal for all the parties. The initial generation bit rate is the minimum between the MaxBitRate and the MBS values. • [0] 8 KBPS (default) • [1] 12 KBPS • [2] 14 KBPS • [3] 16 KBPS • [4] 18 KBPS • [5] 20 KBPS • [6] 22 KBPS • [7] 24 KBPS • [8] 26 KBPS • [9] 28 KBPS • [10] 30 KBPS • [11] 32 KBPS
Web: G729EV receive MBS EMS: G729 EV Receive MBS [G729ECReceiveMBS]	Defines the value of the MBS field of the G.729EV frames to be sent to the other party. This parameter reflects the maximum bit rate, which the local G.729EV supports as a receiver. • [0] 8 KBPS (default) • [1] 12 KBPS • [2] 14 KBPS • [3] 16 KBPS • [4] 18 KBPS • [5] 20 KBPS • [6] 22 KBPS • [7] 24 KBPS • [8] 26 KBPS • [9] 28 KBPS • [10] 30 KBPS • [11] 32 KBPS
Web/EMS: Microsoft RTA Forward Error Correction Mode [MSRTAForwardErrorCorrectionEn able]	Enables Forward Error Correction (FEC) for the Microsoft real-time audio narrowband coder (MS RTA NB). • [0] Disable • [1] Enable (default)
Web/EMS: Microsoft RTA Bit Rate [MSRTATxBitRate]	Defines the transmit (Tx) bit rate for the MS RTA NB at clock rate of 8 kHz. The valid values are 11,800 for Narrowband and 29,000 for Wideband. The default is 11800.
CLI: EVRC-VAD-enable [EnableEVRCVAD]	Enables the EVRC voice activity detector. • [0] = Disable (default)

Version 6.8 781 Mediant 3000

Parameter	Description
	• [1] = Enable Note: This parameter is applicable only to the EVRC and EVRC-B coders.
EMS: VBR Coder DTX Min [EVRCDTXMin]	Defines the minimum gap between two SID frames when using the EVRC voice activity detector. Units are in EVRC frame size (20 msec). The range is 0 to 20000. The default is 12. Note: This parameter is applicable only to the EVRC and EVRC-B coders.
EMS: VBR Coder DTX Max [EVRCDTXMax]	Defines the maximum gap between two SID frames when using the EVRC voice activity detector. Units are in EVRC frame size (20 msec). The range is 0 to 20000. The default is 32. Note: This parameter is applicable only to the EVRC and EVRC-B coders.
EMS: VBR Coder Header Format [VBRCoderHeaderFormat]	 Determines the format of the RTP header for VBR coders. [0] = (Default) Payload only (no header, TOC, or m-factor) - similar to RFC 3558 Header Free format. [1] = Supports RFC 2658 - 1 byte for interleaving header (always 0), TOC, no m-factor. [2] = Payload including TOC only, allow m-factor. [3] = RFC 3558 Interleave/Bundled format.
EMS: VBR Coder Hangover [VBRCoderHangover]	Defines the required number of silence frames at the beginning of each silence period when using the VBR coder silence suppression. The range is 0 to 255. The default is 1.
Web: AMR Payload Format [AmrOctetAlignedEnable]	Defines the AMR payload format type. • [0] Bandwidth Efficient • [1] Octet Aligned (default)
EMS: AMR Coder Header Format [AMRCoderHeaderFormat]	 Determines the payload format of the AMR header. [0] = Non-standard multiple frames packing in a single RTP frame. Each frame has a CMR and TOC header. [1] = AMR frame according to RFC 3267 bundling. [2] = AMR frame according to RFC 3267 interleaving. [3] = AMR is passed using the AMR IF2 format. Note: Bandwidth Efficient mode is not supported; the mode is always Octet-aligned.
Web: Speex NB Bit Rate EMS: Speex NB Bit Rate [SpeexNBBitRate] Web: Speex WB Bit Rate	Defines the transmit (Tx) bit rate for the Speex narrowband codec at clock rate of 8 kHz sampling rate. Ill 2.15 Kbps Ill 5.95 Kbps Ill 8.00 Kbps (default) Ill 11.0 Kbps Ill 15.0 Kbps Ill 18.2 Kbps Ill 24.6 Kbps Ill 3.95 Kbps Defines the transmit (Tx) bit rate for the Speex wideband codec

Parameter	Description
EMS: Speex WB Bit Rate [SpeexWBBitRate]	at clock rate of 16 kHz sampling rate. • [0] 3.95 Kbps • [1] 5.75 Kbps • [2] 7.75 Kbps • [3] 9.80 Kbps • [4] 12.8 Kbps • [5] 16.8 Kbps • [6] 20.6 Kbps • [7] 23.8 Kbps • [8] 27.8 Kbps(default) • [9] 34.2 Kbps • [10] 42.2 Kbps
DSP Templates Table	
Web: DSP Template Mix Table EMS: VoP Media Provisioning > General Settings [DSPTemplates]	This table parameter allows the device to use a combination of two DSP templates and determines the percentage of DSP resources allocated per DSP template. The format of the ini file table parameter is as follows: [DspTemplates] FORMAT DspTemplates_Index = DspTemplates_DspTemplateNumber, DspTemplates_DspResourcesPercentage; [\DspTemplates] For example, to load DSP Template 1 to 50% of the DSPs, and DSP Template 2 to the remaining 50%, the table is configured as follows: DspTemplates 0 = 1, 50; DspTemplates 1 = 2, 50; Notes: The DSPVersionTemplateNumber parameter is ignored when the DSPTemplates parameter is configured. For a list of supported DSP templates, see DSP Templates.
Web: DSP Version Template Number EMS: Version Template Number [DSPVersionTemplateNumber]	Determines the DSP template used by the device. Each DSP template supports specific coders, channel capacity, and features. The default is DSP Template 0. You can load different DSP templates to digital modules using the syntax DSPVersionTemplateNumber=xy where: y = 0 to 5 for DSP templates of digital modules Notes: For this parameter to take effect, a device reset is required. For a list of supported DSP templates, see DSP Templates.

50.9.3 DTMF Parameters

The dual-tone multi-frequency (DTMF) parameters are described in the table below.

Table 50-38: DTMF Parameters

Parameter	Description
Web/EMS: DTMF Transport Type [DTMFTransportType]	 Determines the DTMF transport type. [0] Mute DTMF = DTMF digits are removed from the voice stream and are not relayed to remote side. [2] Transparent DTMF = DTMF digits remain in the voice stream. [3] RFC 2833 Relay DTMF = (Default) DTMF digits are removed from the voice stream and are relayed to remote side according to RFC 2833. [7] RFC 2833 Relay Decoder Mute = DTMF digits are sent according to RFC 2833 and muted when received. Note: This parameter is automatically updated if the parameters TxDTMFOption or RxDTMFOption are configured.
Web: DTMF Volume (-31 to 0 dB) EMS: DTMF Volume (dBm) [DTMFVolume]	Defines the DTMF gain control value (in decibels) to the PSTN side. The valid range is -31 to 0 dB. The default is -11 dB. Note: This parameter can also be configured in a Tel Profile.
Web: DTMF Generation Twist EMS: DTMF Twist Control [DTMFGenerationTwist]	Defines the range (in decibels) between the high and low frequency components in the DTMF signal. Positive decibel values cause the higher frequency component to be stronger than the lower one. Negative values cause the opposite effect. For any parameter value, both components change so that their average is constant. The valid range is -10 to 10 dB. The default is 0 dB. Note: For this parameter to take effect, a device reset is required.
EMS: DTMF Inter Interval (msec) [DTMFInterDigitInterval]	Defines the time (in msec) between generated DTMF digits to PSTN side (if TxDTMFOption = 1, 2 or 3). The valid range is 0 to 32767. The default is 100.
EMS: DTMF Length (msec) [DTMFDigitLength]	Defines the time (in msec) for generating DTMF tones to the PSTN side (if TxDTMFOption = 1, 2 or 3). It also configures the duration that is sent in INFO (Cisco) messages. The valid range is 0 to 32767. The default is 100.
EMS: Rx DTMF Relay Hang Over Time (msec) [RxDTMFHangOverTime]	Defines the Voice Silence time (in msec) after playing DTMF or MF digits to the Tel/PSTN side that arrive as Relay from the IP side. Valid range is 0 to 2,000 msec. The default is 1,000 msec.
EMS: Tx DTMF Relay Hang Over Time (msec) [TxDTMFHangOverTime]	Defines the Voice Silence time (in msec) after detecting the end of DTMF or MF digits at the Tel/PSTN side when the DTMF Transport Type is either Relay or Mute. Valid range is 0 to 2,000 msec. The default is 1,000 msec.
Web/EMS: NTE Max Duration [NTEMaxDuration]	Defines the maximum time for sending Named Telephony Events / NTEs (RFC 4733/2833 DTMF relay) to the IP side, regardless of the DTMF signal duration on the TDM side. The range is -1 to 200,000,000 msec. The default is -1 (i.e., NTE stops only upon detection of an End event).

50.9.4 RTP, RTCP and T.38 Parameters

The RTP, RTCP and T.38 parameters are described in the table below.

Table 50-39: RTP/RTCP and T.38 Parameters

Tuble 50 0	9: RTP/RTCP and 1.38 Parameters
Parameter	Description
Web: Dynamic Jitter Buffer Minimum Delay EMS: Minimal Delay (dB) [DJBufMinDelay]	Global parameter that defines the minimum delay (in msec) of the device's dynamic Jitter Buffer. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_JitterBufMinDelay) or Tel Profiles. For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314, or in the Tel Profile table, see Configuring Tel Profiles on page 312. Note: If this functionality is configured for a specific profile, the settings of this global parameter is ignored for calls associated with the profile.
Web: Dynamic Jitter Buffer Optimization Factor EMS: Opt Factor [DJBufOptFactor]	Global parameter that defines the Dynamic Jitter Buffer frame error/delay optimization factor. You can also configure this functionality per specific calls, using IP Profiles or Tel Profiles. For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314, or in the Tel Profile table, see Configuring Tel Profiles on page 312. Note: If this functionality is configured for a specific profile, the settings of this global parameter is ignored for calls associated with the profile.
Web: RTP Redundancy Depth EMS: Redundancy Depth [RTPRedundancyDepth]	Global parameter that enables the device to generate RFC 2198 redundant packets. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_RTPRedundancyDepth). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Enable RTP Redundancy Negotiation [EnableRTPRedundancyNegotiation]	Enables the device to include the RTP redundancy dynamic payload type in the SDP, according to RFC 2198. • [0] Disable (default) • [1] Enable When enabled, the device includes in the SDP message the RTP payload type "RED" and the payload type configured by the parameter RFC2198PayloadType. a=rtpmap: <pt> RED/8000</pt>
	Where <pt> is the payload type as defined by RFC2198PayloadType. The device sends the INVITE message with "a=rtpmap:<pt> RED/8000" and responds with a 18x/200 OK and "a=rtpmap:<pt> RED/8000" in the SDP. Notes:</pt></pt></pt>
	 For this feature to be functional, you must also set the parameter RTPRedundancyDepth to 1 (i.e., enabled).

Parameter	Description
	 Currently, the negotiation of "RED" payload type is not supported and therefore, it should be configured to the same PT value for both parties.
Web: RFC 2198 Payload Type EMS: Redundancy Payload Type	Defines the RTP redundancy packet payload type according to RFC 2198.
[RFC2198PayloadType]	The range is 96 to 127. The default is 104.
	Note: This parameter is applicable only if the parameter RTPRedundancyDepth is set to 1.
Web: Packing Factor EMS: Packetization Factor [RTPPackingFactor]	N/A. Controlled internally by the device according to the selected coder.
Web/EMS: Basic RTP Packet Interval [BasicRTPPacketInterval]	N/A. Controlled internally by the device according to the selected coder.
Web: RTP Directional Control [RTPDirectionControl]	N/A. Controlled internally by the device according to the selected coder.
Web/EMS: RFC 2833 TX Payload Type	Defines the Tx RFC 2833 DTMF relay dynamic payload type for outbound calls.
[RFC2833TxPayloadType]	The valid range is 96 to 127. The default is 96.
	Note: When RFC 2833 payload type negotiation is used (i.e., the parameter TxDTMFOption is set to 4), this payload type is used for the received DTMF packets. If negotiation isn't used, this payload type is used for receive and for transmit.
Web/EMS: RFC 2833 RX Payload Type	Defines the Rx RFC 2833 DTMF relay dynamic payload type for inbound calls.
[RFC2833RxPayloadType]	The valid range is 96 to 127. The default is 96.
	Note: When RFC 2833 payload type negotiation is used (i.e., the parameter TxDTMFOption is set to 4), this payload type is used for the received DTMF packets. If negotiation isn't used, this payload type is used for receive and for transmit.
[EnableDetectRemoteMACChange]	Determines whether the device changes the RTP packets according to the MAC address of received RTP packets and according to Gratuitous Address Resolution Protocol (GARP) messages.
	• [0] = Nothing is changed.
	 [1] = If the device receives RTP packets with a different source MAC address (than the MAC address of the transmitted RTP packets), then it sends RTP packets to this MAC address and removes this IP entry from the
	device's ARP cache table.
	 [2] = (Default) The device uses the received GARP packets to change the MAC address of the transmitted RTP packets.
	• [3] = Options 1 and 2 are used.
	Notes: For this parameter to take effect, a device reset is required.
	 For this parameter to take effect, a device reset is required. If the device is located in a network subnet which is
	connected to other gateways using a router that uses Virtual Router Redundancy Protocol (VRRP) for redundancy, then set this parameter to 0 or 2.

Parameter	Description
EMS: Enable Media UDP Checksum [EnableMediaUDPChecksum]	 Enables the device to insert a non-zero UDP layer checksum on outgoing packets for UDP streams carrying media content (audio and video). [0] = (Default) Disable - the outgoing UDP packets carry the value of 0x00 (i.e., no checksum) in the UDP checksum field of the UDP header. [1] = Enable - UDP checksum is added in the outgoing UDP header.
	Note: For this parameter to take effect, a device reset is required.
Web: RTP Base UDP Port EMS: Base UDP Port [BaseUDPport]	Global parameter that defines the lower boundary of the UDP port used for RTP, RTCP (RTP port + 1) and T.38 (RTP port + 2). For a detailed description of configuring the UDP port range, see Configuring RTP Base UDP Port on page 195. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_RemoteBaseUDPPort) - see Configuring IP Profiles on page 314.
	 Notes: For this parameter to take effect, a device reset is required. If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
EMS: No Op Enable [NoOpEnable]	 Enables the transmission of RTP or T.38 No-Op packets. [0] = Disable (default) [1] = Enable This mechanism ensures that the NAT binding remains open during RTP or T.38 silence periods.
EMS: No Op Interval [NoOpInterval]	Defines the time interval in which RTP or T.38 No-Op packets are sent in the case of silence (no RTP/T.38 traffic) when No-Op packet transmission is enabled. The valid range is 20 to 65,000 msec. The default is 10,000. Note: To enable No-Op packet transmission, use the NoOpEnable parameter.
EMS: No Op Payload Type [RTPNoOpPayloadType]	Defines the payload type of No-Op packets. The valid range is 96 to 127 (for the range of Dynamic RTP Payload Type for all types of non hard-coded RTP Payload types, refer to RFC 3551). The default is 120. Note: When defining this parameter, ensure that it doesn't cause collision with other payload types.

Parameter	Description
CLI: rtcp-act-mode [RTCPActivationMode]	Disables RTCP traffic when there is no RTP traffic. This feature is useful, for example, to stop RTCP traffic that is typically sent when calls are put on hold (by an INVITE with 'a=inactive' in the SDP).
	• [0] Active Always = (Default) RTCP is active even during inactive RTP periods, i.e., when the media is in 'recvonly' or 'inactive' mode.
	 [1] Inactive Only If RTP Inactive = No RTCP is sent when RTP is inactive.
	Note: This parameter is applicable only to Gateway calls (not SBC).
RTP Control Protocol Extended Re	ports (RTCP XR) Parameters
Web: Enable RTCP XR EMS: RTCP XR Enable	Enables voice quality monitoring and RTCP XR, according to RFC 3611.
[VQMonEnable]	 [0] Disable (default) [1] Enable Fully = Calculates voice quality metrics, uses them for QoE calculations, reports them to SEM (if configured), and sends them to remote side using RTCP XR.
	• [2] Enable Calculation Only = Calculates voice quality metrics, uses them for QoE calculations, reports them to SEM (if configured), but does not send them to remote side using RTCP XR.
	Note: For this parameter to take effect, a device reset is required.
Web: Minimum Gap Size EMS: GMin [VQMonGMin]	Defines the voice quality monitoring - minimum gap size (number of frames). The default is 16.
Web/EMS: Burst Threshold [VQMonBurstHR]	Defines the voice quality monitoring - excessive burst alert threshold. The default is -1 (i.e., no alerts are issued).
Web/EMS: Delay Threshold [VQMonDelayTHR]	Defines the voice quality monitoring - excessive delay alert threshold. The default is -1 (i.e., no alerts are issued).
Web: R-Value Delay Threshold EMS: End of Call Rval Delay Threshold [VQMonEOCRValTHR]	Defines the voice quality monitoring - end of call low quality alert threshold. The default is -1 (i.e., no alerts are issued).
Web: RTCP XR Packet Interval EMS: Packet Interval [RTCPInterval]	Defines the time interval (in msec) between adjacent RTCP XR reports. This interval starts from call establishment. Thus, the device can send RTCP XR reports during the call, in addition to at the end of the call. If the duration of the call is shorter than this interval, RTCP XR is sent only at the end of the call.
LW L DI LL DTCT VT L	The valid value range is 0 to 65,535. The default is 5,000.
Web: Disable RTCP XR Interval Randomization EMS: Disable Interval Randomization	Determines whether RTCP report intervals are randomized or whether each report interval accords exactly to the parameter RTCPInterval. • [0] Disable = (Default) Randomize
	[0] Disable = (Default) Randomize

Parameter	Description
[DisableRTCPRandomize]	[1] Enable = No Randomize
EMS: RTCP XR Collection Server Transport Type [RTCPXRESCTransportType]	Defines the transport layer used for outgoing SIP dialogs initiated by the device to the RTCP XR Collection Server. • [-1] Not Configured (default) • [0] UDP • [1] TCP • [2] TLS Notes: • When set to [-1], the value of the SIPTransportType parameter is used. • This parameter is applicable only to the Gateway application.
Web: RTCP XR Collection Server EMS: Esc IP [RTCPXREscIP]	Defines the IP address of the Event State Compositor (ESC). The device sends RTCP XR reports to this server, using SIP PUBLISH messages, according to Internet-Draft draft-ietf-sipping-rtcp-summary-13. The address can be configured as a numerical IP address or as a domain name. Note: This parameter is applicable only to the Gateway application.
Web: Gateway RTCP XR Report Mode EMS: Report Mode [RTCPXRReportMode]	Determines whether RTCP XR reports are sent to the Event State Compositor (ESC) and defines the interval at which they are sent. • [0] Disable = (Default) RTCP XR reports are not sent. • [1] End Call = RTCP XR reports are sent at the end of each call. • [2] End Call & Periodic = RTCP XR reports are sent at the end of each call and periodically according to the RTCPInterval parameter. Note: This parameter is applicable only to the Gateway application.
Web: SBC RTCP XR Report Mode [SBCRtcpXrReportMode]	Enables the sending of RTCP XR reports of QoE metrics at the end of each call session (i.e., after a SIP BYE). The RTCP XR is sent in the SIP PUBLISH message. • [0] Disable (default) • [1] End of Call Note: This parameter is applicable only to the SBC application.

50.10 Gateway and IP-to-IP Parameters

50.10.1 Fax and Modem Parameters

The fax and modem parameters are described in the table below.

Table 50-40: Fax and Modem Parameters

Parameter	Description
Web: Fax Transport Mode EMS: Transport Mode [FaxTransportMode]	Determines the fax transport mode used by the device. • [0] Disable = transparent mode • [1] T.38 Relay (default) • [2] Bypass • [3] Events Only Note: This parameter is overridden by the parameter IsFaxUsed. If the parameter IsFaxUsed is set to 1 (T.38 Relay) or 3 (Fax Fallback), then FaxTransportMode is always set to 1 (T.38 relay).
EMS: V34 Transport Method [V34FaxTransportType]	Determines the V.34 fax transport method (whether V34 fax falls back to T.30 or pass over Bypass). • [0] = Transparent • [1] = (Default) Relay • [2] = Bypass • [3] = Transparent with Events Note: To configure V34FaxTransportType to 1 (i.e., fax relay), you also need to configure FaxTransportMode to 1 (fax relay).
Web: V.21 Modem Transport Type EMS: V21 Transport [V21ModemTransportType]	Determines the V.21 modem transport type. • [0] Disable = (Default) Transparent. • [2] Enable Bypass • [3] Events Only = Transparent with Events. Note: You can also configure this functionality per specific calls, using IP Profiles (IpProfile_VxxTransportType). For more information, see "Configuring IP Profiles" on page 314.
Web: V.22 Modem Transport Type EMS: V22 Transport [V22ModemTransportType]	Determines the V.22 modem transport type. • [0] Disable = Transparent. • [2] Enable Bypass (default) • [3] Events Only = Transparent with Events. Note: You can also configure this functionality per specific calls, using IP Profiles (IpProfile_VxxTransportType). For more information, see "Configuring IP Profiles" on page 314.
Web: V.23 Modem Transport Type EMS: V23 Transport [V23ModemTransportType]	Determines the V.23 modem transport type. • [0] Disable = Transparent. • [2] Enable Bypass (default) • [3] Events Only = Transparent with Events. Note: You can also configure this functionality per specific calls, using IP Profiles (IpProfile_VxxTransportType). For more information, see "Configuring IP Profiles" on page 314.
Web: V.32 Modem Transport Type EMS: V32 Transport	Determines the V.32 modem transport type. • [0] Disable = Transparent. • [2] Enable Bypass (default)

Parameter	Description
[V32ModemTransportType]	 [3] Events Only = Transparent with Events. Notes: This parameter applies only to V.32 and V.32bis modems. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_VxxTransportType). For more information, see "Configuring IP Profiles" on page 314.
Web: V.34 Modem Transport Type EMS: V34 Transport [V34ModemTransportType]	Determines the V.90/V.34 modem transport type. • [0] Disable = Transparent. • [2] Enable Bypass (default) • [3] Events Only = Transparent with Events. Note: You can also configure this functionality per specific calls, using IP Profiles (IpProfile_VxxTransportType). For more information, see "Configuring IP Profiles" on page 314.
EMS: Bell Transport Type [BellModemTransportType]	Determines the Bell modem transport method. • [0] = Transparent (default) • [2] = Bypass • [3] = Transparent with events
Web/EMS: Fax CNG Mode [FaxCNGMode]	 Determines the device's handling of fax relay upon detection of a fax CNG tone or a V.34/Super G3 V8-CM (Call Menu) signal from originating faxes. [0] Doesn't send T.38 Re-INVITE = (Default) SIP re-INVITE is not sent. [1] Sends on CNG tone = Sends a SIP re-INVITE with T.38 parameters in SDP to the terminating fax upon detection of a fax CNG tone, if the CNGDetectorMode parameter is set to 1. [2] Sends on CNG or v8-cn = Sends a SIP re-INVITE with T.38 parameters in SDP to the terminating fax upon detection of a fax CNG tone (if the CNGDetectorMode parameter is set to 1) or upon detection of a V8-CM signal. Notes: Option [2] is applicable only if the device is loaded with DSP template 10 (i.e., DSPVersionTemplateNumber parameter is set to 10). If this parameter is set to [2] and the CNGDetectorMode parameter is set to [6], the device sends a re-INVITE only if it detects a V8-CM signal from the originating fax. This feature is applicable only if the IsFaxUsed parameter is set to [1] or [3]. The device also sends T.38 re-INVITE if the CNGDetectorMode parameter is set to [2], regardless of the FaxCNGMode parameter settings.
Web/EMS: CNG Detector Mode [CNGDetectorMode]	Global parameter that enables the detection of the fax calling tone (CNG) and defines the detection method. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_CNGmode). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.

Version 6.8 791 Mediant 3000

Parameter	Description
Web: Fax Detect Timeout Since Connect (msec) CLI: configure voip > sip- definition general-settings > fax-detect-timeout-since- connect [FaxDetectTimeoutSinceC onnect]	Defines a timeout (in msec) for detecting fax from the Tel side during an established voice call. The interval starts from when the voice call is established. If the device detects a fax tone within the interval, it ends the voice session and sends a T.38 or VBD re-INVITE message to the IP side and processes the fax. If the interval expires without any received fax event, the device ignores all subsequent fax events during the voice session. The valid value is 0 to 120000. The default is 0. If set to 0, the device can detect fax during the entire voice call.
Web: SIP T.38 Version [SIPT38Version]	Determines the T.38 fax relay version. • [-1] Not Configured = (Default) No T.38 • [0] Version 0 • [3] Version 3 = T.38 Version 3 (V.34 over T.38) Note: For a description on V.34 over T.38 fax relay, see V.34 Fax Support on page 184.
Web: Fax Relay Enhanced Redundancy Depth EMS: Enhanced Relay Redundancy Depth [FaxRelayEnhancedRedundancyDepth]	Defines the number of times that control packets are retransmitted when using the T.38 standard. The valid range is 0 to 4. The default is 0.
Web: Fax Relay Redundancy Depth EMS: Relay Redundancy Depth [FaxRelayRedundancyDep th]	Defines the number of times that each fax relay payload is retransmitted to the network. • [0] = (Default) No redundancy • [1] = One packet redundancy • [2] = Two packet redundancy Note: This parameter is applicable only to non-V.21 packets.
Web: Fax Relay Max Rate (bps) EMS: Relay Max Rate [FaxRelayMaxRate]	Defines the maximum rate (in bps) at which fax relay messages are transmitted (outgoing calls). [0] 2400 = 2.4 kbps [1] 4800 = 4.8 kbps [2] 7200 = 7.2 kbps [3] 9600 = 9.6 kbps [4] 12000 = 12.0 kbps [5] 14400 = 14.4 kbps (maximum for T38 Version 0) [6] 16800bps = 16.8 kbps [7] 19200bps = 19.2 kbps [8] 21600bps = 21.6 kbps [9] 24000bps = 24 kbps [10] 26400bps = 26.4 kbps [11] 28800bps = 28.8 kbps [11] 28800bps = 31.2 kbps [12] 31200bps = 31.2 kbps T13] 33600bps = 33.6 kbps (default) Notes: The rate is negotiated between both sides (i.e., the device adapts to the capabilities of the remote side). Negotiation of the T.38 maximum supported fax data rate is provided in SIP's SDP T38MaxBitRate parameter. The negotiated T38MaxBitRate is the minimum rate supported between the local and remote endpoints.

Parameter	Description
	 Fax relay rates greater than 14.4 kbps are applicable only to V.34 / T.38 fax relay. For non-T.38 V.34 supporting devices, configuration greater than 14.4 kbps is truncated to 14.4 kbps.
Web: Fax Relay ECM Enable EMS: Relay ECM Enable [FaxRelayECMEnable]	 Enables Error Correction Mode (ECM) mode during fax relay. [0] Disable [1] Enable (default)
Web: Fax/Modem Bypass Coder Type EMS: Coder Type [FaxModemBypassCoderT ype]	Determines the coder used by the device when performing fax/modem bypass. Typically, high-bit-rate coders such as G.711 should be used. • [0] G.711Alaw= (Default) G.711 A-law 64 • [1] G.711Mulaw = G.711 μ -law
Web: Fax/Modem Bypass Packing Factor EMS: Packetization Period [FaxModemBypassM]	Defines the number (20 msec) of coder payloads used to generate a fax/modem bypass packet. The valid range is 1, 2, or 3 coder payloads. The default is 1 coder payload.
[FaxModemNTEMode]	Determines whether the device sends RFC 2833 ANS/ANSam events upon detection of fax and/or modem Answer tones (i.e., CED tone). • [0] = Disabled (default) • [1] = Enabled Note: This parameter is applicable only when the fax or modem transport type is set to bypass or Transparent-with-Events.
Web/EMS: Fax Bypass Payload Type [FaxBypassPayloadType]	Defines the fax bypass RTP dynamic payload type. The valid range is 96 to 120. The default is 102.
EMS: Modem Bypass Payload Type [ModemBypassPayloadTy pe]	Defines the modem bypass dynamic payload type. The range is 0-127. The default is 103.
EMS: Relay Volume (dBm) [FaxModemRelayVolume]	Defines the fax gain control. The range is -18 to -3, corresponding to -18 dBm to -3 dBm in 1-dB steps. The default is -6 dBm fax gain control.
Web/EMS: Fax Bypass Output Gain [FaxBypassOutputGain]	Defines the fax bypass output gain control. The range is -31 to +31 dB, in 1-dB steps. The default is 0 (i.e., no gain).
Web/EMS: Modem Bypass Output Gain [ModemBypassOutputGain]	Defines the modem bypass output gain control. The range is -31 dB to +31 dB, in 1-dB steps. The default is 0 (i.e., no gain).
EMS: Basic Packet Interval [FaxModemBypassBasicR TPPacketInterval]	Defines the basic frame size used during fax/modem bypass sessions. • [0] = (Default) Determined internally • [1] = 5 msec (not recommended) • [2] = 10 msec • [3] = 20 msec Note: When set to 5 msec (1), the maximum number of simultaneous channels supported is 120.

Parameter	Description
EMS: Dynamic Jitter Buffer Minimal Delay (dB) [FaxModemBypasDJBufMi nDelay]	Defines the Jitter Buffer delay (in milliseconds) during fax and modem bypass session. The range is 0 to 150 msec. The default is 40.
EMS: Enable Inband Network Detection [EnableFaxModemInbandN etworkDetection]	 [0] = (Default) Disable. [1] = Enable. When this parameter is enabled on Bypass and transparent with events mode (VxxTransportType is set to 2 or 3), a detection of an Answer Tone from the network triggers a switch to bypass mode in addition to the local Fax/Modem tone detections. However, only a high bit-rate coder voice session effectively detects the Answer Tone sent by a remote endpoint. This can be useful when, for example, the payload of voice and bypass is the same, allowing the originator to switch to bypass mode as well.
EMS: NSE Mode [NSEMode]	Global parameter that enables Cisco's compatible fax and modem bypass mode, Named Signaling Event (NSE) packets. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_NSEMode). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
EMS: NSE Payload Type [NSEPayloadType]	Defines the NSE payload type for Cisco Bypass compatible mode. The valid range is 96-127. The default is 105. Note: Cisco gateways usually use NSE payload type of 100.
EMS: T38 Use RTP Port [T38UseRTPPort]	 Defines the port (with relation to RTP port) for sending and receiving T.38 packets. [0] = (Default) Use the RTP port +2 to send/receive T.38 packets. [1] = Use the same port as the RTP port to send/receive T.38 packets. Notes: For this parameter to take effect, you must reset the device. When the device is configured to use V.152 to negotiate audio and T.38 coders, the UDP port published in SDP for RTP and for T38 must be different. Therefore, set the T38UseRTPPort parameter to 0.
Web/EMS: T.38 Max Datagram Size [T38MaxDatagramSize]	Defines the maximum size of a T.38 datagram that the device can receive. This value is included in the outgoing SDP when T.38 is used. The valid range is 120 to 600. The default is 560.
Web/EMS: T38 Fax Max Buffer [T38FaxMaxBufferSize]	Defines the maximum size (in bytes) of the device's T.38 buffer. This value is included in the outgoing SDP when T.38 is used for fax relay over IP. The valid range is 500 to 3000. The default is 3000.
Web: Detect Fax on Answer Tone EMS: Enables Detection of FAX on Answer Tone [DetFaxOnAnswerTone]	Determines when the device initiates a T.38 session for fax transmission. • [0] Initiate T.38 on Preamble = (Default) The device to which the called fax is connected initiates a T.38 session on receiving V.21 Preamble signal from the fax.

Parameter	Description
	 [1] Initiate T.38 on CED = The device to which the called fax is connected initiates a T.38 session on receiving a CED answer tone from the fax. This option can only be used to relay fax signals, as the device sends T.38 Re-INVITE on detection of any fax/modem Answer tone (2100 Hz, amplitude modulated 2100 Hz, or 2100 Hz with phase reversals). The modem signal fails when using T.38 for fax relay. Note: This parameters is applicable only if the IsFaxUsed parameter is set to 1 (T.38 Relay) or 3 (Fax Fallback).
Web: CED Transfer Mode	Defines the method for sending fax/modem CED (answering) tones.
[CEDTransferMode]	• [0] Fax Relay or VBD = (Default) The device transfers the CED tone in Relay mode and starts the fax session immediately.
	 [1] Voice Mode or VBD = The device transfers the CED tone in either Voice or Bypass mode and starts the fax session on V21 preamble.
	• [2] RFC 4733 Blocking RTP VBD = The device transfers the CED tone in RFC 2833. This is applicable only to V.150.1 modem relay and fax bypass.
	• [3] RFC 4733 Along with RTP VBD = The device transfers the CED tone in RFC 2833 and bypass, in parallel. For combined V.150.1 modem relay and fax relay, use this option.
Web: T.38 Fax Session [T38FaxSessionImmediate	Enables fax transmission of T.38 "no-signal" packets to the terminating fax machine.
Start]	[0] Disable (default)
	• [1] Immediate Start on Fax = Device activates T.38 fax relay upon receipt of a re-INVITE with T.38 only in the SDP.
	 [2] Immediate Start on Fax & Voice = Device activates T.38 fax relay upon receipt of a re-INVITE with T.38 and audio media in the SDP.
	This parameter is used for transmission from fax machines connected to the device and located inside a NAT. Generally, the firewall blocks T.38 (and other) packets received from the WAN, unless the device behind NAT sends at least one IP packet from the LAN to the WAN through the firewall. If the firewall blocks T.38 packets sent from the termination IP fax, the fax fails.
	To overcome this, the device sends No-Op ("no-signal") packets to open a pinhole in the NAT for the answering fax machine. The originating fax does not wait for an answer, but immediately starts sending T.38 packets to the terminating fax machine.
	Note: To enable No-Op packet transmission, use the NoOpEnable and NoOpInterval parameters.
Web: Profile Number EMS: Allocation Profile [V1501AllocationProfile]	Defines the V.150.1 profile, which determines how many DSP channels support V.150.1.
	The value range is 0 to 20. The default is 0. Note: For this parameter to take effect, a device reset is required.
Web/EMS: SSE Payload Type Rx	Defines the V.150.1 (modem relay protocol) State Signaling Event (SSE) payload type Rx.
[V1501SSEPayloadTypeRx]	The value range is 96 to 127. The default is 105.

Version 6.8 795 Mediant 3000

Parameter	Description
Web/EMS: SSE Redundancy Depth [V1501SSERedundancyDep th]	Defines the SSE redundancy depth. The value range is 1-6. The default is 3.
Web: SPRT Transport Ch.0 Max Payload Size [V1501SPRTTransportChan nel0MaxPayloadSize]	Defines the maximum payload size for V.150.1 SPRT Transport Channel 0. The range is 140 to 256. The default is 140.
Web: SPRT Transport Ch.2 Max Payload Size [V1501SPRTTransportChan nel2MaxPayloadSize]	Defines the maximum payload size for V.150.1 SPRT Transport Channel 2. The range is 132 to 256. The default is 132.
Web: SPRT Transport Ch.2 Max Window Size [V1501SPRTTransportChan nel2MaxWindowSize]	Defines the maximum window size of SPRT transport channel 2. The value range is 8 to 32. The default is 8.
Web: SPRT Transport Ch.3 Max Payload Size [V1501SPRTTransportChan nel3MaxPayloadSize]	Defines the maximum payload size for V.150.1 SPRT Transport Channel 3. The range is 140 to 256. The default is 140.

50.10.2 DTMF and Hook-Flash Parameters

The DTMF and hook-flash parameters are described in the table below.

Table 50-41: DTMF and Hook-Flash Parameters

Table 30-41. DTML and Hook-Hash Latameters	
Parameter	Description
Hook-Flash Parameters	
Web/EMS: Hook-Flash Code [HookFlashCode]	Defines the digit pattern used by the PBX to indicate a Hook Flash event. When this pattern is detected from the Tel side, the device responds as if a Hook Flash event has occurred and sends a SIP INFO message if the HookFlashOption parameter is set to 1, 5, 6, or 7 (indicating a Hook Flash). If configured and a Hook Flash indication is received from the IP side, the device generates this pattern to the Tel side.
	The valid range is a 25-character string. The default is a null string.
	Note: This parameter can also be configured in a Tel Profile.
Web/EMS: Hook-Flash Option [HookFlashOption]	Determines the hook-flash transport type (i.e., method by which hook-flash is sent and received). This feature is applicable only if the HookFlashCode parameter is configured.
	 [0] Not Supported = (Default) Hook-Flash indication is not sent. [1] INFO = Sends proprietary INFO message (Broadsoft) with Hook-Flash indication. The device sends the INFO message as follows:
	Content-Type: application/broadsoft; version=1.0 Content-Length: 17 event flashhook
	 [4] RFC 2833 = This option is currently not supported. [5] INFO (Lucent) = Sends proprietary SIP INFO message with

Parameter	Description
	Hook-Flash indication. The device sends the INFO message as follows: Content-Type: application/hook-flash Content-Length: 11 signal=hf
	• [6] INFO (NetCentrex) = Sends proprietary SIP INFO message with Hook-Flash indication. The device sends the INFO message as follows:
	Content-Type: application/dtmf-relay Signal=16
	 Where 16 is the DTMF code for hook flash. [7] INFO (HUAWEI) = Sends a SIP INFO message with Hook-Flash indication. The device sends the INFO message as follows:
	Content-Length: 17 Content-Type: application/sscc event=flashhook
	Note: The device can interwork DTMF HookFlashCode to SIP INFO messages with Hook Flash indication.
DTMF Parameters	
EMS: Use End of DTMF [MGCPDTMFDetectionPoint]	 Determines when the detection of DTMF events is notified. [0] = DTMF event is reported at the end of a detected DTMF digit. [1] = (Default) DTMF event is reported at the start of a detected DTMF digit.
Web: Declare RFC 2833 in SDP EMS: Rx DTMF Option [RxDTMFOption]	Global parameter that enables the device to declare the RFC 2833 'telephony-event' parameter in the SDP. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_RxDTMFOption). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314.
	Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web/EMS: 1st Tx DTMF Option / 2nd Tx DTMF Option [TxDTMFOption]	 Defines up to two preferred transmit DTMF negotiation methods. [0] Not Supported = (Default) No negotiation - DTMF digits are sent according to the parameters DTMFTransportType and RFC2833PayloadType. [1] INFO (Nortel) = Sends DTMF digits according to IETF Internet-Draft draft-choudhuri-sip-info-digit-00. [2] NOTIFY = Sends DTMF digits according to IETF Internet-Draft draft-mahy-sipping-signaled-digits-01. [3] INFO (Cisco) = Sends DTMF digits according to Cisco format. [4] RFC 2833. [5] INFO (Korea) = Sends DTMF digits according to Korea Telecom format. The format of the ini file table parameter is as follows: [TxDTMFOption] FORMAT TxDTMFOption_Index = TxDTMFOption_Type; [\TxDTMFOption] For example:

Parameter	Description
	TxDTMFOption 0 = 1; TxDTMFOption 1 = 3;
	Notes:
	 DTMF negotiation methods are prioritized according to the order of their appearance.
	 When out-of-band DTMF transfer is used ([1], [2], [3], or [5]), the parameter DTMFTransportType is automatically set to 0 (DTMF digits are erased from the RTP stream).
	When RFC 2833 (4) is selected, the device:
	a. Negotiates RFC 2833 payload type using local and remote SDPs.
	 b. Sends DTMF packets using RFC 2833 payload type according to the payload type in the received SDP. c. Expects to receive RFC 2833 packets with the same payload type as configured by the parameter RFC2833PayloadType. d. Removes DTMF digits in transparent mode (as part of the voice stream).
	 When TxDTMFOption is set to 0, the RFC 2833 payload type is set according to the parameter RFC2833PayloadType for both transmit and receive.
	 You can also configure this functionality per specific calls, using IP Profiles (IpProfile_FirstTxDtmfOption and IpProfile_SecondTxDtmfOption). For configuring IP Profiles, see "Configuring IP Profiles" on page 314.
[DisableAutoDTMFMute]	Enables the automatic muting of DTMF digits when out-of-band DTMF transmission is used.
	 [0] = (Default) Automatic mute is used. [1] = No automatic mute of in-band DTMF.
	When this parameter is set to 1, the DTMF transport type is set according to the parameter DTMFTransportType and the DTMF digits aren't muted if out-of-band DTMF mode is selected (TxDTMFOption set to 1, 2 or 3). This enables the sending of DTMF digits in-band (transparent of RFC 2833) in addition to out-of-band DTMF messages. Note: Usually this mode is not recommended.
Web/EMS: Enable Digit Delivery to IP [EnableDigitDelivery2IP]	Enables the Digit Delivery feature whereby DTMF digits are sent to the destination IP address after the Tel-to-IP call is answered.
[Endblebightbenveryzh]	[0] Disable (default).[1] Enable = Enable digit delivery to IP.
	To enable this feature, modify the called number to include at least one 'p' character. The device uses the digits before the 'p' character in the initial INVITE message. After the call is answered, the device waits for the required time (number of 'p' multiplied by 1.5 seconds), and then sends the rest of the DTMF digits using the method chosen (in-band or out-of-band).
	Notes:
	 For this parameter to take effect, a device reset is required. The called number can include several 'p' characters (1.5 seconds pause), for example, 1001pp699, 8888p9p300.
Web: Enable Digit Delivery to Tel EMS: Enable Digit Delivery	Enables the Digit Delivery feature, which sends DTMF digits of the called number to the device's B-channel (phone line) after the call is answered for IP-to-Tel calls.

Parameter	Description
[EnableDigitDelivery]	 [0] Disable (default). [1] Enable = Enable Digit Delivery feature for the device (two-stage dialing).
	If the called number in IP-to-Tel call includes the characters 'w' or 'p', the device places a call with the first part of the called number (before 'w' or 'p') and plays DTMF digits after the call is answered. If the character 'w' is used, the device waits for detection of a dial tone before it starts playing DTMF digits. For example, if the called number is '1007766p100', the device places a call with 1007766 as the destination number, then after the call is answered it waits 1.5 seconds ('p') and plays the rest of the number (100) as DTMF digits.
	Additional examples: 1664wpp102, 66644ppp503, and 7774w100pp200.
	 Notes: For this parameter to take effect, a device reset is required. This parameter can also be configured in a Tel Profile.
Web: Special Digit Representation EMS: Use Digit For Special DTMF [UseDigitForSpecialDTMF]	Defines the representation for 'special' digits ('*' and '#') that are used for out-of-band DTMF signaling (using SIP INFO/NOTIFY). • [0] Special = (Default) Uses the strings '*' and '#'. • [1] Numeric = Uses the numerical values 10 and 11.

50.10.3 Digit Collection and Dial Plan Parameters

The digit collection and dial plan parameters are described in the table below.

Table 50-42: Digit Collection and Dial Plan Parameters

Parameter	Description
Web/EMS: Dial Plan Index [DialPlanIndex]	Defines the Dial Plan index to use in the external Dial Plan file. The Dial Plan file is loaded to the device as a .dat file (converted using the DConvert utility). The Dial Plan index can be defined globally or per Tel Profile.
	The valid value range is 0 to 7, where 0 denotes PLAN1, 1 denotes PLAN2, and so on. The default is -1, indicating that no Dial Plan file is used.
	Notes:
	 If this parameter is configured to select a Dial Plan index, the settings of the parameter DigitMapping are ignored. If this parameter is configured to select a Dial Plan index from an external Dial Plan file, the device first attempts to locate a matching digit pattern in the Dial Plan file, and if not found, then attempts to locate a matching digit pattern in the Digit Map rules configured by the DigitMapping parameter.
	 This parameter is applicable also to ISDN with overlap dialing. For E1 CAS MFC-R2 variants (which don't support terminating digit for the called party number, usually I-15), this parameter and the DigitMapping parameter are ignored. Instead, you can define a Dial Plan template per trunk using the parameter CasTrunkDialPlanName_x (or in the Trunk Settings page). This parameter can also be configured in a Tel Profile.

Parameter	Description
	 For more information on the Dial Plan file, see "Dialing Plans for Digit Collection" on page 561.
[Tel2IPSourceNumberMappin gDiaIPlanIndex]	Defines the Dial Plan index in the external Dial Plan file for the Telto-IP Source Number Mapping feature. The valid value range is 0 to 7, defining the Dial Plan index [Plan x] in the Dial Plan file. The default is -1 (disabled). For more information on this feature, see "Modifying ISDN-to-IP Calling Party Number" on page 568.
Web: Digit Mapping Rules EMS: Digit Map Pat terns [DigitMapping]	Defines the digit map pattern (used to reduce the dialing period when ISDN overlap dialing). If the digit string (i.e., dialed number) matches one of the patterns in the digit map, the device stops collecting digits and establishes a call with the collected number. The digit map pattern can contain up to 52 options (rules), each separated by a vertical bar (). The maximum length of the entire digit pattern is 152 characters. The available notations include the following: [n-m]: Range of numbers (not letters).
	 . (single dot): Repeat digits until next notation (e.g., T). x: Any single digit. T: Dial timeout (configured by the TimeBetweenDigits parameter). S: Short timer (configured by the TimeBetweenDigits parameter; default is two seconds) that can be used when a specific rule is defined after a more general rule. For example, if the digit map is 99 998, then the digit collection is terminated after the first two 9 digits are received. Therefore, the second rule of 998 can never be matched. But when the digit map is 99s 998, then after dialing the first two 9 digits, the device waits another two seconds within which the caller can enter the digit 8.
	An example of a digit map is shown below: 11xS 00T [1-7]xxx 8xxxxxxxx #xxxxxxx 91xxxxxxxxx 9011x.T In the example above, the last rule can apply to International numbers: 9 for dialing tone, 011 Country Code, and then any number of digits for the local number ('x.'). Notes:
	 For ISDN interfaces, the digit map mechanism is applicable only when ISDN overlap dialing is used (ISDNRxOverlap is set to 1). If the DialPlanIndex parameter is configured (to select a Dial Plan index), then the device first attempts to locate a matching digit pattern in the Dial Plan file, and if not found, then attempts to locate a matching digit pattern in the Digit Map rules configured by the DigitMapping parameter. For more information on digit mapping, see "Digit Mapping" on page 432.
Web: Max Digits in Phone Num EMS: Max Digits in Phone Number [MaxDigits]	Defines the maximum number of collected destination number digits that can be received from the Tel side when Tel-to-IP ISDN overlap dialing is performed. When the number of collected digits reaches this maximum, the device uses these digits for the called destination number. The valid range is 1 to 49. The default is 30.
	Note: Instead of using this parameter, Digit Mapping rules can be configured.

Parameter	Description
Web: Inter Digit Timeout for Overlap Dialing [sec] EMS: Interdigit Timeout (Sec) [TimeBetweenDigits]	Defines the time (in seconds) that the device waits between digits that are received from the PSTN or IP during overlap dialing. When this inter-digit timeout expires, the device uses the collected digits to dial the called destination number. The valid range is 1 to 10. The default is 4.

50.10.4 Voice Mail Parameters

The voice mail parameters are described in the table below. For more information on the Voice Mail application, refer to the *CPE Configuration Guide for Voice Mail*.

Table 50-43: Voice Mail Parameters

Table 50-43: Voice Mail Parameters	
Parameter	Description
Web/EMS: Voice Mail Interface [VoiceMailInterface]	Enables the device's Voice Mail application and determines the communication method between the device and PBX. [0] None (default) [1] DTMF [2] SMDI [3] QSIG [4] SETUP Only = Applicable only to ISDN. [5] MATRA/AASTRA QSIG [6] QSIG SIEMENS = QSIG MWI activate and deactivate messages include Siemens Manufacturer Specific Information (MSI) [7] IP2IP = The device's IP-to-IP application is used for interworking between an IP Voice Mail server and the device. This is implemented for sending unsolicited SIP NOTIFY messages received from the Voice Mail server to an IP Group (configured using the NotificationIPGroupID parameter). [8] ETSI = Euro ISDN, according to ETS 300 745-1 V1.2.4, section 9.5.1.1. Enables MWI interworking from IP to Tel, typically used for BRI phones. [9] = ISDN PRI trunks set to NI-2. This is used for interworking the SIP Message Waiting Indication (MWI) NOTIFY message to ISDN PRI NI-2 Message Waiting Notification (MWN) that is sent in the ISDN Facility IE message. This option is applicable when the device is connected to a PBX through an ISDN PRI trunk configured to NI-2. Note: To disable voice mail per Trunk Group, you can use a Tel Profile with the EnableVoiceMailDelay parameter set to disabled (0). This eliminates the phenomenon of call delay on Trunks not implementing voice mail when voice mail is enabled using this global parameter.
Web: Enable VoiceMail URI EMS: Enable VMURI [EnableVMURI]	Enables the interworking of target and cause for redirection from Tel to IP and vice versa, according to RFC 4468. • [0] Disable (default) • [1] Enable Upon receipt of an ISDN Setup message with Redirect values, the device maps the Redirect phone number to the SIP 'target'

Version 6.8 801 Mediant 3000

Parameter	Description
	parameter and the Redirect number reason to the SIP 'cause' parameter in the Request-URI. Redirecting Reason >> SIP Response Code Unknown >> 404 User busy >> 486 No reply >> 408 Deflection >> 487/480 Unconditional >> 302 Others >> 302 If the device receives a Request-URI that includes a 'target' and 'cause' parameter, the 'target' is mapped to the Redirect phone number and the 'cause' is mapped to the Redirect number reason.
[WaitForBusyTime]	Defines the time (in msec) that the device waits to detect busy and/or reorder tones. This feature is used for semi-supervised PBX call transfers (i.e., the LineTransferMode parameter is set to 2). The valid value range is 0 to 20000 (i.e., 20 sec). The default is 2000 (i.e., 2 sec).
Web/EMS: Line Transfer Mode [LineTransferMode]	Defines the call transfer method used by the device. This parameter is applicable to as well as E1/T1 CAS call transfer if the TrunkTransferMode_x parameter is set to 3 (CAS Normal) or 1 (CAS NFA). • [0] None = (Default) IP. • [1] Blind = PBX blind transfer: ** E1/T1 CAS: When a SIP REFER message is received, the device performs a blind transfer, by performing a CAS wink, waiting a user-defined time (configured by the WaitForDialTime parameter), dialing the Refer-To number, and then releasing the call. The PBX performs the transfer internally. • [2] Semi Supervised = PBX semi-supervised transfer: ** the user-defined interval set by the WaitForBusyTime parameter), ** E1/T1 CAS: The device performs a CAS wink, waits a user-defined time (configured by the WaitForBusyTime parameter), and then dials the Refer-To number. If during the user-defined interval set by the WaitForBusyTime parameter, no busy or reorder tones are detected, the device completes the call transfer by releasing the line. If during this interval, the device detects these tones, the transfer operation is cancelled, the device sends a SIP NOTIFY message with a failure reason (e.g., 486 if a busy tone is detected), and then generates an additional wink toward the CAS line to restore connection with the original call. • [3] Supervised = PBX Supervised transfer: ** E1/T1 CAS: The device performs a supervised transfer to the PBX. The device performs a CAS wink, waits a user-defined time (configured by the WaitForDialTime parameter), and then dials the Refer-To number. The device completes the call transfer by releasing the line only

Parameter	Description
	after detection of the transferred party answer. To enable answer supervision, you also need to do the following: 1) Enable voice detection (i.e., set the EnableVoiceDetection parameter to 1). 2) Set the EnableDSPIPMDetectors parameter to 1. 3) Install the IPMDetector DSP option Feature License Key.
Message Waiting Indication (M	WI) Parameters
Web: MWI Off Digit Pattern EMS: MWI Off Code [MWIOffCode]	Defines the digit code used by the device to notify the PBX that there are no messages waiting for a specific extension. This code is added as prefix to the dialed number. The valid range is a 25-character string.
Web: MWI On Digit Pattern EMS: MWI On Code [MWIOnCode]	Defines the digit code used by the device to notify the PBX of messages waiting for a specific extension. This code is added as prefix to the dialed number. The valid range is a 25-character string.
Web: MWI Suffix Pattern EMS: MWI Suffix Code [MWISuffixCode]	Defines the digit code used by the device as a suffix for 'MWI On Digit Pattern' and 'MWI Off Digit Pattern'. This suffix is added to the generated DTMF string after the extension number. The valid range is a 25-character string.
Web: MWI Source Number EMS: MWI Source Name [MWISourceNumber]	Defines the calling party's phone number used in the Q.931 MWI Setup message to PSTN. If not configured, the channel's phone number is used as the calling number.
[MWISubscribelPGroupID]	Defines the IP Group ID used when subscribing to an MWI server. The 'The SIP Group Name' field value of the IP Group table is used as the Request-URI host name in the outgoing MWI SIP SUBSCRIBE message. The request is sent to the IP address defined for the Proxy Set that is associated with the IP Group. The Proxy Set's capabilities such as proxy redundancy and load balancing are also applied to the message.
	For example, if the 'SIP Group Name' field of the IP Group is set to "company.com", the device sends the following SUBSCRIBE message:
	SUBSCRIBE sip:company.com
	Instead of:
	Note: If this parameter is not configured, the MWI SUBSCRIBE message is sent to the MWI server as defined by the MWIServerIP parameter.
[NotificationIPGroupID]	Defines the IP Group ID to which the device sends SIP NOTIFY MWI messages. Notes:
	 This is used for MWI Interrogation. For more information on the interworking of QSIG MWI to IP, see Message Waiting Indication on page 438. To determine the handling method of MWI Interrogation.
	 To determine the handling method of MWI Interrogation messages, use the TrunkGroupSettings_MWIInterrogationType, parameter (in the Trunk Group Settings table).

Parameter	Description
[MWIQsigMsgCentreldIDPartyN umber]	Defines the Message Centred ID party number used for QSIG MWI messages. If not configured (default), the parameter is not included in MWI (activate and deactivate) QSIG messages. The valid value is a string.
Digit Patterns The following digit pattern parameters apply only to voice mail applications that use the DTMF communication method. For the available pattern syntaxes, refer to the <i>CPE Configuration Guide for Voice Mail</i> .	
Web: Forward on Busy Digit Pattern (Internal) EMS: Digit Pattern Forward On Busy [DigitPatternForwardOnBusy]	Defines the digit pattern used by the PBX to indicate 'call forward on busy' when the original call is received from an internal extension. The valid range is a 120-character string.
Web: Forward on No Answer Digit Pattern (Internal) EMS: Digit Pattern Forward On No Answer [DigitPatternForwardOnNoAn swer]	Defines the digit pattern used by the PBX to indicate 'call forward on no answer' when the original call is received from an internal extension. The valid range is a 120-character string.
Web: Forward on Do Not Disturb Digit Pattern (Internal) EMS: Digit Pattern Forward On DND [DigitPatternForwardOnDND]	Defines the digit pattern used by the PBX to indicate 'call forward on do not disturb' when the original call is received from an internal extension. The valid range is a 120-character string.
Web: Forward on No Reason Digit Pattern (Internal) EMS: Digit Pattern Forward No Reason [DigitPatternForwardNoReaso n]	Defines the digit pattern used by the PBX to indicate 'call forward with no reason' when the original call is received from an internal extension. The valid range is a 120-character string.
Web: Forward on Busy Digit Pattern (External) EMS: VM Digit Pattern On Busy External [DigitPatternForwardOnBusy Ext]	Defines the digit pattern used by the PBX to indicate 'call forward on busy' when the original call is received from an external line (not an internal extension). The valid range is a 120-character string.
Web: Forward on No Answer Digit Pattern (External) EMS: VM Digit Pattern On No Answer Ext [DigitPatternForwardOnNoAn swerExt]	Defines the digit pattern used by the PBX to indicate 'call forward on no answer' when the original call is received from an external line (not an internal extension). The valid range is a 120-character string.
Web: Forward on Do Not Disturb Digit Pattern (External) EMS: VM Digit Pattern On DND External [DigitPatternForwardOnDNDE xt]	Defines the digit pattern used by the PBX to indicate 'call forward on do not disturb' when the original call is received from an external line (not an internal extension). The valid range is a 120-character string.

Parameter	Description
Web: Forward on No Reason Digit Pattern (External) EMS: VM Digit Pattern No Reason External [DigitPatternForwardNoReaso nExt]	Defines the digit pattern used by the PBX to indicate 'call forward with no reason' when the original call is received from an external line (not an internal extension). The valid range is a 120-character string.
Web: Internal Call Digit Pattern EMS: Digit Pattern Internal Call [DigitPatternInternalCall]	Defines the digit pattern used by the PBX to indicate an internal call. The valid range is a 120-character string.
Web: External Call Digit Pattern EMS: Digit Pattern External Call [DigitPatternExternalCall]	Defines the digit pattern used by the PBX to indicate an external call. The valid range is a 120-character string.
Web: Disconnect Call Digit Pattern EMS: Tel Disconnect Code [TelDisconnectCode]	Defines a digit pattern that when received from the Tel side, indicates the device to disconnect the call. The valid range is a 25-character string.
Web: Digit To Ignore Digit Pattern EMS: Digit To Ignore [DigitPatternDigitToIgnore]	Defines a digit pattern that if received as Src (S) or Redirect (R) numbers is ignored and not added to that number. The valid range is a 25-character string.

50.10.5 Supplementary Services Parameters

This subsection describes the device's supplementary telephony services parameters.

50.10.5.1 Caller ID Parameters

The caller ID parameters are described in the table below.

Table 50-44: Caller ID Parameters

Parameter	Description
Web/EMS: Enable Caller ID [EnableCallerID]	Global parameter that enables Caller ID. ■ [0] Disable (default) ■ [1] Enable ✓ CAS: The device detects the Caller ID signal received from the Tel and sends it to the IP in the SIP INVITE message (as the 'Display' element).
Web: Asserted Identity Mode EMS: Asserted ID Mode [AssertedIdMode]	Determines whether the SIP header P-Asserted-Identity or P-Preferred-Identity is added to the sent INVITE, 200 OK, or UPDATE request for Caller ID (or privacy). These headers are used to present the calling party's Caller ID, which is composed of a Calling Number and a Calling Name (optional).
	 [0] Disabled = (Default) P-Asserted-Identity and P-Preferred-Identity headers are not added. [1] Add P-Asserted-Identity [2] Add P-Preferred-Identity
	The used header also depends on the calling Privacy (allowed or restricted). These headers are used together with the Privacy

Parameter	Description
	header. If Caller ID is restricted (i.e., P-Asserted-Identity is not sent), the Privacy header includes the value 'id' ('Privacy: id'). Otherwise, for allowed Caller ID, 'Privacy: none' is used. If Caller ID is restricted (received from PSTN), the From header is set to <anonymous@anonymous.invalid>.</anonymous@anonymous.invalid>
	The 200 OK response can contain the connected party CallerID - Connected Number and Connected Name. For example, if the call is answered by the device, the 200 OK response includes the P-Asserted-Identity with Caller ID. The device interworks (in some ISDN variants), the Connected Party number and name from Q.931 Connect message to SIP 200 OK with the P-Asserted-Identity header. In the opposite direction, if the ISDN device receives a 200 OK with P-Asserted-Identity header, it interworks it to the Connected party number and name in the Q.931 Connect message, including its privacy.
Web/EMS: Use Destination As Connected Number [UseDestinationAsConnected Number]	Enables the device to include the Called Party Number, from outgoing Tel calls (after number manipulation), in the SIP P-Asserted-Identity header. The device includes the SIP P-Asserted-Identity header in 180 Ringing and 200 OK responses for IP-to-Tel calls. • [0] Disable (default) • [1] Enable Notes:
	 For this feature to function, you also need to enable the device to include the P-Asserted-Identity header in 180/200 OK responses, by setting the AssertedIDMode parameter to Add P-Asserted-Identity. If the received Q.931 Connect message contains a Connected Party Number, this number is used in the P-Asserted-Identity header in 200 OK response. This parameter is applicable to ISDN, CAS interfaces.
Web: Caller ID Transport Type EMS: Transport Type [CallerIDTransportType]	Determines the device's behavior for Caller ID detection. [0] Disable = The caller ID signal is not detected - DTMF digits remain in the voice stream. [1] Relay = (Currently not applicable.) [3] Mute = (Default) The caller ID signal is detected from the PSTN side and then erased from the voice stream.
Reject Anonymous Calls Per P	ort Table
[RejectAnonymousCallPerPort]	This table parameter determines whether the device rejects incoming anonymous calls. If enabled, when a device's FXS interface receives an anonymous call, it rejects the call and responds with a SIP 433 (Anonymity Disallowed) response. The format of the ini file table parameter is as follows:
	[RejectAnonymousCallPerPort] FORMAT RejectAnonymousCallPerPort_Index = RejectAnonymousCallPerPort_Enable; [\RejectAnonymousCallPerPort]
	 Where, Enable = accept [0] (default) or reject [1] incoming anonymous calls.
	For example: RejectAnonymousCallPerPort 0 = 0;

Parameter	Description
	RejectAnonymousCallPerPort 1 = 1;
	Note: This parameter is applicable only to FXS interfaces.

50.10.5.2 Call Waiting Parameters

The call waiting parameters are described in the table below.

Table 50-45: Call Waiting Parameters

Parameter	Description
Web/EMS: Enable Call Waiting [EnableCallWaiting]	 Enables the Call Waiting feature. [0] Disable [1] Enable (Default) If enabled and the device initiates a Tel-to-IP call to a destination that is busy, it plays a call waiting ringback tone to the caller. The tone is played only if the destination returns a 182 "Queued" SIP response. Note: The device's Call Progress Tones (CPT) file must include a Call Waiting ringback tone.
EMS: Send 180 For Call Waiting [Send180ForCallWaiting]	Determines the SIP response code for indicating Call Waiting. • [0] = (Default) Use 182 Queued response to indicate call waiting. • [1] = Use 180 Ringing response to indicate call waiting.

50.10.5.3 Call Forwarding Parameters

The call forwarding parameters are described in the table below.

Table 50-46: Call Forwarding Parameters

Parameter	Description
Web: Enable Call Forward [EnableForward]	Enables the Call Forwarding feature. • [0] Disable • [1] Enable (Default) Notes:
	 To use this service, the devices at both ends must support this option. For the device to respond to SIP 3xx responses with a new SIP request (forwarding the original request), set this parameter to Enable.

50.10.5.4 Call Hold Parameters

The call hold parameters are described in the table below.

Table 50-47: Call Hold Parameters

Parameter	Description
Web/EMS: Enable Hold [EnableHold]	Global parameter that enables the interworking of the Hold/Retrieve supplementary service from ISDN PRI to SIP. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_EnableHold). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web/EMS: Hold Format [HoldFormat]	 Defines the format of the SDP in the sent re-INVITE hold request. [0] 0.0.0.0 = (Default) The SDP "c=" field contains the IP address "0.0.0.0" and the "a=inactive" attribute. [1] Send Only = The SDP "c=" field contains the device's IP address and the "a=sendonly" attribute. [2] x.y.z.t = The SDP "c=" field contains the device's IP address and the "a=inactive" attribute. Notes:
	 The device does not send any RTP packets when it is in hold state. This parameter is applicable only to QSIG and Euro ISDN protocols.
Web/EMS:Held Timeout [HeldTimeout]	Defines the time interval that the device allows for a call to remain on hold. If a Resume (un-hold Re-INVITE) message is received before the timer expires, the call is renewed. If this timer expires, the call is released (terminated). • [-1] = (Default) The call is placed on hold indefinitely until the initiator of the on hold retrieves the call again. • [0 - 2400] = Time to wait (in seconds) after which the call is released.
[PlayDTMFduringHold]	Determines whether the device sends DTMF signals (or DTMF SIP INFO message) when a call is on hold. ■ [0] = (Default) Disable. ■ [1] = Enable - If the call is on hold, the device stops playing the Held tone (if it is played) and sends DTMF: ✓ To Tel side: plays DTMF digits according to the received SIP INFO message(s). (The stopped held tone is not played again.) ✓ To IP side: sends DTMF SIP INFO messages to an IP destination if it detects DTMF digits from the Tel side.

50.10.5.5 Call Transfer Parameters

The call transfer parameters are described in the table below.

Table 50-48: Call Transfer Parameters

Parameter	Description
Web/EMS: Enable Transfer [EnableTransfer]	 Enables the Call Transfer feature. [0] Disable [1] Enable = (Default) The device responds to a REFER message with the Referred-To header to initiate a call transfer. Notes: To use call transfer, the devices at both ends must support this option. To use call transfer, set the parameter EnableHold to 1.
Web: Transfer Prefix EMS: Logical Prefix For Transferred Call [xferPrefix]	Defines the string that is added as a prefix to the transferred/forwarded called number when the REFER/3xx message is received. Notes: The number manipulation rules apply to the user part of the Refer-To and/or Contact URI before it is sent in the INVITE message. This parameter can be used to apply different manipulation rules to differentiate transferred number from the originally dialed number.
Web: Transfer Prefix IP 2 Tel [XferPrefixIP2Tel]	Defines the prefix that is added to the destination number received in the SIP Refer-To header (for IP-to-Tel calls). This parameter is applicable to CAS blind transfer modes, i.e., LineTransferMode = 1, 2 or 3, and TrunkTransferMode = 1 or 3 (for CAS). The valid range is a string of up to 9 characters. By default, no value is defined. Note: This parameter is also applicable to ISDN Blind Transfer, according to AT&T Toll Free Transfer Connect Service (TR 50075) "Courtesy Transfer-Human-No Data". To support this transfer mode, you need to configure the parameter XferPrefixIP2Tel to "*8" and the parameter TrunkTransferMode to 5.
Web/EMS: Enable Semi-Attended Transfer [EnableSemiAttendedTransfer]	Determines the device behavior when Transfer is initiated while in Alerting state. • [0] Disable = (Default) Send REFER with the Replaces header. • [1] Enable = Send CANCEL, and after a 487 response is received, send REFER without the Replaces header.
Web: Blind EMS: Blind Transfer [KeyBlindTransfer]	Defines the keypad sequence to activate blind transfer for established Tel-to-IP calls. The Tel user can perform blind transfer by dialing the KeyBlindTransfer digits, followed by a transferee destination number. After the KeyBlindTransfer DTMF digits sequence is dialed, the current call is put on hold (using a Re-INVITE message), a dial tone is played to the channel, and then the phone number

Parameter	Description
	collection starts. After the destination phone number is collected, it is sent to the transferee in a SIP REFER request in a Refer-To header. The call is then terminated and a confirmation tone is played to the channel. If the phone number collection fails due to a mismatch, a reorder tone is played to the channel.
EMS: Blind Transfer Disconnect Timeout [BlindTransferDisconnectTimeout]	Defines the duration (in milliseconds) for which the device waits for a disconnection from the Tel side after the Blind Transfer Code (KeyBlindTransfer) has been identified. When this timer expires, a SIP REFER message is sent toward the IP side. If this parameter is set to 0, the REFER message is immediately sent. The valid value range is 0 to 1,000,000. The default is 0.
Web: QSIG Path Replacement Mode [QSIGPathReplacementMode]	 Enables QSIG transfer for IP-to-Tel and Tel-to-IP calls. [0] IP2QSIGTransfer = (Default) Enables IP-to-QSIG transfer. [1] QSIG2IPTransfer = Enables QSIG-to-IP transfer.
[ReplaceTel2IPCallingNumTimeout]	Defines the maximum duration (timeout) to wait between call Setup and Facility with Redirecting Number for replacing the calling number (for Tel-to-IP calls). The valid value range is 0 to 10,000 msec. The default is 0. The interworking of the received Setup message to a SIP INVITE is suspended when this parameter is set to any value greater than 0. This means that the redirecting number in the Setup message is not checked. When a subsequent Facility with Call Transfer Complete/Update is received with a non-empty Redirection Number, the Calling Number is replaced with the received redirect number in the sent INVITE message. If the timeout expires, the device sends the INVITE without changing the calling number. Notes: The suspension of the INVITE message occurs for all calls. This parameter is applicable to QSIG.
Web: IP2IP Transfer Mode [IP2IPTransfermode]	 Determines the interworking of incoming mid-call SIP REFER messages to outgoing REFER messages, for calls pertaining to the IP-to-IP application. [0] Disable = (Default) Upon receipt of a REFER message, the device sends an INVITE to the refer-to destination with or without the Replaces header. [1] Enable = Upon receipt of a REFER message, the device forwards the REFER message and all relevant SIP messages from and to the transferor, to the target destination during call transfer. For consultation call transfer, the REFER message contains a 'replaces' parameter in the Refer-To header. In this case, the outgoing REFER also contains a 'replaces' parameter in the Refer-To header. Note: This parameter is applicable to blind and consultation call transfers.

50.10.5.6 MLPP and Emergency Call Parameters

The Multilevel Precedence and Preemption (MLPP) and emergency E911 call parameters are described in the table below.

Table 50-49: MLPP and Emergency E911 Call Parameters

Table 50-49: MLFF and Emergency E911 Call Farameters	
Parameter	Description
Web/EMS: Call Priority Mode [CallPriorityMode]	 ▶ [0] Disable (default). ▶ [1] MLPP = MLPP Priority Call handling is enabled. MLPP prioritizes call handling whereby the relative importance of various kinds of communications is strictly defined, allowing higher precedence communication at the expense of lower precedence communications. Higher priority calls override less priority calls when, for example, congestion occurs in a network. ▶ [2] Emergency = Preemption of IP-to-Tel E911 emergency calls. If the device receives an E911 call and there are unavailable channels to receive the call, the device terminates one of the channel calls and sends the E911 call to that channel. The preemption is done only on a channel pertaining to the same Trunk Group for which the E911 call was initially destined and if the channel select mode (configured by the ChannelSelectMode parameter) is set to other than By Dest Phone Number (0). The preemption is done only if the incoming IP-to-Tel call is identified as an emergency call. The device identifies emergency calls by one of the following: ▶ The destination number of the IP call matches one of the numbers defined by the EmergencyNumbers parameter. (For E911, you must define this parameter with the value "911".) ▶ The incoming SIP INVITE message contains the "emergency" value in the Priority header. Notes: ▶ This parameter is applicable to CAS, and ISDN. ▶ MLPP and Emergency services can also be configured in a Tel Profile. ▶ For more information, see "Pre-empting Existing Call for E911 IP-to-Tel Call" on page 440.
Emergency E911 Parameters	
[E911Gateway]	Enables Enhanced 9-1-1(E9-1-1) support for ELIN handling in Microsoft Lync Server 2010 environment. • [0] = Disable (default) • [1] = Enable • [2] = Location-based manipulations
[E911CallbackTimeout]	Defines the maximum interval within which the PSAP can use the ELIN to call back the E9-1-1 caller. This interval starts from when the initial call established with the PSAP is terminated. The valid range is 1 to 60 (minutes). The default is 30.
Web: Emergency Special Release	Enables the device to send a SIP 503 "Service Unavailable"

Version 6.8 811 Mediant 3000

Parameter	Description
Cause [EmergencySpecialReleaseCause]	response if an emergency call cannot be established (i.e., rejected). This can occur, for example, due to the PSTN (for example, the destination is busy or not found) or ELIN Gateway (for example, lack of resources or an internal error). • [0] = Disable (default) • [1] = Enable
Web/EMS: Emergency Numbers [EmergencyNumbers]	Defines a list of "emergency" numbers. For CAS, and ISDN: These emergency numbers are used for the preemption of E911 IP-to-Tel calls when there are unavailable or busy channels. In this scenario, the device terminates one of the busy channels and sends the emergency call to this channel. This feature is enabled by setting the CallPriorityMode parameter to 2 ("Emergency"). For a description of this feature, see "Pre-empting Existing Call for E911 IP-to-Tel Call" on page 440. The list can include up to four different numbers, where each number can be up to four digits long. Example: EmergencyNumbers = '100','911','112'
Multilevel Precedence and Preem	ption (MLPP) Parameters
Web: MLPP Default Namespace EMS: Default Name Space [MLPPDefaultNamespace]	Determines the namespace used for MLPP calls received from the ISDN side without a Precedence IE and destined for an Application server. This value is used in the Resource-Priority header of the outgoing SIP INVITE request. In It is provided by the image of the outgoing SIP INVITE request. In It is provided by the image of the image of the outgoing SIP INVITE request. In It is provided by the image of
[ResourcePriorityNetworkDomains]	Defines up to 32 user-defined MLPP network domain names (namespaces). This value is used in the AS-SIP Resource-Priority header of the outgoing SIP INVITE request. This parameter is used in combination with the MLPPDefaultNamespace parameter, where you need to enter the table row index as its value. This parameter is also used for mapping the Resource-Priority field value of the SIP Resource-Priority header to the ISDN PRI Precedence Level IE. The mapping is configured by the field, Enablelp2TelInterworking: Disabled: The network-domain field in the Resource-Priority header is set to "0 1 0 0" (i.e., "routine") in the Precedence Level field. Enabled: The network-domain field in the Resource-Priority header is set in the Precedence Level field according to Table 5.3.2.12-4 (Mapping of RPH r-priority Field to PRI Precedence Level Value). The domain name can be a string of up to 10 characters.

Parameter	Description
	The format of this table ini file parameter is as follows: FORMAT ResourcePriorityNetworkDomains_Index = ResourcePriorityNetworkDomains_Name, ResourcePriorityNetworkDomains_EnableIp2TelInterworking; ResourcePriorityNetworkDomains 1 = dsn, 0;
	ResourcePriorityNetworkDomains 2 = dod, 0; ResourcePriorityNetworkDomains 3 = drsn, 0; ResourcePriorityNetworkDomains 5 = uc, 1; ResourcePriorityNetworkDomains 7 = cuc, 0;
	[\ResourcePriorityNetworkDomains] Notes:
	 Indices 1, 2, 3, 5, and 7 cannot be modified and are defined for DSN, DOD, DRSN, UC, and CUC, respectively. If the MLPPDefaultNamespace parameter is set to -1, interworking from PSTN NI digits is done automatically.
Web/EMS: Default Call Priority [SIPDefaultCallPriority]	Determines the default call priority for MLPP calls. • [0] 0 = (Default) ROUTINE • [2] 2 = PRIORITY • [4] 4 = IMMEDIATE • [6] 6 = FLASH • [8] 8 = FLASH-OVERRIDE • [9] 9 = FLASH-OVERRIDE
	If the incoming SIP INVITE request doesn't contain a valid priority value in the SIP Resource-Priority header, the default value is used in the Precedence IE (after translation to the relevant ISDN Precedence value) of the outgoing PRI Setup message. If the incoming PRI Setup message doesn't contain a valid Precedence Level value, the default value is used in the Resource-Priority header of the outgoing SIP INVITE request. In this scenario, the character string is sent without translation to a numerical value.
Web: MLPP DiffServ EMS: Diff Serv [MLPPDiffserv]	Defines the DiffServ value (differentiated services code point/DSCP) used in IP packets containing SIP messages that are related to MLPP calls. This parameter defines DiffServ for incoming and outgoing MLPP calls with the Resource-Priority header. The valid range is 0 to 63. The default is 50.
Web/EMS: Preemption Tone Duration [PreemptionToneDuration]	Defines the duration (in seconds) in which the device plays a preemption tone to the Tel and IP sides if a call is preempted. The valid range is 0 to 60. The default is 3. Note: If set to 0, no preemption tone is played.
Web: MLPP Normalized Service Domain EMS: Normalized Service Domain [MLPPNormalizedServiceDomain]	Defines the MLPP normalized service domain string. If the device receives an MLPP ISDN incoming call, it uses the parameter (if different from 'FFFFFF') as a Service domain in the SIP Resource-Priority header in outgoing INVITE messages. If the parameter is configured to 'FFFFFF', the Resource-Priority header is set to the MLPP Service Domain obtained from the Precedence IE. The valid value is 6 hexadecimal digits. The default is '000000'.

Version 6.8 813 Mediant 3000

Parameter	Description
	Note: This parameter is applicable only to the MLPP NI-2 ISDN variant with CallPriorityMode set to 1.
[MLPPNetworkIdentifier]	Defines the MLPP network identifier (i.e., International prefix or Telephone Country Code/TCC) for IP-to-ISDN calls, according to the UCR 2008 and ITU Q.955 specifications. The valid range is 1 to 999. The default is 1 (i.e., USA). The MLPP network identifier is sent in the Facility IE of the ISDN Setup message. For example: MLPPNetworkIdentifier set to default (i.e., USA, 1): PlaceCall- MLPPNetworkID:0100 MlppServiceDomain:123abc, MlppPrecLevel:5 Fac(1c): 91 a1 15 02 01 05 02 01 19 30 0d 0a 01 05 0a 01 01 04 05 01 00 12 3a bc MLPPNetworkIdentifier set to 490: PlaceCall- MLPPNetworkID:9004 MlppServiceDomain:123abc, MlppPrecLevel:5 Fac(1c): 91 a1 15 02 01 0a 02 01 19 30 0d 0a 01 05 0a 01 01 04 05 90 04 12 3a bc
Web: MLPP Default Service Domain EMS: Default Service Domain [MLPPDefaultServiceDomain]	Defines the MLPP default service domain string. If the device receives a non-MLPP ISDN incoming call (without a Precedence IE), it uses the parameter (if different than "FFFFFF") as a Service domain in the SIP Resource-Priority header in outgoing (Tel-to-IP calls) INVITE messages. This parameter is used in conjunction with the parameter SIPDefaultCallPriority. If MLPPDefaultServiceDomain is set to 'FFFFFF', the device interworks the non-MLPP ISDN call to non-MLPP SIP call, and the outgoing INVITE does not contain the Resource-Priority header. The valid value is a 6 hexadecimal digits. The default is "000000". Note: This parameter is applicable only to the MLPP NI-2 ISDN variant with CallPriorityMode set to 1.
[RPRequired]	 Determines whether the SIP resource-priority tag is added in the SIP Require header of the INVITE message for Tel-to-IP calls. [0] Disable = Excludes the SIP resource-priority tag from the SIP Require header. [1] Enable = (Default) Adds the SIP resource-priority tag in the SIP Require header. Note: This parameter is applicable only to MLPP priority call handling (i.e., only when the CallPriorityMode parameter is set to 1).

Multiple Differentiated Services Code Points (DSCP) per MLPP Call Priority Level (Precedence) Parameters

The MLPP service allows placement of priority calls, where properly validated users can preempt (terminate) lower-priority phone calls with higher-priority calls. For each MLPP call priority level, the DSCP can be set to a value from 0 to 63. The Resource Priority value in the Resource-Priority SIP header can be one of the following:

MLPP Precedence Level	Precedence Level in Resource-Priority SIP Header
0 (lowest)	routine
2	priority

Parameter	Description	
4 im	mediate	
6 fla	sh	
8 fla	sh-override	
9 (highest) fla	flash-override-override	
Web/EMS: RTP DSCP for MLPP Routine [MLPPRoutineRTPDSCP]	Defines the RTP DSCP for MLPP Routine precedence call level. The valid range is -1 to 63. The default is -1. Note: If set to -1, the DiffServ value is taken from the global parameter PremiumServiceClassMediaDiffServ or as defined in IP Profiles per call.	
Web/EMS: RTP DSCP for MLPP Priority [MLPPPriorityRTPDSCP]	Defines the RTP DSCP for MLPP Priority precedence call level. The valid range is -1 to 63. The default is -1. Note: If set to -1, the DiffServ value is taken from the global parameter PremiumServiceClassMediaDiffServ or as defined in IP Profiles per call.	
Web/EMS: RTP DSCP for MLPP Immediate [MLPPImmediateRTPDSCP]	Defines the RTP DSCP for MLPP Immediate precedence call level. The valid range is -1 to 63. The default is -1. Note: If set to -1, the DiffServ value is taken from the global parameter PremiumServiceClassMediaDiffServ or as defined in IP Profiles per call.	
Web/EMS: RTP DSCP for MLPP Flash [MLPPFlashRTPDSCP]	Defines the RTP DSCP for MLPP Flash precedence call level. The valid range is -1 to 63. The default is -1. Note: If set to -1, the DiffServ value is taken from the global parameter PremiumServiceClassMediaDiffServ or as defined in IP Profiles per call.	
Web/EMS: RTP DSCP for MLPP Flash Override [MLPPFlashOverRTPDSCP]	Defines the RTP DSCP for MLPP Flash-Override precedence call level. The valid range is -1 to 63. The default is -1. Note: If set to -1, the DiffServ value is taken from the global parameter PremiumServiceClassMediaDiffServ or as defined in IP Profiles per call.	
Web/EMS: RTP DSCP for MLPP Flash-Override-Override [MLPPFlashOverOverRTPDSCP]	Defines the RTP DSCP for MLPP Flash-Override-Override precedence call level. The valid range is -1 to 63. The default is -1. Note: If set to -1, the DiffServ value is taken from the global parameter PremiumServiceClassMediaDiffServ or as defined in IP Profiles per call.	

50.10.5.7 Call Cut-Through Parameters

The call cut-through parameters are described in the table below.

Table 50-50: Call Cut-Through Parameters

Parameter	Description
	Enables PSTN CAS channels/endpoints to receive incoming IP calls even

Parameter	Description
[DigitalCutThrough]	if the B-channels are in off-hook state.
	• [0] Disabled (default)
	• [1] Enabled
	When enabled, this feature operates as follows:
	1 A Tel-to-IP call is established (connected) by the device for a B-channel.
	2 The device receives a SIP BYE (i.e., IP side ends the call) and plays a reorder tone to the PSTN side for the duration set by the CutThroughTimeForReOrderTone parameter. The device releases the call towards the IP side (sends a SIP 200 OK).
	3 The PSTN side, for whatever reason, remains off-hook.
	4 If a new IP call is received for this B-channel after the reorder tone has ended, the device "cuts through" the channel and connects the call immediately (despite the B-channel being in physical off-hook state) without playing a ring tone. If an IP call is received while the reorder tone is played, the device rejects the call.
	Notes:
	 If this parameter is disabled and the PSTN side remains in off-hook state after the IP call ends the call, the device releases the call after 60 seconds.
	 A special CAS table can be used to report call status events (Active/Idle) to the PSTN side during Cut Through mode.
	 This feature can also be configured in a Tel Profile and therefore, assigned to specific B-channels that use specific CAS tables.

50.10.5.8 TTY/TDD Parameters

The TTY (telephone typewriter) or telecommunications device for the deaf (TDD) is an electronic device for text communication via a telephone line for those with impaired hearing. The TTY/TDD parameters are described in the table below.

Table 50-51: TTY Parameters

Parameter	Description
EMS: TTY Transport Type [TTYTransportType]	 Defines the device's transferring method of TTY signals during a call. [0] = (Default) Disable. [1] = Bypass - entering HBR on TTY tone detection. The HBR coder is selected by the FaxModemBypassCoderType parameter. The network packets that are generated and received during the bypass period are regular voice RTP packets (per the selected bypass coder), but with a different RTP payload type (103). You can change this payload type by using the ModemBypassPayloadType parameter. When TTY signal transmission ends, reverse switching from bypass coder to regular voice coder is performed. [2] = Relay (signals sent over the EVRC/B or AMR codec) - TTY phone device transfer using In-Band Relay mode for TTY signal transport. The following TTY relay standards are supported: ✓ 3GPP2 C.S0014-0-3 and 3GPP2C.s0028-0 v2.0 over EVRC and EVRC B. ✓ Text over Cellular Text Modem (CTM) over an existing

Parameter	Description
	speech path when using AMR or GSM EFR coders. Note: To support TTY Relay (2), you must configure the device to use the EVRC/B, AMR, or GSM EFR coder.

50.10.6 PSTN Parameters

This subsection describes the device's PSTN parameters.

50.10.6.1 General Parameters

The general PSTN parameters are described in the table below.

Table 50-52: General PSTN Parameters

Table 50-52: General PSTN Parameters	
Parameter	Description
Web: Trunk Name CLI: name (config-voip > interface <e1 t1 bri> name</e1 t1 bri>	Defines an arbitrary name for a trunk (where x denotes the trunk number for the ini file parameter). This can be used to help you easily identify the trunk.
[DigitalPortInfo_x]	The valid value is a string of up to 40 characters. The following special characters can be used (without the quotes):
	" " (space)"." (period)
	= "equal sign)
	- "-" (hyphen)
	"_" (underscore)"#" (pound sign)
	By default, the value is undefined.
Web/EMS: Protocol Type [ProtocolType]	Defines the PSTN protocol for all the Trunks. To configure the protocol type for a specific Trunk, use the <i>ini</i> file parameter ProtocolType_x: [0] NONE
	• [1] E1 EURO ISDN = ISDN PRI Pan-European (CTR4) protocol
	• [2] T1 CAS = Common T1 robbed bits protocols including E&M wink start, E&M immediate start, E&M delay dial/start and loop-start and ground start.
	• [3] T1 RAW CAS
	 [4] T1 TRANSPARENT = Transparent protocol, where no signaling is provided by the device. Timeslots 1 to 24 of all trunks are mapped to DSP channels.
	• [5] E1 TRANSPARENT 31 = Transparent protocol, where no signaling is provided by the device. Timeslots 1 to 31 of each trunk are mapped to DSP channels.
	• [6] E1 TRANSPARENT 30 = Transparent protocol, where no signaling is provided by the device. Timeslots 1 to 31, excluding time slot 16 of all trunks are mapped to DSP channels.
	• [7] E1 MFCR2 = Common E1 MFC/R2 CAS protocols (including line signaling and compelled register signaling).
	• [8] E1 CAS = Common E1 CAS protocols (including line signaling and MF/DTMF address transfer).

Parameter	Description
	 [9] E1 RAW CAS [10] T1 NI2 ISDN = National ISDN 2 PRI protocol [11] T1 4ESS ISDN = ISDN PRI protocol for the Lucent™/AT&T™ 4ESS switch. [12] T1 5ESS 9 ISDN = ISDN PRI protocol for the Lucent™/AT&T™ 5ESS-9 switch. [13] T1 5ESS 10 ISDN = ISDN PRI protocol for the Lucent™/AT&T™ 5ESS-9 switch. [14] T1 DMS100 ISDN = ISDN PRI protocol for the Nortel™ DMS switch. [15] J1 TRANSPARENT [16] T1 NTT ISDN = ISDN PRI protocol for the Japan - Nippon Telegraph Telephone (known also as INS 1500). [17] E1 AUSTEL ISDN = ISDN PRI protocol for the Australian Telecom. [18] E1 HKT ISDN = ISDN PRI (E1) protocol for the Hong Kong - HKT. [19] E1 KOR ISDN = ISDN PRI protocol for Korean Operator (similar to ETSI). [20] T1 HKT ISDN = ISDN PRI (T1) protocol for the Hong Kong - HKT. [21] E1 QSIG = ECMA 143 QSIG over E1 [22] E1 TNZ = ISDN PRI protocol for Telecom New Zealand (similar to ETSI) [23] T1 QSIG = ECMA 143 QSIG over T1 [30] E1 FRENCH VN6 ISDN = France Telecom VN6 [31] E1 FRENCH VN3 ISDN = France Telecom VN3 [34] T1 EURO ISDN =ISDN PRI protocol for Euro over T1 [35] T1 DMS100 Meridian ISDN = ISDN PRI protocol for the Nortel™ DMS Meridian switch [36] T1 NI1 ISDN = National ISDN 1 PRI protocol over E1 Note: All PRI trunks must be configured as the same line type (either E1 or T1). The device can support different variants of CAS and PRI protocols on different E1/T1 spans (no more than four simultaneous PRI variants).
[ProtocolType_x]	Defines the protocol type for a specific trunk ID (where x denotes the Trunk ID and 0 is the first trunk). For more information, see the ProtocolType parameter.
[ISDNTimerT310]	Defines the T310 override timer for DMS, Euro ISDN, and ISDN NI-2 variants. An ISDN timer is started when a Q.931 Call Proceeding message is received. The timer is stopped when a Q.931 Alerting, Connect, or Disconnect message is received from the other end. If no ISDN Alerting, Progress, or Connect message is received within the duration of T310 timer, the call clears. The valid value range is 0 to 600 seconds. The default is 0 (i.e., use the default timer value according to the protocol's specifications). Notes:
	 For this parameter to take effect, a device reset is required. When both the parameters ISDNDmsTimerT310 and

Parameter	Description
	ISDNTimerT310 are configured, the value of the parameter ISDNTimerT310 prevails.
[ISDNDMSTimerT310]	Defines the override T310 timer for the DMS-100 ISDN variant. T310 defines the timeout between the receipt of a Proceeding message and the receipt of an Alerting/Connect message. The valid range is 10 to 30. The default is 10 (seconds). Notes: Instead of configuring this parameter, it is recommended to use the parameter ISDNTimerT310. This parameter is applicable only to Nortel DMS and Nortel MERIDIAN PRI variants (ProtocolType = 14 and 35).
[ISDNTimerT301]	Defines the override T301 timer (in seconds). The T301 timer is started when a Q.931 Alert message is received. The timer is stopped when a Q.931 Connect/Disconnect message is received from the other side. If no Connect or Disconnect message is received within the duration of T301, the call is cleared. The valid range is 0 to 2400. The default is 0 (i.e., the default T301 timer value - 180 seconds - is used). If set to any other value than 0, it overrides the timer with this value. Notes: For this parameter to take effect, a device reset is required. This parameter is applicable only to the QSIG variant.
[ISDNJapanNTTTimerT3JA]	Defines the T3_JA timer (in seconds). This parameter overrides the internal PSTN T301 timeout on the Users Side (TE side). If an outgoing call from the device to ISDN is not answered during this timeout, the call is released. The valid range is 10 to 240. The default is 50. Notes: This timer is also affected by the parameter PSTNAlertTimeout. This parameter is applicable only to the Japan NTT PRI variant (ProtocolType = 16).
Web/EMS: Trace Level [TraceLevel]	Defines the trace level: • [0] No Trace (default) • [1] Full ISDN Trace • [2] Layer 3 ISDN Trace • [3] Only ISDN Q.931 Messages Trace • [4] Layer 3 ISDN No Duplication Trace
Web/EMS: Framing Method [FramingMethod]	 Determines the physical framing method for the trunk. [0] Extended Super Frame = (Default) Depends on protocol type: E1: E1 CRC4 MultiFrame Format extended G.706B (same as c) T1: T1 Extended Super Frame with CRC6 (same as D) [1] Super Frame = T1 SuperFrame Format (as B). [a] E1 FRAMING DDF = E1 DoubleFrame Format - CRC4 is forced to off [b] E1 FRAMING MFF CRC4 = E1 CRC4 MultiFrame Format - CRC4 is always on [c] E1 FRAMING MFF CRC4 EXT = E1 CRC4 MultiFrame

Version 6.8 819 Mediant 3000

Parameter	Description
	Format extended G.706B - auto negotiation is on. If the negotiation fails, it changes automatically to CRC4 off (ddf) [A] T1 FRAMING F4 = T1 4-Frame multiframe. [B] T1 FRAMING F12 = T1 12-Frame multiframe (D4). [C] T1 FRAMING ESF = T1 Extended SuperFrame without CRC6 [D] T1 FRAMING ESF CRC6 = T1 Extended SuperFrame with CRC6 [E] T1 FRAMING F72 = T1 72-Frame multiframe (SLC96) [F] T1 FRAMING ESF CRC6 J2 = J1 Extended SuperFrame with CRC6 (Japan)
[FramingMethod_x]	Same as the description for parameter FramingMethod, but for a specific trunk ID (where <i>x</i> denotes the Trunk ID and 0 is the first Trunk).
Web/EMS: Clock Master [ClockMaster]	 Determines the Tx clock source of the E1/T1 line. [0] Recovered = (Default) Generate the clock according to the Rx of the E1/T1 line. [1] Generated = Generate the clock according to the internal TDM bus. Notes: The source of the internal TDM bus clock is determined by the parameter TDMBusClockSource. This parameter is applicable only to E1/T1 interfaces.
[ClockMaster_x]	Same as the description for parameter ClockMaster, but for a specific Trunk ID (where <i>x</i> denotes the Trunk ID and 0 is the first Trunk). Note: This parameter is applicable only to E1/T1 interfaces.
Web/EMS: Line Code [LineCode]	Selects B8ZS or AMI for T1 spans, and HDB3 or AMI for E1 spans. • [0] B8ZS = (Default) B8ZS line code (for T1 trunks only). • [1] AMI = AMI line code. • [2] HDB3 = HDB3 line code (for E1 trunks only).
[LineCode_x]	Same as the description for parameter LineCode, but for a specific trunk ID (where 0 denotes the first trunk).
[AdminState]	 Defines the administrative state for all trunks. [0] = Lock the trunk; stops trunk traffic to configure the trunk protocol type. [1] = Shutting down (read only). [2] = (Default) Unlock the trunk; enables trunk traffic. Notes: For this parameter to take effect, a device reset is required. When the device is locked from the Web interface, this parameter changes to 0. To define the administrative state per trunk, use the TrunkAdministrativeState parameter.
[TrunkAdministrativeState_x]	Defines the administrative state per trunk, where x denotes the trunk number. • [0] = Lock the trunk; stops trunk traffic to configure the trunk protocol type.

Parameter	Description
	 [1] = shutting down (read only). [2] = (Default) Unlock the trunk; enables trunk traffic.
Web/EMS: Line Build Out Overwrite [LineBuildOut.OVERWRITE]	Overwrites the Framer's XPM register values. These registers control the line pulse shape. • [0] OFF = (Default) No overwrite. • [1] ON = Overwrite.
Web/EMS: Line Build Out Loss [LineBuildOut.Loss]	Defines the line build out loss for the selected T1 trunk. • [0] 0 dB (default) • [1] -7.5 dB • [2] -15 dB • [3] -22.5 dB Note: This parameter is applicable only to T1 trunks.
Web/EMS: Line Build Out XPM0 [LineBuildOut.XPM0]	Defines the Framer's XPM0 register value (line pulse shape control). The range is 0 to 255. The default is 0. Note: This parameter is applicable only when the parameter TrunkConfig.LineBuildOut.Overwrite is set to 1.
Web/EMS: Line Build Out XPM1 [LineBuildOut.XPM1]	Defines the Framer's XPM1 register value (line pulse shape control). The range is 0 to 255. The default is 0. Note: Applicable only when TrunkConfig.LineBuildOut.Overwrite is set to 1.
Web/EMS: Line Build Out XPM2 [LineBuildOut.XPM2]	Defines the Framer's XPM2 register value (line pulse shape control). The range is 0 to 255. The default is 0. Note: This parameter is applicable only when the parameter TrunkConfig.LineBuildOut.Overwrite is set to 1.
[TDMHairPinning]	Defines static TDM hair-pinning (cross-connection) performed at initialization. The connection is between trunks with an option to exclude a single B-channel in each trunk. Format example: T0-T1/B3,T2-T3,T4-T5/B2. Note: For this parameter to take effect, a device reset is required.
Web: Enable TDM Tunneling EMS: TDM Over IP [EnableTDMoverIP]	 [0] Disable (default) [1] Enable When TDM Tunneling is enabled, the originating device automatically initiates SIP calls from all enabled B-channels pertaining to E1/T1/J1 spans that are configured with the 'Transparent' protocol. The called number of each call is the internal phone number of the B-channel from where the call originates. The Inbound IP Routing table is used to define the destination IP address of the terminating device. The terminating device automatically answers these calls if its E1/T1 protocol is set to 'Transparent' (ProtocolType = 5). Notes: For this parameter to take effect, a device reset is required. For an overview on TDM tunneling, see "TDM Tunneling" on

Version 6.8 821 Mediant 3000

Parameter	Description
	page 357.
[ISO8859CharacterSet]	Defines the ISO 8859 character set type (languages) for representing the alphanumeric string of the calling name (caller ID) in the forwarded message, for IP-to-Tel and Tel-to-IP calls.
	 [0] No Accented = Proprietary method where incoming INVITE messages with any accented characters (e.g., á, é, í, ó, and ü), which are represented in a 2-byte unicode character, are translated to Latin-only, which are normal one-byte ASCII characters (a, e, i, o, and u, respectively). [1] Western European (Default) [2] Central European [3] South European [4] North European [5] Cyrillic [6] Arabic [7] Hebrew [8] Turkish

50.10.6.2 TDM Bus and Clock Timing Parameters

The TDM Bus and clock timing parameters are described in the table below.

Table 50-53: TDM Bus and Clock Timing Parameters

Parameter	Description
TDM Bus and BITS (Timing) Pa	arameters
TDM Bus Type [TDMBusType]	Defines the TDM bus interface. • [2] Framers (default) • [4] H110 Note: Only one TDM bus interface can be enabled at a time, although more than one can physically exist on the device.
Web: TDMBusSpeed [TDMBusSpeed]	Defines the TDM bus speed according to the TDM bus type (see the TDMBusType parameter). • [0] 2 Mbps • [2] 4 Mbps • [3] 8 Mbps • [4] 16 Mbps (default)
Web/EMS: PCM Law Select [PCMLawSelect]	Determines the type of pulse-code modulation (PCM) companding algorithm law in input and output TDM bus. Illian Illi

Parameter	Description
	spans.
Web/EMS: Idle PCM Pattern [IdlePCMPattern]	Defines the PCM Pattern that is applied to the E1/T1 timeslot (B-channel) when the channel is idle. The range is 0 to 255. The default is set internally according to the Law select 1 (0xFF for Mu-Law; 0x55 for A-law). Note: For this parameter to take effect, a device reset is required.
Web/EMS: Idle ABCD Pattern [IdleABCDPattern]	Defines the ABCD (CAS) Pattern that is applied to the CAS signaling bus when the channel is idle. The valid range is 0x0 to 0xF. The default is -1 (i.e., default pattern is 0000). Notes: For this parameter to take effect, a device reset is required. This parameter is applicable only when using PSTN interface with CAS protocols.
Web/EMS: TDM Bus Clock Source [TDMBusClockSource]	 Determines the clock source to which the device synchronizes. [1] Internal = (Default) Generate clock from local source. [4] Network = Recover clock from PSTN line. Notes: For this parameter to take effect, a device reset is required. This parameter is not required when operating in BITS mode.
Web/EMS: TDM Bus Local Reference [TDMBusLocalReference]	Defines the physical Trunk ID from which the device recovers (receives) its clock synchronization. The range is 0 to the maximum number of Trunks. The default is 0. Note: This parameter is applicable only if the parameter TDMBusClockSource is set to 4 and the parameter TDMBusPSTNAutoClockEnable is set to 0.
Web/EMS: TDM Bus Enable Fallback [TDMBusEnableFallback]	Defines the automatic fallback of the clock. This sets the fallback clock method between primary and secondary BITS clock references. • [0] Manual (default) • [1] Auto Non-Revertive • [2] Auto Revertive
Web: TDM Bus Fallback Clock Source EMS: TDM Bus Fallback Clock [TDMBusFallbackClock]	Determines the fallback clock source on which the device synchronizes in the event of a clock failure. [4] Network (default) [8] H.110_A [9] H.110_B [10] NetReference1
Web/EMS: TDM Bus Master-Slave Selection [TDMBusMasterSlaveSelection]	 Defines the SC/MVIP/H.100/H.110. [0] SlaveMode = (Default) Slave mode (another device must supply the clock to the TDM bus) or Master mode (the device is the clock source for the TDM bus) or Secondary Master mode (for H100/H110 Bus only). [1] MasterMode = H110A Master in Master mode. [2] SecondaryMasterMode = H.110B Master.
Web/EMS: TDM Bus Net	Defines the NetRef frequency (for both generation and

Version 6.8 823 Mediant 3000

Parameter	Description
Reference Speed [TDMBusNetrefSpeed]	synchronization). • [0] 8 kHz (default) • [1] 1.544 MHz • [2] 2.048 MHz
Web: TDM Bus PSTN Auto FallBack Clock EMS: TDM Bus Auto Fall Back Enable [TDMBusPSTNAutoClockEna ble]	 Enables the PSTN trunk Auto-Fallback Clock feature. [0] Disable = (Default) Recovers the clock from the E1/T1 line defined by the parameter TDMBusLocalReference. [1] Enable = Recovers the clock from any connected synchronized slave E1/T1 line. If this trunk loses its synchronization, the device attempts to recover the clock from the next trunk. Note that initially, the device attempts to recover the clock from the trunk defined by the parameter TDMBusLocalReference. Notes: For this parameter to take effect, a device reset is required.
	This parameter is relevant only if the parameter TDMBusClockSource is set to 4.
Web: TDM Bus PSTN Auto Clock Reverting EMS: TDM Bus Auto Fall Back Reverting Enable [TDMBusPSTNAutoClockRev ertingEnable]	Enables the PSTN trunk Auto-Fallback Reverting feature. If enabled and a trunk returning to service has an AutoClockTrunkPriority parameter value that is higher than the priority of the local reference trunk (set in the TDMBusLocalReference parameter), the local reference reverts to the trunk with the higher priority that has returned to service for the device's clock source. • [0] Disable (default) • [1] Enable Notes: • For this parameter to take effect, a device reset is required.
	This parameter is applicable only when the TDMBusPSTNAutoClockEnable parameter is set to 1.
Web: Auto Clock Trunk Priority EMS: Auto Trunk Priority [AutoClockTrunkPriority]	Defines the trunk priority for auto-clock fallback (per trunk parameter). The valid range is 0 to 100, where 0 (default) is the highest priority and 100 indicates that the device does not perform a fallback to the trunk (typically, used to mark untrusted source of clock). Note: Fallback is enabled when the TDMBusPSTNAutoClockEnable parameter is set to 1.
Web: TDM Bits Clock Reference EMS: TDM Bus Bits Reference [TDMBITSClockReference]	Defines the BITS clock reference when the device's source clock is set to BITS and TDMBusEnableFallback is set to Manual (0) or Auto Non-Revertive (1). • [1] 1 = (Default) BITS A is primary clock reference. • [2] 2 = BITS B is primary clock reference.
Web: TDM Bits Clock Source A/B/C/D [TDMBITSClockSource_0] [TDMBITSClockSource_1] [TDMBITSClockSource_2] [TDMBITSClockSource_3]	Determines which clock is output to the BITS card and on which output signal. • [0] Null = (Default) No output • [4] Network = Network • [19] Network_DS3_1 = When the PSTN Transmission type is set to Copper DS3 (using the PSTNTransmissionType parameter), this option provides the BITs system clock from DS3_1 peer to peer clock. This clock is not recommended.

Parameter	Description
	 [20] Network_DS3_1 = When the PSTN Transmission type is set to Copper DS3, setting this option provides the BITs system clock from DS3_1 peer to peer clock. This clock is not recommended.
Web: PLL Out Of Range EMS: TDM Bus PLL Out Of Range [PLLOutOfRange]	 Determines the valid PPM range outside the Stratum 3 standard. [0] OOR 9.2 to 12 ppm = (Default) Out of Range 9.2 to 12 ppm. [1] OOR 40 to 52 ppm = Out of Range 40 to 52 ppm. [2] OOR 100 to 130 ppm = Out of Range 100 to 130 ppm. [3] OOR 64 to 83 ppm = Out of Range 64 to 83 ppm. [4] OOR 13.8 to 18 ppm = Out of Range 13.8 to 18 ppm. [5] OOR 24.6 to 32 ppm = Out of Range 24.6 to 32 ppm. [6] OOR 36.6 to 47.5 ppm = Out of Range 36.6 to 47.5 ppm [7] OOR 52 to 67.5 ppm = Out of Range 52 to 67.5 ppm Notes: This parameter is applicable only when using BITS Synchronization or Line Synchronization modes (refer to the parameter TMMode). This parameter is applicable to Mediant 3000 systems housing TP-8410 blades. For Mediant 3000 systems housing TP-6310 blades, configure this parameter to [0] to use a 12 ppm reference.
Web: Timing Module Mode EMS: Mode [TMMode]	 Determines the device's Timing Synchronization mode. [0] StandAlone = (Default) Standalone Synchronization mode - without using the SAT timing module. [1] External = External, where each blade is synchronized from one of the PSTN interfaces (without using the SAT timing module). This must be selected for the BITS Synchronization mode. [2] LineSync = Line Synchronization mode - synchronizes the device with one of the PSTN interfaces.
Web: External Interface Type EMS: External IF Type [TMExternalIFType]	Defines the external BITS reference transmission type for both primary and secondary interfaces. • [0] E1 CRC4 (default) • [1] E1 CAS • [2] E1 FAS • [3] T1 D4 • [4] T1 ESF • [5] T12
Web: T1 External Reference Transmit Line Build Out EMS: T1 Line Build Out [TMT1LineBuildOut]	Defines the transmission power between the timing module on the SAT blade and the T1 external reference clock (External Reference Transmit Line Build Out). • [0] = DSX 1.0 to 133 feet 0 dB CSU • [1] = (Default) DSX 1.133 to 266 feet • [2] = DSX 1.266 to 399_feet • [3] = DSX 1.399 to 533 feet • [4] = DSX 1.533 to 655 feet • [7] = DSX 1.0 to 133 feet 0 dB CSU pluse enable transmit and receive gapped clock Note: This parameter is applicable only when using BITS

Version 6.8 825 Mediant 3000

Parameter	Description
	Synchronization (i.e., the parameter TMMode is set to 1).
Web: E1 External Reference Transmit Line Build Out EMS: E1 Line Build Out [TME1LineBuildOut]	Defines the transmission power (in ohm) between the timing module on the SAT blade and the E1 external reference clock. • [0] E 75 ohms normal • [1] E 120 ohms normal (default) • [4] E 75 ohms with high return loss • [5] E 120 ohms with high return loss • [6] E 75 ohms normal plus enable transmit and receive gapped clock • [7] E 120 ohms normal plus enable transmit and receive gapped clock Note: This parameter is applicable only when using BITS Synchronization (i.e., the parameter TMMode is set to 1).
Web: Reference Validation Time EMS: Validation Time [TMReferenceValidationTime]	Defines the Reference validation time. The valid range is 0 to 15 minutes. The default is 1 minute. The resolution is 1 minute. Note: This parameter is applicable only for External timing (i.e., BITS) and Line timing references (refer to the parameter TMMode).

50.10.6.3 CAS Parameters

The Common Channel Associated (CAS) parameters are described in the table below.

Table 50-54: CAS Parameters

Parameter	Description
Web: CAS Transport Type EMS: CAS Relay Transport Mode [CASTransportType]	 Determines the ABCD signaling transport type over IP. [0] CAS Events Only = (Default) Disable CAS relay. [1] CAS RFC2833 Relay = Enable CAS relay mode using RFC 2833. The CAS relay mode can be used with the TDM tunneling feature to enable tunneling over IP for both voice and CAS signaling bearers.
[CASAddressingDelimiters]	 Enables the addition of delimiters to the received address or received ANI digits string. [0] = (default) Disable. The address and ANI strings remain without delimiters. [1] = Enable. Delimiters such as '*', '#', and 'ST' are added to the received address or received ANI digits string.
[CASDelimitersPaddingUsage]	 Defines the digits string delimiter padding usage per trunk. [0] = (Default) Default address string padding: '*XXX#' (where XXX is the digit string that begins with '*' and ends with '#', when using padding). [1] = Special use of asterisks delimiters: '*XXX*YYY*' (where XXX is the address, YYY is the source phone number, and '*' is the only delimiter padding). Note: For this parameter to take effect, a device reset is required.
Web: CAS Table per Trunk EMS: Trunk CAS Table Index	Defines the CAS protocol per trunk from a list of CAS protocols

Parameter	Description
[CASTableIndex_x]	defined by the parameter CASFileName_x. For example, the below configuration specifies Trunks 0 and 1 to use the E&M Winkstart CAS (E_M_WinkTable.dat) protocol, and Trunks 2 and 3 to use the E&M Immediate Start CAS (E_M_ImmediateTable.dat) protocol: CASFileName_0 = 'E_M_WinkTable.dat' CASFileName_1 = 'E_M_ImmediateTable.dat' CASTableIndex_0 = 0 CASTableIndex_1 = 0 CASTableIndex_2 = 1 CASTableIndex_3 = 1 Notes: You can define CAS tables per B-channel using the parameter CASChannelIndex. The x in the ini file parameter name denotes the trunk number,
Web: Dial Plan EMS: Dial Plan Name [CASTrunkDialPlanName_x]	where 0 is Trunk 1. Defines the CAS Dial Plan name per trunk. The range is up to 11 characters. For example, the below configures E1_MFCR2 trunk with a single protocol (Trunk 5): ProtocolType_5 = 7 CASFileName_0='R2_Korea_CP_ANI.dat' CASTableIndex_5 = 0 DialPlanFileName = 'DialPlan_USA.dat' CASTrunkDialPlanName_5 = 'AT_T' Note: The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
[CASFileName_x]	Defines the CAS file name (e.g., 'E_M_WinkTable.dat') that defines the CAS protocol, where x denotes the CAS file ID (0-7). It is possible to define up to eight different CAS files by repeating this parameter. Each CAS file can be associated with one or more of the device's trunks, using the parameter CASTableIndex_x. Note: For this parameter to take effect, a device reset is required.
Web/EMS: CAS Table per Channel [CASChannelIndex]	Defines the loaded CAS protocol table index per B-channel pertaining to a CAS trunk. This parameter is assigned a string value and can be set in one of the following two formats: • CAS table per channel: Each channel is separated by a comma and the value entered denotes the CAS table index used for that channel. The syntax is <cas index="">,<cas index="">,<cas index=""> (e.g., "1,2,1,2"). For this format, 31 indices must be defined for E1 trunks (including dummy for B-channel 16), or 24 indices for T1 trunks. Below is an example for configuring a T1 CAS trunk (Trunk 5) with several CAS variants: ProtocolType_5 = 7 CASFILENAME_0='E_M_FGBWinkTable.dat' CASFILENAME_1='E_M_FGDWinkTable.dat' CASFILENAME_2='E_M_WinkTable.txt' CasChannelIndex_5 = '0,0,0,1,1,1,2,2,2,2,0,0,0,1,1,1,0,1,2,0,2,1,2,2,2,2</cas></cas></cas>

Parameter	Description		
	• CAS table per channel group: Each channel group is separated by a colon and each channel is separated by a comma. The syntax is <x-y channel="" range="">:<cas index="" table="">, (e.g., "1-10:1,11-31:3"). Every B-channel (including 16 for E1) must belong to a channel group. Below is an example for configuring an E1 CAS trunk (Trunk 5) with several CAS variants: ProtocolType_5 = 8 CASFILENAME_2='E1_R2D' CASFILENAME_7= E_M_ImmediateTable_A-Bit.txt' CasChannelIndex_5 = '1-10:2,11-20:7,21-31:2'</cas></x-y>		
	Notes:		
	 To configure this parameter, the trunk must first be stopped. Only one of these formats can be implemented; not both. When this parameter is not configured, a single CAS table for the entire trunk is used, configured by the parameter CASTableIndex. 		
[CASTablesNum]	Defines how many CAS protocol configurations files are loaded. The valid range is 1 to 8.		
	Note: For this parameter to take effect, a device reset is required.		
	CAS State Machines Parameters Note: For configuring the CAS State Machine table using the Web interface, see "Configuring CAS State Machines" on page 353.		
Web: Generate Digit On Time [CASStateMachineGenerateDig itOnTime]	Generates digit on-time (in msec). The value must be a positive value. The default is -1.		
Web: Generate Inter Digit Time [CASStateMachineGenerateInte rDigitTime]	Generates digit off-time (in msec). The value must be a positive value. The default is -1.		
Web: DTMF Max Detection Time [CASStateMachineDTMFMaxOn DetectionTime]	Detects digit maximum on time (according to DSP detection information event) in msec units. The value must be a positive value. The default is -1.		
Web: DTMF Min Detection Time [CASStateMachineDTMFMinOn DetectionTime]	Detects digit minimum on time (according to DSP detection information event) in msec units. The digit time length must be longer than this value to receive a detection. Any number may be used, but the value must be less than CasStateMachineDTMFMaxOnDetectionTime. The value must be a positive value. The default is -1.		
Web: MAX Incoming Address Digits [CASStateMachineMaxNumOfl ncomingAddressDigits]	Defines the limitation for the maximum address digits that need to be collected. After reaching this number of digits, the collection of address digits is stopped. The value must be an integer. The default is -1.		
Web: MAX Incoming ANI Digits [CASStateMachineMaxNumOfl ncomingANIDigits]	Defines the limitation for the maximum ANI digits that need to be collected. After reaching this number of digits, the collection of ANI digits is stopped. The value must be an integer. The default is -1.		
Web: Collect ANI [CASStateMachineCollectANI]	In some cases, when the state machine handles the ANI collection (not related to MFCR2), you can enable the state machine to collect ANI or discard ANI.		

Parameter	Description
	 [0] No = Don't collect ANI. [1] Yes = Collect ANI. [-1] Default = Default value.
Web: Digit Signaling System [CASStateMachineDigitSignalin gSystem]	Defines which Signaling System to use in both directions (detection\generation). • [0] DTMF = DTMF signaling. • [1] MF = (Default) MF signaling. • [-1] Default = Default value.

50.10.6.4 ISDN Parameters

The ISDN parameters are described in the table below.

Table 50-55: ISDN Parameters

Parameter	Description
Web: ISDN Termination Side EMS: Termination Side [TerminationSide]	 Determines the ISDN termination side. [0] User side = (Default) ISDN User Termination Equipment (TE) side. [1] Network side = ISDN Network Termination (NT) side. Note: Select 'User side' when the PSTN or PBX side is configured as 'Network side' and vice versa. If you don't know the device's ISDN termination side, choose 'User side'. If the D-channel alarm is indicated, choose 'Network Side'.
[TerminationSide_x]	Same as the description for parameter TerminationSide, but for a specific trunk ID (where <i>x</i> denotes the Trunk ID and 0 is the first Trunk).
Web/EMS: B-channel Negotiation [BchannelNegotiation]	 Determines the ISDN B-Channel negotiation mode. [0] Preferred [1] Exclusive (default) [2] Any Notes: This parameter is applicable only to ISDN protocols. For some ISDN variants, when 'Any' (2) is selected, the Setup message excludes the Channel Identification IE. The Any' (2) option is applicable only if the following conditions are met: ✓ The parameter TerminationSide is set to 0 ('User side'). ✓ The PSTN protocol type (ProtocolType) is configured as Euro ISDN.
Web: Enable ignoring ISDN Disconnect with PI [KeepISDNCallOnDisconnectWithPI]	 Allows the device to ignore ISDN Disconnect messages with PI 1 or 8. [1] = The call (in connected state) is not released if a Q.931 Disconnect with PI (PI = 1 or 8) message is received during the call. [0] = (Default) The call is disconnected.
Web: PI For Setup Message [PIForSetupMsg]	Determines whether and which Progress Indicator (PI) information element (IE) is added to the sent ISDN Setup

Version 6.8 829 Mediant 3000

Parameter	Description
	 message. Some ISDN protocols such as NI-2 or Euro ISDN can optionally contain PI = 1 or PI = 3 in the Setup message. [0] = PI is not added (default). [1] = PI 1 is added to a sent ISDN Setup message - call is not end-to-end ISDN. [3] = PI 3 is added to a sent ISDN Setup message - calling
NFAS Parameters	equipment is not ISDN.
Web: NFAS Group Number EMS: Group Number [NFASGroupNumber_x]	Defines the ISDN Non-Facility Associated Signaling (NFAS) group number (NFAS member), per trunk. • [0] = (Default) Non-NFAS trunk. • [1] to [12] = NFAS group number. Trunks that belong to the same NFAS group have the same number. With NFAS, you can use a single D-channel to control multiple PRI interfaces. Notes: • For this parameter to take effect, a device reset is required. • This parameter is applicable only to T1 ISDN protocols. • The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1. • For more information on NFAS, see "ISDN Non-Facility Associated Signaling (NFAS)" on page 362.
Web/EMS: D-channel Configuration [DChConfig_x]	 Defines primary, backup (optional), and B-channels only, per trunk. [0] PRIMARY= (Default) Primary Trunk - contains a D-channel that is used for signaling. [1] BACKUP = Backup Trunk - contains a backup D-channel that is used if the primary D-channel fails. [2] NFAS = NFAS Trunk - contains only 24 B-channels, without a signaling D-channel. Notes: This parameter is applicable only to T1 ISDN protocols. The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web: NFAS Interface ID EMS: ISDN NFAS Interface ID [ISDNNFASInterfaceID_x]	 Defines a different Interface ID per T1 trunk. The valid range is 0 to 100. The default interface ID equals the trunk's ID. Notes: To set the NFAS interface ID, configure ISDNIBehavior_x to include '512' feature per T1 trunk. The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1. For more information on NFAS, see "ISDN Non-Facility Associated Signaling (NFAS)" on page 362.
ISDN Flexible Behavior Parameters ISDN protocol is implemented in different switches/PBXs by different vendors. Several implementations may vary slightly from the specification. Therefore, to provide a flexible interface that supports these ISDN variants, the ISDN behavior parameters can be used.	
Web/EMS: Incoming Calls	Determines the bit-field used to determine several behavior

Parameter	Description
Behavior [ISDNInCallsBehavior]	options that influence how the ISDN Stack INCOMING calls behave. • [32] DATA CONN RS = The device automatically sends a Q.931 Connect (answer) message on incoming Tel calls (Q.931 Setup). • [64] VOICE CONN RS = The device sends a Connect (answer) message on incoming Tel calls. • [2048] CHAN ID IN FIRST RS = (Default) The device sends Channel ID in the first response to an incoming Q.931 Call Setup message. Otherwise, the Channel ID is sent only if the device requires changing the proposed Channel ID. • [4096] USER SETUP ACK = The Setup Ack message is sent by the SIP Gateway application layer and not automatically by the PSTN stack. By default, this bit is set. • [8192] CHAN ID IN CALL PROC = The device sends Channel ID in a Q.931 Call Proceeding message. • [65536] PROGR IND IN SETUP ACK = The device includes Progress Indicator (PI=8) in Setup Ack message if an empty called number is received in an incoming Setup message. This option is applicable to the overlap dialing mode. The device also plays a dial tone (for TimeForDialTone) until the next called number digits are received. By default, this is bit is set. • [2147483648] USER SCREEN INDICATOR = When the device receives two Calling Number IE's in the Setup message, the device, by default, uses only one of the numbers according to the following: • Network provided, Network provided - the first one is used • Vetwork provided, User provided: the first one is used • Vetwork provided, Network provided: the first calling number is used • Network provided, Network provided: the first one is used • Vetwork provided, Network provided: the first one is used • Network provided, Network provided: the first one is used • Vetwork provided, Network provided: the first one is used • Vetwork provided, Network provided: the first one is used • Vetwork provided, Network provided: the first one is used • Vetwork provided, Network provided: the first one is used • Vetwork provided, user provided: the first one is used • Vetwork provided, Network provided: the
[ISDNInCallsBehavior_x]	Same as the description for the parameter ISDNInCallsBehavior, but per trunk (i.e., where <i>x</i> denotes the Trunk ID).
Web/EMS: Q.931 Layer Response Behavior [ISDNIBehavior]	Bit-field used to determine several behavior options that influence the behaviour of the Q.931 protocol. • [0] = Disable (default). • [1] NO STATUS ON UNKNOWN IE = Q.931 Status message isn't sent if Q.931 received message contains an unknown/unrecognized IE. By default, the Status message is sent.

Version 6.8 831 Mediant 3000

Parameter	Description
	 ASN.1 type is used. Note: This option is applicable only to QSIG. [2147483648] 5ESS National Mode For Bch Maintenance = Use the National mode of AT&T 5ESS for B-channel maintenance. Notes: To configure the device to support several ISDNIBehavior features, enter a summation of the individual feature values. For example, to support both [512] and [2048] features, set the parameter ISDNIBehavior is set to 2560 (i.e., 512 + 2048). When configuring in the Web interface, to select the options click the arrow button and then for each required option select 1 to enable.
[ISDNIBehavior_x]	Same as the description for parameter ISDNIBehavior, but for a specific trunk ID.
Web: General Call Control Behavior EMS: General CC Behavior [ISDNGeneralCCBehavior]	Bit-field for determining several general CC behavior options. To select the options, click the arrow button, and then for each required option, select 1 to enable. The default is 0 (i.e., disable). [2] = Data calls with interworking indication use 64 kbps B-channels (physical only). [8] REVERSE CHAN ALLOC ALGO = Channel ID allocation algorithm. [16] = The device clears down the call if it receives a NOTIFY message specifying 'User-Suspended'. A NOTIFY (User-Suspended) message is used by some networks (e.g., in Italy or Denmark) to indicate that the remote user has cleared the call, especially in the case of a long distance voice call. [32] CHAN ID 16 ALLOWED = Applies only to ETSI E1 lines (30B+D). Enables handling the differences between the newer QSIG standard (ETS 300-172) and other ETSI-based standards (ETS 300-102 and ETS 300-403) in the conversion of B-channel ID values into timeslot values: In 'regular ETSI' standards, the timeslot is identical to the B-channel ID value, and the range for both is 1 to 15 and 17 to 31. The D-channel is identified as channel-id #16 and carried into the timeslot #16. In newer QSIG standards, the channel-id range is 1 to 30, but the timeslot range is still 1 to 15 and 17 to 31. The D-channel is not identified as channel-id #16, but is still carried into the timeslot #16. When this bit is set, the channel ID #16 is considered as a valid B-channel ID, but timeslot values are converted to reflect the range 1 to 15 and 17 to 31. This is the new QSIG mode of operation. When this bit is not set (default), the channel_id #16 is not allowed, as for all ETSI-like standards. [64] USE T1 PRI = PRI interface type is forced to T1. [128] USE E1 PRI = PRI interface type is forced to E1. [256] START WITH B CHAN OOS = B-channels start in the Out-Of-Service state (OOS).

Parameter	Description
	 [1024] CHAN ALLOC HIGHEST = CC allocates B-channels starting from the highest available B-channel id. [16384] CC_TRANSPARENT_UUI bit: The UUI-protocol implementation of CC is disabled allowing the application to freely send UUI elements in any primitive, regardless of the UUI-protocol requirements (UUI Implicit Service 1). This allows more flexible application control on the UUI. When this bit is not set (default behavior), CC implements the UUI-protocol as specified in the ETS 300-403 standards for Implicit Service 1. [65536] GTD5 TBCT = CC implements the VERIZON-GTD-5 Switch variant of the TBCT Supplementary Service, as specified in FSD 01-02-40AG Feature Specification Document from Verizon. Otherwise, TBCT is implemented as specified in GR-2865-CORE specification (default behavior). Note: When using the <i>ini</i> file to configure the device to support several ISDNGeneralCCBehavior features, add the individual feature values. For example, to support both [16] and [32] features, set ISDNGeneralCCBehavior = 48 (i.e., 16 + 32).
Web/EMS: Outgoing Calls Behavior [ISDNOutCallsBehavior]	Determines several behaviour options (bit fields) that influence the behaviour of the ISDN Stack outgoing calls. To select options, click the arrow button, and then for each required option, select 1 to enable. The default is 0 (i.e., disable). Igluser sending Complete E in the default behavior of the device (when this bit is not set) is to automatically generate the Sending-Complete IE in the Setup message. This behavior is used when overlap dialing is not needed. When overlap dialing is needed, set this bit and the behavior is changed to suit the scenario, i.e., Sending-Complete IE is added when required in the Setup message for Enblock mode or in the last Digit with Overlap mode. If Gluse Mulaw = The device sends G.711-m-Law in outgoing voice calls. When disabled, the device sends G.711-A-Law in outgoing voice calls. When disabled, the Korean variant. Iglaer Inis option is applicable only to the Korean variant. Iglaer Inis option is applicable only to the Korean variant (Korean network). This is useful for Korean switches that don't accept the CALLED_NB IE. Igsel Store Chan Id In Setup = The device forces the sending of a Channel-Id IE in an outgoing Setup message even if it's not required by the standard (i.e., optional) and no Channel-Id has been specified in the establishment request. This is useful for improving required compatibility with switches. On PRI lines it indicates an unused channel ID, preferred only. Igsel A LAW = The device sends G.711 A-Law in outgoing voice calls. When disabled, the device sends the default G.711-Law in outgoing voice calls. Note: This option is applicable only to the E10 variant. Igough Electric This option is applicable only to the E10 variant.

Parameter	Description
	 plan/type for T1 calls are set according to the length of the calling number. [2048] = The device accepts any IA5 character in the called_nb and calling_nb strings and sends any IA5 character in the called_nb, and is not restricted to extended digits only (i.e., 0-9,*,#). [16384] DLCI REVERSED OPTION = Behavior bit used in the IUA interface groups to indicate that the reversed format of the DLCI field must be used. Note: When using the <i>ini</i> file to configure the device to support several ISDNOutCallsBehavior features, add the individual feature values. For example, to support both [2] and [16] features, set ISDNOutCallsBehavior = 18 (i.e., 2 + 16).
[ISDNOutCallsBehavior_x]	Same as the description for parameter ISDNOutCallsBehavior, but for a specific trunk ID.
Web: ISDN NS Behaviour 2 [ISDNNSBehaviour2]	 Bit-field to determine several behavior options that influence the behavior of the Q.931 protocol. [8] NS BEHAVIOUR2 ANY UUI = Any User to User Information Element (UUIE) is accepted for any protocol discriminator. This is useful for interoperability with nonstandard switches. [16] NS BEHAVIOUR2 DISPLAY = The Display IE is accepted even if it is not defined in the QSIG ISDN protocol standard. This is applicable only when configuration is QSI. [64] NS BEHAVIOUR2 FAC REJECT = When this bit is set, the device answers with a Facility IE message with the Reject component on receipt of Facility IE with unknown/invalid Invoke component. This bit is implemented in QSIG and ETSI variants.
[PSTNExtendedParams]	 Determines the bit map for special PSTN behavior parameters: [0] = (Default) Applicable for NI-2 ISDN and QSIG "Networking Extensions". This bit (i.e., bit #0) is responsible for the Invoke ID size: ✓ If this bit is not set (default), then the Invoke ID size is always one byte, with a value of 01 to 7f. ✓ If this bit is set, then the Invoke ID size is one or two bytes according to the Invoke ID value. [2] = Applicable to the ROSE format (according to the old QSIG specifications). This bit (i.e., bit #1) is responsible for the QSIG octet 3. According to the ECMA-165 new version, octet 3 in all QSIG supplementary services Facility messages should be 0x9F = Networking Extensions. However, according to the old version, the value should be 0x91 = ROSE: ✓ If this bit is not set (default): 0x9F = Networking Extensions. ✓ If this bit is set: 0x91 = ROSE. [3] = Use options [0] and [2] above. Note: For this parameter to take effect, a device reset is required.

50.10.6.5 DS3 Parameters

The DS3 parameters are described in the table below.

Note: DS3 interface is applicable only to Mediant 3000 with TP-6310.

Table 50-56: DS3 Parameters

Parameter	Description
DS3 Settings Table	
[DS3Config]	This table parameter configures the DS3 (T3) interfaces. This parameter has the following format: [DS3CONFIG] FORMAT DS3CONFIG_Index = DS3CONFIG_FramingMethod, DS3CONFIG_ClockSource, DS3CONFIG_LineBuildOut, DS3CONFIG_CircuitIdentifier, DS3CONFIG_TrapEnable, DS3CONFIG_PmOnOff, DS3CONFIG_TappingEnable, DS3CONFIG_AdminState; [\DS3CONFIG] For example: DS3CONFIG 0 = 0, 1, 2, , 1, 1, 0, 1; Note: For a description of the parameters included in this table, refer to their individual parameter descriptions below.
Web: Framing Method [DS3Config_FramingMethod]	Determines the physical DS3 framing method for the interface. • [0] M23 = (Default) M23 framing. • [1] C Bit Parity = C Bit Parity.
Web: Clock Source EMS: DS3 Transmit Clock Source [DS3Config_ClockSource]	 Determines the DS3 clock mode for the interface. [0] External = DS3 clock is recovered from the line. [1] Local Board = (Default) DS3 trunk clock source is provided by the device's internal clock.
Web: Line Build Out [DS3Config_LineBuildOut]	Determines the DS3 line build out (i.e., the level of signal transmit). This level influences the cable length that can be used with the device. • [2] = level 1 • [3] = Level 2 • [4] = Level 3 • [5] = Level 4 (default) • [6] = Level 5 • [7] = Level 6
[DS3Config_CircuitIdentifier]	Defines the interface SNMP name, which is represented by a string of up to 15 characters. By default, no value is defined.
[DS3Config_TrapEnable]	 Enables SNMP traps for DS3. [0] = Disable [1] = Enable (default)
[DS3Config_PmOnOff]	 Enables performance monitoring for the DS3 interface. [0] = Disables performance monitoring for the specific DS3

Parameter	Description
	interface. • [1] = (Default) Enable.
[DS3Config_TappingEnable]	Enables special DS3 Tapping mode. In this mode, the interface is capable of receiving a signal with additional 14-dB attenuation to the standard maximum length. • [0] = Disable (default) • [1] = Enable
Web: Administrative State [DS3Config_AdminState]	Determines the DS3 interface Administrative status. When the interface Administrative status is set to Down, all 28 underlying DS1 interfaces are unavailable. • [1] Up = (Default) Administrative status Up. • [2] Down = Administrative status Down (currently, not supported).

50.10.6.6 SDH/SONET Parameters

The SDH/SONET parameters are described in the table below.

Note: SDH/SONET interface is applicable only to Mediant 3000 with TP-6310.

Table 50-57: SDH/SONET Parameters

Parameter	Description
Web/EMS: Transmission Type [PSTNTransmissionType]	Defines the PSTN transmission type for the device. • [0] None = (Default) PSTN Transmission type is not defined. • [1] SONET/SDH = Optical SONET or SDH transmission type. • [2] DS3 = Copper T3 transmission type. Notes: • For this parameter to take effect, a device reset is required. • This parameter is relevant only when the parameter TDMBusType is set to FRAMERS (2).
Web: Mode [SdhFbrGrp_SdhSonetMode]	Determines the SDH/SONET mode for the PSTN interface, typically per Fiber Group. • [0] UNKNOWN = Not defined • [1] STM1 = STM-1 • [2] OC3 = OC-3 When STM-1 mode is selected, set the SDHFbrGrp_Mapping_Type parameter to 1 (i.e., Asynchronous TU12 and E1) and ProtocolType for E1. When OC-3 mode is selected, set the SDHFbrGrp_Mapping_Type parameter to 0 (Asynchronous VT1.5), 2 (Byte-synchronous VT1.5), or 3 (Asynchronous mapping of DS3 in STS1), and ProtocolType for DS1. Notes:
	For this parameter to take effect, a device reset is required.

Parameter	Description
	 This parameter is relevant only when the TDMBusType parameter is set to acFRAMERS (2), PSTNTransmissionType is set to SONET/SDH (1), and SdhFbrGrp_SdhSonetMode is not set to UNKNOWN (0).
Web: Mapping Type EMS: Fiber Group Mapping Type [SDHFbrGrp_Mapping_Type]	Determines the SDH/SONET mapping type (signal label and payload mapping type) for the PSTN interface. This is typically selected per Fiber Group.
	• [0] VT1.5 Asynchronous = Asynchronous VT1.5 and DS1 (for OC-3).
	• [1] TU-12 Asynchronous = Asynchronous TU12 and E1 (for STM-1).
	• [2] TU-11 Byte Synchronous = VT1.5 Byte Synchronous mapping (for OC-3).
	• [3] Asynchronous DS3 = Asynchronous mapping of DS3 in STS1, DS3 channelized to DS1's - asynchronous mapping of channelized DS3 to OC-3, so that the actual interface is OC-3 but mapped to three DS3 trunk interfaces (DS1 > DS3 > STS-1 > OC-3).
	• [15] UNDEFINED = (Default) Not defined.
	Notes:
	 For this parameter to take effect, a device reset is required. The setting of this parameter should be in coordination with
	the parameters SDHFbrGrp_SDHSONETMode and ProtocolType.
	 This parameter is applicable only when TDMBusType = acFRAMERS (2) and PSTNTransmissionType = Optical SONET or SDH Transmission type(1).
	 When option [3] is selected, the clock source is automatically set to 'Local Board' (synchronization supplied by device) and cannot be changed.
	 For more details regarding this parameter, see the SDHFbrGrp_SdhSonetMode parameter.
Web: Protected [SDHFbrGrp_Protected]	Activates the Automatic Protection Switching (APS) mechanism on the PSTN interface, typically per Fiber Group.
	• [0] False = APS not activated.
	• [1] True = (Default) APS activated.
	Note: For this parameter to take effect, a device reset is required.
Web: APS Revert Mode EMS: Fiber Group APS Revert Mode	Enables the Automatic Protection Switch (APS) Revertive mode for users operating in SDH/SONET mode. The Revertive mode enables the switching of traffic from the active fiber link
[SDHFbrGrp_APS_RevertMode]	(previously redundant) back to the original link (previously active) after the link is restored.
	[0] Non-Revertive (default)[1] Revertive
	Notes:
	 For this parameter to take effect, a device reset is required. This parameter is applicable only when the
	SDHFbrGrp_Protected parameter is set to 1.
	 When configured in Revertive mode, the Wait-to-Restore time can be defined (using the SDHFbrGrp_APS_WTR parameter).
Web: APS WTR	Defines the time (Wait-to-Restore time) after which traffic is

Parameter	Description	
EMS: Fiber Group APS Wait To Restore Time [SDHFbrGrp_APS_WTR]	switched from the redundant link back to the original link when restored. Wait-to-Restore time is relevant when the Revertive mode of Automatic Protection Switch (APS) is configured (using the parameter SDHFbrGrpAPSRevertMode) for users operating in SDH/SONET mode.	
	The valid range is 5 to 12 min. The default is 5 min.	
	Notes: For this parameter to take effect, a device reset is required.	
	 This parameter is relevant only when SDHFbrGrp_APS_RevertMode is set to 1. 	
Web: APS Direction Mode EMS: Fiber Group APS Direction	Determines the Automatic Protection Switch (APS) mode for the fiber group:	
Mode [SDHFbrGrp_APS_DirMode]	 [0] = (Default) Unidirectional APS mode. [1] = Bidirectional APS mode. Notes: 	
	 For this parameter to take effect, a device reset is required. 	
	This parameter is applicable only when the SDHFbrGrp_Protected parameter is set to 1.	
Web: Tributary KLM Numbering EMS: Fiber Group KLM	Determines the KLM numbering scheme for VC/VT numbering on STM-1/OC-3 interfaces.	
Numbering Scheme [SDHFbrGrp_KLM_Numbering_ Scheme]	• [0] MLK (ETSI) = (Default) numbering scheme where M is run first, then L, and last K. Typically used for SDH.	
Gonomo	 [1] LMK (GR-253) = Numbering scheme where L is run first, then M, and last K. Typically used for SONET. 	
	 [2] KLM (Timeslots) = Numbering scheme where K is run first, then L, and last M. 	
	Once a scheme is selected, there is mapping of three variables (K, L, and M) that identify VC/VT in the STM-1/OC-3 to a trunk number (0 to 62, or 0 to 83):	
	 K: TUG3 number (SDH) or STS-1 number (SONET) L: TUG2 number (SDH) or VT group number (SONET) M: TU number (SDH) or VT number (SONET) 	
	In the Web interface, click the Go to the KLM Mapping Table button to view the 'KLM Numbering Mapping Table page.	
	Notes:	
	 For this parameter to take effect, a device reset is required. This parameter is applicable only to Mediant 3000/TP-6310. 	
	This parameter is relevant only when the parameter	
	TDMBusType is set to acFRAMERS (2), and PSTNTransmissionType is set to Optical SONET or SDH Transmission type (1).	
	 For more information on KLM Numbering, see "Trunk Numbering (KLM Numbering)" on page 368. 	
[SonetSdhMediumCircuitIdentif	Defines the SDH/SONET circuit name.	
ier]	Note: For this parameter to take effect, a device reset is required.	
[SDHPmEnable]	Enables performance monitoring for the fiber group.	
	[0] = Disables[1] = Enable (default)	
	[·] Liable (deladit)	

50.10.7 ISDN and CAS Interworking Parameters

The ISDN and CAS interworking parameters are described in the table below.

Table 50-58: ISDN and CAS Interworking Parameters

Table 50-58: ISDN and CAS Interworking Parameters		
Parameter	Description	
ISDN Parameters		
Web: Send Local Time To ISDN Connect [SendLocalTimeToISDNConnect]	 Determines the device's handling of the date and time sent in the ISDN Connect message (Date / Time IE) upon receipt of SIP 200 OK messages. [0] Disable = (Default) If the SIP 200 OK includes the Date header, the device sends its value in the ISDN Connect Date / Time IE. If the 200 OK does not include this header, it does not add the Date / Time IE to the sent ISDN Connect message. [1] Enable = If the SIP 200 OK includes the Date header, the device sends its value (i.e. date and time) in the ISDN Connect Date / Time IE. If the 200 OK does not include this header, the device uses its internal, local date and time for the Date / Time IE, which it adds to the sent ISDN Connect message. [2] Always Send Local Date and Time = The device always sends its local date and time (obtained from its internal clock) to PBXs in ISDN Q.931 Connect messages (Date / Time IE). It does this regardless of whether or not the incoming SIP 200 OK includes the Date header. If the SIP 200 OK includes the Date header, the device ignores its value. Notes: This feature is applicable only to Tel-to-IP calls. For IP-to-Tel calls, this parameter is not applicable. Only if the incoming ISDN Connect message contains the Date / Time IE does the device add the Date header to the sent SIP 200 OK message. 	
Web/EMS: Min Routing Overlap Digits [MinOverlapDigitsForRouting]	Defines the minimum number of overlap digits to collect (for ISDN overlap dialing) before sending the first SIP message for routing Tel-to-IP calls. The valid value range is 0 to 49. The default is 1. Note: This parameter is applicable when the ISDNRxOverlap parameter is set to [2].	
Web/EMS: ISDN Overlap IP to Tel Dialing [ISDNTxOverlap]	Enables ISDN overlap dialing for IP-to-Tel calls. This feature is part of ISDN-to-SIP overlap dialing according to RFC 3578. • [0] Disable (default) • [1] Enable When enabled, for each received INVITE of the same dialog session, the device sends an ISDN Setup (and subsequent ISDN Info Q.931 messages) with the collected digits to the Tel side. For all subsequent INVITEs received, the device sends a SIP 484 Address Incomplete response in order to maintain the current dialog session and receive additional digits from subsequent INVITEs. Note: When IP-to-Tel overlap dialing is enabled, to send ISDN Setup messages without the Sending Complete IE, the ISDNOutCallsBehavior parameter must be set to USER SENDING COMPLETE (2).	

Parameter	Description
Web: Enable Receiving of Overlap Dialing [ISDNRxOverlap_x]	 Determines the receiving (Rx) type of ISDN overlap dialing for Telto-IP calls, per trunk. [0] None = (Default) Disabled. [1] Local receiving = ISDN Overlap Dialing - the complete number is sent in the INVITE Request-URI user part. The device receives ISDN called number that is sent in the 'Overlap' mode. The ISDN Setup message is sent to IP only after the number (including the Sending Complete IE) is fully received (via Setup and/or subsequent Info Q.931 messages). In other words, the device waits until it has received all the ISDN signaling messages containing parts of the called number, and only then it sends a SIP INVITE with the entire called number in the Request-URI. [2] Through SIP = Interworking of ISDN Overlap Dialing to SIP, based on RFC 3578. The device interworks ISDN to SIP by sending digits each time they are received (from Setup and subsequent Info Q.931 messages) to the IP, using subsequent SIP INVITE messages.
	 Notes: When option [2] is configured, you can define the minimum number of overlap digits to collect before sending the first SIP message for routing the call, using the MinOverlapDigitsForRouting parameter. When option [2] is configured, even if SIP 4xx responses are received during this ISDN overlap receiving, the device does not release the call. The MaxDigits parameter can be used to limit the length of the collected number for ISDN overlap dialing (if Sending Complete is not received). If a digit map pattern is defined (using the DigitMapping or DialPlanIndex parameters), the device collects digits until a match is found (e.g., for closed numbering schemes) or until a timer expires (e.g., for open numbering schemes). If a match is found (or the timer expires), the digit collection process is terminated even if Sending Complete is not received. For enabling ISDN overlap dialing for IP-to-Tel calls, use the ISDNTxOverlap parameter. The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1. For more information on ISDN overlap dialing, see "ISDN Overlap Dialing" on page 365.
[ISDNRxOverlap] Web/EMS: Mute DTMF In Overlap [MuteDTMFInOverlap]	Same as the description for parameter ISDNRxOverlap_x, but for all trunks. Enables the muting of in-band DTMF detection until the device receives the complete destination number from the ISDN (for Tel-to-IP calls). In other words, the device does not accept DTMF digits received in the voice stream from the PSTN, but only accepts digits from ISDN Info messages. • [0] Don't Mute (default). • [1] Mute DTMF in Overlap Dialing = The device ignores in-band DTMF digits received during ISDN overlap dialing (disables the DTMF in-band detector).

Version 6.8 841 Mediant 3000

Parameter	Description
	Note: This parameter is applicable to ISDN Overlap mode only when dialed numbers are sent using Q.931 Information messages.
[ConnectedNumberType]	Defines the Numbering Type of the ISDN Q.931 Connected Number IE that the device sends in the Connect message to the ISDN (for Tel-to-IP calls). This is interworked from the P-Asserted-Identity header in SIP 200 OK. The default is [0] (i.e., unknown).
[ConnectedNumberPlan]	Defines the Numbering Plan of the ISDN Q.931 Connected Number IE that the device sends in the Connect message to the ISDN (for Tel-to-IP calls). This is interworked from the P-Asserted-Identity header in SIP 200 OK. The default is [0] (i.e., unknown).
Web/EMS: Enable ISDN Tunneling Tel to IP [EnableISDNTunnelingTel2IP]	 [0] Disable (default). [1] Using Header = Enable ISDN Tunneling from ISDN PRI to SIP using a proprietary SIP header. [2] Using Body = Enable ISDN Tunneling from ISDN PRI to SIP using a dedicated message body. When ISDN Tunneling is enabled, the device sends all ISDN PRI messages using the correlated SIP messages. The ISDN Setup message is tunneled using SIP INVITE, all mid-call messages are tunneled using SIP INFO, and ISDN Disconnect/Release message is tunneled using SIP BYE messages. The raw data from the ISDN is inserted into a proprietary SIP header (X-ISDNTunnelingInfo) or a dedicated message body (application/isdn) in the SIP messages. Notes: For this feature to function, you must set the parameter ISDNDuplicateQ931BuffMode to 128 (i.e., duplicate all messages). ISDN tunneling is applicable for all ISDN variants as well as QSIG.
Web/EMS: Enable ISDN Tunneling IP to Tel [EnableISDNTunnelingIP2Tel]	 [0] Disable (default) [1] Enable ISDN Tunneling from IP to ISDN When ISDN Tunneling is enabled, the device extracts raw data received in the proprietary SIP header, x-isdntunnelinginfo, or a dedicated message body (application/isdn) in the SIP message and then sends the data in an ISDN message to the PSTN. If the raw data in this SIP header is suffixed with the string "ADDE", then the raw data is extracted and added as Informational Elements (IE) in the outgoing Q.931 message. The tunneling of the x-isdntunnelinginfo SIP header with IEs is converted from INVITE, 180, and 200 OK SIP messages to Q.931 SETUP, ALERT, and CONNECT respectively. For example, if the following SIP header is received, x-isdntunnelinginfo: ADDE1C269FAA 06 800100820100A10F020136 0201F0A00702010102021F69 then it is added as an IE to the outgoing Q.931 message as 1C269FAA 06 800100820100A10F020136 0201F0A00702010102021F69, where, for example, "1C269F" is a 26 byte length Facility IE.

Parameter	Description
	Note: This feature is similar to that of the AddlEinSetup parameter. If both parameters are configured, the x-isdntunneling parameter takes precedence.
Web/EMS: Enable QSIG Tunneling [EnableQSIGTunneling]	Global parameter that enables QSIG tunneling-over-SIP for all calls. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_EnableQSIGTunneling). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
[QSIGTunnelingMode]	Defines the format of encapsulated QSIG message data in the SIP message MIME body. • [0] = (Default) ASCII presentation of Q.931 QSIG message. • [1] = Binary encoding of Q.931 QSIG message (according to ECMA-355, RFC 3204, and RFC 2025). Note: This parameter is applicable only if the QSIG Tunneling feature is enabled (using the EnableQSIGTunneling parameter).
Web: Enable Hold to ISDN EMS: Enable Hold 2 ISDN [EnableHold2ISDN]	 Enables SIP-to-ISDN interworking of the Hold/Retrieve supplementary service. [0] Disable (default) [1] Enable Notes: This parameter is applicable to Euro ISDN variants - from TE (user) to NT (network). If the parameter is disabled, the device plays a held tone to the Tel side when a SIP request with 0.0.0.0 or "inactive" in SDP is received. An appropriate CPT file with the held tone should be used.
EMS: Duplicate Q931 Buff Mode [ISDNDuplicateQ931BuffMod e]	Determines the activation/deactivation of delivering raw Q.931 messages. • [0] = (Default) ISDN messages aren't duplicated. • [128] = All ISDN messages are duplicated. Note: For this parameter to take effect, a device reset is required.
Web/EMS: ISDN SubAddress Format [ISDNSubAddressFormat]	Determines the encoding format of the SIP Tel URI parameter 'isub', which carries the encoding type of ISDN subaddresses. This is used to identify different remote ISDN entities under the same phone number (ISDN Calling and Called numbers) for interworking between ISDN and SIP networks.
	 [0] = (Default) ASCII - IA5 format that allows up to 20 digits. Indicates that the 'isub' parameter value needs to be encoded using ASCII characters. [1] = BCD (Binary Coded Decimal) - allows up to 40 characters (digits and letters). Indicates that the 'isub' parameter value needs to be encoded using BCD when translated to an ISDN message. [2] = User Specified For IP-to-Tel calls, if the incoming SIP INVITE message includes subaddress values in the 'isub' parameter for the Called Number (in the Request-URI) and/or the Calling Number (in the From header),

Version 6.8 843 Mediant 3000

Parameter	Description		
	these values are mapped to the outgoing ISDN Setup message. If the incoming ISDN Setup message includes 'subaddress' values for the Called Number and/or the Calling Number, these values are mapped to the outgoing SIP INVITE message's 'isub' parameter in accordance with RFC 4715.		
[IgnoreISDNSubaddress]	 Determines whether the device ignores the Subaddress from the incoming ISDN Called and Calling numbers when sending to IP. [0] = (Default) If an incoming ISDN Q.931 Setup message contains a Called/Calling Number Subaddress, the Subaddress is interworked to the SIP 'isub' parameter according to RFC. [1] = The device removes the ISDN Subaddress and does not include the 'isub' parameter in the Request-URI and does not process INVITEs with this parameter. 		
[ISUBNumberOfDigits]	Defines the number of digits (from the end) that the device takes from the called number (received from the IP) for the isub number (in the sent ISDN Setup message). This feature is only applicable for IP-to-ISDN calls. The valid value range is 0 to 36. The default is 0. This feature operates as follows: 1 If an isub parameter is received in the Request-URI, for example, INVITE sip:9565645; isub=1234@host.domain:user=phone SIP/2.0 then the isub value is sent in the ISDN Setup message as the destination subaddress. 2 If the isub parameter is not received in the user part of the Request-URI, the device searches for it in the URI parameters of the To header, for example, To: "Alex" <sip: 9565645@host.domain;isub="1234"> If present, the isub value is sent in the ISDN Setup message as the destination subaddress. 3 If the isub parameter is not present in the Request-URI header nor To header, the device does the following: ✓ If the called number (that appears in the user part of the Request-URI) starts with zero (0), for example, INVITE sip:05694564@host.domain:user=phone SIP/2.0 then the device maps this called number to the destination number of the ISDN Setup message, and the destination subaddress in this ISDN Setup message remains empty. ✓ If the called number (that appears in the user part of the Request-URI) does not start with zero, for example, INVITE sip:5694564@host.domain:user=phone SIP/2.0 then the device maps this called number to the destination number of the ISDN Setup message, and the destination subaddress in this ISDN Setup message, and the destination number of the ISDN Setup message, and the destination subaddress in this ISDN Setup message, and the destination number of the ISDN Setup message, and the destination subaddress in this ISDN Setup message, and the destination subaddress in this ISDN Setup message, and the destination subaddress in this ISDN Setup message, and the destination subaddress in this ISDN Setup message, and the destination subaddress in this ISDN Setup message then cont</sip:>		
Web: Default Cause Mapping From ISDN to SIP	value, the subaddress remains empty. Defines a single default ISDN release cause that is used (in ISDN-to-IP calls) instead of all received release causes, except when the following Q.931 cause values are received: Normal Call Clearing		

Parameter	Description			
[DefaultCauseMapISDN2IP]	(16), User Busy (17), No User Responding (18), or No Answer from User (19). The range is any valid Q.931 release cause (0 to 127). The default is 0 (i.e., not configured - static mapping is used).			
Web/EMS: Enable Calling Party Category CLI: ni2-cpc [EnableCallingPartyCategory]]	Enables the mapping of the calling party category (CPC) between the incoming PSTN message and outgoing SIP message, and vice versa (i.e., for IP-to-Tel and Tel-to-IP calls). The CPC characterizes the station used to originate a call (e.g., a payphone or an operator). • [0] Disable = (Default) CPC is not relayed between SIP and PSTN. • [1] Enable The CPC is denoted in the PSTN message as follows: • ISDN PRI NI-2: In the Originating Line Information (OLI) Information Element (IE) of the ISDN Setup message. • MFC-R2: ANI II digits. The device supports the Brazilian and Argentinian variants. This regional support is configured using the CallingPartyCategoryMode. The CPC is denoted in the SIP INVITE message using the 'cpc=' parameter in the From or P-Asserted-Identity headers. For example, the 'cpc=' parameter in the below INVITE message is set to "payphone": INVITE sip:bob@biloxi.example.com SIP/2.0 To: "Bob" <sip:bob@biloxi.example.com> From: <tel:+17005554141;cpc=payphone>;tag=1928301774 The table below shows the mapping of CPC between SIP and</tel:+17005554141;cpc=payphone></sip:bob@biloxi.example.com>			
	PSTN:	NI O DDI	MEG	· Po
	SIP CPC	NI-2 PRI	Argentina MFC	-R2 Brazil
	ordinary	23	II-1	II-1
	priority	n/a	II-2	II-2
	data	n/a	II-6	II-6
	test	n/a	II-3	II-3
	operator	35	II-5	II-5
	payphone	70	II-4	II-7
	unknown	n/a	II-1	II-1
	subscriber	23	n/a	II-1
	cellular	61	II-13	n/a
	locutorio	n/a	II-11	n/a
	servicio-publico	n/a	II-12	n/a
	red-privada-virtual / private-virtual- network	n/a	II-14	n/a
	linea-especial / special-operator- handling-required	n/a	II-15	n/a

Parameter	Description			
	operadora-con- intervencion / telco- operator-handled- call	n/a	II-5	n/a
	prison	29	n/a	n/a
	hotel	66	n/a	n/a
	cellular-roaming	63	n/a	n/a
	Note: This feature	e is applicable only to	the NI-2 PRI and E1 I	MFC-R2 variants.
Web: Calling Party Category Mode CLI: cpc-mode [CallingPartyCategoryMode]	Defines the regional Calling Party Category (CPC) mapping variant between SIP and PSTN for MFC-R2. • [0] None (default) • [1] Brazil R2 • [2] Argentina R2			
	parameter to	1.	he EnableCallingl	
Web/EMS: Enable Calling Party Category [EnableCallingPartyCategory]	Determines whether Calling Party Category (CPC) is mapped between SIP and PRI. • [0] Disable = (Default) Don't relay the CPC between SIP and PRI. • [1] Enable = The CPC is relayed between SIP and PRI. If enabled, the CPC received in the Originating Line Information (OLI) IE of an incoming ISDN Setup message is relayed to the From/P-Asserted-Identity headers using the 'cpc' parameter in the outgoing INVITE message, and vice versa. For example (calling party is a payphone): From: <sip:2000;cpc=payphone@10.8.23.70>;tag=1c18 06157451 Note: This feature is applicable only to the NI-2 PRI and E1_MFC_R2 variants.</sip:2000;cpc=payphone@10.8.23.70>			
[UserToUserHeaderFormat]	Defines the interworking between the SIP INVITE's User-to-User header and the ISDN User-to-User (UU) IE data. • [0] = (Default) SIP header format: X-UserToUser. • [1] = SIP header format: User-to-User with Protocol Discriminator (pd) attribute (according to IETF Internet-Draft draft-johnston-sipping-cc-uui-04). For example: User-to- User=3030373435313734313635353b313233343b3834; pd =4 • [2] = SIP header format: User-to-User with encoding=hex at the end and pd embedded as the first byte (according to IETF Internet-Draft draft-johnston-sipping-cc-uui-03). For example: User-to- User=043030373435313734313635353b313233343b3834; encoding=hex where "04" at the beginning of this message is the pd. • [3] = Interworks the SIP User-to-User header containing text format to ISDN UUIE in hexadecimal format, and vice versa. For example:			

Parameter	Description
	SIP Header in text format: User-to-User=01800213027b712a; NULL; 4582166; Translated to hexadecimal in the ISDN UUIE: 303138303032313330323762373132613b4e554c4c3b3435 38323136363b The Protocol Discriminator (pd) used in UUIE is "04" (IUA characters). Note: This parameter is applicable for Tel-to-IP and IP-to-Tel calls.
Web/EMS: Remove CLI when Restricted [RemoveCLIWhenRestricted]	Determines (for IP-to-Tel calls) whether the Calling Number and Calling Name IEs are removed from the ISDN Setup message if the presentation is set to Restricted. • [0] No = (Default) IE's are not removed. • [1] Yes = IE's are removed.
Web/EMS: Remove Calling Name [RemoveCallingName]	Enables the device to remove the Calling Name from SIP-to-ISDN calls for all trunks. • [0] Disable = (Default) Does not remove Calling Name. • [1] Enable = Removes Calling Name. Note: Some PSTN switches / PBXs may not be configured to support the receipt of the "Calling Name" information. These switches might respond to an ISDN Setup message (including the Calling Name) with an ISDN "REQUESTED_FAC_NOT_SUBSCRIBED" failure. This parameter can be set to Enable (1) to remove the "Calling Name" from SIP-to-ISDN calls and allow the call to proceed.
Web: Remove Calling Name EMS: Remove Calling Name For Trunk Mode [RemoveCallingNameForTrunk_x]	 Enables the device to remove the Calling Name for SIP-to-ISDN calls, per trunk. [-1] Use Global Parameter = (Default) Settings of the global parameter RemoveCallingName are used. [0] Disable = Does not remove Calling Name. [1] Enable = Remove Calling Name. Note: The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web/EMS: Progress Indicator to ISDN [ProgressIndicator2ISDN_x]	 [-1] Not Configured = (Default) The PI in ISDN messages is set according to the parameter PlayRBTone2Tel. [0] No PI = PI is not sent to ISDN. [1] PI = 1; [8] PI = 8: The PI value is sent to PSTN in Q.931/Proceeding and Alerting messages. Typically, the PSTN/PBX cuts through the audio channel without playing local ringback tone, enabling the originating party to hear remote Call Progress Tones or network announcements. Note: The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web: Set PI in Rx Disconnect Message EMS: Set PI For Disconnect Msg [PIForDisconnectMsg_x]	Defines the device's behavior per trunk when a Disconnect message is received from the ISDN before a Connect message is received. • [-1] Not Configured = (Default) Sends a 183 SIP response according to the received progress indicator (PI) in the ISDN Disconnect message. If PI = 1 or 8, the device sends a 183

Version 6.8 847 Mediant 3000

Parameter	Description
	 response, enabling the PSTN to play a voice announcement to the IP side. If there isn't a PI in the Disconnect message, the call is released. [0] No PI = Doesn't send a 183 response to IP. The call is released. [1] PI = 1; [8] PI = 8: Sends a 183 response to IP. Note: The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
EMS: Connect On Progress Ind [ConnectOnProgressInd]	 Enables the play of announcements from IP to PSTN without the need to answer the Tel-to-IP call. It can be used with PSTN networks that don't support the opening of a TDM channel before an ISDN Connect message is received. [0] = (Default) Connect message isn't sent after SIP 183 Session Progress message is received. [1] = Connect message is sent after SIP 183 Session Progress message is received.
Web: Local ISDN Ringback Tone Source EMS: Local ISDN RB Source [LocalISDNRBSource_x]	Determines whether the ringback tone is played to the ISDN by the PBX/PSTN or by the device, per trunk. • [0] PBX = (Default) PBX/PSTN plays the ringback tone. • [1] Gateway = The device plays the ringback tone. Notes: • This parameter is applicable to ISDN protocols. • This parameter is used together with the PlayRBTone2Trunk parameter. • The <i>x</i> in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web/EMS: PSTN Alert Timeout [TrunkPSTNAlertTimeout_x]	Defines the Alert Timeout (ISDN T301 timer) in seconds for outgoing calls to PSTN, per trunk. This timer is used between the time that an ISDN Setup message is sent to the Tel side (IP-to-Tel call establishment) and a Connect message is received. If Alerting is received, the timer is restarted. The range is 1 to 600. The default is 180. Note: The <i>x</i> in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web: B-Channel Negotiation EMS: B-Channel Negotiation For Trunk Mode [BChannelNegotiationForTru nk_x]	 Determines the ISDN B-channel negotiation mode, per trunk. [-1] Not Configured = (Default) Use per device configuration of the BChannelNegotiation parameter. [0] Preferred. [1] Exclusive. [2] Any. Notes: This parameter is applicable to ISDN protocols. The option Any is only applicable if TerminationSide is set to 0 (i.e., User side). The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
[SendISDNServiceAfterResta rt]	Enables the device to send an ISDN SERVice message per trunk upon device reset. The messsage (transmitted on the trunk's D-channel) indicates the availability of the trunk's B-channels (i.e., trunk in service).

Parameter	Description
	[0] = Disable (default)[0] = Enable
EMS: Support Redirect InFacility [SupportRedirectInFacility]	Determines whether the Redirect Number is retrieved from the Facility IE. [0] = (Default) Not supported. [1] = Supports partial retrieval of Redirect Number (number only) from the Facility IE in ISDN Setup messages. This is applicable to Redirect Number according to ECMA-173 Call Diversion Supplementary Services. Note: To enable this feature, the parameter ISDNDuplicateQ931BuffMode must be set to 1.
[CallReroutingMode]	Determines whether ISDN call rerouting (call forward) is performed by the PSTN instead of by the SIP side. This call forwarding is based on Call Deflection for Euro ISDN (ETS-300-207-1) and QSIG (ETSI TS 102 393). • [0] Disable (default). • [1] Enable = Enables ISDN call rerouting. When the device sends the INVITE message to the remote SIP entity and receives a SIP 302 response with a Contact header containing a URI host name that is the same as the device's IP address, the device sends a Facility message with a Call Rerouting invoke method to the ISDN and waits for the PSTN side to disconnect the call. Note: When this parameter is enabled, ensure that you configure in the Inbound IP Routing table (PSTNPrefix <i>ini</i> file parameter) a rule to route the redirected call (using the user part from the 302 Contact header) to the same Trunk Group from where the incoming Tel-to-IP call was received.
EMS: Enable CIC [EnableCIC]	 Determines whether the Carrier Identification Code (CIC) is relayed to ISDN. [0] = (Default) Do not relay the Carrier Identification Code (CIC) to ISDN. [1] = CIC is relayed to the ISDN in Transit Network Selection (TNS) IE. If enabled, the CIC code (received in an INVITE Request-URI) is included in a TNS IE in the ISDN Setup message. For example: INVITE sip:555666;cic=2345@100.2.3.4 sip/2.0. Notes: This feature is supported only for SIP-to-ISDN calls. The parameter AddCicAsPrefix can be used to add the CIC as a prefix to the destination phone number for routing IP-to-Tel calls.
Web/EMS: AoC Support [EnableAOC]	Enables the interworking of ISDN Advice of Charge (AOC) messages to SIP. • [0] Disable (default) • [1] Enable For more information on AOC, see "Advice of Charge Services for Euro ISDN" on page 456.
Web: IPMedia Detectors EMS: DSP Detectors Enable [EnableDSPIPMDetectors]	Enables the device's DSP detectors.[0] = Disable (default)

Version 6.8 849 Mediant 3000

Parameter	Description
	 [1] = Enable Notes: For this parameter to take effect, a device reset is required. The DSP Detectors feature is available only if the device is installed with a Software License Key that includes this feature. For installing a Software License Key, see "Software License Key" on page 575. When enabled (1), the number of available channels is reduced.
Web: Add IE in SETUP EMS: IE To Be Added In Q.931 Setup [AddlEinSetup]	Global parameter that defines an optional Information Element (IE) data (in hex format) to add to ISDN Setup messages. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_AddIEInSetup). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Trunk Groups to Send IE EMS: List Of Trunk Groups To Send IE [SendlEonTG]	 Defines Trunk Group IDs (up to 50 characters) from where the optional ISDN IE (defined by the parameter AddIEinSetup) is sent. For example: '1,2,4,10,12,6'. Notes: You can configure different IE data for Trunk Groups by defining this parameter for different IP Profile IDs (using the parameter IPProfile), and then assigning the required IP Profile ID in the Inbound IP Routing table (PSTNPrefix). When IP Profiles are used for configuring different IE data for Trunk Groups, this parameter is ignored.
Web: Enable User-to-User IE for Tel to IP EMS: Enable UUI Tel 2 Ip [EnableUUITel2IP]	 Enables transfer of User-to-User (UU) IE from ISDN PRI to SIP. [0] Disable (default) [1] Enable The device supports the following ISDN PRI-to-SIP interworking: Setup to SIP INVITE, Connect to SIP 200 OK, User Information to SIP INFO, Alerting to SIP 18x response, and Disconnect to SIP BYE response messages. Note: The interworking of ISDN User-to-User IE to SIP INFO is applicable only to the Euro ISDN, QSIG, and 4ESS PRI variants.
Web: Enable User-to-User IE for IP to Tel EMS: Enable UUI Ip 2 Tel [EnableUUIIP2Tel]	 Enables interworking of SIP user-to-user information (UUI) to User-to-User IE in ISDN Q.931 messages. [0] Disable = (Default) Received UUI is not sent in ISDN message. [1] Enable = The device interworks UUI from SIP to ISDN messages. The device supports the following SIP-to-ISDN interworking of UUI: SIP INVITE to Q.931 Setup SIP REFER to Q.931 Setup SIP 200 OK to Q.931 Connect SIP INFO to Q.931 User Information SIP 18x to Q.931 Alerting SIP BYE to Q.931 Disconnect Notes:
	The interworking of ISDN User-to-User IE to SIP INFO is

Parameter		Description
	 To interwork the UUIE 	Euro ISDN, QSIG, and 4ESS PRI variants. header from SIP-to-ISDN messages with t, the ISDNGeneralCCBehavior parameter
[Enable911LocationIdIP2Tel]	Enables interworking of Emergency Location Identification from SIF to PRI.	
	[0] = Disabled (default[1] = Enabled	()
		header received in the SIP INVITE is ng ISDN IE's:
	Emergency Call Contr	
	 Generic Information - information. 	to carry the Location Identification Number
	 Generic Information - information. 	to carry the Calling Geodetic Location
		oplicable only to the NI-2 ISDN variant.
[EarlyAnswerTimeout]	Global parameter that defines the duration (in seconds) that the device waits for an ISDN Connect message from the called party (Tel side), started from when it sends a Setup message. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_EarlyAnswerTimeout). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314.	
		s configured for a specific IP Profile, the ameter is ignored for calls associated with
Web/EMS: Trunk Transfer Mode [TrunkTransferMode]	Determines the trunk transfer method (for all trunks) when a SIP REFER message is received. The transfer method depends on the Trunk's PSTN protocol (configured by the parameter ProtocolType) and is applicable only when one of these protocols are used:	
	PSTN Protocol	Transfer Method (Described Below)
	E1 Euro ISDN [1]	ECT [2] or InBand [5]
	E1 QSIG [21], T1 QSIG [23]	Single Step Transfer [4], Path Replacement Transfer [2], or InBand [5]
	T1 NI2 ISDN [10], T1 4ESS ISDN [11], T1 5ESS 9 ISDN [12]	TBCT [2] or InBand [5]
	T1 DMS-100 ISDN [14]	RTL [2] or InBand [5]
	T1 RAW CAS [3], T1 CAS [2], E1 CAS [8], E1 RAW CAS [9]	[1] CAS NFA DMS-100 or [3] CAS Normal transfer
	T1 DMS-100 Meridian ISDN [35]	RTL [2] or InBand [5]
	• [0] = Not supported (d	arameter are described below: efault). FA DMS-100 transfer. When a SIP

Version 6.8 851 Mediant 3000

Parameter	Description
	REFER message is received, the device performs a Blind Transfer by executing a CAS Wink, waits for an acknowledged Wink from the remote side, dials the Refer-to number to the switch, and then releases the call. Note: A specific NFA CAS table is required.
	• [2] = Supports ISDN transfer - Release Link Trunk (RLT) (DMS-100), Two B Channel Transfer (TBCT) (NI2), Explicit Call Transfer (ECT) (EURO ISDN), and Path Replacement (QSIG). When a SIP REFER message is received, the device performs a transfer by sending Facility messages to the PBX with the necessary information on the call's legs to be connected. The different ISDN variants use slightly different methods (using Facility messages) to perform the transfer. Notes:
	 ✓ For RLT ISDN transfer, the parameter SendISDNTransferOnConnect must be set to 1. ✓ The parameter SendISDNTransferOnConnect can be used to define if the TBCT/ECT transfer is performed after receipt of Alerting or Connect messages. For RLT, the transfer is always done after receipt of Connect (SendISDNTransferOnConnect is set to 1).
	 ✓ This transfer can be performed between B-channels from different trunks or Trunk Groups, by using the parameter EnableTransferAcrossTrunkGroups. ✓ The device initiates the ECT process after receiving a SIP REFER message only for trunks that are configured to User side.
	 [3] = Supports CAS Normal transfer. When a SIP REFER message is received, the device performs a Blind Transfer by executing a CAS Wink, dialing the Refer-to number to the switch, and then releasing the call.
	[4] = Supports QSIG Single Step transfer: IP-to-Tel: When a SIP REFER message is received, the device performs a transfer by sending a Facility message to the PBX, initiating Single Step transfer. Once a success return result is received, the transfer is completed. Tel-to-IP: When a Facility message initiating Single Step transfer is received from the PBX, a SIP REFER message is sent to the
	 [5] = IP-to-Tel Blind Transfer mode supported for ISDN protocols and implemented according to AT&T Toll Free Transfer Connect Service (TR 50075) "Courtesy Transfer-Human-No Data". When the device receives a SIP REFER message, it performs a blind transfer by first dialing the DTMF digits (transfer prefix) defined by the parameter XferPrefixIP2Tel (configured to "*8" for AT&T service), and then (after 500 msec) the device dials the DTMF of the number (referred) from the Refer-To header sip:URI userpart.
	If the hostpart of the Refer-To sip:URI contains the device's IP address, and if the Trunk Group selected according to the IP to Tel Routing table is the same Trunk Group as the original call, then the device performs the in-band DTMF transfer; otherwise, the device sends the INVITE according to regular transfer rules. After completing the in-band transfer, the device waits for the ISDN Disconnect message. If the Disconnect message is received during the first 5 seconds, the device sends a SIP

Parameter	Description
	NOTIFY with 200 OK message; otherwise, the device sends a NOTIFY with 4xx message. ■ [6] = Supports AT&T toll free out-of-band blind transfer for trunks configured with the 4ESS ISDN protocol. AT&T courtesy transfer is a supplementary service which enables a user (e.g., user "A") to transform an established call between it and user "B" into a new call between users "B" and "C", whereby user "A" does not have a call established with user "C" prior to call transfer. The device handles this feature as follows: ✓ IP-to-Tel (user side): When a SIP REFER message is received, the device initiates a transfer by sending a Facility message to the PBX. ✓ Tel-to-IP (network side): When a Facility message initiating an out-of-band blind transfer is received from the PBX, the device sends a SIP REFER message to the IP side (if the EnableNetworkISDNTransfer parameter is set to 1). Note: For configuring trunk transfer mode per trunk, use the parameter TrunkTransferMode_x.
[TrunkTransferMode_x]	Determines the trunk transfer mode per trunk (where <i>x</i> denotes the Trunk number). For configuring trunk transfer mode for all trunks and for a description of the parameter options, refer to the parameter TrunkTransferMode.
[EnableTransferAcrossTrunk Groups]	 Determines whether the device allows ISDN ECT, RLT or TBCT IP-to-Tel call transfers between B-channels of different Trunk Groups. [0] = (Default) Disable - ISDN call transfer is only between B-channels of the same Trunk Group. [1] = Enable - the device performs ISDN transfer between any two PSTN calls (between any Trunk Group) handled by the device. Note: The ISDN transfer also requires that you configure the parameter TrunkTransferMode_x to 2.
Web: ISDN Transfer Capabilities EMS: Transfer Capability To ISDN [ISDNTransferCapability_x]	Defines the IP-to-ISDN Transfer Capability of the Bearer Capability IE in ISDN Setup messages, per trunk. I [-1] Not Configured I [0] Audio 3.1 (default) I [1] Speech I [2] Data I [3] Audio 7 Notes: If this parameter is not configured or is set to -1, Audio 3.1 capability is used. The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
[TransferCapabilityForDataCalls]	 Defines the ISDN Transfer Capability for data calls. [0] = (Default) ISDN Transfer Capability for data calls is 64k unrestricted (data). [1] = ISDN Transfer Capability for data calls is determined according to the ISDNTransferCapability parameter.
Web: ISDN Transfer On Connect	This parameter is used for the ECT/TBCT/RLT/Path Replacement ISDN transfer methods. Usually, the device requests the PBX to

Version 6.8 853 Mediant 3000

Parameter	Description
EMS: Send ISDN Transfer On Connect [SendISDNTransferOnConne	connect an incoming and outgoing call. This parameter determines if the outgoing call (from the device to the PBX) must be connected before the transfer is initiated.
ct]	• [0] Alert = (Default) Enables ISDN Transfer if the outgoing call is in Alerting or Connect state.
	• [1] Connect = Enables ISDN Transfer only if the outgoing call is in Connect state.
	Note: For RLT ISDN transfer (TrunkTransferMode = 2 and ProtocolType = 14 DMS-100), this parameter must be set to 1.
[ISDNTransferCompleteTime out]	Defines the timeout (in seconds) for determining ISDN call transfer (ECT, RLT, or TBCT) failure. If the device does not receive any response to an ISDN transfer attempt within this user-defined time, the device identifies this as an ISDN transfer failure and subsequently performs a hairpin TDM connection or sends a SIP NOTIFY message with a SIP 603 response (depending whether hairpin is enabled or disabled, using the parameter DisableFallbackTransferToTDM). The valid range is 1 to 10. The default is 4.
Web/EMS: Enable Network ISDN Transfer [EnableNetworkISDNTransfer]	Determines whether the device allows interworking of network-side received ECT/TBCT Facility messages (NI-2 TBCT - Two B-channel Transfer and ETSI ECT - Explicit Call Transfer) to SIP REFER.
•	 [0] Disable = Rejects ISDN transfer requests. [1] Enable = (Default) The device sends a SIP REFER message to the remote call party if ECT/TBCT Facility messages are received from the ISDN side (e.g., from a PBX).
[DisableFallbackTransferToT DM]	Enables "hairpin" TDM transfer upon ISDN (ECT, RLT, or TBCT) call transfer failure. When this feature is enabled and an ISDN call transfer failure occurs, the device sends a SIP NOTIFY message with a SIP 603 Decline response.
	 [0] = (Default) The device performs a hairpin TDM transfer upon ISDN call transfer. [1] = Hairpin TDM transfer is disabled.
Web: Enable QSIG Transfer Update [EnableQSIGTransferUpdate]	Determines whether the device interworks QSIG Facility messages with CallTranferComplete or CallTransferUpdate invoke application protocol data units (APDU) to SIP UPDATE messages with P-Asserted-Identity and optional Privacy headers. This feature is supported for IP-to-Tel and Tel-to-IP calls.
	 [0] Disable = (Default) Ignores QSIG Facility messages with CallTranferComplete or CallTransferUpdate invokes. [1] Enable
	For example, assume A and C are PBX call parties and B is the SIP IP phone:
	1 A calls B; B answers the call.
	2 A places B on hold and calls C; C answers the call.
	3 A performs a call transfer (the transfer is done internally by the PBX); B and C are connected to one another.
	In the above example, the PBX updates B that it is now talking with C. The PBX updates this by sending a QSIG Facility message with CallTranferComplete invoke APDU. The device interworks this message to a SIP UPDATE message containing a P-Asserted-Identity header with the number and name derived from the QSIG

Parameter	Description
	CallTranferComplete RedirectionNumber and RedirectionName. Notes: For IP-to-Tel calls, the RedirectionNumber and RedirectionName in the CallTRansferComplete invoke is derived from the P-Asserted-Identity and Privacy headers in the received SIP INFO message. To include the P-Asserted-Identity header in outgoing SIP UPDATE messages, set the AssertedIDMode parameter to Add P-Asserted-Identity.
EMS: CAS Detection Of Hook Flash [CASSendHookFlash]	Enables sending Wink signal toward CAS trunks. • [0] = Disable (default) • [1] = Enable If the device receives a mid-call SIP INFO message with flashhook event body (as shown below) and this parameter is set to 1, the device generates a wink signal toward the CAS trunk. The CAS wink signal is done by changing the A bit from 1 to 0, and then back to 1 for 450 msec. INFO sip:4505656002@192.168.13.40:5060 SIP/2.0 Via: SIP/2.0/UDP 192.168.13.2:5060 From: <sip:06@192.168.13.2:5060></sip:06@192.168.13.2:5060>
	To: <sip:4505656002@192.168.13.40:5060>;tag=13287879 6-1040067870294 Call-ID: 0010-0016-D69A7DA8-1@192.168.13.2 CSeq:2 INFO Content-Type: application/broadsoft Content-Length: 17 event flashhook Note: This parameter is applicable only to T1 CAS protocols.</sip:4505656002@192.168.13.40:5060>
Release Cause Mapping from	
Web: Release Cause Mapping Table EMS: ISDN to SIP Cause Mapping [CauseMapISDN2SIP]	This table parameter maps ISDN Q.850 Release Causes to SIP responses. The format of the ini file table parameter is as follows: [CauseMapISDN2SIP] FORMAT CauseMapISDN2SIP_Index = CauseMapISDN2SIP_IsdnReleaseCause, CauseMapISDN2SIP_SipResponse; [\CauseMapISDN2SIP]
Release Cause Mapping from	SIP to ISDN Table
Web: Release Cause Mapping Table EMS: SIP to ISDN Cause Mapping [CauseMapSIP2ISDN]	This table parameter maps SIP responses to Q.850 Release Causes. The format of the ini file table parameter is as follows: [CauseMapSIP2ISDN] FORMAT CauseMapSIP2ISDN_Index = CauseMapSIP2ISDN_SipResponse, CauseMapSIP2ISDN_IsdnReleaseCause; [\CauseMapSIP2ISDN]

50.10.8 Answer and Disconnect Supervision Parameters

The answer and disconnect supervision parameters are described in the table below.

Table 50-59: Answer and Disconnect Parameters

Parameter	Description
Web: Wait before PSTN Release-Ack CLI: wait-befor-pstn-rel-ack [TimeToWaitForPstnReleaseA ck]	Defines a timeout (in milliseconds) that the device waits for the receipt of an ISDN Q.931 Release message from the PSTN side before releasing the channel. The Release ACK is typically sent by the PSTN in response to the device's Disconnect message to end the call. If the timeout expires and a Release message has not yet been received, the device releases the call channel. The valid value is 1 to 360,000. The default is 6,000. Note: This parameter is applicable only to Digital interfaces.
Web: Answer Supervision EMS: Enable Voice Detection [EnableVoiceDetection]	 Enables the sending of SIP 200 OK upon detection of speech, fax, or modem. [1] Yes = The device sends a SIP 200 OK (in response to an INVITE message) when speech, fax, or modem is detected. [0] No = (Default) The device sends a SIP 200 OK only after it completes dialing. Typically, this feature is used only when early media (enabled using the EnableEarlyMedia parameter) is used to establish the voice path before the call is answered. Notes: To activate this feature, set the EnableDSPIPMDetectors parameter to 1. This feature is applicable only when the protocol type is CAS.
Web/EMS: Max Call Duration (min) [MaxCallDuration]	Defines the maximum duration (in minutes) of a call. If this duration is reached, the device terminates the call. This feature is useful for ensuring available resources for new calls, by ensuring calls are properly terminated. The valid range is 0 to 35,791. The default is 0 (i.e., no limitation).
[MinCallDuration]	Defines the minimum call duration (in seconds) for the Tel side. If an established call is terminated by the IP side before this duration expires, the device terminates the call with the IP side, but delays the termination toward the Tel side until this timeout expires. The valid value range is 0 to 10 seconds, where 0 (default) disables this feature. For example: assume the minimum call duration is set to 10 seconds and an IP phone hangs up a call established with a BRI phone after 2 seconds. As the call duration is less than the minimum call duration, the device does not disconnect the call on the Tel side. However, it sends a SIP 200 OK immediately upon receipt of the BYE to disconnect from the IP phone. The call is disconnected from the Tel side only when the call duration is greater than or equal to the minimum call duration. Notes: This parameter is applicable to IP-to-Tel and Tel-to-IP calls. This parameter is applicable only to ISDN and CAS protocols.

Parameter	Description
Web: Send Digit Pattern on Connect EMS: Connect Code [TelConnectCode]	Defines a digit pattern to send to the Tel side after a SIP 200 OK is received from the IP side. The digit pattern is a user-defined DTMF sequence that is used to indicate an answer signal (e.g., for billing). The valid range is 1 to 8 characters. Note: This parameter is applicable to CAS.
Web: Disconnect on Broken Connection EMS: Disconnect Calls on Broken Connection [DisconnectOnBrokenConnection]	Global parameter that enables the device to release calls if RTP packets are not received within a user-defined timeout (configured by the BrokenConnectionEventTimeout parameter). You can also configure this functionality per specific calls, using IP Profiles (IpProfile_DisconnectOnBrokenConnection). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Broken Connection Timeout EMS: Broken Connection Event Timeout [BrokenConnectionEventTim eout]	Defines the time period (in 100-msec units) after which a call is disconnected if an RTP packet is not received. The valid range is from 3 (i.e., 300 msec) to an unlimited value (e.g., 20 hours). The default is 100 (i.e., 10000 msec or 10 seconds). Notes: This parameter is applicable only if the parameter DisconnectOnBrokenConnection is set to 1. Currently, this feature functions only if Silence Suppression is disabled.
Web: Disconnect Call on Silence Detection EMS: Disconnect On Detection Of Silence [EnableSilenceDisconnect]	Determines whether calls are disconnected after detection of silence. • [1] Yes = The device disconnects calls in which silence occurs (in both call directions) for more than a user-defined time. • [0] No = (Default) Call is not disconnected when silence is detected. The silence duration can be configured by the FarEndDisconnectSilencePeriod parameter (default 120). Note: To activate this feature, set the parameters EnableSilenceCompression and FarEndDisconnectSilenceMethod to 1.
Web: Silence Detection Period [sec] EMS: Silence Detection Time Out [FarEndDisconnectSilencePeriod]	Defines the duration of the silence period (in seconds) after which the call is disconnected. The range is 10 to 28,800 (i.e., 8 hours). The default is 120 seconds. Notes: This parameter is applicable only for DSP templates 2 and 3. For this parameter to take effect, a device reset is required.
Web: Silence Detection Method [FarEndDisconnectSilenceMethod]	 Determines the silence detection method. [0] None = Silence detection option is disabled. [1] Packets Count = According to packet count. Note: For this parameter to take effect, a device reset is required.
[FarEndDisconnectSilenceThr eshold]	Defines the threshold of the packet count (in percentages) below which is considered silence by the device.

Parameter	Description
	 The valid range is 1 to 100%. The default is 8%. Notes: This parameter is applicable only if silence is detected according to packet count (FarEndDisconnectSilenceMethod is set to 1). For this parameter to take effect, a device reset is required.
[BrokenConnectionDuringSile nce]	Enables the generation of the BrokenConnection event during a silence period if the channel's NoOp feature is enabled (using the parameter NoOpEnable) and if the channel stops receiving NoOp RTP packets. • [0] Disable (default) • [1] Enable
Web: Trunk Alarm Call Disconnect Timeout [TrunkAlarmCallDisconnectTim eout]	Defines the duration (in seconds) to wait after an E1/T1 trunk "Red" alarm (LOS / LOF) is raised, before the device disconnects the SIP call. If this timeout expires and the alarm is still raised, the device sends a SIP BYE message to terminate the call. If the alarm is cleared before this timeout expires, the call is not terminated, but continues as normal. The range is 1 to 3600. The default is 0 (20 for E1 and 40 for T1).
Web: Disconnect Call on Busy Tone Detection (ISDN) EMS: Isdn Disconnect On Busy Tone [ISDNDisconnectOnBusyTone]	 Determines whether a call is disconnected upon detection of a busy tone (for ISDN). [0] Disable = (Default) Do not disconnect call upon detection of busy tone. [1] Enable = Disconnect call upon detection of busy tone. Notes: This parameter is applicable only to ISDN protocols. IP-to-ISDN calls are disconnected on detection of SIT tones only in call alert state. If the call is in connected state, the SIT does not disconnect the calls. Detection of busy or reorder tones disconnects the IP-to-ISDN calls also in call connected state. For IP-to-CAS calls, detection of busy, reorder, or SIT tones disconnect the calls in any call state.
Web: Disconnect Call on Busy Tone Detection (CAS) EMS: Disconnect On Detection End Tones [DisconnectOnBusyTone]	Determines whether a call is disconnected upon detection of a busy tone. • [0] Disable = Call is not disconnected upon detection of a busy tone. • [1] Enable = (Default) Call is released upon detection of busy or reorder (fast busy) tone. Notes: • This parameter is applicable only to CAS protocols. • This parameter is also applicable to the IP-to-IP application. • This parameter can also be configured in a Tel Profile.

50.10.9 Tone Parameters

This subsection describes the device's tone parameters.

50.10.9.1 Telephony Tone Parameters

The telephony tone parameters are described in the table below.

Table 50-60: Tone Parameters

Parameter	Description
[PlayHeldToneForIP2IP]	Enables playing a held tone to an IP-to-IP leg instead of placing it on hold.
	 [0] = (Default) Disabled. The device interworks the re- INVITE with 'a=inactive' from one SIP leg to another SIP leg.
	 [1] = Enabled. The device plays a held tone to the IP if it receives a re-INVITE with 'a=inactive' in the SDP from the party initiating the call hold. The held tone must be configured in the CPT or PRT file.
	Note: This parameter is applicable only to the IP-to-IP application.
Web/EMS: Dial Tone Duration [sec] [TimeForDialTone]	Defines the duration (in seconds) that the dial tone is played to an ISDN terminal. This parameter is applicable for overlap dialing when ISDNInCallsBehavior is set to 65536. The dial tone is played if the ISDN Setup message doesn't include the called
	number.
	The valid range is 0 to 60. The default is 5.
Web/EMS: Reorder Tone Duration [sec]	Defines the duration (in seconds) that the CAS device plays a busy or reorder tone before releasing the line.
[TimeForReorderTone]	The valid range is 0 to 15. The default is 10 seconds. Note that the Web interface denotes the default value as a string value of "255".
	Notes:
	 The selected busy or reorder tone is according to the SIP release cause code received from IP.
	 This parameter is also applicable for ISDN when the PlayBusyTone2ISDN parameter is set to 2.
	 This parameter can also be configured for a Tel Profile (in the Tel Profile table).
Web: Cut Through Reorder Tone Duration [sec] [CutThroughTimeForReOrderTone]	Defines the duration (in seconds) of the reorder tone played to the PSTN side after the IP call party releases the call, for the Cut-Through feature. After the tone stops playing, an incoming call is immediately answered if the PSTN is connected.
	The valid values are 0 to 30. The default is 0 (i.e., no reorder tone is played).
	Note: To enable the Cut-Through feature, use the DigitalCutThrough (for CAS channels) parameter.
Web: Play Busy Tone to Tel	Enables the device to play a busy or reorder tone to the

Parameter	Description
[PlayBusyTone2ISDN]	PSTN after a Tel-to-IP call is released.
	[0] Don't Play = (Default) Immediately sends an ISDN Disconnect message.
	• [1] Play when Disconnecting = Sends an ISDN Disconnect message with PI = 8 and plays a busy or reorder tone to the PSTN (depending on the release cause).
	• [2] Play before Disconnect = Delays the sending of an ISDN Disconnect message for a user-defined time (configured by the TimeForReorderTone parameter) and plays a busy or reorder tone to the PSTN. This is applicable only if the call is released from the IP [Busy Here (486) or Not Found (404)] before it reaches the Connect state; otherwise, the Disconnect message is sent immediately and no tones are played.
CLI: configure voip > gw digitalgw digital-gw-parameters > q850-reason-code-2play-user-tone [Q850ReasonCode2PlayUserTone]	Defines an ISDN Q.8931 release cause code(s), which if mapped to the SIP release reason received from the IP side, causes the device to play a user-defined tone from the installed PRT file to the Tel side. For example, if the the received SIP release cause is 480 Temporarily Unavailable and you configure this parameter with Q.931 release code 18 (No User Responding), the device plays the user-defined tone to the Tel side.
	The user-defined tone is configured when creating the PRT file, using AudioCodes DConvert utility. The tone must be assigned to the "acSpecialConditionTone" (Tone Type 21) option in DConvert.
	The parameter can be configured with up to 10 release codes. When configuring multiple codes, separate the codes by commas (without spaces). For example:
	Q850ReasonCode2PlayUserTone = 1,18,24
	If the SIP release reason received from the IP side is mapped to the Q.931 release code specified by the parameter, the device plays the user-defined tone. Otherwise, if not specified and the release code is 17 (User Busy), the device plays the busy tone and for all other release codes, the device plays the reorder tone.
	Note: To enable the feature, the 'Play Busy Tone to Tel' (PlayBusyTone2ISDN) parameter must be enabled (set to 1 or 2).
Web: Play Ringback Tone to Tel EMS: Play Ring Back Tone To Tel [PlayRBTone2Tel]	Determines the playing method of the ringback tone to the Trunk (for digital interfaces) side. This parameter applies to all trunks that are not configured by the PlayRBTone2Trunk parameter (which defines ringback tone per Trunk). • [0] Don't Play =
	✓ The device configured for ISDN / CAS doesn't play a ringback tone. No PI is sent to the ISDN unless the ProgressIndicator2ISDN_x parameter is configured differently.
	• [1] Play on Local =
	✓ The device configured for CAS plays a local ringback tone to the PSTN upon receipt of a SIP 180 Ringing response (with or without SDP). Note that the receipt of a 183 response does not cause the device configured for CAS to play a ringback tone (unless the

Parameter	Description
	SIP183Behaviour parameter is set to 1). The device configured for ISDN operates according to the LocalISDNRBSource parameter: 1) If the device receives a 180 Ringing response (with or without SDP) and the LocalISDNRBSource parameter is set to 1, it plays a ringback tone and sends an ISDN Alert with PI = 8 (unless the ProgressIndicator2ISDN_x parameter is configured differently). 2) If the LocalISDNRBSource parameter is set to 0, the device doesn't play a ringback tone and an Alert message without PI is sent to the ISDN. In this case, the PBX / PSTN plays the ringback tone to the originating terminal. Note that the receipt of a 183 response does not cause the device configured for ISDN to play a ringback tone; the device issues a Progress message (unless SIP183Behaviour is set to 1). If the SIP183Behaviour parameter is set to 1, the 183 response is handled the same way as a 180 Ringing response.
	• [2] Prefer IP = (Default):
	 Prefer IP = (Default): ✓ Plays according to 'Early Media'. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device configured for ISDN / CAS doesn't play the ringback tone; PI = 8 is sent in an ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently). If a 180 response is received, but the 'early media' voice channel is not opened, the device configured for CAS plays a ringback tone to the PSTN. The device configured for ISDN operates according to the LocalISDNRBSource parameter: If LocalISDNRBSource is set to 1, the device plays a ringback tone and sends an ISDN Alert with PI = 8 to the ISDN (unless the ProgressIndicator2ISDN_x parameter is configured differently). If LocalISDNRBSource is set to 0, the device doesn't play a ringback tone. No PI is sent in the ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently). In this case, the PBX / PSTN plays a ringback tone to the originating terminal. Note that the receipt of a 183 response results in an ISDN Progress message (unless SIP183Behaviour is set to 1). If SIP183Behaviour is set to 1 (183 is handled the same way as a 180 + SDP), the device sends an Alert message with PI = 8, without playing a ringback tone. [3] Play Local Until Remote Media Arrive = Plays a
	ringback tone according to received media. The behaviour is similar to [2]. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device plays a local ringback tone if there are no prior received RTP packets. The device stops playing the local ringback tone as soon as it starts

Version 6.8 861 Mediant 3000

Parameter	Description
	receiving RTP packets. At this stage, if the device receives additional 18x responses, it does not resume playing the local ringback tone. Note that for ISDN trunks, this option is applicable only if the LocalISDNRBSource parameter is set to 1.
	Note: This parameter is applicable to the Gateway and IP-to-IP applications.
Web: Play Ringback Tone to Trunk [PlayRBTone2Trunk_x]	Determines the playing method of the ringback tone to the trunk side, per trunk. • [-1] Not configured = (Default) The settings of the
	 PlayRBTone2Tel parameter is used. [0] Don't Play = When the device is configured for ISDN / CAS, it doesn't play a ringback tone. No Progress Indicator (PI) is sent to the ISDN unless the ProgressIndicator2ISDN_x parameter is configured differently.
	• [1] Play on Local = When the device is configured for CAS, it plays a local ringback tone to the PSTN upon receipt of a SIP 180 Ringing response (with or without SDP). Note that the receipt of a SIP 183 response does not cause the device configured for CAS to play a ringback tone (unless the SIP183Behaviour parameter is set to 1). When the device is configured for ISDN, it operates
	according to the LocalISDNRBSource parameter, as follows: ✓ If the device receives a SIP 180 Ringing response (with or without SDP) and the LocalISDNRBSource parameter is set to 1, it plays a ringback tone and sends an ISDN Alert with PI = 8 (unless the ProgressIndicator2ISDN_x parameter is configured differently). ✓ If the LocalISDNRBSource parameter is set to 0, the device doesn't play a ringback tone and an Alert message without PI is sent to the ISDN. In this case, the PBX / PSTN plays the ringback tone to the originating terminal. Note that the receipt of a 183 response does not cause the device to play a ringback tone; the device sends a Progress message (unless SIP183Behaviour is set to 1). If the SIP183Behaviour parameter is set to 1, the 183 response is handled the same way as a 180 Ringing response.
	• [2] Prefer IP = Plays according to 'Early Media'. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device configured for ISDN / CAS doesn't play the ringback tone; PI = 8 is sent in an ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently). If a 180 response is received, but the 'early media' voice channel is not opened, the device configured for CAS plays a ringback tone to the PSTN. The device configured for ISDN operates according to the LocalISDNRBSource parameter: ✓ If LocalISDNRBSource is set to 1, the device plays a

Parameter	Description
	ringback tone and sends an ISDN Alert with PI = 8 to the ISDN (unless the ProgressIndicator2ISDN_x parameter is configured differently). If LocalISDNRBSource is set to 0, the device doesn't play a ringback tone. No PI is sent in the ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently). In this case, the PBX / PSTN plays a ringback tone to the originating terminal. Note that the receipt of a 183 response results in an ISDN Progress message (unless SIP183Behaviour is set to 1). If SIP183Behaviour is set to 1 (183 is handled the same way as a 180 with SDP), the device sends an Alert message with PI = 8 without playing a ringback tone. Igl Play Local Until Remote Media Arrive = Plays tone according to received media. The behaviour is similar to option Igl. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device plays a local ringback tone if there are no prior received RTP packets. The device stops playing the local ringback tone as soon as it starts receiving RTP packets. At this stage, if the device receives additional 18x responses, it does not resume playing the local ringback tone. Note that for ISDN trunks, this option is applicable only if LocalISDNRBSource is set to 1. Notes: This parameter is applicable only to the Gateway (GW) application (i.e., not the IP-to-IP application). The x in the ini file parameter name denotes the trunk number, where 0 is Trunk 1.
Web: Play Ringback Tone to IP EMS: Play Ring Back Tone To IP [PlayRBTone2IP]	Global parameter that enables the device to play a ringback tone to the IP side for IP-to-Tel calls. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_PlayRBTone2IP). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Play Local RBT on ISDN Transfer EMS: Play RBT On ISDN Transfer [PlayRBTOnISDNTransfer]	Determines whether the device plays a local ringback tone for ISDN's Two B Channel Transfer (TBCT), Release Line Trunk (RLT), or Explicit Call Transfer (ECT) call transfers to the originator when the second leg receives an ISDN Alerting or Progress message. • [0] Don't Play (default) • [1] Play Notes: • For Blind transfer, the local ringback tone is played to first call PSTN party when the second leg receives the ISDN Alerting or Progress message. • For Consulted transfer, the local ringback tone is played when the second leg receives ISDN Alerting or Progress

Parameter	Description
	message if the Progress message is received after a SIP REFER.
	 This parameter is applicable only if the parameter SendISDNTransferOnConnect is set to 1.
Web: MFC R2 Category EMS: R2 Category [R2Category]	Defines the tone for MFC R2 calling party category (CPC). The parameter provides information on the calling party such as National or International call, Operator or Subscriber and Subscriber priority.
	The value range is 1 to 15 (defining one of the MFC R2 tones). The default is 1.

50.10.9.2 Tone Detection Parameters

The signal tone detection parameters are described in the table below.

Table 50-61: Tone Detection Parameters

Parameter	Description
EMS: DTMF Enable [DTMFDetectorEnable]	 Enables the detection of DTMF signaling. [0] = Disable [1] = Enable (default)
EMS: MF R1 Enable [MFR1DetectorEnable]	Enables the detection of MF-R1 signaling.[0] = Disable (default)[1] = Enable
EMS: R1.5 Detection Standard [R1DetectionStandard]	 Determines the MF-R1 protocol used for detection. [0] = ITU (default) [1] = R1.5 Note: For this parameter to take effect, a device reset is required.
EMS: User Defined Tone Enable [UserDefinedToneDetectorEnable]	Enables the detection of User Defined Tones signaling, applicable for Special Information Tone (SIT) detection. • [0] = Disable (default) • [1] = Enable
EMS: SIT Enable [SITDetectorEnable]	 Enables SIT detection according to the ITU-T recommendation E.180/Q.35. [0] = Disable (default) [1] = Enable To disconnect IP-to-ISDN calls when a SIT tone is detected, the following parameters must be configured: SITDetectorEnable = 1 UserDefinedToneDetectorEnable = 1 ISDNDisconnectOnBusyTone = 1 (applicable for Busy, Reorder and SIT tones) Another parameter for handling the SIT tone is SITQ850Cause, which determines the Q.850 cause value specified in the SIP Reason header that is included in a 4xx response when a SIT tone is detected on an IP-to-Tel call. To disconnect IP-to-CAS calls when a SIT tone is detected,

Parameter	Description
	 the following parameters must be configured: SITDetectorEnable = 1 UserDefinedToneDetectorEnable = 1 DisconnectOnBusyTone = 1 (applicable for busy, reorder, and SIT tones) Notes: For this parameter to take effect, a device reset is required. The IP-to-ISDN call is disconnected on detection of a SIT
	 tone only in call alert state. If the call is in connected state, the SIT does not disconnect the call. Detection of busy or reorder tones disconnect these calls also in call connected state. For IP-to-CAS calls, detection of busy, reorder, or SIT tones disconnect the call in any call state.
EMS: UDT Detector Frequency Deviation [UDTDetectorFrequencyDeviation]	Defines the deviation (in Hz) allowed for the detection of each signal frequency. The valid range is 1 to 50. The default is 50. Note: For this parameter to take effect, a device reset is required.
EMS: CPT Detector Frequency Deviation [CPTDetectorFrequencyDeviation]	Defines the deviation (in Hz) allowed for the detection of each CPT signal frequency. The valid range is 1 to 30. The default is 10. Note: For this parameter to take effect, a device reset is required.

50.10.9.3 Metering Tone Parameters

The metering tone parameters are described in the table below.

Table 50-62: Metering Tone Parameters

Parameter	Description
Web: Generate Metering Tones EMS: Metering Mode [PayPhoneMeteringMode]	 Defines the method for configuring metering tones that are generated to the Tel side. [0] Disable = (Default) Metering tones are not generated. [1] Internal Table = Metering tones are generated according to user-defined pulses and intervals in the Charge Code table (see Configuring Charge Codes on page 458). [2] SIP Interval Provided = (Proprietary method of TELES Communications Corporation) Advice-of-Charge service toward the PSTN. Periodic generation of AOC-D and AOC-E toward the PSTN. Calculation is based on seconds. The time interval is calculated according to the scale and tariff provided in the proprietary formatted file included in SIP INFO messages, which is always sent before 200 0K. The device ignores tariffs sent after the call is established. [3] SIP RAW Data Provided = (Proprietary method of Cirpack) Advice-of-Charge service toward the PSTN. The received AOC-D messages contain a subtotal. When receiving AOC-D in raw format, provided in the header of SIP INFO messages, the device parses AOC-D raw data to obtain the number of units. This number is sent

Parameter	Description
	 in the Facility message with AOC-D. In addition, the device stores the latest number of units in order to send them in AOC-E IE when the call is disconnected). [4] SIP RAW Data Incremental Provided = (Proprietary method of Cirpack) Advice-of-Charge service toward the PSTN. The AOC-D message in the payload is an increment. When receiving AOC-D in raw format, provided in the header of SIP INFO messages, the device parses AOC-D raw data to obtain the number of units. This number is sent in the Facility message with AOC-D. The device generates the AOC-E. Parsing every AOC-D received and summing the values is required to obtain the total sum (that is placed in the AOC-E).
	Note: This parameter is applicable only to ISDN Euro trunks for sending AOC Facility messages (see Advice of Charge Services for Euro ISDN on page 456).
Charge Codes Table	
[ChargeCode]	This table parameter configures metering tones and their time intervals that the E1 trunk (Euro ISDN) sends in AOC Facility messages to the PSTN (i.e., PBX). The format of the ini file table parameter is as follows: [ChargeCode] FORMAT ChargeCode_Index = ChargeCode_EndTime1, ChargeCode_PulseInterval1, ChargeCode_PulsesOnAnswer1, ChargeCode_EndTime2, ChargeCode_PulseInterval2, ChargeCode_PulsesOnAnswer2, ChargeCode_EndTime3, ChargeCode_PulseInterval3, ChargeCode_PulsesOnAnswer3, ChargeCode_PulseInterval3, ChargeCode_PulsesOnAnswer3, ChargeCode_EndTime4, ChargeCode_PulseInterval4, ChargeCode_PulsesOnAnswer4; [\ChargeCode_PulsesOnAnswer4; \[\ChargeCode]\] Where, • EndTime = Period (1 - 4) end time. • PulseInterval = Period (1 - 4) pulse interval. • PulseSOnAnswer = Period (1 - 4) pulses on answer. For example: ChargeCode 1 = 7,30,1,14,20,2,20,15,1,0,60,1; ChargeCode 2 = 5,60,1,14,20,1,0,60,1; ChargeCode 3 = 0,60,1; ChargeCode 0 = 6, 3, 1, 12, 2, 1, 18, 5, 2, 0, 2, 1; Note: To associate a configured Charge Code to an outgoing Tel-to-IP call, use the Outbound IP Routing table.

50.10.10 Trunk Groups and Routing Parameters

The routing parameters are described in the table below.

Table 50-63: Routing Parameters

Parameter	Description
Trunk Group Table	
Web: Trunk Group Table EMS: SIP Endpoints > Phones	This table parameter configures and activates the device's Trunk channels. This is done by defining telephone numbers

Parameter	Description
[TrunkGroup]	and assigning them to Trunk Groups. The format of the ini file table parameter is as follows: [TrunkGroup] FORMAT TrunkGroup_Index = TrunkGroup_TrunkGroupNum, TrunkGroup_FirstTrunkId, TrunkGroup_FirstBChannel, TrunkGroup_LastBChannel, TrunkGroup_FirstPhoneNumber, TrunkGroup_ProfileId, TrunkGroup_LastTrunkId, TrunkGroup_Module; [\TrunkGroup] Notes: Trunk Group ID 1 is denoted as 0 in the table. For a description of this table, seeConfiguring Trunk Group Table on page 375.
Trunk Group Settings	Crosp radio on page or or
Web: Trunk Group Settings EMS: SIP Routing > Hunt Group [TrunkGroupSettings]	This table parameter configures the rules for channel allocation per Trunk Group. The format of the ini file table parameter is as follows: [TrunkGroupSettings] FORMAT TrunkGroupSettings_Index = TrunkGroupSettings_TrunkGroupId, TrunkGroupSettings_ChannelSelectMode, TrunkGroupSettings_RegistrationMode, TrunkGroupSettings_GatewayName, TrunkGroupSettings_ContactUser, TrunkGroupSettings_ServingIPGroup, TrunkGroupSettings_MVIInterrogationType, TrunkGroupSettings_TrunkGroupName; [\TrunkGroupSettings] For a description of this table, see "Configuring Trunk Group Settings" on page 377.
Web: Channel Select Mode EMS: Channel Selection Mode [ChannelSelectMode]	 Defines the method for allocating incoming IP-to-Tel calls to a channel. This parameter applies to the following: All Trunk Groups configured without a channel select mode in the Trunk Group Settings table (see "Configuring Trunk Group Settings" on page 377). All channels and trunks configured without a Trunk Group ID. for all Trunk Groups channels that are configured without a Trunk Group ID,. [0] By Dest Phone Number [1] Cyclic Ascending (default) [2] Ascending [3] Cyclic Descending [4] Descending [5] Dest Number + Cyclic Ascending. [6] By Source Phone Number [7] Trunk Cyclic Ascending [8] Trunk & Channel Cyclic Ascending [11] Dest Number + Ascending For a detailed description of the parameter's options, see

Parameter	Description
	"Configuring Trunk Group Settings" on page 377.
Web: Default Destination Number [DefaultNumber]	Defines the default destination phone number, which is used if the received message doesn't contain a called party number and no phone number is configured in the Trunk Group table (see Configuring the Trunk Group Table on page 375). This parameter is used as a starting number for the list of channels comprising all the device's Trunk Groups. The default is 1000.
Web: Source IP Address Input [SourcelPAddressInput]	Determines which IP address the device uses to determine the source of incoming INVITE messages for IP-to-Tel routing. • [-1] = (Default) Auto Decision - if the IP-to-IP feature is enabled, this parameter is automatically set to Layer 3 Source IP. If the IP-to-IP feature is disabled, this parameter is automatically set to SIP Contact Header (1). • [0] SIP Contact Header = The IP address in the Contact header of the incoming INVITE message is used. • [1] Layer 3 Source IP = The actual IP address (Layer 3) from where the SIP packet was received is used.
Web: Use Source Number As Display Name EMS: Display Name [UseSourceNumberAsDisplayName]	 Determines the use of Tel Source Number and Display Name for Tel-to-IP calls. [0] No = (Default) If a Tel Display Name is received, the Tel Source Number is used as the IP Source Number and the Tel Display Name is used as the IP Display Name. If no Display Name is received from the Tel side, the IP Display Name remains empty. [1] Yes = If a Tel Display Name is received, the Tel Source Number is used as the IP Source Number and the Tel Display Name is used as the IP Display Name. If no Display Name is received from the Tel side, the Tel Source Number is used as the IP Source Number and also as the IP Display Name. [2] Overwrite = The Tel Source Number is used as the IP Source Number and also as the IP Display Name (even if the received Tel Display Name is not empty). [3] Original = Similar to option [2], except that the operation is done before regular calling number manipulation.
Web/EMS: Use Display Name as Source Number [UseDisplayNameAsSourceNumber]	 Determines the use of Source Number and Display Name for IP-to-Tel calls. [0] No = (Default) If IP Display Name is received, the IP Source Number is used as the Tel Source Number and the IP Display Name is used as the Tel Display Name. If no Display Name is received from IP, the Tel Display Name remains empty. [1] Yes = If an IP Display Name is received, it is used as the Tel Source Number and also as the Tel Display Name, and Presentation is set to Allowed (0). If no Display Name is received from IP, the IP Source Number is used as the Tel Source Number and Presentation is set to Restricted (1). For example: When 'From: 100 <sip:200@201.202.203.204>' is received, the outgoing</sip:200@201.202.203.204>

Parameter	Description
	Source Number and Display Name are set to '100' and the Presentation is set to Allowed (0). When 'From: <sip:100@101.102.103.104>' is received, the outgoing Source Number is set to '100' and the Presentation is set to Restricted (1).</sip:100@101.102.103.104>
Web: ENUM Resolution [EnumService]	Defines the ENUM service for translating telephone numbers to IP addresses or domain names (FQDN), for example, e164.arpa, e164.customer.net, or NRENum.net. The valid value is a string of up to 50 characters. The default is "e164.arpa".
	Note: For the Gateway / IP-to-IP application, ENUM-based routing is configured in the Outbound IP Routing table using the "ENUM" string value as the destination address to denote this parameter's value.
Web: Use Routing Table for Host Names and Profiles EMS: Use Routing Table For Host	Determines whether to use the device's routing table to obtain the URI host name and optionally, an IP profile (per call) even if a Proxy server is used.
Names [AlwaysUseRouteTable]	 [0] Disable = (Default) Don't use internal routing table. [1] Enable = Use the Outbound IP Routing table. Notes:
	 This parameter appears only if the 'Use Default Proxy' parameter is enabled.
	 The domain name is used instead of a Proxy name or IP address in the INVITE SIP URI.
Web/EMS: Tel to IP Routing Mode [RouteModeTel2IP]	For a description of this parameter, see "Configuring Outbound IP Routing Table" on page 407.
Outbound IP Routing Table	
Web: Outbound IP Routing Table EMS: SIP Routing > Tel to IP [Prefix]	This table parameter configures the Outbound IP Routing Table for routing Tel-to-IP and IP-to-IP calls. The format of this parameter is as follows:
	[PREFIX] FORMAT PREFIX_Index = PREFIX_RouteName, PREFIX_DestinationPrefix, PREFIX_DestAddress, PREFIX_SourcePrefix, PREFIX_ProfileId, PREFIX_MeteringCode, PREFIX_DestPort, PREFIX_SrcIPGroupID, PREFIX_DestHostPrefix, PREFIX_DestIPGroupID, PREFIX_SrcHostPrefix, PREFIX_TransportType, PREFIX_SrcTrunkGroupID, PREFIX_DestSRD, PREFIX_CostGroup, PREFIX_ForkingGroup, PREFIX_CallSetupRulesSetId; [\PREFIX]
	For a detailed description of this table, see "Configuring Outbound IP Routing Table" on page 407.
Inbound IP Routing Table	
Web: Inbound IP Routing Table EMS: SIP Routing > IP to Hunt	This table parameter configures the routing of IP-to-Trunk Groups (or inbound IP Groups).
[PSTNPrefix]	The format of the ini file table parameter is as follows: [PSTNPrefix] FORMAT PstnPrefix_Index = PstnPrefix_RouteName,

Version 6.8 869 Mediant 3000

Parameter	Description
	PstnPrefix_DestPrefix, PstnPrefix_TrunkGroupId, PstnPrefix_SourcePrefix, PstnPrefix_SourceAddress, PstnPrefix_ProfileId, PstnPrefix_SrcIPGroupID, PstnPrefix_DestHostPrefix, PstnPrefix_SrcHostPrefix, PstnPrefix_SrcSRDID, PstnPrefix_TrunkId, PstnPrefix_CallSetupRulesSetId; [\PSTNPrefix] For a detailed description of this table, see "Configuring Inbound IP Routing Table" on page 416.
Web/EMS: IP to Tel Routing Mode [RouteModelP2Tel]	Determines whether to route IP calls to the Trunk Group (or IP Group) before or after manipulation of the destination number (configured in "Configuring Source/Destination Number Manipulation Rules" on page 383). • [0] Route calls before manipulation = (Default) Calls are routed before the number manipulation rules are applied. • [1] Route calls after manipulation = Calls are routed after the number manipulation rules are applied.
Web: IP Security EMS: Secure Call From IP [SecureCallsFromIP]	Determines the device's policy on accepting or blocking SIP calls (IP-to-Tel calls). This is useful in preventing unwanted SIP calls, SIP messages, and/or VoIP spam. • [0] Disable = (Default) The device accepts all SIP calls. • [1] Secure Incoming calls = The device accepts SIP calls (i.e., calls from the IP side) only from IP addresses that are defined in the Outbound IP Routing table or Proxy Set table, or IP addresses resolved from DNS servers from FQDN values defined in the Proxy Set table. All other incoming calls are rejected. • [2] Secure All calls = The device accepts SIP calls only from IP addresses (in dotted-decimal notation format) that are defined in the Outbound IP Routing table or Proxy Set table, and rejects all other incoming calls. In addition, if an FQDN is defined in the routing table or Proxy Set table, the call is allowed to be sent only if the resolved DNS IP address appears in one of these tables; otherwise, the call is rejected. Therefore, the difference between this option and option [1] is that this option is concerned only about numerical IP addresses that are defined in the tables. Note: If this parameter is set to [1] or [2], when using Proxies or Proxy Sets, it is unnecessary to configure the Proxy IP addresses in the routing table. The device allows SIP calls received from the Proxy IP addresses even if these addresses are not configured in the routing table.
Web/EMS: Filter Calls to IP [FilterCalls2IP]	 Enables filtering of Tel-to-IP calls when a Proxy is used. [0] Don't Filter = (Default) The device doesn't filter calls when using a Proxy. [1] Filter = Filtering is enabled. When this parameter is enabled and a Proxy is used, the device first checks the Outbound IP Routing table before making a call through the Proxy. If the number is not allowed (i.e., number isn't listed in the table or a call restriction routing rule of IP address 0.0.0.0 is applied), the call is released.

Parameter	Description
	Note: When no Proxy is used, this parameter must be disabled and filtering is according to the Outbound IP Routing table.
Web: IP-to-Tel Tagging Destination Dial Plan Index [IP2TelTaggingDestDialPlanIndex]	Defines the Dial Plan index in the Dial Plan file for called prefix tags for representing called number prefixes in Inbound Routing rules.
	The valid values are 0 to 7, where 0 denotes PLAN1, 1 denotes PLAN2, and so on. The default is -1 (i.e., no dial plan file used).
	For more information on this feature, see Dial Plan Prefix Tags for IP-to-Tel Routing on page 563.
Web: IP to Tel Tagging Source Dial Plan Index [IP2TelTaggingSourceDialPlanIndex]	Defines the Dial Plan index in the Dial Plan file for calling prefix tags for representing calling number prefixes in Inbound Routing rules.
	The valid values are 0 to 7, where 0 denotes PLAN1, 1 denotes PLAN2, and so on. The default is -1 (i.e., no dial plan file used).
	For more information on this feature, see Dial Plan Prefix Tags for IP-to-Tel Routing on page 563.
[EnableETSIDiversion]	Determines the method in which the Redirect Number is sent to the Tel side.
	 [0] = (Default) Q.931 Redirecting Number Information Element (IE). [1] = ETSI DivertingLegInformation2 in a Facility IE.
Web: Add CIC [AddCicAsPrefix]	Determines whether to add the Carrier Identification Code (CIC) as a prefix to the destination phone number for IP-to-Tel calls. When this parameter is enabled, the 'cic' parameter in the incoming SIP INVITE can be used for IP-to-Tel routing decisions. It routes the call to the appropriate Trunk Group based on this parameter's value.
	[0] No (default)[1] Yes
	The SIP 'cic' parameter enables the transmission of the 'cic' parameter from the SIP network to the ISDN. The 'cic'
	parameter is a three- or four-digit code used in routing tables to identify the network that serves the remote user when a call is routed over many different networks. The 'cic' parameter is carried in the SIP INVITE and maps to the ISDN Transit Network Selection Information Element (TNS IE) in the outgoing ISDN Setup message (if the EnableCIC parameter is set to 1). The TNS IE identifies the requested transportation networks and allows different providers equal
	access support, based on customer choice. For example, as a result of receiving the below INVITE, the destination number after number manipulation is
	cic+167895550001: INVITE sip:5550001;cic=+16789@172.18.202.60:5060;user=phone SIP/2.0
	Note: After the cic prefix is added, the Inbound IP Routing table can be used to route this call to a specific Trunk Group.

Version 6.8 871 Mediant 3000

Parameter	Description
	The Destination Number IP to Tel Manipulation table must be used to remove this prefix before placing the call to the ISDN.
[FaxReroutingMode]	Enables the re-routing of incoming Tel-to-IP calls that are identified as fax calls. If a CNG tone is detected on the Tel side of a Tel-to-IP call, the device adds the string, "FAX" as a prefix to the destination number before routing and manipulation. A routing rule in the Outbound IP Routing table having the value "FAX" (case-sensitive) as the destination number is then used to re-route the call to a fax destination and the destination number manipulation mechanism is used to remove the "FAX" prefix before sending the fax, if required. If the initial INVITE used to establish the voice call (not fax) was already sent, a CANCEL (if not connected yet) or a BYE (if already connected) is sent to release the voice call. • [0] Disable (default) • [1] Rerouting without Delay = Upon detection of a CNG tone, the device immediately releases the call of the initial INVITE and then sends a new INVITE to a specific IP Group or fax server according to the Outbound IP Routing table rules. To enable this feature, set the CNGDetectorMode parameter to 2 and the IsFaxUsed parameter to 1, 2, or 3. • [2] Progress and Delay = (Applicable only to ISDN). Incoming ISDN calls are delayed until a CNG tone detection or timeout, set by the FaxReroutingDelay parameter. If the EnableComfortTone parameter is set to 1, a Q.931 Progress message with Protocol Discriminator set to 1 is sent to the PSTN. When the timeout expires, the device sends an INVITE to a specific IP Group or to a fax server, according to the Outbound IP Routing table rules. This option is applicable only to ISDN. • [3] Connect and Delay = (Applicable only to ISDN). Incoming ISDN calls are delayed until a CNG tone detection or timeout, set by the FaxReroutingDelay parameter. A Q.931 Connect message is sent to the PSTN. If the EnableComfortTone parameter is set to 1, a comfort tone is played to the PSTN. When the timeout expires, the device sends an INVITE to a specific IP Group or to a fax server according to the Outbound IP Routing table rules. This option is applicabl
[FaxReroutingDelay]	PaxReroutingMode parameter set to 1. Defines the maximum time interval (in seconds) that the device waits for CNG detection before re-routing calls identified as fax calls to fax destinations (terminating fax machine)
	machine). The valid value range is 1-10. The default is 5.
Call Forking Parameters	

Parameter	Description
Web/EMS: Forking Handling Mode [ForkingHandlingMode]	Determines how the device handles the receipt of multiple SIP 18x forking responses for Tel-to-IP calls. The forking 18x response is the response with a different SIP to-tag than the previous 18x response. These responses are typically generated (initiated) by Proxy / Application servers that perform call forking, sending the device's originating INVITE (received from SIP clients) to several destinations, using the same Call ID.
	• [0] Parallel handling = (Default) If SIP 18x with SDP is received, the device opens a voice stream according to the received SDP and disregards any subsequently received 18x forking responses (with or without SDP). If the first response is 180 without SDP, the device responds according to the PlayRBTone2TEL parameter and disregards the subsequent forking 18x responses.
	• [1] Sequential handling = If 18x with SDP is received, the device opens a voice stream according to the received SDP. The device re-opens the stream according to subsequently received 18x responses with SDP, or plays a ringback tone if 180 response without SDP is received. If the first received response is 180 without SDP, the device responds according to the PlayRBTone2TEL parameter and processes the subsequent 18x forking responses.
	Note: Regardless of this parameter setting, once a SIP 200 OK response is received, the device uses the RTP information and re-opens the voice stream, if necessary.
Web: Forking Timeout [ForkingTimeOut]	Defines the timeout (in seconds) that is started after the first SIP 2xx response has been received for a User Agent when a Proxy server performs call forking (Proxy server forwards the INVITE to multiple SIP User Agents). The device sends a SIP ACK and BYE in response to any additional SIP 2xx received from the Proxy within this timeout. Once this timeout elapses, the device ignores any subsequent SIP 2xx.
	The number of supported forking calls per channel is 20. In other words, for an INVITE message, the device can receive up to 20 forking responses from the Proxy server. The valid range is 0 to 30. The default is 30.
Web: Tel2IP Call Forking Mode [Tel2IPCallForkingMode]	Enables Tel-to-IP call forking, whereby a Tel call can be routed to multiple IP destinations.
	 [0] Disable (default) [1] Enable Note: Once enabled, routing rules must be assigned Forking Groups in the Outbound IP Routing table.
[ForkingDelayTimeForInvite]	Defines the interval (in seconds) to wait before sending INVITE messages to the other members of the forking group. The INVITE is immediately sent to the first member.
	The valid value range is 0 to 40. The default is 0 (i.e., send immediately).

50.10.11 IP Connectivity Parameters

The IP connectivity parameters are described in the table below.

Table 50-64: IP Connectivity Parameters

Table 50-64: IP Connectivity Parameters		
Parameter	Description	
Web: Enable Alt Routing Tel to IP EMS: Enable Alternative Routing [AltRoutingTel2IPEnable]	 Enables the Alternative Routing feature for Tel-to-IP calls. [0] Disable = (Default) Disables the Alternative Routing feature. [1] Enable = Enables the Alternative Routing feature. [2] Status Only = The Alternative Routing feature is disabled, but read-only information on the QoS of the destination IP addresses is provided. 	
Web: Alt Routing Tel to IP Mode EMS: Alternative Routing Mode [AltRoutingTel2IPMode]	 Determines the IP Connectivity event(s) reason for triggering Alternative Routing. [0] None = Alternative routing is not used. [1] Connectivity = Alternative routing is performed if a ping or SIP OPTIONS message to the initial destination fails (determined according to the AltRoutingTel2IPConnMethod parameter). [2] QoS = Alternative routing is performed if poor QoS is detected. [3] Both = (Default) Alternative routing is performed if either ping or SIP OPTIONS to initial destination fails, poor QoS is detected, or the DNS host name is not resolved. Notes: QoS is quantified according to delay and packet loss calculated according to previous calls. QoS statistics are reset if no new data is received within two minutes. To receive quality information (displayed in the 'Quality Status' and 'Quality Info.' fields in "Viewing IP Connectivity" on page 630) per destination, this parameter must be set to 2 or 3. 	
Web: Alt Routing Tel to IP Connectivity Method EMS: Alternative Routing Telephone to IP Connection Method [AltRoutingTel2IPConnMethod] Web: Alt Routing Tel to IP Keep Alive Time EMS: Alternative Routing Keep	 Determines the method used by the device for periodically querying the connectivity status of a destination IP address. [0] ICMP Ping = (Default) Internet Control Message Protocol (ICMP) ping messages. [1] SIP OPTIONS = The remote destination is considered offline if the latest OPTIONS transaction timed out. Any response to an OPTIONS request, even if indicating an error, brings the connectivity status to online. Defines the time interval (in seconds) between SIP OPTIONS Keep-Alive messages used for the IP Connectivity application. The valid range is 5 to 2,000,000. The default is 60. 	
Alive Time [AltRoutingTel2IPKeepAliveTime]	3 , , , , , , , , , , , , , , , , , , ,	
Web: Max Allowed Packet Loss for Alt Routing [%] [IPConnQoSMaxAllowedPL]	Defines the packet loss (in percentage) at which the IP connection is considered a failure and Alternative Routing mechanism is activated. The default is 20%.	

Parameter	Description
Web: Max Allowed Delay for Alt Routing [msec] [IPConnQoSMaxAllowedDelay]	Defines the transmission delay (in msec) at which the IP connection is considered a failure and the Alternative Routing mechanism is activated.
	The range is 100 to 10,000. The default is 250.

50.10.12 Alternative Routing Parameters

The alternative routing parameters are described in the table below.

Table 50-65: Alternative Routing Parameters

Table 50-65: Alternative Routing Parameters	
Parameter	Description
Web: 3xx Use Alt Route Reasons [UseAltRouteReasonsFor3xx]	 Defines the handling of received SIP 3xx responses regarding call redirection to listed contacts in the Contact header. [0] No = (Default) Upon receipt of a 3xx response, the device tries each contact, one by one, listed in the Contact headers, until a successful destination is found. However, if a contact responds with a 486 or 600, the device does not try to redirect the call to next contact, and drops the call. [1] No if 6xx = Upon receipt of a 3xx response, the device tries each contact, one by one, listed in the Contact headers. However, if a 6xx Global Failure response is received during this process (e.g., 600 Busy Everywhere) the device does not try to redirect the call to the next contact, and drops the call. [2] Yes = Upon receipt of a 3xx response, the device redirects the call to the first contact listed in the Contact header. If the contact responds with a SIP response that is defined in the Reasons for Tel-to-IP Alternative Routing table, the device tries to redirect the call to the next contact, and so on. If a contact responds with a response that is not configured in the table, the device does not try to redirect the call to the next contact, and drops the call.
Web/EMS: Redundant Routing Mode [RedundantRoutingMode]	 Determines the type of redundant routing mechanism when a call can't be completed using the main route. [0] Disable = No redundant routing is used. If the call can't be completed using the main route (using the active Proxy or the first matching rule in the Routing table), the call is disconnected. [1] Routing Table = (Default) Internal routing table is used to locate a redundant route. [2] Proxy = Proxy list is used to locate a redundant route. Note: To implement the Redundant Routing Mode mechanism, you first need to configure the parameter AltRouteCauseTEL2IP (Reasons for Alternative Routing table).
[DisconnectCallwithPlifAlt]	Defines when the device sends the IP-to-Tel call to an alternative route (if configured) when it receives an ISDN Q.931 Disconnect message from the Tel side. • [0] (Default) = The device forwards early media to the IP side if Disconnect includes PI, and disconnects the call when a Release message is received. Only after the call is disconnected does the device send the call to an alternative route. • [1] = The device immediately sends the call to the alternative

Parameter	Description
	route. For more information, see Alternative Routing upon ISDN Disconnect on page 430.
[EnableAltMapTel2IP]	Enables different Tel-to-IP destination number manipulation rules per routing rule when several (up to three) Tel-to-IP routing rules are defined and if alternative routing using release causes is used. For example, if an INVITE message for a Tel-to-IP call is returned with a SIP 404 Not Found response, the call can be re-sent to a different destination number (as defined using the parameter NumberMapTel2IP). • [0] = Disable (default) • [1] = Enable
Peasons for Alternative Tel-to-IP Pouting Table	

Reasons for Alternative Tel-to-IP Routing Table

Web: Reasons for Alternative Routing

EMS: Alt Route Cause Tel to IP [AltRouteCauseTel2IP]

This table parameter configures SIP call failure reason values received from the IP side. If an IP call is released as a result of one of these reasons, the device attempts to locate an alternative IP route for the call in the Outbound IP Routing table (if a Proxy is not used) or used as a redundant Proxy (you need to set the parameter RedundantRoutingMode to 2). The release reason for Tel-to-IP calls is provided in SIP 4xx, 5xx, and 6xx response codes. The format of the ini file table parameter is as follows:

[AltRouteCauseTel2IP]
FORMAT AltRouteCauseTel2IP_Index = AltRouteCauseTel2IP_ReleaseCause;
[\AltRouteCauseTel2IP]

For example:

AltRouteCauseTel2IP 0 = 486: (Busy Here)

AltRouteCauseTel2IP 1 = 480; (Temporarily Unavailable)

AltRouteCauseTel2IP 2 = 408; (No Response)

For a detailed description of this table, see "Alternative Routing Based on SIP Responses" on page 423.

Reasons for Alternative IP-to-Tel Routing Table

Web: Reasons for Alternative

IP-to-Tel Routing

EMS: Alt Route Cause IP to Tel [AltRouteCauseIP2Tel]

This table parameter configures call failure reason values received from the PSTN side (in Q.931 presentation). If a call is released as a result of one of these reasons, the device attempts to locate an alternative Trunk Group for the call in the Inbound IP Routing table.

The format of the ini file table parameter is as follows:

[AltRouteCauseIP2Tel]

FORMAT AltRouteCauseIP2Tel_Index = AltRouteCauseIP2Tel_ReleaseCause;

[\AltRouteCauseIP2Tel]

For example:

AltRouteCauseIP2Tel 0 = 3 (No Route to Destination)

AltRouteCauseIP2Tel 1 = 1 (Unallocated Number)

AltRouteCauseIP2Tel 2 = 17 (Busy Here)

AltRouteCauseIP2Tel 2 = 27 (Destination Out of Order)

For a detailed description of this table, see "Alternative Routing to Trunk upon Q.931 Call Release Cause Code" on page 426.

Forward On Busy Trunk Destination Table

Web/EMS: Forward On Busy Trunk Destination

This table parameter configures the Forward On Busy Trunk Destination table. This table allows you to define an alternative IP

Parameter	Description
[ForwardOnBusyTrunkDest]	destination if a trunk is busy for IP-to-Tel calls.
	The format of the ini file table parameter is as follows:
	[ForwardOnBusyTrunkDest] FORMAT ForwardOnBusyTrunkDest_Index = ForwardOnBusyTrunkDest_TrunkGroupId, ForwardOnBusyTrunkDest_ForwardDestination; [\ForwardOnBusyTrunkDest]
	For example, the below configuration forwards IP-to-Tel calls to destination user "112" at host IP address 10.13.4.12, port 5060, using transport protocol TCP, if Trunk Group ID 2 is unavailable:
	ForwardOnBusyTrunkDest 1 = 2, 112@10.13.4.12:5060;transport=tcp;
	For a detailed description of this table, see "Alternative Routing to IP Destination upon Busy Trunk" on page 428.

50.10.13 Number Manipulation Parameters

The number manipulation parameters are described in the table below.

Table 50-66: Number Manipulation Parameters

Parameter	Description
[ManipulateIP2PSTNReferTo]	Enables the manipulation of the called party (destination) number according to the SIP Refer-To header received by the device for TDM (PSTN) blind transfer. The number in the SIP Refer-To header is manipulated for all types of blind transfers to the PSTN (TBCT, ECT, RLT, QSIG, FXO, and CAS).
	[0] Disable (default)[1] Enable
	During the blind transfer, the device initiates a new call to the PSTN and the destination number of this call can be manipulated if this parameter is enabled. When enabled, the manipulation is done as follows:
	1 If you configure a value for the xferPrefix parameter, then this value (string) is added as a prefix to the number in the Refer-To header.
	2 This called party number is then manipulated using the IP-to-Tel Destination Phone Number Manipulation table. The source number of the transferred call is taken from the original call, according to its initial direction:
	 ✓ Source number of the original call if it is a Tel-to-IP call ✓ Destination number of the original call if it is an IP-to-Tel call
	This source number can also be used as the value for the 'Source Prefix' field in the IP-to-Tel Destination Phone Number Manipulation table. The local IP address is used as the value for the 'Source IP Address' field.
	Note: This manipulation does not affect IP-to-Trunk Group routing rules.
Web: Use EndPoint Number As Calling Number Tel2IP	Enables the use of the B-channel number as the calling number (sent in the From field of the INVITE) instead of the number

Parameter	Description
EMS: Use EP Number As Calling Number Tel to IP [UseEPNumAsCallingNumTel2I P]	received in the Q.931 Setup message, for Tel-to-IP calls. • [0] Disable (default) • [1] Enable For example, if the incoming calling party number in the Q.931 Setup message is "12345" and the B-channel number is 17, then the outgoing INVITE From header is set to "17" instead of "12345". Note: When enabled, this feature is applied before routing and manipulation on the source number.
Web: Use EndPoint Number As Calling Number IP2Tel EMS: Use EP Number As Calling Number IP to Tel [UseEPNumAsCallingNumIP2T el]	Enables the use of the B-channel number as the calling party number (sent in the Q.931 Setup message) instead of the number received in the From header of the INVITE, for IP-to-Tel calls. • [0] Disable (default) • [1] Enable For example, if the incoming INVITE From header contains "12345" and the destined B-channel number is 17, then the outgoing calling party number in the Q.931 Setup message is set to "17" instead of "12345". Note: When enabled, this feature is applied after routing and manipulation on the source number (i.e., just before sending to the Tel side).
Web: Tel2IP Default Redirect Reason [Tel2IPDefaultRedirectReason]	Determines the default redirect reason for Tel-to-IP calls when no redirect reason (or "unknown") exists in the received Q931 ISDN Setup message. The device includes this default redirect reason in the SIP History-Info header of the outgoing INVITE. If a redirect reason exists in the received Setup message, this parameter is ignored and the device sends the INVITE message with the reason according to the received Setup message. If this parameter is not configured (-1), the outgoing INVITE is sent with the redirect reason as received in the Setup message (if none or "unknown" reason, then without a reason). If all Busy = Call forwarding busy If a Busy = Call forwarding busy If a Busy = Call forwarding no reply If a Busy = Call forwarding DTE out of order If a Deflection = Call deflection If a Systematic/Unconditional = Call forward unconditional
Web: Redirect Number SIP to TEL EMS: Set IP To Tel Redirect Screening Indicator [SetIp2TelRedirectScreeningInd]	Determines the value of the Redirect Number screening indicator in ISDN Setup messages. I-1] Not Configured (default) [0] User Provided [1] User Passed [2] User Failed [3] Network Provided
Web: Set IP-to-TEL Redirect Reason [SetIp2TelRedirectReason]	Defines the redirect reason for IP-to-Tel calls. If redirect (diversion) information is received from the IP, the redirect reason is set to the value of this parameter before the device sends it on to the Tel. [-1] Not Configured (default) [0] Unkown

Parameter	Description
	 [1] Busy [2] No Reply [3] Network Busy [4] Deflection [9] DTE out of Order [10] Forwarding DTE [13] Transfer [14] PickUp [15] Systematic/Unconditional
Web: Set TEL-to-IP Redirect Reason [SetTel2IpRedirectReason]	Defines the redirect reason for Tel-to-IP calls. If redirect (diversion) information is received from the Tel, the redirect reason is set to the value of this parameter before the device sends it on to the IP. [-1] Not Configured (default) [0] Unkown [1] Busy [2] No Reply [3] Network Busy [4] Deflection [9] DTE out of Order [10] Forwarding DTE [13] Transfer [14] PickUp [15] Systematic/Unconditional
Web: Send Screening Indicator to IP EMS: Screening Indicator To IP [ScreeningInd2IP]	 Overrides the calling party's number (CPN) screening indication in the received ISDN SETUP message for Tel-to-IP calls. [-1] Not Configured = (Default) Not configured (interworking from ISDN to IP) or set to 0 for CAS. [0] User Provided = CPN set by user, but not screened (verified). [1] User Passed = CPN set by user, verified and passed. [2] User Failed = CPN set by user, and verification failed. [3] Network Provided = CPN set by network. Note: This parameter is applicable only if the Remote Party ID (RPID) header is enabled.
Web: Send Screening Indicator to ISDN EMS: Screening Indicator To ISDN [ScreeningInd2ISDN]	Overrides the screening indicator of the calling party's number for IP-to-Tel ISDN calls. I-1] Not Configured = (Default) Not configured (interworking from IP to ISDN). I0] User Provided = user provided, not screened. I1] User Passed = user provided, verified and passed. I2] User Failed = user provided, verified and failed. I3] Network Provided = network provided
Web: Copy Destination Number to Redirect Number EMS: Copy Dest to Redirect Number [CopyDest2RedirectNumber]	Enables the device to copy the received ISDN called number to the outgoing SIP Diversion header for Tel-to-IP calls (even if a Redirecting Number IE is not received in the ISDN Setup message). Therefore, the called number is used as a redirect number. Call redirection information is typically used for Unified Messaging and voice mail services to identify the recipient of a

Parameter	Description
	 [0] Don't copy = (Default) Disable. [1] Copy after phone number manipulation = Copies the called number after manipulation. The device first performs Tel-to-IP destination phone number manipulation (i.e., on the SIP To header), and only then copies the manipulated called number to the SIP Diversion header for the Tel-to-IP call. Therefore, with this option, the called and redirect numbers are identical. [2] Copy before phone number manipulation = Copies the called number before manipulation. The device first copies the original called number to the SIP Diversion header, and then performs Tel-to-IP destination phone number manipulation. Therefore, this allows you to have different numbers for the called (i.e., SIP To header) and redirect (i.e., SIP Diversion header) numbers. Notes: If the incoming ISDN-to-IP call includes a Redirect Number, this number is overridden by the new called number if this parameter is set to [1] or [2]. You can also use this feature for IP-to-Tel calls, by configuring this parameter per IP Profile (IpProfile_CopyDest2RedirectNum). For more information, see Configuring IP Profiles on page 314.
[ReplaceCallingWithRedirectNumber]	 Enables the replacement of the calling number with the redirect number for ISDN-to-IP calls. [0] = Disable (default) [1] = The calling name is removed and left blank. The outgoing INVITE message excludes the redirect number that was used to replace the calling number. The replacement is done only if a redirect number is present in the incoming Tel call. [2] = Manipulation is done on the new calling party number (after manipulation of the original calling party number, using the Tel2IPSourceNumberMappingDiaIPlanIndex parameter), but before the regular calling or redirect number manipulation: ✓ If a redirect number exists, it replaces the calling party number. If there is no redirect number, the calling number is left unchanged. ✓ If there is a calling "display" name, it remains unchanged. ✓ The redirect number remains unchanged and is included in the SIP Diversion header.
Web/EMS: Add Trunk Group ID as Prefix [AddTrunkGroupAsPrefix]	Determines whether the Trunk Group ID is added as a prefix to the destination phone number (i.e., called number) for Tel-to-IP calls. • [0] No = (Default) Don't add Trunk Group ID as prefix. • [1] Yes = Add Trunk Group ID as prefix to called number. Notes: • This option can be used to define various routing rules. • To use this feature, you must configure the Trunk Group IDs (see Configuring Trunk Group Table on page 375).
Web: Add Trunk ID as Prefix EMS: Add Port ID As Prefix [AddPortAsPrefix]	Determines whether or not the port numberTrunk ID is added as a prefix to the called (destination) number for Tel-to-IP calls. • [0] No (Default) • [1] Yes If enabled, the device adds the following prefix to the called phone

Parameter	Description
	number: port numberTrunk ID (single digit in the range 1 to 83). This option can be used to define various routing rules.
Web/EMS: Add Trunk Group ID as Prefix to Source [AddTrunkGroupAsPrefixToS ource]	Determines whether the device adds the Trunk Group ID (from where the call originated) as the prefix to the calling number (i.e. source number). • [0] No (default) • [1] Yes
Web: Replace Empty Destination with B-channel Phone Number EMS: Replace Empty Dst With Port Number [ReplaceEmptyDstWithPortNum ber]	Determines whether the internal channel number is used as the destination number if the called number is missing. • [0] No (default) • [1] Yes Note: This parameter is applicable only to Tel-to-IP calls and if the called number is missing.
[CopyDestOnEmptySource]	Determines whether the destination number is copied to the source number if no source number is present, for Tel-to-IP calls. • [0] = (Default) Source Number is left empty. • [1] = If the Source Number of a Tel-to-IP call is empty, the Destination Number is copied to the Source Number.
Web: Add NPI and TON to Calling Number EMS: Add NPI And TON As Prefix To Calling Number [AddNPIandTON2CallingNumb er]	 Determines whether the Numbering Plan Indicator (NPI) and Type of Numbering (TON) are added to the Calling Number for Tel-to-IP calls. [0] No = (Default) Do not change the Calling Number. [1] Yes = Add NPI and TON to the Calling Number ISDN Tel-to-IP call. For example: After receiving a Calling Number of 555, NPI of 1, and TON of 3, the modified number becomes 13555. This number can later be used for manipulation and routing.
Web: Add NPI and TON to Called Number EMS: Add NPI And TON As Prefix To Called Number [AddNPlandTON2CalledNumbe r]	 Determines whether NPI and TON are added to the Called Number for Tel-to-IP calls. [0] No = (Default) Do not change the Called Number. [1] Yes = Add NPI and TON to the Called Number of ISDN Tel-to-IP call. For example: After receiving a Called Number of 555, NPI of 1 and TON of 3, the modified number becomes 13555. This number can later be used for manipulation and routing.
Web: Add NPI and TON to Redirect Number [AddNPIandTON2RedirectNum ber]	Determines whether the NPI and TON values are added as the prefix to the Redirect number in INVITE messages' Diversion or History-Info headers, for ISDN Tel-to-IP calls. • [0] Yes (Default) • [1] No
Web: IP to Tel Remove Routing Table Prefix EMS: Remove Prefix [RemovePrefix]	Determines whether or not the device removes the prefix (as configured in the Inbound IP Routing table - see "Configuring Inbound IP Routing Table" on page 416) from the destination number for IP-to-Tel calls, before sending it to the Tel. • [0] No (default) • [1] Yes For example: To route an incoming IP-to-Tel call with destination number "21100", the Inbound IP Routing table is scanned for a

Version 6.8 881 Mediant 3000

Parameter	Description
	matching prefix. If such a prefix is found (e.g., "21"), then before the call is routed to the corresponding Trunk Group, the prefix "21" is removed from the original number, and therefore, only "100" remains. Notes:
	 This parameter is applicable only if number manipulation is performed after call routing for IP-to-Tel calls (i.e., RouteModeIP2Tel parameter is set to 0). Similar operation (of removing the prefix) is also achieved by
	using the usual number manipulation rules.
Web/EMS: Swap Redirect and Called Numbers [SwapRedirectNumber]	 [0] No = (Default) Don't change numbers. [1] Yes = Incoming ISDN call that includes a redirect number (sometimes referred to as 'original called number') uses the redirect number instead of the called number.
[UseReferredByForCallingNum ber]	Determines whether the device uses the number from the URI in the SIP Referred-By header as the calling number in the outgoing Q.931 Setup message, when SIP REFER messages are received. • [0] = (Default) No • [1] = Yes Notes:
	 This parameter is applicable to all ISDN (TBCT, RLT, ECT) and CAS blind call transfers (except for in-band) and when the device receives SIP REFER messages with a Referred-By header. This manipulation is done before regular IP-to-Tel source number manipulation.
[SwapTel2IPCalled&CallingNumbers]	Determines whether the device swaps the calling and called numbers received from the Tel side (for Tel-to-IP calls). The SIP INVITE message contains the swapped numbers. • [0] = (Default) Disabled • [1] = Swap calling and called numbers Note: This parameter can also be configured for a Tel Profile (in the Tel Profile table).
Web/EMS: Add Prefix to Redirect Number [Prefix2RedirectNumber]	Defines a string prefix that is added to the Redirect number received from the Tel side. This prefix is added to the Redirect Number in the SIP Diversion header. The valid range is an 8-character string. By default, no value is defined.
Web: Add Number Plan and Type to RPI Header EMS: Add Ton 2 RPI [AddTON2RPI]	Determines whether the TON/PLAN parameters are included in the Remote-Party-ID (RPID) header. • [0] No • [1] Yes (default) If the Remote-Party-ID header is enabled (EnableRPIHeader = 1) and AddTON2RPI = 1, it's possible to configure the calling and called number type and number plan using the Number Manipulation tables for Tel-to-IP calls.
Web/EMS: Source Manipulation Mode [SourceManipulationMode]	Determines the SIP headers containing the source number after manipulation: • [0] = (Default) The SIP From and P-Asserted-Identity headers contain the source number after manipulation.

Parameter	Description
	 [1] = Only SIP From header contains the source number after manipulation, while the P-Asserted-Identity header contains the source number before manipulation.
Calling Name Manipulations	IP-to-Tel Table
[CallingNameMaplp2Tel]	Configures rules for manipulating the calling name (caller ID) in the received SIP message for IP-to-Tel calls. This can include modifying or removing the calling name. The format of this table ini file parameter is as follows:
	[CallingNameMaplp2Tel] FORMAT CallingNameMaplp2Tel_Index = CallingNameMaplp2Tel_ManipulationName, CallingNameMaplp2Tel_DestinationPrefix, CallingNameMaplp2Tel_SourcePrefix, CallingNameMaplp2Tel_CallingNamePrefix, CallingNameMaplp2Tel_SourceAddress, CallingNameMaplp2Tel_RemoveFromLeft, CallingNameMaplp2Tel_RemoveFromRight, CallingNameMaplp2Tel_LeaveFromRight, CallingNameMaplp2Tel_Prefix2Add, CallingNameMaplp2Tel_Suffix2Add; [\CallingNameMaplp2Tel_Suffix2Add; [\CallingNameMaplp2Tel]
	For a detailed description of this table, see "Configuring SIP Calling

Calling Name Manipulations Tel-to-IP Table

[CallingNameMapTel2lp]

This table parameter configures rules for manipulating the calling name (caller ID) for Tel-to-IP calls. This can include modifying or removing the calling name.

[CallingNameMapTel2Ip]

Name Manipulation" on page 390.

FORMAT CallingNameMapTel2lp_Index = CallingNameMapTel2lp_ManipulationName, CallingNameMapTel2lp_DestinationPrefix, CallingNameMapTel2lp_SourcePrefix, CallingNameMapTel2lp_CallingNamePrefix, CallingNameMapTel2lp_SrcTrunkGroupID, CallingNameMapTel2lp_SrcIPGroupID, CallingNameMapTel2lp_RemoveFromLeft, CallingNameMapTel2lp_RemoveFromRight, CallingNameMapTel2lp_LeaveFromRight, Callin

Destination Phone Number Manipulation for IP-to-Tel Calls Table

Web: Destination Phone Number Manipulation Table for IP > Tel Calls

EMS: SIP Manipulations > Destination IP to Telcom [NumberMapIP2Tel]

This table parameter manipulates the destination number of IP-to-Tel calls. The format of the ini file table parameter is as follows:

[NumberMaplp2Tel]

FORMAT NumberMaplp2Tel_Index = NumberMaplp2Tel_ManipulationName, NumberMaplp2Tel_DestinationPrefix, NumberMaplp2Tel_SourcePrefix, NumberMaplp2Tel_SourceAddress,

Parameter	Description
	NumberMaplp2Tel_NumberType, NumberMaplp2Tel_NumberPlan, NumberMaplp2Tel_RemoveFromLeft, NumberMaplp2Tel_RemoveFromRight, NumberMaplp2Tel_LeaveFromRight, NumberMaplp2Tel_LeaveFromRight, NumberMaplp2Tel_Prefix2Add, NumberMaplp2Tel_Suffix2Add, NumberMaplp2Tel_IsPresentationRestricted; [\NumberMaplp2Tel] For a detailed description of this table, see "Configuring Source/Destination Number Manipulation" on page 383.
EMS: Perform Additional IP2TEL Destination Manipulation [PerformAdditionalIP2TELDestinationManipulation]	Enables additional destination number manipulation for IP-to-Tel calls. The additional manipulation is done on the initially manipulated destination number, and this additional rule is also configured in the manipulation table (NumberMapIP2Tel parameter). This enables you to configure only a few manipulation rules for complex number manipulation requirements (that generally require many rules). • [0] = Disable (default) • [1] = Enable
Destination Phone Number Manipulation for Tel-to-IP Calls Table	

Web: Destination Phone Number Manipulation Table for Tel > IP Calls

EMS: SIP Manipulations > Destination Telcom to IPs [NumberMapTel2IP]

This table parameter manipulates the destination number of Tel-to-IP calls. The format of the ini file table parameter is as follows:

[NumberMapTel2lp]

FORMAT NumberMapTel2lp_Index = NumberMapTel2lp ManipulationName, NumberMapTel2Ip_DestinationPrefix, NumberMapTel2lp_SourcePrefix, NumberMapTel2lp SourceAddress,

NumberMapTel2lp NumberType, NumberMapTel2lp NumberPlan, NumberMapTel2lp RemoveFromLeft,

NumberMapTel2lp RemoveFromRight, NumberMapTel2lp LeaveFromRight,

NumberMapTel2lp_Prefix2Add, NumberMapTel2lp_Suffix2Add,

NumberMapTel2lp_IsPresentationRestricted,

NumberMapTel2lp SrcTrunkGroupID, NumberMapTel2lp

SrcIPGroupID: [\NumberMapTel2Ip]

For a detailed description of this table, see "Configuring Source/Destination Number Manipulation" on page 383.

Source Phone Number Manipulation for IP-to-Tel Calls Table

Web: Source Phone Number Manipulation Table for IP > Tel Calls

EMS: SIP Manipulations > Source IP to Telcom

[SourceNumberMapIP2Tel]

This parameter table manipulates the source number for IP-to-Tel calls. The format of the ini file table parameter is as follows:

[SourceNumberMaplp2Tel]

FORMAT SourceNumberMaplp2Tel Index = SourceNumberMapIp2Tel_ManipulationName, SourceNumberMapIp2Tel_DestinationPrefix, SourceNumberMapIp2Tel_SourcePrefix, SourceNumberMapIp2Tel_SourceAddress,

SourceNumberMapIp2Tel NumberType, SourceNumberMaplp2Tel NumberPlan,

SourceNumberMapIp2Tel_RemoveFromLeft, SourceNumberMapIp2Tel_RemoveFromRight, SourceNumberMaplp2Tel LeaveFromRight,

SourceNumberMaplp2Tel_Prefix2Add,

Parameter	Description
	SourceNumberMapIp2Tel_Suffix2Add, SourceNumberMapIp2Tel_IsPresentationRestricted; [\SourceNumberMapIp2Tel] For a detailed description of this table, see "Configuring Source/Destination Number Manipulation" on page 383.
EMS: Perform Additional IP2TEL Source Manipulation [PerformAdditionalIP2TELSourceManipulation]	Enables additional source number manipulation for IP-to-Tel calls. The additional manipulation is done on the initially manipulated source number, and this additional rule is also configured in the manipulation table (SourceNumberMapIP2Tel parameter). This enables you to configure only a few manipulation rules for complex number manipulation requirements (that generally require many rules). • [0] = Disable (default) • [1] = Enable
Source Phone Number Manipu	lation for Tel-to-IP Calls Table
Web: Source Phone Number Manipulation Table for Tel > IP Calls EMS: SIP Manipulations > Source Telcom to IP [SourceNumberMapTel2IP]	This table parameter manipulates the source phone number for Tel-to-IP calls. The format of the ini file table parameter is as follows: [SourceNumberMapTel2Ip] FORMAT SourceNumberMapTel2Ip_Index = SourceNumberMapTel2Ip_ManipulationName, SourceNumberMapTel2Ip_DestinationPrefix, SourceNumberMapTel2Ip_SourcePrefix, SourceNumberMapTel2Ip_SourceAddress, SourceNumberMapTel2Ip_NumberType, SourceNumberMapTel2Ip_NumberPlan, SourceNumberMapTel2Ip_RemoveFromLeft, SourceNumberMapTel2Ip_RemoveFromRight, SourceNumberMapTel2Ip_LeaveFromRight, SourceNumberMapTel2Ip_LeaveFromRight, SourceNumberMapTel2Ip_Suffix2Add, SourceNumberMapTel2Ip_Suffix2Add, SourceNumberMapTel2Ip_IsPresentationRestricted, NumberMapTel2Ip_SrcTrunkGroupID, NumberMapTel2Ip_SrcIPGroupID; [\SourceNumberMapTel2Ip] For a detailed description of this table, see "Configuring Source/Destination Number Manipulation" on page 383.
Redirect Number IP -to-Tel Table	9
Web: Redirect Number IP -> Tel EMS: Redirect Number Map IP to Tel [RedirectNumberMapIp2Tel]	This table parameter manipulates the redirect number for IP-to-Tel calls. The format of the ini file table parameter is as follows: [RedirectNumberMaplp2Tel] FORMAT RedirectNumberMaplp2Tel_Index = RedirectNumberMaplp2Tel_ManipulationName, RedirectNumberMaplp2Tel_DestinationPrefix, RedirectNumberMaplp2Tel_RedirectPrefix, RedirectNumberMaplp2Tel_SourceAddress, RedirectNumberMaplp2Tel_SrcHost, RedirectNumberMaplp2Tel_DestHost,

Version 6.8 885 Mediant 3000

RedirectNumberMaplp2Tel_DestHost,
RedirectNumberMaplp2Tel_NumberType,
RedirectNumberMaplp2Tel_NumberPlan,
RedirectNumberMaplp2Tel_RemoveFromLeft,

Parameter	Description
	RedirectNumberMapIp2Tel_RemoveFromRight, RedirectNumberMapIp2Tel_LeaveFromRight, RedirectNumberMapIp2Tel_Prefix2Add, RedirectNumberMapIp2Tel_Suffix2Add, RedirectNumberMapIp2Tel_IsPresentationRestricted; [RedirectNumberMapIp2Tel] For a description of this table, see Configuring Redirect Number Manipulation on page 393.
Redirect Number Tel-to-IP Tabl	· · · · · · · · · · · · · · · · · · ·
Web: Redirect Number Tel -> IP EMS: Redirect Number Map Tel to IP [RedirectNumberMapTel2IP]	This table parameter manipulates the Redirect Number for Tel-to-IP calls. The format of the ini file table parameter is as follows: [RedirectNumberMapTel2Ip] FORMAT RedirectNumberMapTel2Ip_Index = RedirectNumberMapTel2Ip_ManipulationName, RedirectNumberMapTel2Ip_DestinationPrefix, RedirectNumberMapTel2Ip_RedirectPrefix, RedirectNumberMapTel2Ip_RemoveFromLeft, RedirectNumberMapTel2Ip_RemoveFromRight, RedirectNumberMapTel2Ip_LeaveFromRight, RedirectNumberMapTel2Ip_Prefix2Add, RedirectNumberMapTel2Ip_Suffix2Add, RedirectNumberMapTel2Ip_IsPresentationRestricted, RedirectNumberMapTel2Ip_SrcTrunkGroupID, RedirectNumberMapTel2Ip_SrcIPGroupID; [\RedirectNumberMapTel2Ip] For a description of this table, see "Configuring Redirect Number Manipulation" on page 393.
Phone Context Table	
Web: Phone Context Table EMS: SIP Manipulations > Phone Context [PhoneContext]	This table parameter configures the Phone Context table. This parameter maps NPI and TON to the SIP 'phone-context' parameter, and vice versa. The format for this parameter is as follows: [PhoneContext] FORMAT PhoneContext_Index = PhoneContext_Npi, PhoneContext_Ton, PhoneContext_Context; [VPhoneContext] For example: PhoneContext 0 = 0,0,unknown.com PhoneContext 1 = 1,1,host.com PhoneContext 2 = 9,1,na.e164.host.com For a detailed description of this table, see "Configuring NPI/TON-SIP Phone-Context Mapping Rules" on page 397.
Web/EMS: Add Phone Context As Prefix [AddPhoneContextAsPrefix]	Determines whether the received Phone-Context parameter is added as a prefix to the outgoing ISDN Setup message withCalled and Calling numbers. • [0] Disable (default) • [1] Enable

50.11 SBC Parameters

The SBC parameters are described in the table below.

Table 50-67: SBC Parameters

Parameter Parameter	
Parameter	Description
Web/EMS: Enable SBC [EnableSBCApplication]	 Enables the Session Border Control (SBC) application. [0] Disable (default) [1] Enable Notes: For this parameter to take effect, a device reset is required. In addition to enabling this parameter, the number of maximum SBC/IP-to-IP sessions must be included in the Software License Key.
Web: Unclassified Calls [AllowUnclassifiedCalls]	Determines whether incoming calls that cannot be classified (i.e. classification process fails) to a Source IP Group are rejected or processed. ■ [0] Reject = (Default) Call is rejected if classification fails. ■ [1] Allow = If classification fails, the incoming packet is assigned to a source IP Group (and subsequently processed) as follows: ✓ The source SRD is determined according to the SIP Interface to where the SIP-initiating dialog request is sent. The source IP Group is set to the default IP Group associated with this SRD. ✓ If the source SRD is ID 0, then source IP Group ID 0 is chosen. In case of any other SRD, then the first IP Group associated with this SRD is chosen as the source IP Group or the call. If no IP Group is associated with this SRD, the call is rejected.
Web: SBC No Answer Timeout [SBCAlertTimeout]	Defines the timeout (in seconds) for SBC outgoing (outbound IP routing) SIP INVITE messages. If the called IP party does not answer the call within this user-defined interval, the device disconnects the session. The device starts the timeout count upon receipt of a SIP 180 Ringing response from the called party. If no other SIP response (for example, 200 OK) is received thereafter within this timeout, the call is released. The valid range is 0 to 3600 seconds. the default is 600.
[NumOfSubscribes]	Defines the maximum number of concurrent SIP SUBSCRIBE sessions permitted on the device. The valid value is any value between 0 and the maximum supported SUBSCRIBE sessions. When set to -1, the device uses the default value. For more information, contact your AudioCodes sales representative. Notes: For this parameter to take effect, a device reset is required. The maximum number of SUBSCRIBE sessions can be increased by reducing the maximum number of SBC channels in the Software License Key. For every reduced SBC session, the device gains two SUBSCRIBE sessions.
[SBCInDialogSubscribeRoute Mode]	Enables the device to route in-dialog, refresh SIP SUBSCRIBE requests to the "working" (has connectivity) proxy.

Parameter	Description
	 [0] = (Default) Disable – the device sends in-dialog, refresh SUBSCRIBES according to the address in the Contact header of the 200 OK response received from the proxy to which the initial SUBSCRIBE was sent (as per the SIP standard). [1] = Enable – the device routes in-dialog, refresh SUBSCRIBES to the "working" proxy (regardless of the Contact header). The "working" proxy (address) is determined by the device's keep-alive mechanism for the Proxy Set that was used to route the initial SUBSCRIBE. Note: For this feature to be functional, ensure the following: Keep-alive mechanism is enabled for the Proxy Set ('Enable Proxy Keep Alive' parameter is set to any value other than
	 Disable). Load-balancing between proxies is disabled ('Proxy Load Balancing Method' parameter is set to Disable).
[SBCMaxForwardsLimit]	 Defines the Max-Forwards SIP header value. The Max-Forwards header is used to limit the number of servers (such as proxies) that can forward the SIP request. The Max-Forwards value indicates the remaining number of times this request message is allowed to be forwarded. This count is decremented by each server that forwards the request. This parameter affects the Max-Forwards header in the received message as follows: If the received header's original value is 0, the message is not passed on and is rejected. If the received header's original value is less than this parameter's value, the header's value is decremented before being sent on. If the received header's original value is greater than the parameter's value, the header's value is replaced by the user-defined parameter's value. The valid value range is 1-70. The default is 10.
Web: SBC Session-Expires [SBCSessionExpires]	Defines the SBC session refresh timer (in seconds) in the Session-Expires header of outgoing INVITE messages. The valid value range is 90 (according to RFC 4028) to 86400. The default is 180.
Web: Minimum Session-Expires [SBCMinSE]	Defines the minimum amount of time (in seconds) between session refresh requests in a dialog before the session is considered timed out. This value is conveyed in the SIP Min-SE header. The valid range is 0 (default) to 1,000,000, where 0 means that the device does not limit Session-Expires.
Web: SBC Session Refreshing Policy CLI: configure voip/sbc general-setting/sbc-session-refresh-policy [SBCSessionRefreshingPolicy]	Defines the SIP user agent responsible for periodically sending refresh requests for established sessions (active calls). The session refresh allows SIP UAs or proxies to determine the status of the SIP session. When a session expires, the session is considered terminated by the UAs, regardless of whether a SIP BYE was sent by one of the UAs. The SIP Session-Expires header conveys the lifetime of the session, which is sent in re-INVITE or UPDATE requests (session refresh requests). The 'refresher=' parameter in the Session-Expires header (sent in the initial INVITE or subsequent 2xx response) indicates who sends the session refresh requests. If the

Parameter	Description
	parameter contains the value 'uac', the device performs the refreshes; if the parameter contains the value 'uas', the remote proxy performs the refreshes. An example of the Session-Expires header is shown below:
	Session-Expires: 4000; refresher=uac
	Thus, this parameter is useful when a UA does not support session refresh requests or does not support the indication of who performs session refresh requests. In such a scenario, the device can be configured to perform the session refresh requests.
	• [0] Remote Refresher = (Default) The UA (proxy) performs the session refresh requests. The device indicates this to the UA by sending the SIP message with the 'refresher=' parameter in the Session-Expires header set to 'uas'.
	• [1] SBC Refresher = The device performs the session refresh requests. The device indicates this to the UA by sending the SIP message with the 'refresher=' parameter in the Session-Expires header set to 'uac'.
	Note: The time values of the Session-Expires (session refresh interval) and Min-SE (minimum session refresh interval) headers can be configured using the SBCSessionExpires and SBCMinSE parameters, respectively.
Web: User Registration Grace Time	Defines additional time (in seconds) to add to the registration expiry time of registered users in the device's Users Registration database.
[SBCUserRegistrationGraceTi me]	The valid value is 0 to 300 (i.e., 5 minutes). The default is 0.
Web/EMS: Handle P-Asserted- Identity [SBCAssertIdentity]	Global parameter that defines the handling of the SIP P-Asserted- Identity header. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_SBCAssertIdentity). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314.
	settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Keep original user in Register [SBCKeepContactUserinRegi	Determines whether the device replaces the Contact user with a unique Contact user in the outgoing message in response to a REGISTER request.
ster]	 [0] Disable = (Default) The device replaces the original Contact user with a unique Contact user, for example: ✓ Received Contact: <sip:123@domain.com></sip:123@domain.com> ✓ Outgoing (unique) Contact: <sip:feu1_7_1@sbc></sip:feu1_7_1@sbc> [1] Enable = The original Contact user is retained and used in the outgoing REGISTER request.
	Note: This parameter is applicable only to REGISTER messages received from User-type IP Groups and that are sent to Server-type IP Groups.
Web: SBC Remote Refer Behavior [SBCReferBehavior]	Global parameter that defines the handling of SIP REFER requests. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_SBCRemoteReferBehavior). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on

Version 6.8 889 Mediant 3000

Parameter	Description
	page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
[SBCXferPrefix]	When the SBCReferBehavior is set to 1, the device, while interworking the SIP REFER message, adds the prefix "T~&R-" to the user part of the URI in the Refer-To header. After this, the device can receive an INVITE with such a prefix (the INVITE is sent by the UA that receives the REFER message or 302 response). If the device receives an INVITE with such a prefix, it replaces the prefix with the value defined for the SBCXferPrefix parameter.
	By default, no value is defined. Note: This feature is also applicable to 3xx redirect responses. The device adds the prefix "T~&R-" to the URI user part in the Contact header if the SBC3xxBehavior parameter is set to 1.
[SBC3xxBehavior]	Global parameter that defines the handling of SIP 3xx redirect responses. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_SBCRemote3xxBehavior). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314.
	Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
[SBCEnforceMediaOrder]	Enables the device to include all previously negotiated media lines within the current session ('m=' line) in the SDP offer-answer exchange (RFC 3264). • [0] Disable (default) • [1] Enable For example, assume a call (audio) has been established between two endpoints and one endpoint wants to subsequently send an image in the same call session. If this parameter is enabled, the endpoint includes the previously negotiated media type (i.e., audio) with the new negotiated media type (i.e., image) in its SDP offer: V=0 o=bob 2890844730 2890844731 IN IP4 host.example.com s= c=IN IP4 host.example.com t=0 0 m=audio 0 RTP/AVP 0 m=image 12345 udpt1 t38 If this parameter is disabled, the only 'm=' line included in the SDP is the newly negotiated media (i.e., image).
Web: SBC Diversion URI Type CLI: sbc-diversion-uri-type (configure voip > sbc general- setting) [SBCDiversionUriType]	Defines the URI type to use in the SIP Diversion header of the outgoing SIP message. • [0] Transparent = (Default) The device does not change the URI and leaves it as is. • [1] Sip = The "sip" URI is used. • [2] Tel = The "tel" URI is used.
	Note: The parameter is applicable only if the Diversion header is used. The SBCDiversionMode and SBCHistoryInfoMode

Parameter	Description
	parameters in the IP Profile table determine the call redirection (diversion) SIP header to use - History-Info or Diversion.
Web: SBC Server Auth Mode [SBCServerAuthMode]	Defines whether authentication of the SIP client is done locally (by the device) or by a RADIUS server. • [0] (default) = Authentication is done by the device (locally). • [1] = Authentication is done by the RFC 5090 compliant RADIUS server • [2] = Authentication is done according to the Draft Sterman-aaa-sip-01 method. Note: Currently, option [1] is not supported.
Web: Lifetime of the nonce in seconds [AuthNonceDuration]	Defines the lifetime (in seconds) that the current nonce is valid for server-based authentication. The device challenges a message that attempts to use a server nonce beyond this period. This parameter is used to provide replay protection (i.e., ensures that old communication streams are not used in replay attacks). The valid value range is 30 to 600. The default is 300.
Web: Authentication Challenge Method [AuthChallengeMethod]	 Defines the type of server-based authentication challenge. [0] 0 = (Default) Send SIP 401 "Unauthorized" with a WWW-Authenticate header as the authentication challenge response. [1] 1 = Send SIP 407 "Proxy Authentication Required" with a Proxy-Authenticate header as the authentication challenge response.
Web: Authentication Quality of Protection [AuthQOP]	Defines the authentication and integrity level of quality of protection (QoP) for digest authentication offered to the client. When the device challenges a SIP request (e.g., INVITE), it sends a SIP 401 response with the Proxy-Authenticate header or WWW-Authenticate header containing the 'qop' parameter. The QoP offered in the 401 response can be 'auth', 'auth-int', both 'auth' and 'auth-int', or the 'qop' parameter can be omitted from the 401 response. In response to the 401, the client needs to send the device another INVITE with the MD5 hash of the INVITE message and indicate the selected auth type. • [0] 0 = The device sends 'qop=auth' in the SIP response, requesting authentication (i.e., validates user by checking user name and password). This option does not authenticate the message body (i.e., SDP). • [1] 1 = The device sends 'qop=auth-int' in the SIP response, indicating required authentication and authentication with integrity (e.g., checksum). This option restricts the client to authenticating the entire SIP message, including the body, if present. • [2] 2 = (Default) The device sends 'qop=auth, auth-int' in the SIP response, indicating either authentication or integrity. This enables the client to choose 'auth' or 'auth-int'. If the client chooses 'auth-int', then the body is included in the authentication. If the client chooses 'auth', then the body is not authenticated. • [3] 3 = No 'qop' parameter is offered in the SIP 401 challenge message.
Web: SBC User Registration Time	Global parameter that defines the duration (in seconds) of the periodic registrations that occur between the user and the device

Version 6.8 891 Mediant 3000

Parameter	Description
[SBCUserRegistrationTime]	(the device responds with this value to the user). You can also configure this functionality per specific calls, using IP Profiles (IpProfile_SBCUserRegistrationTime). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314.
	Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
CLI: config-voip>sbc general- setting sbc-rand-expire [SBCRandomizeExpires]	Defines a value (in seconds) that is used to calculate a new value for the expiry time in the Expires header of SIP 200 OK responses for user registration and subscription requests from users.
[The expiry time value appears in the Expires header in REGISTER and SUBSCRIBE SIP messages. When the device receives such a request from a user, it forwards it to the proxy or registrar server. Upon a successful registration or subscription, the server sends a SIP 200 OK response. If the expiry time was unchanged by the server, the device applies this feature and changes the expiry time in the SIP 200 OK response before forwarding it to the user; otherwise, the device does not change the expiry time.
	This feature is useful in scenarios where multiple users may refresh their registration or subscription simultaneously, thereby causing the device to handle many such sessions at a given time. This may result in an overload of the device (reaching maximum session capacity), thereby preventing the establishment of new calls or preventing the handling of some user registration or subscription requests. When this feature is enabled, the device assigns a random expiry time to each user registration or subscription and thus, ensuring future user registration and subscription requests are more distributed over time (i.e., do not all occur simultaneously).
	The device takes any random number between 0 and the value configured by this parameter, and then subtracts this random number from the original expiry time value. For example, assume that the original expiry time is 120 and this parameter is set to 10. If the device randomly chooses the number 5 (i.e., between 0 and 10), the resultant expiry time will be 115 (120 minus 5).
	The valid value is 0 to 20. The default is 10. If set to 0, the device does not change the expiry time.
	Notes:
	 The lowest expiry time that the device sends in the 200 OK, regardless of the resultant calculation, is 10 seconds. For example, if the original expiry time is 12 seconds and this parameter is set to 5, theoretically, the new expiry time can be less than 10 (e.g., 12 – 4 = 8). However, the expiry time will be set to 10. The expiry time received from the user can be changed by the device before forwarding it to the proxy. This is configured by
	the SBCUserRegistrationTime parameter.
Web: SBC Proxy Registration Time [SBCProxyRegistrationTime]	Defines the duration (in seconds) for which the user is registered in the proxy database (after the device forwards the REGISTER message). When set to 0, the device sends the Expires header's value as received from the user to the proxy.
	The valid range is 0 to 2,000,000 seconds. The default is 0.

Parameter	Description
Web: SBC Survivability Registration Time [SBCSurvivabilityRegistration Time]	Defines the duration of the periodic registrations between the user and the device, when the device is in survivability state (i.e., when REGISTER requests cannot be forwarded to the proxy and are terminated by the device). When set to 0, the device uses the value set by the SBCUserRegistrationTime parameter for the device's response. The valid range is 0 to 2,000,000 seconds. The default is 0.
	<u> </u>
[SBCEnableAASTRASurvivab ilityNotice]	Enables the device to notify Aastra IP phones that the device is currently operating in Survivability mode. When this occurs, the Aastra IP phones display the message, "Stand Alone Mode" on their LCD screens. Survivability mode occurs when connectivity with the WAN fails and as a result, the device enables communication between IP phone users within the LAN enterprise. • [0] = Disable • [1] = Enable When this feature is enabled and the SBC device is in Survivability mode, it responds to SIP REGISTER messages from the IP phones with a SIP 200 OK containing the following XML body:
	Content-Type: application/xml
	<pre><?xml version="1.0" encoding="utf-8"?></pre>
	<pre><lmidocument version="1.0"> <localmodestatus></localmodestatus></lmidocument></pre>
	<pre><localmodestatus> <localmodeactive>true</localmodeactive></localmodestatus></pre>
Web: SBC Dialog-Info Interworking	Enables the interworking of dialog information (parsing of call identifiers in XML body) in SIP NOTIFY messages received from a remote application server.
[EnableSBCDialogInfoInterwo rking]	[0] Disable (default)[1] Enable
	For more information, see "Interworking Dialog Information in SIP NOTIFY Messages" on page 495.
[SBCKeepOriginalCallId]	Enables the device to use the same call identification value received in incoming messages for the call identification in outgoing messages. The call identification value is contained in the SIP Call-ID header.
	 [0] = (Default) Disable - the device creates a new Call-ID value for the outgoing message. [1] = Enable - the device uses the received Call-ID value of the
	incoming message in the outgoing message. Note: When the device sends an INVITE as a result of a REFER/3xx termination, the device always creates a new Call-ID value and ignores this parameter's settings.
Web: SBC GRUU Mode [SBCGruuMode]	Determines the Globally Routable User Agent (UA) URI (GRUU) support, according to RFC 5627.
	 [0] None = No GRUU is supplied to users. [1] As Proxy = (Default) The device provides same GRUU types

Parameter	Description
	 as the proxy provided the device's GRUU clients. [2] Temporary only = Supply only temporary GRUU to users. (Currently not supported.) [3] Public only = The device provides only public GRUU to users. [4] Both = The device provides temporary and public GRUU to users. (Currently not supported.) This parameter allows the device to act as a GRUU server for its SIP UA clients, providing them with public GRUU's, according to RFC 5627. The public GRUU provided to the client is denoted in the SIP Contact header parameters, "pub-gruu". Public GRUU remains the same over registration expirations. On the other SBC leg communicating with the Proxy/Registrar, the device acts as a GRUU client. The device creates a GRUU value for each of its registered clients, which is mapped to the GRUU value received from the Proxy server. In other words, the created GRUU value is only used between the device and its clients (endpoints). Public-GRUU: sip:userA@domain.com;gr=unique-id
Web: Bye Authentication [SBCEnableByeAuthenticatio n]	Enables authenticating a SIP BYE request before disconnecting the call. This feature prevents, for example, a scenario in which the SBC SIP client receives a BYE request from a third-party imposer assuming the identity of a participant in the call and as a consequence, the call between the first and second parties is inappropriately disconnected. • [0] Disable (default) • [1] Enable = The device forwards the SIP authentication response (for the BYE request) to the request sender and waits for the user to authenticate it. The call is disconnected only if the authenticating server responds with a 200 OK.
Web: SBC Enable Subscribe Trying [SBCSendTryingToSubscribe]	Enables the device to send SIP 100 Trying responses upon receipt of SUBSCRIBE or NOTIFY messages. • [0] Disable (Default) • [1] Enable
[SBCExtensionsProvisioning Mode]	 Enables SBC user registration for interoperability with BroadSoft's BroadWorks server, to provide call survivability in case of connectivity failure with the BroadWorks server. [0] = (Default) Normal processing of REGISTER messages. [1] = Registration method for BroadWorks server. In a failure scenario with BroadWorks, the device acts as a backup SIP proxy server, maintaining call continuity between the enterprise LAN users (subscribers) and between the subscribers and the PSTN (if provided). Note: For a detailed description of this feature, see "Auto-Provisioning of Subscriber-Specific Information for BroadWorks Server" on page 487.
Web: SBC Direct Media [SBCDirectMedia]	Enables the No Media Anchoring feature (i.e., direct media) for all SBC calls, whereby SIP signaling is handled by the device without handling the RTP/SRTP (media) flow between the user agents (UA). The RTP packets do not traverse the device. Instead, the two SIP UAs establish a direct RTP/SRTP flow between one another. Signaling continues to traverse the device with minimal

Parameter	Description
	 intermediation and involvement to enable certain SBC abilities such as routing [0] Disable = (Default) All calls traverse the device (i.e., no direct media). If No Media Anchoring is enabled for an SRD (in the SRD table), then calls between endpoints belonging to that SRD use No Media Anchoring. [1] Enable = All SBC calls use the No Media Anchoring feature (i.e., direct media). Note: For more information on No Media Anchoring, see "No Media Anchoring (Anti Tromboning)" on page 473.
Web: Transcoding Mode CLI: transcoding-mode [TranscodingMode]	Global parameter that defines the voice transcoding mode (media negotiation). You can also configure this functionality per specific calls, using IP Profiles (IpProfile_TranscodingMode). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: SBC Preferences Mode [SBCPreferencesMode]	 Determines the order of the Extension coders (coders added if there are no common coders between SDP offered coders and Allowed coders) and Allowed coders (configured in the Allowed Coders Group table) in the outgoing SIP message (in the SDP). [0] Doesn't Include Extensions = (Default) Extension coders are added at the end of the coder list. [1] Include Extensions = Extension coders and Allowed coders are arranged according to their order of appearance in the Allowed Coders Group table. Note: This parameter is applicable only if an Extension Coders Group is assigned to the IP Profile (IP Profile table's parameter, SBCExtensionCodersGroupID).
SBC RTCP Mode [SBCRTCPMode]	Global parameter that defines the handling of RTCP packets. You can also configure this functionality per specific calls, using IP Profiles (IPProfile_SBCRTCPMode). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see "Configuring IP Profiles" on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: SBC Send Invite To All Contacts [SBCSendInviteToAllContacts]	 Enables call forking of INVITE message received with a Request-URI of a specific contact registered in the device's database, to all users under the same AOR as the contact. [0] Disable (default) = Sends the INVITE only to the contact of the received Request-URI. [1] Enable To configure call forking initiated by the device, see "Initiating SIP Call Forking" on page 492.
Web: SBC Shared Line Registration Mode [SBCSharedLineRegMode]	Enables the termination on the device of SIP REGISTER messages from secondary lines pertaining to the Shared Line feature. • [0] Disable = (Default) Device forwards the REGISTER

Version 6.8 895 Mediant 3000

Parameter	Description
	 messages as is (i.e., not terminated on the device). [1] Enable = REGISTER messages of secondary lines are terminated on the device. Note: The device always forwards REGISTER messages of the primary line.
Web: SBC Forking Handling Mode [SBCForkingHandlingMode]	 Defines the handling of SIP 18x responses received due to call forking of an INVITE. [0] Latch On First = (Default) Only the first 18x is forwarded to the INVITE-initiating UA. If SIP 18x with SDP is received, the device opens a voice stream according to the received SDP and disregards any subsequent 18x forking responses (with or without SDP). If the first response is 180 without SDP, the device sends it to the other side. [1] Sequential = All 18x responses are forwarded, one at a time (sequentially) to the INVITE-initiating UA. If a 18x arrives with an offer only, then only the first offer is forwarded to the INVITE-initiating UA and subsequent 18x responses are discarded.
Web: Gateway Direct Route Prefix [GWDirectRoutePrefix]	Defines the prefix destination Request-URI user part that is appended to the original user part for alternative IP-to-IP call routing from SBC to Gateway (Tel) interfaces. The valid value is a string of up to 16 characters. The default is "acgateway- <original destination="" number="" prefix="">". For example, "acgateway-200". For more information, see Configuring SBC IP-to-IP Routing Rules on page 510.</original>
[EnableSBCMediaSync]	Enables SBC media synchronization process for calls established from SIP forking that is initiated by external proxy servers. It is possible that a call is established with the media not synchronized between the SBC legs. Media synchronization resolves this issue. • [0] Disable • [1] Enable (default)
Web/EMS: SBC Fax Detection Timeout CLI: configure voip/sbc general- setting/sbc-fax-detection- timeout [SBCFaxDetectionTimeout]	Defines the duration (in seconds) for which the device attempts to detect fax (CNG tone) immediately upon the establishment of a voice session. The interval starts from the establishment of the voice call. The valid value is 1 to any integer. The default is 10. The feature applies to faxes that are sent immediately after the voice channel is established (i.e., after 200 OK). You can configure the handling of fax negotiation by the device for specific calls, using IP Profiles configured in the IP Profile table (see the IpProfile_SBCRemoteRenegotiateOnFaxDetection parameter in Configuring IP Profiles).
Admission Control Table	
Web: Admission Control EMS: Call Admission Control [SBCAdmissionControl]	This table parameter defines Call Admission Control (CAC) rules for limiting the number of allowed concurrent calls (SIP dialogs). The format of the ini file table parameter is as follows: [SBCAdmissionControl] FORMAT SBCAdmissionControl_Index = SBCAdmissionControl_AdmissionControlName, SBCAdmissionControl_LimitType, SBCAdmissionControl_IPGroupID, SBCAdmissionControl_SRDID,

Parameter	Description		
	SBCAdmissionControl_RequestType, SBCAdmissionControl_RequestDirection, SBCAdmissionControl_Limit, SBCAdmissionControl_LimitPerUser, SBCAdmissionControl_Rate, SBCAdmissionControl_MaxBurst, SBCAdmissionControl_Reservation; [\SBCAdmissionControl]		
	For a detailed description of this table, see "Configuring Admission Control" on page 497.		
Allowed Audio Coders Table			
Web: Allowed Audio Coders [AllowedCodersGroupX]	This table parameter defines Allowed Coders Groups, which determine the audio (voice) coders that can be used for a specific SIP entity.		
	The format of the ini file table parameter is as follows:		
	[AllowedCodersGroupX] FORMAT AllowedCodersGroup_Index = AllowedCodersGroup_Name; [\AllowedCodersGroup]		
	Where X represents the index number.		
	For a detailed description of this table, see "Configuring Allowed Audio Coder Groups" on page 500.		
Allowed Video Coders Table			
[AllowedVideoCodersGroupX	This table parameter defines Allowed Video Coders Groups, which determine the video coders that can be used for a specific SIP entity.		
-	The format of the ini file table parameter is as follows:		
	[AllowedVideoCodersGroup0] FORMAT AllowedVideoCodersGroup_Index = AllowedVideoCodersGroup_Name; [\AllowedVideoCodersGroup]		
	Where X represents the index number.		
	For a detailed description of this table, see "Configuring Allowed Video Coder Groups" on page 501.		
Classification Table			
Web: Classification Table EMS: SBC Classification [Classification]	This table parameter configures the Classification table. This table classifies incoming SIP dialogs to Source IP Groups. The format of the ini file table parameter is as follows:		
	[Classification] FORMAT Classification_Index = Classification_ClassificationName, Classification_MessageCondition, Classification_SrcSRDID, Classification_SrcAddress, Classification_SrcPort, Classification_SrcTransportType, Classification_SrcUsernamePrefix, Classification_SrcHost, Classification_DestUsernamePrefix, Classification_DestHost, Classification_ActionType, Classification_SrcIPGroupID; [\Classification]		
	For a detailed description of this table, see "Configuring Classification Rules" on page 502.		
Condition Table			

Version 6.8 897 Mediant 3000

Parameter	Description		
Web: Condition Table [ConditionTable]	This table parameter configures Message Condition rules for SIP messages. [ConditionTable]		
	FORMAT ConditionTable_Index = ConditionTable_Condition, ConditionTable_Description; [\ConditionTable]		
	For a detailed description of this table, see "Configuring Message Condition Rules" on page 508.		
SBC IP-to-IP Routing Table			
Web: IP-to-IP Routing Table EMS: IP to IP Routing [IP2IPRouting]	This table parameter configures the SBC IP-to-IP Routing table for routing incoming SIP messages such as INVITE messages to an IP destination. The format of the ini file table parameter is as follows: [IP2IPRouting] FORMAT IP2IPRouting_Index = IP2IPRouting_RouteName, IP2IPRouting_SrcIPGroupID, IP2IPRouting_SrcUsernamePrefix, IP2IPRouting_SrcHost, IP2IPRouting_DestUsernamePrefix, IP2IPRouting_DestHost, IP2IPRouting_RequestType, IP2IPRouting_MessageCondition, IP2IPRouting_MessageCondition, IP2IPRouting_ReRouteIPGroupID, IP2IPRouting_Trigger, IP2IPRouting_CallSetupRulesSetId, IP2IPRouting_DestType, IP2IPRouting_DestIPGroupID, IP2IPRouting_DestSRDID, IP2IPRouting_DestAddress, IP2IPRouting_DestPort, IP2IPRouting_DestTransportType, IP2IPRouting_AltRouteOptions, IP2IPRouting_GroupPolicy, IP2IPRouting_CostGroup; [\IP2IPRouting] For a detailed description of this table, see "Configuring SBC IP-to-IP Routing Rules" on page 510.		
SBC Alternative Routing Reason	ons Table		
Web: SBC Alternative Routing Reasons EMS: Alternative Routing Reasons [SBCAlternativeRoutingReas	This table parameter configures the SBC Alternative Routing Reasons table. The format of the ini file table parameter is as follows: [SBCAlternativeRoutingReasons] FORMAT SBCAlternativeRoutingReasons_Index =		
ons]	SBCAlternativeRoutingReasons_ReleaseCause; [\SBCAlternativeRoutingReasons]		
	For a detailed description of this table, see "Configuring SIP Response Codes for Alternative Routing Reasons" on page 518.		
IP to IP Inbound Manipulation	IP to IP Inbound Manipulation Table		
Web: IP to IP Inbound Manipulation EMS: IP to IP Inbound Manipulation [IPInboundManipulation]	This table parameter configures the IP to IP Inbound Manipulation table. This table allows you to manipulate the SIP URI user part (source and/or destination) of the inbound SIP dialog message. The format of the ini file table parameter is as follows: [IPInboundManipulation] FORMAT IPInboundManipulation_Index = IPInboundManipulation_ManipulationName IPInboundManipulation_IsAdditionalManipulation, IPInboundManipulation_ManipulatedURI, IPInboundManipulation_Manipulation_Name		
	IPInboundManipulation_ManipulationPurpose, IPInboundManipulation_SrcIPGroupID, IPInboundManipulation_SrcUsernamePrefix,		

Parameter	Description	
	IPInboundManipulation_SrcHost, IPInboundManipulation_DestUsernamePrefix, IPInboundManipulation_DestHost, IPInboundManipulation_RequestType, IPInboundManipulation_RemoveFromLeft, IPInboundManipulation_RemoveFromRight, IPInboundManipulation_LeaveFromRight, IPInboundManipulation_Prefix2Add, IPInboundManipulation_Suffix2Add; [\IPInboundManipulation] For a detailed description of this table, see "Configuring IP-to-IP"	
	Inbound Manipulations" on page 522.	
IP to IP Outbound Manipulation Table		
Web: IP to IP Outbound Manipulation EMS: IP to IP Outbound Manipulation [IPOutboundManipulation]	This table parameter configures the IP to IP Outbound Manipulation table. This table allows you to manipulate the SIP URI user part (source and/or destination) of the outbound SIP dialog message. The format of the ini file table parameter is as follows: FORMAT IPOutboundManipulation_Index = IPOutboundManipulation_ManipulationName, IPOutboundManipulation_IsAdditionalManipulation, IPOutboundManipulation_SrcIPGroupID, IPOutboundManipulation_DestIPGroupID, IPOutboundManipulation_SrcUsernamePrefix, IPOutboundManipulation_DestUsernamePrefix, IPOutboundManipulation_DestUsernamePrefix, IPOutboundManipulation_DestHost, IPOutboundManipulation_RequestType, IPOutboundManipulation_ReRouteIPGroupID, IPOutboundManipulation_ReRouteIPGroupID, IPOutboundManipulation_ManipulatedURI, IPOutboundManipulation_RemoveFromLeft, IPOutboundManipulation_RemoveFromRight, IPOutboundManipulation_LeaveFromRight, IPOutboundManipulation_Prefix2Add, IPOutboundManipulation_Prefix2Add, IPOutboundManipulation_PrivacyRestrictionMode; For a detailed description of this table, see "Configuring IP-to-IP Outbound Manipulations" on page 525.	

50.12 Standalone Survivability Parameters

The Stand-alone Survivability (SAS) parameters are described in the table below. For a detailed description of SAS, refer to the SAS Configuration Guide.

Table 50-68: SAS Parameters

Parameter	Description
Web: Enable SAS EMS: Enable [EnableSAS]	Enables the Stand-Alone Survivability (SAS) feature.[0] Disable (default)[1] Enable
	When enabled, the device receives the registration requests

Parameter	Description
	from different SIP entities in the local network and then forwards them to the defined proxy. If the connection to the proxy fails ('Emergency Mode'), the device serves as a proxy by allowing calls internal to the local network or outgoing to PSTN.
	Note: For this parameter to take effect, a device reset is required.
Web: SAS Local SIP UDP Port EMS: Local SIP UDP [SASLocalSIPUDPPort]	Defines the local UDP port for sending and receiving SIP messages for SAS. The SIP entities in the local network need to send the registration requests to this port. When forwarding the requests to the proxy ('Normal Mode'), this port serves as the source port. The valid range is 1 to 65,534. The default is 5080.
Web: SAS Default Gateway IP EMS: Default Gateway IP [SASDefaultGatewayIP]	Defines the Default Gateway used in SAS 'Emergency Mode'. When an incoming SIP INVITE is received and the destination Address-Of-Record is not included in the SAS database, the request is immediately sent to this default gateway. The address can be configured as an IP address (dotted-decimal notation) or as a domain name (up to 49 characters). You can also configure the IP address with a destination port, e.g., "10.1.2.3:5060". The default is a null string, i.e., the local IP address of the gateway.
Web: SAS Registration Time EMS: Registration Time [SASRegistrationTime]	Defines the value of the SIP Expires header that is sent in a 200 OK response to an incoming REGISTER message when in SAS 'Emergency Mode'. The valid range is 10 to 2,000,000. The default is 20.
Web: SAS Local SIP TCP Port EMS: Local SIP TCP Port [SASLocalSIPTCPPort]	Defines the local TCP port used to send/receive SIP messages for the SAS application. The SIP entities in the local network need to send the registration requests to this port. When forwarding the requests to the proxy ('Normal Mode'), this port serves as the source port. The valid range is 1 to 65,534. The default is 5080.
Web: SAS Local SIP TLS Port EMS: Local SIP TLS Port [SASLocalSIPTLSPort]	Defines the local TLS port used to send/receive SIP messages for the SAS application. The SIP entities in the local network need to send the registration requests to this port. When forwarding the requests to the proxy ('Normal Mode'), this port serves as the source port. The valid range is 1 to 65,534. The default is 5081.
Web: SAS Connection Reuse [SASConnectionReuse]	Enables the re-use of the same TCP connection for sessions with the same user in the SAS application. • [0] Disable • [1] Enable (default) The device can use the same TCP connection for multiple SIP requests / responses for a specific SIP UA. For example, assume the following:
	 User A sends a REGISTER message to SAS with transport=TCP. User B sends an INVITE message to A using SAS.
	In this scenario, the SAS application forwards the INVITE request using the TCP connection that User A initially opened with the REGISTER message.

Parameter	Description
Web/EMS: Enable Record-Route [SASEnableRecordRoute]	Determines whether the device's SAS application adds the SIP Record-Route header to SIP requests. This ensures that SIP messages traverse the device's SAS agent by including the SAS IP address in the Record-Route header. • [0] Disable (default) • [1] Enable The Record-Route header is inserted in a request by a SAS proxy to force future requests in the dialog session to be routed through the SAS agent. Each traversed proxy in the path can insert this header, causing all future dialogs in the session to pass through it as well. When this feature is enabled, the SIP Record-Route header includes the URI "Ir" parameter, indicating loose routing, for example: Record-Route: <sip:server10.biloxi.com;lr></sip:server10.biloxi.com;lr>
Web: SAS Proxy Set	Defines the Proxy Set (index number) used in SAS Normal
EMS: Proxy Set [SASProxySet]	mode to forward REGISTER and INVITE requests from users that are served by the SAS application.
	The valid range is 0 to 5. The default is 0 (i.e., default Proxy Set).
Web: Redundant SAS Proxy Set EMS: Redundant Proxy Set [RedundantSASProxySet]	Defines the Proxy Set (index number) used in SAS Emergency mode for fallback when the user is not found in the Registered Users database. Each time a new SIP request arrives, the SAS application checks whether the user is listed in the registration database. If the user is located in the database, the request is sent to the user. If the user is not found, the request is forwarded to the next redundant SAS defined in the Redundant SAS Proxy Set. If that SAS Proxy IP appears in the Via header of the request, it is not forwarded (thereby, preventing loops in the request's course). If no such redundant SAS exists, the SAS sends the request to its default gateway (configured by the parameter SASDefaultGatewayIP). The valid range is -1 to 5. The default is -1 (i.e., no redundant Proxy Set).
Web/EMS: SAS Block Unregistered Users	Determines whether the device rejects SIP INVITE requests received from unregistered SAS users. This applies to SAS
[SASBlockUnRegUsers]	 Normal and Emergency modes. [0] Un-Block = (Default) Allow INVITE from unregistered SAS users. [1] Block = Reject dialog-establishment requests from unregistered SAS users.
[SASEnableContactReplace]	Enables the device to change the SIP Contact header so that it points to the SAS host and therefore, the top-most SIP Via header and the Contact header point to the same host.
	• [0] (default) = Disable - when relaying requests, the SAS agent adds a new Via header (with the SAS IP address) as the top-most Via header and retains the original Contact header. Thus, the top-most Via header and the Contact header point to different hosts.
	• [1] = Enable - the device changes the Contact header so that it points to the SAS host and therefore, the top-most Via

Version 6.8 901 Mediant 3000

Parameter	Description
	header and the Contact header point to the same host. Note: Operating in this mode causes all incoming dialog requests to traverse the SAS, which may cause load problems.
Web: SAS Survivability Mode EMS: Survivability Mode [SASSurvivabilityMode]	 [0] Standard = (Default) Incoming INVITE and REGISTER requests are forwarded to the defined Proxy list of SASProxySet in Normal mode and handled by the SAS application in Emergency mode. [1] Always Emergency = The SAS application does not use Keep-Alive messages towards the SASProxySet, instead it always operates in Emergency mode (as if no Proxy in the SASProxySet is available). [2] Ignore Register = Use regular SAS Normal/Emergency logic (same as option [0]), but when in Normal mode incoming REGISTER requests are ignored. [3] Auto-answer REGISTER = When in Normal mode, the device responds to received REGISTER requests by sending a SIP 200 OK (instead of relaying the registration requests to a Proxy), and enters the registrations in its SAS database. [4] Use Routing Table only in Normal mode = The device uses the IP-to-IP Routing table to route IP-to-IP SAS calls only when in SAS Normal mode (and is unavailable when SAS is in Emergency mode). This allows routing of SAS IP-to-IP calls to different destinations (and not only to the SAS Proxy Set).
Web: SAS Subscribe Response [SASSubscribeResponse]	Defines the SIP response upon receipt of a SUBSCRIBE message when SAS is in Emergency mode. For example, if this parameter is set to "200", then SAS sends a SIP 200 OK in response to a SUBSCRIBE message, when in Emergency mode. The valid value is 200 to 699. The default is 489.
Web: Enable ENUM [SASEnableENUM]	Enables SAS to perform ENUM (E.164 number to URI mapping) queries when receiving INVITE messages in SAS emergency mode. • [0] Disable (default) • [1] Enable
Web: SAS Binding Mode EMS: Binding Mode [SASBindingMode]	 Determines the SAS application database binding mode. [0] URI = (Default) If the incoming AoR in the INVITE requests is using a 'tel:' URI or 'user=phone' is defined, the binding is performed according to the user part of the URI only. Otherwise, the binding is according to the entire URI, i.e., User@Host. [1] User Part only = The binding is always performed according to the User Part only.
Web: SAS Emergency Numbers [SASEmergencyNumbers]	Defines emergency numbers for the device's SAS application. When the device's SAS agent receives a SIP INVITE (from an IP phone) that includes one of the emergency numbers (in the SIP user part), it forwards the INVITE to the default gateway (configured by the parameter SASDefaultGatewayIP), i.e., the device itself, which sends the call directly to the PSTN. This is important for routing emergency numbers such as 911 (in North America) directly to the PSTN. This is applicable to SAS

Parameter	Description
	operating in Normal and Emergency modes. Up to four emergency numbers can be defined, where each number can be up to four digits.
[SASEmergencyPrefix]	Defines a prefix that is added to the Request-URI user part of the INVITE message that is sent by the device's SAS agent when in Emergency mode to the default gateway or to any other destination (using the IP-to-IP Routing table). This parameter is required to differentiate between normal SAS calls routed to the default gateway and emergency SAS calls. Therefore, this allows you to define different manipulation rules for normal and emergency calls. This valid value is a character string. By default, no value is defined.
Web: SAS Entering Emergency Mode [SASEnteringEmergencyMode]	 Determines for which sent SIP message types the device enters SAS Emergency mode if no response is received for them from the proxy server. [0] = (Default) SAS enters Emergency mode only if no response is received from sent SIP OPTIONS messages. [1] = SAS enters Emergency mode if no response is received from sent SIP OPTIONS, INVITE, or REGISTER messages.
	Note: If the keep-alive mechanism is disabled for the Proxy Set (in the Proxy Set table) and this parameter is set to [1], SAS enters Emergency mode only if no response is received from sent INVITE or REGISTER messages.
[SASInDialogRequestMode]	Defines how the device sends incoming SIP dialog requests received from users when not in SAS Emergency mode. • [0] = (Default) Send according to the SIP Request-URI. • [1] = Send to Proxy server.
Web: SAS Inbound Manipulation Mode [SASInboundManipulationMode]	Enables destination number manipulation of incoming INVITE messages when SAS is in Emergency mode. The manipulation rule is done in the IP to IP Inbound Manipulation table. • [0] None (default) • [1] Emergency Only Note: Inbound manipulation applies only to INVITE requests.
SAS Registration Manipulation Ta	
Web: SAS Registration Manipulation EMS: Stand-Alone Survivability [SASRegistrationManipulation]	This table parameter configures the SAS Registration Manipulation table. This table is used by the SAS application to manipulate the SIP Request-URI user part of incoming INVITE messages and of incoming REGISTER request AoR (To header), before saving it to the registered users database. The format of this table parameter is as follows:
	[SASRegistrationManipulation] FORMAT SASRegistrationManipulation_Index = SASRegistrationManipulation_RemoveFromRight, SASRegistrationManipulation_LeaveFromRight; [\SASRegistrationManipulation]
	For example, the manipulation rule below routes an INVITE with Request-URI header "sip:7184002@10.33.4.226" to user "4002@10.33.4.226" (i.e., keep only four digits from right of user part):

Parameter	Description
	SASRegistrationManipulation 0 = 0, 4;
Web: SAS IP-to-IP Routing Table	
[IP2IPRouting]	This table parameter configures the IP-to-IP Routing table for SAS routing rules. The format of the ini file table parameter is as follows: [IP2IPRouting] FORMAT IP2IPRouting_Index = IP2IPRouting_SrcIPGroupID, IP2IPRouting_SrcUsernamePrefix, IP2IPRouting_SrcHost, IP2IPRouting_DestUsernamePrefix, IP2IPRouting_DestHost, IP2IPRouting_DestType, IP2IPRouting_DestIPGroupID, IP2IPRouting_DestSRDID, IP2IPRouting_DestAddress, IP2IPRouting_DestPort, IP2IPRouting_DestTransportType, IP2IPRouting_AltRouteOptions; [\IP2IPRouting] For example: IP2IPRouting 1 = -1, *, *, *, *, *, 0, -1, -1, , 0, -1, 0;

50.13 IP Media Parameters

The IP media parameters are described in the table below.

Table 50-69: IP Media Parameters

Table 50-05. If Media Farameters	
Parameter	Description
Web: Number of Media Channels EMS: Media Channels [MediaChannels]	Defines the maximum number of DSP channels allocated for various functionalities such as transcoding, IP conferencing, IP-to-IP sessions.
	The RTP streams for IP-to-IP calls always transverse the device and two DSP channels are allocated per IP-to-IP session. Therefore, the maximum number of media channels for IP-to-IP calls is 2016, corresponding to 1008 IP-to-IP calls. The default is 0.
	Notes:
	 For this parameter to take effect, a device reset is required. The SBC application does not require DSP channels. The SBC application uses DSP channels only if media transcoding is needed, where two DSP channels are used per transcoding session. Other DSP channels can be used for PSTN interfaces.
Web: NetAnn Announcement ID [NetAnnAnncID]	Defines the NetAnn identification string (up to 16 characters) for playing an announcement using the NetAnn interface. The application server sends a regular SIP INVITE message with a SIP URI that includes this identifier string and a "play=" parameter that identifies the necessary announcement. The default is 'annc'.
	Example 1: INVITE sip: annc@10.2.3.4;play=http://localhost/1. Example 2: INVITE sip: annc@10.2.3.4;play=http://10.2.3.4/Annc/ello.wav.
Web: Transcoding ID [TranscodingID]	Defines the Transcoding identification string (up to 16 characters) used for identifying an incoming Transcoding call.

Parameter	Description
	The default is 'trans'.
	For more information on Transcoding, see NetAnn Interface.
Conferencing Parameters	
Web/EMS: Conference ID [ConferenceID]	Defines the Conference Identification string. The valid value is a string of up to 16 characters. The default is "conf".
	Note: To join a conference, the INVITE URI must include the Conference ID string preceded by the number of the participants in the conference and terminated by a unique number. For example: INVITE sip:4conf1234@10.1.10.10
	INVITE messages with the same URI join the same conference.
Web: Beep on Conference [BipOnConference]	Enables playing a beep when a participant joins or leaves a conference (in the latter case, a beep of a different pitch is heard). • [0] Disable • [1] Enable (default)
Web: Enable Conference DTMF Clamping [EnableConferenceDTMFClamp]	Determines the device logic once a DTMF is received on any conference participant. If enabled, the DTMF is not regenerated toward the other conference participants. This logic is only relevant for simple conferencing (NetAnn). • [0] Disable • [1] Enable (default)
Web: Enable Conference DTMF Reporting [EnableConferenceDTMFReporting]	Determines the device logic once a DTMF is received on any conference participant. If enabled, the device reports this DTMF in an out-of-band SIP message (according to TxDTMFOptions). This logic is only relevant for simple conferencing (NetAnn). • [0] Disable (default) • [1] Enable
Web: Active Speakers Min. Interval [ActiveSpeakersNotificationMinInte rval]	Defines the minimum interval (in 100 msec units) between each Active Speaker Notification (ASN) events report. These events report on the active speakers in a conference. The event is issued whenever the active speakers change. Minimum configurable interval between events is 500 msec (5
	units). The range is 5 to 2147483647 units. The default is 20 (i.e., 100 msec).
Automatic Gain Control (AGC) Para	meters
Web: Enable AGC EMS: AGC Enable [EnableAGC]	Enables the AGC mechanism. The AGC mechanism adjusts the level of the received signal to maintain a steady (configurable) volume level. • [0] Disable (default) • [1] Enable Notes:
	 This parameter can also be configured for a Tel Profile (in the Tel Profile table). For a description of AGC, see Automatic Gain Control (AGC)
	on page 202.

Parameter	Description
Web: AGC Slope EMS: Gain Slope [AGCGainSlope]	Determines the AGC convergence rate: [0] 0 = 0.25 dB/sec [1] 1 = 0.50 dB/sec [2] 2 = 0.75 dB/sec [3] 3 = 1.00 dB/sec (default) [4] 4 = 1.25 dB/sec [5] 5 = 1.50 dB/sec [6] 6 = 1.75 dB/sec [7] 7 = 2.00 dB/sec [8] 8 = 2.50 dB/sec [9] 9 = 3.00 dB/sec [10] 10 = 3.50 dB/sec [11] 11 = 4.00 dB/sec [11] 11 = 4.00 dB/sec [12] 12 = 4.50 dB/sec [13] 13 = 5.00 dB/sec [14] 14 = 5.50 dB/sec [15] 15 = 6.00 dB/sec [16] 16 = 7.00 dB/sec [17] 17 = 8.00 dB/sec [18] 18 = 9.00 dB/sec [19] 19 = 10.00 dB/sec [20] 20 = 11.00 dB/sec [21] 21 = 12.00 dB/sec [21] 21 = 12.00 dB/sec [22] 22 = 13.00 dB/sec [23] 23 = 14.00 dB/sec [24] 24 = 15.00 dB/sec [25] 25 = 20.00 dB/sec [27] 27 = 30.00 dB/sec [28] 28 = 35.00 dB/sec [29] 29 = 40.00 dB/sec [29] 29 = 40.00 dB/sec [30] 30 = 50.00 dB/sec [31] 31 = 70.00 dB/sec
Web: AGC Redirection EMS: Redirection [AGCRedirection]	Determines the AGC direction. • [0] 0 = (Default) AGC works on signals from the TDM side. • [1] 1 = AGC works on signals from the IP side.
Web: AGC Target Energy EMS: Target Energy [AGCTargetEnergy]	Defines the signal energy value (dBm) that the AGC attempts to attain. The valid range is 0 to -63 dBm. The default is -19 dBm.
Web: AGC Minimum Gain EMS: Minimal Gain [AGCMinGain]	Defines the minimum gain (in dB) by the AGC when activated. The range is 0 to -31. The default is -20. Note: For this parameter to take effect, a device reset is required.
Web: AGC Maximum Gain EMS: Maximal Gain [AGCMaxGain]	Defines the maximum gain (in dB) by the AGC when activated. The range is 0 to 18. The default is 15. Note: For this parameter to take effect, a device reset is required.

Parameter	Description
Web/EMS: Disable Fast Adaptation [AGCDisableFastAdaptation]	 Enables the AGC Fast Adaptation mode. [0] = Disable (default) [1] = Enable Note: For this parameter to take effect, a device reset is required.
Answering Machine Detection (AMD) Parameters
Web: Web: Answer Machine Detector Sensitivity Parameter Suit [AMDSensitivityParameterSuit]	Global parameter that defines the AMD Parameter Suite to use. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_AMDSensitivityParameterSuit). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314.
	For more information on AMD, see 'Answering Machine Detection (AMD)' on page 196.
	Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: Answer Machine Detector Sensitivity Level [AMDSensitivityLevel]	Global parameter that defines the AMD detection sensitivity level of the selected AMD Parameter Suite. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_AMDSensitivityLevel). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314.
	Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
Web: AMD Sensitivity File [AMDSensitivityFileName]	Defines the name of the AMD Sensitivity file that contains the AMD Parameter Suites. Notes:
	 This file must be in binary format (.dat). You can use the DConvert utility to convert the original file format from XML to .dat.
	 You can load this file using the Web interface (see Loading Auxiliary Files on page 555).
[AMDSensitivityFileUrl]	Defines the URL path to the AMD Sensitivity file for downloading from a remote server.
[AMDMinimumVoiceLength]	Defines the AMD minimum voice activity detection duration (in 5-ms units). Voice activity duration below this threshold is ignored and considered as non-voice.
	The valid value range is 10 to 100. The default is 42 (i.e., 210 ms).
EMS: AMD Max Greeting Time [AMDMaxGreetingTime]	Global parameter that defines the maximum duration that the device can take to detect a greeting message. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_AMDMaxGreetingTime). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314.
	Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls

Version 6.8 907 Mediant 3000

Parameter	Description
	associated with the IP Profile.
EMS: AMD Max Post Silence Greeting Time [AMDMaxPostGreetingSilenceTim e]	Global parameter that defines the maximum duration of silence from after the greeting time is over (defined by AMDMaxGreetingTime) until the device's AMD decision. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_AMDMaxPostSilenceGreetingTime). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls associated with the IP Profile.
EMS: Time Out [AMDTimeout]	Defines the timeout (in msec) between receiving Connect messages from the ISDN and sending AMD results. The valid range is 1 to 30,000. The default is 2,000 (i.e., 2 seconds).
Web/EMS: AMD Beep Detection Mode [AMDBeepDetectionMode]	Determines the AMD beep detection mode. This mode detects the beeps played at the end of an answering machine message, by using the X-Detect header extension. The device sends a SIP INFO message containing the field values Type=AMD and SubType=Beep. This feature allows users of certain third-party, Application server to leave a voice message after an answering machine plays the "beep". • [0] Disabled (default) • [1] Start After AMD • [2] Start Immediately
Web: Answer Machine Detector Beep Detection Timeout EMS: Beep Detection Timeout [AMDBeepDetectionTimeout]	Defines the AMD beep detection timeout (i.e., the duration that the beep detector functions from when detection is initiated). This is used for detecting beeps at the end of an answering machine message. The valid value is in units of 100 milliseconds, from 0 to 1638. The default is 200 (i.e., 20 seconds).
Web: Answer Machine Detector Beep Detection Sensitivity EMS: Beep Detection Sensitivity [AMDBeepDetectionSensitivity]	Defines the AMD beep detection sensitivity for detecting beeps at the end of an answering machine message. The valid value is 0 to 3, where 0 (default) is the least sensitive.
[EnableEarlyAMD]	 Enables AMD detection to be activated upon receipt of an ISDN Alerting message. alerting otherwise on connect [0] = (Default) Disable - AMD is activated upon receipt of ISDN Connect message. [1] = Enable - AMD is activated upon receipt of ISDN Alerting message.
Web: AMD mode [AMDmode]	Global parameter that enables the device to disconnect the IP-to-Tel call upon detection of an answering machine on the Tel side. You can also configure this functionality per specific calls, using IP Profiles (IpProfile_AmdMode). For a detailed description of this parameter and for configuring this functionality in the IP Profile table, see Configuring IP Profiles on page 314. Note: If this functionality is configured for a specific IP Profile, the settings of this global parameter is ignored for calls

Parameter	Description
	associated with the IP Profile.
Energy Detector Parameters	
Enable Energy Detector [EnableEnergyDetector]	Enables the Energy Detector feature. This feature generates events (notifications) when the signal received from the PSTN is higher or lower than a user-defined threshold (defined by the EnergyDetectorThreshold parameter). • [0] Disable (default) • [1] Enable
Energy Detector Quality Factor [EnergyDetectorQualityFactor]	Defines the Energy Detector's sensitivity level. The valid range is 0 to 10, where 0 is the lowest sensitivity and 10 the highest sensitivity. The default is 4.
Energy Detector Threshold [EnergyDetectorThreshold]	Defines the Energy Detector's threshold. A signal below or above this threshold invokes an 'Above' or 'Below' event. The threshold is calculated as follows: Actual Threshold = -44 dBm + (EnergyDetectorThreshold * 6) The valid value range is 0 to 7. The default is 3 (i.e., -26 dBm).
Pattern Detection Parameters Note: For an overview on the patter on page 360.	n detector feature for TDM tunneling, see DSP Pattern Detector
Web: Enable Pattern Detector [EnablePatternDetector]	Enables the Pattern Detector (PD) feature.[0] Disable (default)[1] Enable
[PDPattern]	Defines the patterns that can be detected by the Pattern Detector. The valid range is 0 to 0xFF. Note: For this parameter to take effect, a device reset is required.
[PDThreshold]	Defines the number of consecutive patterns to trigger the pattern detection event. The valid range is 0 to 31. The default is 5. Note: For this parameter to take effect, a device reset is required.

50.14 Services

50.14.1 SIP-based Media Recording Parameters

The SIP-based media recording parameters are described in the table below.

Table 50-70: SIP-based Media Recording Parameters

Parameter	Description
Web: SIP Recording Application [EnableSIPRec]	 Enables the SIP-based Media Recording feature: [0] Disable (default) [1] Enable Note: For this parameter to take effect, a device reset is required.
Web: Recording Server (SRS) Destination Username [SIPRecServerDestUsername]	Defines the SIP user part for the recording server. This user part is added in the SIP To header of the INVITE message that the device sends to the recording server. The valid value is a string of up to 50 characters. By default, no user part is defined.
SIP Recording Routing Table	
Web: SIP Recording Routing table [SIPRecRouting]	Defines SIP Recording Routing rules (calls to record). The format of the ini file table parameter is as follows: [SIPRecRouting] FORMAT SIPRecRouting_Index = SIPRecRouting_RecordedIPGroupID, SIPRecRouting_RecordedSourcePrefix, SIPRecRouting_RecordedDestinationPrefix, SIPRecRouting_PeerIPGroupID, SIPRecRouting_PeerTrunkGroupID, SIPRecRouting_Caller, SIPRecRouting_SRSIPGroupID; [\SIPRecRouting_SIPRecRouting] For a detailed description of this table, see "Configuring SIP Recording Routing Rules" on page 210.

50.14.2 RADIUS and LDAP Parameters

50.14.2.1 General Parameters

The general RADIUS and LDAP parameters are described in the table below.

General RADIUS and LDAP Parameters

Parameter	Description
Web: Use Local Users Database CLI: configure system >	Defines when the device uses its local user database (Web Users table) for LDAP- or RADIUS-based management-user login authentication.
mgmt-auth > use-local- users-db [MgmtLocalDatabaseBe havior]	 [0] When No Auth Server Defined = (Default) When no LDAP/RADIUS server is configured (or as fallback if the server is inaccessible). [1] Always = Always first verify the user's credentials in the Web

Parameter	Description			
	Users table, and if not found, then search the LDAP/RADIUS server.			
Web: Behavior upon Authentication Server Timeout CLI: configure system > mgmt-auth > timeout- behavior [MgmtBehaviorOnTimeo ut]	Defines the device's response when a connection timeout occurs with the LDAP/RADIUS server.			
	 [0] Deny Access = User is denied access to the management platform. 			
	• [1] Verify Access Locally = (Default) Device verifies the user's credentials in its Web Users table (local database).			
	Note: The parameter is applicable to LDAP- or RADIUS-based management-user login authentication.			
Web: Default Access Level CLI: default-access-level [DefaultAccessLevel]	Defines the default access level for the device when the LDAP/RADIUS response doesn't include an access level attribute for determining the user's management access level.			
	The valid range is 0 to 255. The default is 200 (i.e., Security Administrator).			
	Note: The parameter is applicable to LDAP- or RADIUS-based management-user login authentication and authorization.			

50.14.2.2 RADIUS Parameters

The RADIUS parameters are described in the table below.

RADIUS Parameters

Parameter	Description			
RADIUS Accounting Parameters				
Web: Enable RADIUS Access Control CLI: enable [EnableRADIUS]	 Enables the RADIUS application. [0] Disable (Default) [1] Enable Note: For this parameter to take effect, a device reset is required. 			
Web: Accounting Server IP Address CLI: accounting-server-ip [RADIUSAccServerIP]	Defines the IP address of the RADIUS accounting server.			
Web: Accounting Port CLI: accounting-port [RADIUSAccPort]	Defines the port of the RADIUS accounting server. The default is 1646.			
Web/EMS: RADIUS Accounting Type CLI: radius-accounting [RADIUSAccountingTyp e]	Determines when the RADIUS accounting messages are sent to the RADIUS accounting server. • [0] At Call Release = (Default) Sent at call release only. • [1] At Connect & Release = Sent at call connect and release. • [2] At Setup & Release = Sent at call setup and release.			
Web: AAA Indications EMS: Indications CLI: aaa-indications [AAAIndications]	Determines the Authentication, Authorization and Accounting (AAA) indications. • [0] None = (Default) No indications. • [3] Accounting Only = Only accounting indications are used.			

Parameter	Description				
General RADIUS Parameters					
Web: Use RADIUS for Web/Telnet Login EMS: Web Use Radius Login CLI: enable-mgmt-login [WebRADIUSLogin]	 Enables RADIUS queries for Web and Telnet login authentication. When enabled, logging into the device's Web and Telnet embedded servers is done through a RADIUS server. The device communicates with a user-defined RADIUS server and verifies the given username and password against a remote database, in a secure manner. [0] Disable (default) [1] Enable Notes: For RADIUS login authentication to function, you also need to set the following parameters: ✓ EnableRADIUS = 1 (Enable) ✓ WebAuthMode = 0 (Basic Mode) RADIUS authentication requires HTTP basic authentication, where the username and password are transmitted in clear text over the network. Therefore, it's recommended to set the HTTPSOnly parameter to 1 to force the use of HTTPS, since the transport is encrypted. 				
Web: RADIUS Authentication Server IP Address EMS: RADIUS Auth Server IP CLI: auth-server-ip [RADIUSAuthServerIP]	Defines the IP address of the RADIUS authentication server. Note: For this parameter to take effect, a device reset is required.				
Web: RADIUS Authentication Server Port EMS: RADIUS Auth Server Port CLI: auth-server-port [RADIUSAuthPort]	Defines the port of the RADIUS authentication server. Note: For this parameter to take effect, a device reset is required.				
Web: RADIUS Shared Secret EMS: RADIUS Auth Server Secret CLI: shared-secret [SharedSecret]	Defines the 'secret' used to authenticate the device to the RADIUS server. This should be a cryptically strong password.				
RADIUS Authentication P	arameters				
Web: Password Local Cache Mode CLI: local-cache-mode [RadiusLocalCacheMod e]	Defines the device's mode of operation regarding the timer (configured by the parameter RadiusLocalCacheTimeout) that determines the validity of the username and password (verified by the RADIUS server). • [0] Absolute Expiry Timer = When you access a Web page, the timeout doesn't reset, instead it continues decreasing. • [1] Reset Timer Upon Access = (Default) Upon each access to a Web page, the timeout always resets (reverts to the initial value configured by RadiusLocalCacheTimeout).				
Web: Password Local Cache Timeout CLI: local-cache-timeout [RadiusLocalCacheTime	Defines the time (in seconds) the locally stored username and password (verified by the RADIUS server) are valid. When this time expires, the username and password become invalid and a must be re-				

Parameter	Description			
out]	The valid range is 1 to 0xFFFFFF. The default is 300 (5 minutes). • [-1] = Never expires. • [0] = Each request requires RADIUS authentication.			
Web: RADIUS VSA Vendor ID CLI: vsa-vendor-id [RadiusVSAVendorID]	Defines the vendor ID that the device accepts when parsing a RADIUS response packet. The valid range is 0 to 0xFFFFFFF. The default is 5003.			
Web: RADIUS VSA Access Level Attribute CLI: vsa-access-level [RadiusVSAAccessAttri bute]	Defines the code that indicates the access level attribute in the Vendor Specific Attributes (VSA) section of the received RADIUS packet. The valid range is 0 to 255. The default is 35.			
[MaxRADIUSSessions]	Defines the number of concurrent calls that can communicate with the RADIUS server (optional). The valid range is 0 to 240. The default is 240.			
EMS: RADIUS Auth Number of Retries [RADIUSRetransmission]	Defines the number of retransmission retries. The valid range is 1 to 10. The default is 3.			
[RadiusTO]	Defines the time interval (measured in seconds) that the device waits for a response before a RADIUS retransmission is issued. The valid range is 1 to 30. The default is 10.			

50.14.2.3 LDAP Parameters

The Lightweight Directory Access Protocol (LDAP) parameters are described in the table below.

LDAP Parameters

Parameter	Description			
Web: LDAP Service CLI: configure voip/ldap/enable [LDAPServiceEnable]	 Enables the LDAP feature. [0] Disable (default) [1] Enable Note: For this parameter to take effect, a device reset is required. 			
CLI: search-dns-in-parallel [LDAPSearchDNsinParalle I]	 Defines the method of how the device queries the DN object within each LDAP server. [0] Sequential = (Default) The query is done in each DN object, one by one, until a result is returned. [1] Parallel = The query is done in all DN objects at the same time. 			
Web: LDAP Search Server Method CLI: Idap-search-server- method [LDAPSearchServerMethod]	 Defines the method of how the device queries between two LDAP severs. [0] Sequential = The device first queries one of the LDAP servers, and if the DN object is not found, it queries the second LDAP server. [1] Parallel = (Default) The device queries the LDAP servers at 			

Version 6.8 913 Mediant 3000

Parameter	Description			
	the same time.			
Web: LDAP Authentication Filter CLI: configure voip > Idap > auth-filter [LDAPAuthFilter]	Defines the LDAP search filter attribute for searching the login username in the directory's subtree for LDAP-based user authentication and authorization. You can use the dollar (\$) sign to represent the username. For example, if this parameter is set to "(sAMAccountName=\$)" and the user logs in with the username "SueM", the LDAP query is run for sAMAccountName=SueM.			
Web: Use LDAP for Web/Telnet Login CLI: configure voip > Idap > enable-mgmt-login [MgmtLDAPLogin]	Enables LDAP-based management-user login authentication and authorization. • [0] Disable (default) • [1] Enable Note: For this parameter to take effect, a device reset is required.			
[LDAPDebugMode]	Determines whether to enable the LDAP task debug messages. This is used for providing debug information regarding LDAP tasks. The valid value range is 0 to 3. The default is 0.			
Web: MS LDAP OCS Number attribute name EMS: LDAP ocs Number Attribute Name CLI: Idap-ocs-nm-attr [MSLDAPOCSNumAttribut eName]	Defines the name of the attribute that represents the user's Lync number in the Microsoft AD database. The valid value is a string of up to 49 characters. The default is "msRTCSIP-PrimaryUserAddress".			
Web: MS LDAP PBX Number attribute name CLI: Idap-pbx-nm-attr [MSLDAPPBXNumAttribut eName]	Defines the name of the attribute that represents the user PBX number in the Microsoft AD database. The valid value is a string of up to 49 characters. The default is "telephoneNumber".			
Web: MS LDAP MOBILE Number attribute name CLI: Idap-mobile-nm-attr [MSLDAPMobileNumAttri buteName]	Defines the name of the attribute that represents the user Mobile number in the Microsoft AD database. The valid value is a string of up to 49 characters. The default is "mobile".			
CLI: Idap-private-nm-attr [MSLDAPPrivateNumAttri buteName]	Defines the name of the attribute that represents the user's private number in the AD. If this value equals the value of the MSLDAPPrimaryKey or MSLDAPSecondaryKey parameter, then the device queries the AD for the destination number in this private attribute name; otherwise, this parameter is not used as a search key. The default is "msRTCSIP-PrivateLine".			
Web: MS LDAP DISPLAY Name Attribute Name CLI: Idap-display-nm-attr [MSLDAPDisplayNameAtt ributeName]	Defines the attribute name that represents the Calling Name in the AD for LDAP queries based on calling number. The valid value is a string of up to 49 characters. The default is "displayName".			
CLI: Idap-primary-key [MSLDAPPrimaryKey]	Defines the name of the attribute used as a query search key for the destination number in the AD. This is used instead of the "PBX" attribute name (configured by the MSLDAPPBXNumAttributeName parameter). The default is not configured.			

Parameter	Description			
CLI: Idap-secondary-key [MSLDAPSecondaryKey]	Defines the name of the attribute used as the second query search key for the destination number in the AD, if the primary search key or PBX search is not found.			
LDAP Cache Service CLI: cache [LDAPCacheEnable]	 Enables the LDAP cache service. [0] Disable (default) [1] Enable Notes: For this parameter to take effect, a device reset is required. For more information on LDAP caching, see 'Configuring the Device's LDAP Cache' on page 226. 			
LDAP Cache Entry Timeout CLI: entry-timeout [LDAPCacheEntryTimeout]	Defines the duration (in minutes) that an entry in the LDAP cache is valid. If the timeout expires, the cached entry is only used if there is no connectivity with the LDAP server. The default is 1200.			
LDAP Cache Entry Removal Timeout CLI: entry-removal- timemout [LDAPCacheEntryRemova ITimeout]	Defines the duration (in hours) after which the LDAP entry is removed from the cache. The default is 0.			
LDAP Configuration Table				
Web: LDAP Configuration Table CLI: configure voip > Idap > Idap-configuration [LdapConfiguration]	Defines the LDAP servers. [LdapConfiguration] FORMAT LdapConfiguration_Index = LdapConfiguration_LdapConfServerIp, LdapConfiguration_LdapConfServerPort, LdapConfiguration_LdapConfServerMaxRespondTime, LdapConfiguration_LdapConfServerDomainName, LdapConfiguration_LdapConfPassword, LdapConfiguration_LdapConfBindDn, LdapConfiguration_LdapConfInterfaceType, LdapConfiguration_Type, LdapConfiguration_MngmAuthAtt, LdapConfiguration_ConnectionStatus; [\LdapConfiguration] For a detailed description of this table, see 'Configuring LDAP Servers' on page 219.			
LDAP Server Search DN Ta	ble			
Web: LDAP Search DN Table CLI: configure voip > Idap > Idap-servers-search-dns [LdapServersSearchDNs]	Defines the full base path (i.e., distinguished name / DN) to the objects in the AD where the query is done, per LDAP server. [LdapServersSearchDNs] FORMAT LdapServersSearchDNs_Index = LdapServersSearchDNs_Base_Path, LdapServersSearchDNs_LdapConfigurationIndex, LdapServersSearchDNs_SearchDnInternalIndex; [\LdapServersSearchDNs] For a detailed description of this table, see 'Configuring LDAP DNs (Base Paths) per LDAP Server' on page 222.			
Management LDAP Groups	Table			

Version 6.8 915 Mediant 3000

Parameter	Description	
Web: Management LDAP Groups Table CLI: configure voip > Idap > mgmt-Idap-groups [MgmntLDAPGroups]	Defines the users group attribute in the AD and corresponding management access level.	
	[MgmntLDAPGroups] FORMAT MgmntLDAPGroups_Index = MgmntLDAPGroups_LdapConfigurationIndex, MgmntLDAPGroups_GroupIndex, MgmntLDAPGroups_Level, MgmntLDAPGroups_Group; [\MgmntLDAPGroups]	
	For a detailed description of this table, see 'Configuring Access Level per Management Groups Attributes' on page 224.	

50.14.3 Least Cost Routing Parameters

The Least Cost Routing (LCR) parameters are described in the table below.

Table 50-71: LCR Parameters

Parameter	Description			
Web: Routing Rule Groups Table [RoutingRuleGroups]	This table parameter enables the LCR feature and configures the average call duration and default call cost. The default call cost determines whether routing rules that are not configured with a Cost Group are considered as a higher or lower cost route compared to other matching routing rules that are assigned Cost Groups. [RoutingRuleGroups] FORMAT RoutingRuleGroups_Index = RoutingRuleGroups_LCREnable, RoutingRuleGroups_LCRAverageCallLength, RoutingRuleGroups_LCRDefaultCost; [\RoutingRuleGroups]			
	Note: For a detailed description of this table, see "Enabling LCR and Configuring Default LCR" on page 242.			
Web: Cost Group Table EMS: Cost Group Provisioning > Cost Group [CostGroupTable]	This table parameter configures the Cost Groups for LCR, where each Cost Group is configured with a name, fixed call connection charge, and a call rate (charge per minute). [CostGroupTable] FORMAT CostGroupTable_Index = CostGroupTable_CostGroupName, CostGroupTable_DefaultConnectionCost, CostGroupTable_DefaultMinuteCost; [\CostGroupTable] For example: CostGroupTable 2 = "Local Calls", 2, 1;			
	Note: For a detailed description of this table, see "Configuring Cost Groups" on page 244.			

Parameter	Description
Web: Cost Group > Time Band Table EMS: Time Band Provisioning > Time Band [CostGroupTimebands]	This table parameter configures time bands and associates them with Cost Groups. [CostGroupTimebands] FORMAT CostGroupTimebands_TimebandIndex = CostGroupTimebands_StartTime, CostGroupTimebands_EndTime, CostGroupTimebands_ConnectionCost, CostGroupTimebands_MinuteCost; [\CostGroupTimebands] Note: For a detailed description of this table, see "Configuring Time Bands for Cost Groups" on page 245.

50.14.4 Call Setup Rules Parameters

The Call Setup Rules parameters are described in the table below.

Table 50-72: Call Setup Rules Parameters

Parameter	Description			
Web: Call Setup Rules [CallSetupRules]	This table parameter defines Call Setup Rules that the device runs at call setup for LDAP-based routing and other advanced routing logic requirements including manipulation.			
	[CallSetupRules] FORMAT CallSetupRules_Index = CallSetupRules_RulesSetID, CallSetupRules_AttributesToQuery, CallSetupRules_AttributesToGet, CallSetupRules_RowRole, CallSetupRules_Condition, CallSetupRules_ActionSubject, CallSetupRules_ActionType, CallSetupRules_ActionValue; [\CallSetupRules] Note: For a detailed description of this table, see "Configuring Call Setup Rules" on page 247.			

51 SBC and DSP Channel Capacity

This chapter lists the supported DSP firmware templates and channel capacity.

Notes:

- Installation and use of voice coders is subject to obtaining the appropriate license and royalty payments.
- The number of channels refers to the maximum channel capacity of the device.
- For additional DSP templates, contact your AudioCodes sales representative.
- To select the DSP Template that you want to use on the device, see Configuring DSP Templates on page 204.

51.1 Signaling-Media Sessions & User Registrations

The table below lists the maximum capacity. This includes SIP signaling sessions, SBC sessions, and registered users.

Table 51-1: Maximum Call Sessions and Registered Users

	Media Sessions			
Signaling Sessions	RTP-to-RTP	SRTP-RTP and SRTP-RTP	Codec Transcoding	Registered Users
1008	1,008	882	1,008	3,000 (5,000 Depop.)

Notes:

- The capacity figures listed in the table below are accurate at the time of publication of this document. However, these figures may change due to a later software update. For the latest figures, please contact your AudioCodes sales representative.
- The maximum number of SBC signaling and media sessions are specified in the installed Software License Key, which defines maximum figures for each one separately.
- The maximum number of voice transcoding sessions is specified in the installed Software License Key.
- Registered Users indicates the maximum number of users that can be registered
 with the device (i.e., in the device's registration database). This applies to all the
 supported applications.
- Regarding signaling, media, and transcoding session resources:
 - √ A signaling session is a SIP dialog session between two SIP entities, traversing the SBC and using one signaling session resource.
 - A media session is an audio (RTP or SRTP), fax (T.38), or video session between two SIP entities, traversing the SBC and using one media session resource.
 - √ A gateway session (i.e. TDM-RTP or TDM-SRTP) is also considered as a media session for the calculation of media sessions. In other words, the maximum Media Sessions specified in the table refer to the sum of gateway sessions and SBC sessions.
 - In case of direct media (i.e., Anti-tromboning / Non-Media Anchoring), where only SIP signaling traverses the SBC and media flows directly between the SIP entities, only a signaling session resource is used. Thus, if a greater signaling session capacity exists than media, even when media session resources have been exhausted, additional signaling sessions can still be handled for direct-media calls.
 - For call sessions requiring transcoding, one transcoding session resource is also used. For example, for a non-direct media call in which one leg uses G.711 and the other leg uses G.729, one signaling resource, one media session resource, and one transcoding session resource is used.

This section lists the device's supported channel capacity and DSP templates for the following:

- Mediant 3000 full chassis
- Mediant 3000 with 16 E1 / 21 T1
- Mediant 3000 with single T3
- DSP template mix feature

51.2.1 Mediant 3000 Full Chassis

The table below lists the supported channel capacity per DSP firmware template.

Table 51-2: DSP Firmware Templates

51.2.2 Mediant 3000 16 E1 / 21 T1

The DSP templates for 16 E1 / 21 T1 are shown in the table below.

Notes:

- For each IP-to-IP transcoding call, two DSP channels are required.
- For each IP-to-IP call, one DSP channel is required.

Table 51-3: DSP Firmware Templates for 16 E1 / 21 T1

51.2.4 Mediant 3000 DSP Template Mix Feature

The device can operate (and be loaded) with up to two DSP templates. The channel capacity per DSP template is approximately 50%, with alignment to the number of DSP's present in the device.

Table 51-5: Template Mix Feature Channel Capacity

DSP Template Mix	Number of Channels				
1 (AMR) / 2 (EVRC)	960				
1 (AMR) / 5 (EVRCB)	768				
1 (AMR) / 7 (iLBC)	864				

52 Technical Specifications

The table below lists the device's main technical specifications.

Note: All specifications in this document are subject to change without prior notice.

Table 52-1: Technical Specifications

Function	Specification
Trunk & Channel Capacity	
PSTN-IP Calls	2,016 simultaneous voice, fax, and data channels
IP-to-IP RTP Forwarding Interfaces	 Max RTP packet payload size: 1,000 bytes Max RTP payload bit rate on a single session: 384 kbps Average RTP payload bit rate on full capacity: 200 kbps
Ethernet	 Ethernet interface depends on the blade that is housed in the device's chassis: 6310 Blade: Dual (1+1 redundancy) Gigabit Ethernet (GbE) ports, full-duplex mode with auto-negotiation. These ports are available (by customer order) in one of the following hardware configurations: 10/100/1000Base-TX RJ-45 connector interface (CAT-5 twisted-pair copper cabling) 1000Base-SX 1.25 Gbps multi-mode optical small form-factor pluggable (SFP) transceiver, using 850 nm wavelength (hot-swappable) 8410 Blade: Four 10/100Base-TX RJ-45 LAN port interfaces (CAT-5 twisted-pair copper cabling) for Physical Network Separation (used by the active blade in HA mode). Dual (1+1 redundancy) Gigabit Ethernet (GbE) LAN ports, full-duplex mode with auto-negotiation per blade. These ports are available (by customer order) in one of the following hardware configurations: 1) 10/100/1000Base-TX RJ-45 connector interface (CAT-5 twisted-pair copper cabling) 2) 1000Base-SX multi-mode optical small form-factor pluggable (SFP) transceiver, using 850 nm wavelength
E1/T1	Up to 63 E1 and 84 T1 interfaces. Note: Applicable only to Mediant 3000 with TP-8410 blade.
OC-3/STM-1 PSTN	1+1 Protected STM-1/OC-3 interface. Two 155.54 Mbps single-mode optical SFP transceiver module, using 1310 nm wavelength. Note: Applicable only to Mediant 3000 with TP-6310 blade.
T3/DS3 PSTN	Up to three Mini-SMB T3/DS3 (44.736 Mbps, 75 Ohm coax) interfaces. Supports depopulated configuration providing a single DS3. Note: Applicable only to Mediant 3000 with TP-6310 blade.
RS-232	One RS-232 serial interface for serial configuration

Function	Specification					
Voice and Tone						
VoIP Standards Compliance	RTP/RTCP per RFC 3550/3551DTMF over RTP per RFC 4733					
Voice Compression (Independent dynamic vocoder selection per channel)	G.711 PCM at 64 kbps µ-law/A-law; G.722; AMR; AMR-WB; EVRC; EVRC-B (4GV); G.723.1 MP-MLQ at 5.3 or 6.3 kbps; G.726 at 32 kbps ADPCM; G.729 CS-ACELP 8 Kbps Annex A / B; G.729.1; GSM-EFR; GSM Full Rate; iLBC; Microsoft GSM; Microsoft RTA (Narrow Band and Wideband); Speex (Narrowband and Wideband); T.38 Ver. 3.					
Silence Suppression	 G.723.1 Annex A; G.729 Annex B PCM and ADPCM: Standard Silence Descriptor (SID) with Proprietary Voice Activity Detection (VAD) and Comfort Noise Generation (CNG) 					
Echo Cancellation	G.165 and G.168 2000 with 32, 64 or 128 msec tail length.					
Answer Detector	Answer detection					
Answer Machine Detector	Detects whether voice or an answering machine is answering the call. Note: When implementing Answer Machine Detector, channel capacity may be reduced.					
DTMF & Tone Signaling	DTMF detection and generation per TIA 464B					
	MF-R1, MFC-R2, detection and generationCall progress Tone detection and generation					
In-band/Out-of-band Signaling	Packet side, DTMF and tone detection and generation					
Gain Control	Configurable					
Session Border Controller (VoIP Security)	 SIP Header conversion: IP to IP Routing translations of SIP, UDP, TCP, TLS Translation of RTP, SRTP; Support SIP trunk with multi-ITSP (Registrations to ITSPs is invoked independently); Topology hiding; Call Admission Control; Call Black/White list Intrusion detection/prevention (NIDS); Anti SPIT & SPAM mechanisms 					
Fax Modem Relay/ByPass	 T.38 (IP) Versions 0 & 3 fax relay for both T.30 and V.34 fax transports Fax bypass (switch to G.711) Modem Bypass (including V.90) 					
Stand Alone Survivability	(SAS) Application					
SAS	SAS ensures call continuity between LAN SIP clients upon connectivity failure with IP Centrex services (e.g., WAN IP PBX).					
Max. Capacity						
TLS Sessions	100					
Voice Messaging						
Playback from Local Storage	Voice prompts and announcements playback (10 MB integral memory of G.711 recorded prompts)					
Signaling						

Function	Specification
PSTN	 CAS - T1 robbed bit: WinkStart, delay dial, immediate start, FGB, FGD, etc. MFC/R2 numerous country variants Unique script for each country variant, enabling maximum flexibility of the entire state machine of each CAS protocol CCS - ISDN PRI: ETSI EURO ISDN, ANSI NI-2, DMS, 5ESS, Japan INS1500, QSIG, Australian Telecom, New Zealand Telecom, Hong Kong Variant, Korean MIC, France Telecom
Media Processing	
IP Transport	VoIP (RTP/ RTCP) per IETF RFC 3550 and RFC 3551
DTMF/MF Transport	DTMF/MF RTP Relay per RFC-2833, Mute, Transparent (transfer in coder as voice)
Security	SRTP using AES and ARIA
Voice Quality Monitoring	RTCP XR (IETF RFC 3611)
High Availability	
1+1 System Setup	System houses 2 blades - one active in working mode; the other redundant in standby mode
Management Interfaces	
SNMP V2c, SNMP V3	Standard MIB-2, ALARM-MIB (RFC 3877), DS1-MIB (RFC 2495), DS3-MIB (RFC 3896), ENTITY-MIB (RFC 2737), IF-MIB (RFC 2863), IP-FORWARD (RFC 4292), IP-MIB (RFC 4293), NOTIFICATION-LOG-MIB (RFC 3014), RTCPXR-MIB, RTP-MIB (RFC 2959), SNMP-FRAMEWORK-MIB (RFC 3411), SNMPv2-TC, SONET-MIB (RFC 3592), TCP-MIB (RFC 4022), UDP-MIB (RFC 4113), and many other AudioCodes' proprietary MIBs
Embedded Web Server	Configuration and run-time monitoring using a Web browser
Syslog	Supported by Syslog servers
Processor	
Control Processor	Motorola PowerQUICC 8280
Control Processor Memory	 480 channels: SDRAM - 256 MB (applicable only to device's housing TP-8410) 2016 channels: SDRAM - 512 MB
Signal Processors	AudioCodes AC491 VoIP DSP @ 300 MHz
LED Indicators	
LED Indications on Front Panel	Visual status indications and alarms: Power, Fan Tray, ACT/Fail, E1/T1 status, LAN status, Swap ready
Connectors	
Rear Panel	
E1/T1 Interface	Two 100-pin SCSI connectors for Trunks 1-25 and 43-67. Two 68-pin SCSI connectors for Trunks 26-42 and 68-84. Note: Applicable only to Mediant 3000 with TP-8410.

Function	Specification
STM-1/OC-3 Interface	Two fiber optical 155.54-Mbps SFP modules (1+1 redundancy). The SFP modules accept twin single-mode fiber optic cables terminated with LC-type connectors (not supplied). Note: Applicable only to Mediant 3000 with TP-6310.
T3 Interface	Up to three SMB Tx/Rx connector pairs - receives RG-179/U coaxial cables terminated with 75-ohm male SMB connectors (not supplied) Note: Applicable only to Mediant 3000 with TP-6310.
Gigabit Ethernet (GbE)	 Two (1+1 redundancy) Gigabit Ethernet ports, full-duplex mode with auto-negotiation, available in one of the following (by customer ordered): 10/100/1000Base-TX RJ-45 connector interface (CAT 5 twisted pair) 10/100/1000Base-RX 1.25 Gbps optical SFP modules (hot swappable)
ESD Connectors	ESD connectors
Alarm Terminal Block Closures	Connection mate (on PEM module) of type FK-MC 0.5/8-ST-2,5 Phoenix Contact
BITS/SETS	RJ-48 connector (on the PEM module)
AC Power	3-Prong IEC 60320 type AC power inlet on the PEM module.
DC Power	 Two available connection types (on PEM module): 2-pin terminal block screw connection type, suitable for up to 10 AWG field wiring applications connecting DC Power connector: MSTB2.5/2-STF (5.08 mm) from Phoenix Contact. Cable connection mate: PC4/2-STF-7,62 (AudioCodes supplied) 2-pin terminal block crimp connection type, supplied with 14-16 AWG cable crimped to connector. [2 x crimp terminal female 10 AWG (Phoenix P/N: STG-MTN 1,5-2,5) and 1x terminal block shroud FML 7.62mm 2 POLE CBL MNT (Phoenix female P/N: STG-MTN 1,5-2,5)]
Front Panel	
Hardware Reset Button	Push button for resetting to default settings
RS-232	3-pin connector on blade for RS-232 serial configuration (DB9 to 3-pin cable adapter supplied)
Fiber Optic Cable	
PSTN (SDH) Single-Mode Fiber	 Input Sensitivity: -32 dBm typical; -28 dBm maximum Output Power: -15 dBm minimum; -8 dBm maximum Note: Applicable only to Mediant 3000 with TP-6310.
LAN (GbE) - Multi-Mode Fiber	 Input Sensitivity: -29 dBm typical; -17 dBm maximum Output Power: -9.5 dBm minimum; -2 dBm maximum Note: For TP-8410, the optical LAN interface is supported only for a fully populated TP-8410 or scalable configuration.
Power	
AC Power Input	Power input range 100-240 VAC at a nominal 50/60 Hz line frequency.
AC Power Supply Voltages and Power Consumption (Typical)	Depends on installed blades and configuration: ■ TP-6310 OC-3/STM-1 Simplex: ✓ 2.1A @ 110VAC, 235W

Function	Specification
	 ✓ 1A @ 230VAC, 235W TP-6310 OC-3/STM-1 HA: ✓ 3.4A @ 110VAC, 373W ✓ 1.6A @ 230VAC, 373W TP-8410 Simplex 24 E1/T1: ✓ 1.5A @ 110VAC, 162W ✓ 0.7A @ 230VAC, 162W TP-8410 HA 24 E1/T1: ✓ 2.1A @ 110VAC, 230W ✓ 1A @ 230VAC, 230W TP-8410 Simplex 63 E1/84 T1: ✓ 2.1A @ 110VAC, 230W ✓ 1A @ 230VAC, 230W TP-8410 HA 63 E1/84 T1: ✓ 3.3A @ 110VAC, 336W ✓ 1.6A @ 230VAC, 336W
DC Power Input	Power input range -40.5 to -60 VDC
DC Power Supply Voltages and Power Consumption (Typical)	Depends on installed blades and configuration: ■ TP-6310: ■ OC-3/STM-1 Simplex: 4.5A @ 48 VDC, 216W ■ OC-3/STM-1 HA: 7.1A @ 48 VDC, 343W ■ TP-8410: ■ 16E1/21T1 Simplex: 3.1A @ 48 VDC, 150W ■ 16E1/21T1 HA: 4.4A @ 48 VDC, 211W ■ 63E1/84T1 Simplex: 4.4A @ 48 VDC, 211W ■ 63E1/84T1 HA: 7A @ 48 VDC, 336W
Environmental	
Operating Temperature	0 to 40°C (32 to 104°F)
Storage	-40 to 70°C (-40 to 158°F)
Relative Humidity	10 to 90% non-condensing
Dimensions	
Enclosure	 2U high, 19-inch wide rack mount, 4-slot chassis Dimensions (H x W x D): 88 x 482.6 x 296.8 mm (3.5 x 19 x 11.87 inch), including mounting brackets Two middle mounting brackets (optional)
Weight (Fully Populated)	10.4 kg (23 lbs)
Mounting	19-inch rack mounting, shelf mounting, or desktop mounting
Hot Swap	Full blade hot-swap supported for media processing blades according to PICMG 2.1.
Host Interface	Via Packet interface using AudioCodes' proprietary TPNCP or standard control protocols
Regulatory Compliance	

Function	Specification
Telecommunication Standards	FCC part 68, TBR4 and TBR13
Safety and EMC Standards	 UL 60950-1 FCC part 15 Class A CE mark (EN 55022 Class A, EN 60950-1, EN 55024, EN 300 386)
